APPENDICES

APPENDIX A PROCESSED TELEVIEWER IMAGE LOGS, FTC, ELOG, AND NATURAL GAMMA LOGS

INTRODUCTION

Borehole geophysical measurements were acquired in one borehole in Rosamond, California. The work was performed for Crux Subsurface Inc. Data acquisition was completed by Colog and **GEOVision** on May 31st and June 1st, 2024. Data acquired by Colog and **GEOVision** and was processed by **GEOVision**. Data analysis and report preparation were reviewed by a **GEOVision** Professional Geophysicist or Engineer.

SCOPE OF WORK

This report presents the results of borehole geophysical measurements collected as detailed in Table 1. Acoustic televiewer (ATV), Elog, Fluid Temperature / Conductivity (FTC), and Natural Gamma (NG) data were acquired. The purpose of these measurements was to supplement borehole data obtained during the drilling investigation, identify flow zones and stratigraphy, as well to obtain information about fracture location, dip, orientation and aperture, as a function of depth.

An ALT ABI-40 acoustic televiewer (ATV) was used to collect acoustic televiewer images and borehole deviation data in one borehole. Acquired data were analyzed and a profile of borehole deviation versus depth was produced. Borehole images were analyzed and features such as bedding planes and fractures were identified with calculated feature dip and azimuth.

Mt. Sopris and Robertson ELOG, FTC, and natural gamma probes were used to collect normal resistivity, self-potential, single point resistance, fluid temperature, fluid conductivity and natural gamma data, respectively.

Data were processed and compiled to generate profiles of the preceding parameters versus depth.

INSTRUMENTATION

Televiewer / Borehole Deviation Instrumentation

Acoustic televiewer data were collected in one borehole by Colog using an ALT ABI40 acoustic borehole imager probe. A simple diagram of the tool is presented in Figure 1.

The acoustic borehole imager generates a 3D image from the borehole wall. The tool emits ultrasound pulses towards the formation and records the amplitude and the travel time of the reflected signal. A built-in high precision orientation package incorporating a 3-axis magnetometer and 3-axis accelerometer allows orientation of the images to a global reference and determination of the borehole's azimuth and inclination. The amplitude of the reflection from the borehole wall is representative of the acoustic properties of the formation. The travel time is used to determine exceptionally accurate borehole diameter data, which makes the tool ideal for borehole deformation description and casing inspection.

The tool generates an image of the borehole wall by transmitting ultrasound pulses and recording the amplitude and the travel time of the reflected signal and is capable of detecting multiple reflections. This multi-echo system is achieved by digital recording of the reflected acoustic wave train. Online analysis of the acoustic data is made by a DSP (Digital Signal Processor). Sophisticated algorithms allow the system to detect the reflection from the acoustic window and to separate all subsequent echoes. This probe features automatic optimization of the measurement window under all borehole conditions with very high travel time resolution and the caliper resolution is better than 0.1 mm.

The probe contains an APS 544 3-axis magnetometer to monitor magnetic north, and all raw televiewer data are referenced to magnetic north. Processed data are referenced to true north, using site and logging date-specific declination (11.4 degrees east) obtained from NOAA (<https://www.ngdc.noaa.gov/geomag/calculators/magcalc.shtml#declination>). Also, a three-axis accelerometer is enclosed in the probe to record boring deviation data while logging; this permits correction of structure dip angle from apparent dip, referenced to boring axis, to true dip

(referenced to a vertical axis) in non-vertical borings. The probe is centered in the borehole by two sets of plastic bow spring centralizers.

Elog / Natural Gamma Instrumentation

Elog data were collected using a Mt Sopris QL40-Elog probe (Elog). A simple diagram of the tool is presented in Figure 3. This probe measures single point resistance (SPR), normal resistivity at 8, 16, 32, and 64 inches, voltage self-potential (SP), and natural gamma (NG). The Elog probe is 75 inches long, and 1.7 inches in diameter. This tool requires a fluid-filled borehole and works best in best in relatively resistive media such as dry limestone, well cemented sandstone, or igneous rock.

The Mt. Sopris QL40-GR Natural Gamma (NG) probe was used to collect natural gamma radiation data in the borehole. The tool was connected to the other tools in a stack. This tool is 40.5 inches in length. The QL40-GR probe measures the amount of naturally occurring gamma radiation within the formations crossed by the borehole. Gamma rays are produced mainly by isotopes of potassium, thorium, and uranium. The natural gamma log is widely used in the groundwater and mining industries to identify lithology and perform clay content analyses.

The probe is useful in the studies of:

- Bed boundary analysis
- Facies changes
- Coarsening/ Fining Sequences
- Identify Clay Aquitards
- Aquifer Thickness
- Uranium Concentration

Total gamma counts may be presented in counts per second (CPS) or American Petroleum Institute (API) units.

Fluid Temperature / Fluid Conductivity Instrumentation

Fluid temperature, fluid conductivity and natural gamma data were collected in one borehole using a QL40-FTCI temperature / conductivity probe (FTC). A simple diagram of the tool is presented in Figure 2. This tool is 37 inches long. This probe was run in a stack with the acoustic televiewer.

This probe is useful in the following studies:

- Location of permeable zones in water wells or open holes
- Casing leak detection in completed wells
- Identification of cross-communicating aquifers in water wells or open holes

The temperature probe and conductivity electrodes are located in an insulated cavity at the bottom of probe body, with a fluid inlet opening at the tip and exit openings on the side of the probe approximately 8 inches above the tip. This tool is designed to collect data as it is lowered into the boring, so that the boring fluid moves through the cavity and passes over the sensors with a minimum of mixing or disturbance of the fluid by the passage of the probe. For the same reason, this is generally the first probe deployed in a suite of boring geophysical measurements.

MEASUREMENT PROCEDURES

Televiewer / Borehole Deviation Procedures

Acoustic televiewer data were collected by Colog following their standard operating televiewer data collection procedures.

Fluid Temperature / Fluid Conductivity Procedures

Temperature and conductivity data were collected by Colog following their standard operating data collection procedures.

Elog / Natural Gamma Measurement Procedures

Elog and natural gamma data were collected by Colog following their standard operating data collection procedures. Elog was also collected by **GEO***Vision* due to malfunction of Colog's Elog tool.

DATA ANALYSIS

Televiewer / Borehole Deviation Analysis

Televiewer feature classification followed **GEOVision** Televiewer Feature Notes and Picking Criteria (Appendix A). Acoustic televiewer data were processed using WellCAD Image & Structure Interpretation (ISI) Workspace. Sinusoidal projections of planar features on the borehole walls were interactively picked on the un-wrapped televiewer image and presented on the logs as colored sinusoids superimposed over the televiewer image. Sinusoidal projections were processed using the determined borehole gauge to calculate apparent dip angle. True dip was calculated, correcting for the plunge of the boreholes using recorded data from the accelerometers located in the probe, and presented in tadpole format, with true dip indicated by the tadpole position across the plot. The azimuth of dip (not strike) is indicated by the direction of the tadpole tail, with true north being “up.”

Televiewer data were also processed to extract deviation data and produce an Excel data file and plots of borehole deviation.

Fluid Temperature / Fluid Conductivity Analysis

FTC and NG data do not require analysis; however, depths were compared to verify consistent depth readings on all logs. Using WellCAD software, FTC data were combined with other log data and converted to LAS 2.0 and PDF formats.

Elog / Natural Gamma Data Analysis

Elog data do not require analysis; however, depths to identifiable borehole log features, such as distinct natural gamma transitions, were compared with other logs to verify consistent depth readings. Using WellCAD software, Elog data were combined with other log data and exported as LAS 2.0 and logs as PDF.

RESULTS

Televiewer / Borehole Deviation Results

One borehole was processed for televiewer features. Televiewer data were generally of very good quality. Acoustic televiewer logs with superimposed sinusoids and tadpole plots are presented in Appendix A. Both are provided as PDF in the data directory that accompanies this report. Televiewer results are presented in the figures and tables in this report in sequential order as follows: Stereonet diagram, rose diagram, deviation cylindrical projection, deviation bullseye projection, and televiewer features table.

Tabulated features data were exported as Excel format and accompany this report. Stereonet and rose plots were exported as PDF and borehole deviation as cylindrical projection and bullseye projection were exported as images; both accompany this report.

Per standard procedure, televiewer feature classification followed **GEOVision** Televiewer Feature Notes and Picking Criteria (included in Appendix A). Sinusoidal features and corrected arrow plots are displayed on the televiewer feature logs in Appendix A. Corrected acoustic feature depth, dip, and the azimuth of dip data are provided in the tables, as well as in Microsoft Excel® format. Depths on all figures and tables are referenced to ground surface. All data except tabulated deviation data references true north.

Rose diagram and stereonet were processed for acoustic features. Feature types are denoted in the log legends and identified by color. The same color key is used for the tadpole plots and stereonet poles. In the stereonet legend, each row represents a feature type by associated color, listing the total feature count, average dip and average azimuth of all features of that type on the stereonet.

Borehole deviation data extracted from the acoustic televiewer log is presented graphically in the figures and summarized in Table 3. Deviation data plots are provided in BMP or JPEG format and

deviation data tabulated at 1-foot intervals are provided in Excel® format. Deviation azimuths in the Excel® table references magnetic north.

Fluid Temperature / Fluid Conductivity/ Elog / Natural Gamma Results

FTC, Elog and natural gamma data are presented on the televiewer log plots scaled 1 foot = 20 feet in Appendix A. Depths on all figures and tables are referenced to ground surface.

SUMMARY

Discussion of Acoustic Televiwer / Boring Deviation Results

Acoustic televiwer data and borehole deviation data were collected below water level and surface casing. Acoustic televiwer images were of very good quality. Data reveal many identifiable hairline and open fractures generally in agreement with FTC and NG results. Occasional large voids are visible, as well as zones of greater weathering or softer rock, and harder rock at depth.

Televiwer Data Reliability

Depth indications are very reliable with estimated precision of ± 0.2 feet. Estimated precision of dip is ± 5 degrees and azimuth of dip is ± 10 degrees. Standardized field procedures and quality assurance checks add to the reliability of these data.

Discussion of Fluid Temperature / Fluid Conductivity Results

The FTC shows temperature gradually increases with depth however conductivity increased around 1750 feet then decreases to depth.

Discussion of Natural Gamma / Elog Results

Self-potential slowly decreases to 250 feet, then increases at 265, general decreasing with depth. Generally it opposes SPR and Normal resistivity which track together. Natural gamma is fairly constant throughout the borehole with spikes around 420 and 1400.

Quality Assurance

These borehole geophysical measurements were performed using industry-standard or better methods for measurements and analyses. All work was performed under **GEOVision** quality assurance procedures, which include:

- Use of NIST-traceable calibrations, where applicable, for field and laboratory instrumentation
- Use of standard field data logs
- Independent review of calculations and results by a registered professional engineer, geologist, or geophysicist.

CERTIFICATION

All geophysical data, analysis, interpretations, conclusions, and recommendations in this document have been prepared under the supervision of and reviewed by a **GEOVision** California Professional Geophysicist and/or Engineer.

APPENDIX A

PROCESSED TELEVIEWER IMAGE LOGS, FTC, ELOG, AND GAMMA LOGS

Aquisition Information:

Project: Rosamond
Location: Rosamond, CA
Client: Crux
Drilling Company: Crux
Date: 6/1/2024 Operator: Colog/GG
Borehole ID: ZEV-CH-05-24 Diameter: 4"
Start Depth: 99 End Depth: 2284

Tool(s): ABI
Elog
Gamma
FTC

Processing Information:

Processed: EF
Reviewed: RS

Depth Unit: Feet Log Version: Final

Log Nomenclature:
Acoustic Calliper = 360° average from travel time
Amplitude = Acoustic amplitude (true north)

Travel Time = Acoustic travel time (true north)

Structures = Apparent Structures oriented to hole
Corrected Tadpoles =Structures Oriented to true north
3D Acoustic = 3D representation of acoustic log

Structural Legend:

● Open Joint / Fracture ● Filled Joint / Fracture

Comments:
