CODE ABIGUITY

I would like "Ducts in Conditioned Space" addressed. The code does not properly define this requirement, as there are (2) definitions-Directly and Indirectly. All of my training as a HERS Rater has defined it as Directly Conditioned Space, but there is no language in the code to support that. This has been an ongoing issue that everyone is aware of, but never seems to be addressed.

I would also like to see more education on the heat pump requirements for performance modeling. The fact that if a combination of equipment is installed that is not listed on ASHRI it does not comply, but if the same system is installed under prescriptive, it does comply.
