Energy Needs

California is facing an energy crisis and is falling behind other states due to its stubborn adherence to using mainly solar and wind power. Nuclear power is a safe and reliable way to produce power.

In addition to nuclear power, let's use common sense solar deployments by incentivizing landowners to cover large parking lots with elevated solar panels. This will provide electricity as well as shaded and dry parking spaces. Couple the nuclear power and solar deployments with large-scale BESS and we could stabilize the grid and be ready for businesses of the future.
