Fire and potential long term effects

Solar farms can potentially have an increased risk of Fire due to lithium batteries. California is already having difficulty with maintaining fire insurance for homeowners, this could potentially cause more companies to pull out of California leaving homes uninsured due to high fire risk. This location is near a lot of vegetation and hills , therefore a fire could spread rapidly. It's also near your homes and schools. There is a potential long-term effect from electromagnetic fields so close to homes. Please consider relocating to an area that's not close to home or hills.
