Fire Emergency Services

Licensing application documents describe, or should describe, how local authorities will respond to worst credible design-basis fires. But, have inspections been done, or will they be done, to confirm that there are enough locally available trained responders with the right equipment to handle a BESS fire that could release toxic gases or cause an explosion? If such an inspection shows a negative result are there government based funding mechanisms at any level to improve response to potential fire events, including worst case?
