Why

I'm still trying to wrap my mind around how this is a good use of land that is already prone to fire danger with or without outside influence. Sandwiched in a small area surrounded by hillsides under high fire danger designation by the state already, next to the necessary 5 freeway artery, homes very close by that would be right in the fire path(including mine), this goes against the wishes of an entire community. For the sake of saving some money because there are transmission lines is just not enough to justify the risk. Who is going to clear the hillsides of overgrowth, perhaps add sprinklers for year round watering so they don't easily ignite? Who is going to pay for our continued increase in insurance costs as we get our premiums elevated again and again and again, or dropped altogether!? Why is compass not managing with their own people to watch the facility? As stated, it's for their own safety. From my understanding the owner of this is from overseas, so there's no vested interest in the community, rather it's an opportunity to make money from the state which has already overstepped by overruling cities. The supermajority is the worst thing to happen this state. It is crippling the people which pay for it's existence. Please consider that if you were to live here and have experienced the area and how fragile it is/can be, what you would do. One last question I ask is how the artificial push for EV's that necessitate the extra electricity is actually good for citizens? It is bankrupting people at the pump with insane gas prices that are not in line with the national averages in fluctuation up or down. In summary, there are other places this can go. A desert would be best. They have the money, SDGE has the money, the state has the money, they can invest in moving or adding transmission lines. If this is that important, find a place outside of high fire, community neighborhood areas, please!
