Poor use of natural resources

Placing a power plant (and data center) that will utilize a large amount of water in a desert area that has a rapidly depleting aquifer is a foolhardy decision. The water is needed for the citizens of the area and for the military base to continue its mission. If the water is depleted, both will have to leave the area. Unless the power plant pulls water from another area (tied in to the aqueduct specifically or trucked in from another state), it could spell doom for the local community.
