3.8 Paleontological Resources

This section describes the potential effects the construction and operation of the Seahawk Battery Energy Storage System (BESS) Project (project) may have on paleontological resources at and in the vicinity of the project site. The project would consist of an up to 200-megawatt containerized BESS facility using lithium-iron phosphate cells, or similar technology, operations and maintenance buildings, a project substation, a 115-kilovolt overhead generation interconnection (gen-tie) transmission line, a fire protection system, access improvements, stormwater management, a sound wall, Supervisory Control and Data Acquisition (SCADA), and a temporary construction laydown yard. The project would interconnect from the on-site collector substation to the adjacent Pacific Gas & Electric Company (PG&E) Green Valley Substation via a 115-kilovolt gen-tie transmission line. The gen-tie line would be installed underground from the project substation to the Point of Change of Ownership at an overhead riser pole on the PG&E parcel, and an overhead gen-tie line would connect to the Point of Interconnection at the PG&E Green Valley Substation.

This evaluation of paleontological resources includes the following elements:

- Section 3.8.1 describes the existing environment that could be affected, including regional and local geologic environment;
- Section 3.8.2 identifies potential environmental impacts that may result from project construction, operation, maintenance, and decommissioning;
- Section 3.8.3 discusses the potential cumulative effects;
- Section 3.8.4 identifies project design and mitigation measures that should be considered during project construction, operation, maintenance, and decommissioning to avoid or minimize potentially significant effects;
- Section 3.8.5 presents laws, ordinances, regulations, and standards applicable to paleontological resources;
- Section 3.8.6 identifies regulatory agency contacts;
- Section 3.8.7 describes permits required for the project related to paleontological resources; and
- Section 3.8.8 provides references used to develop this section.

The following environmental setting and impact evaluation is based in part on the following project-specific technical report and engineering plans, included as appendices to this application:

- Appendix 3.4A – Geotechnical Engineering Report
- Appendix 3.8A – Confidential Paleontological Resources Records Search Results
- Appendix 3.8B – Paleontological Resources Constraints Assessment

A summary of the paleontological resources evaluation is provided in the table below.

	Potentially Significant Impact	Less Than Significant Impact With Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:				
1) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☐	☒	☐	☐

3.8.1 Affected Environment

3.8.1.1 Physiographic and Geologic Setting

The project site lies within the Northern Coastline Subprovince, which superimposes coastal landforms such as steep cliffs, beaches, lagoons, etc., along the western length of the Coast Ranges Geomorphic Province. This Subprovince does not have the buffering effects of the broad continental shelf and so high energy wave action affects the shores. Beaches tend to be cobbly to gravelly with few scattered sandy beaches. The Coast Ranges Geomorphic Province is characterized by northwest trending mountains and valleys that are subparallel to the San Andreas Fault. The coastline is uplifted, terraced, and wave-cut. The strata within the Coast Ranges are thick units of Mesozoic and Cenozoic sediments (CGS 2002).

According to geological mapping by Brabb (1989 and 1997) at a 1:62,500 scale, the project site is underlain by middle to early Holocene (approximately 4,200 to 11,700 years ago; Cohen et al. 2024) older flood-plain deposits (map unit Qof) and Pleistocene (11,700 years ago to 2.58 million years ago; Cohen et al. 2024) terrace deposits of Watsonville, fluvial facies (map unit Qwf) (Figure 3.8-1, Paleontological Sensitivity). Lithologically, the older flood-plain deposits are characterized by loose, fine-grained sand, silt, and clay (Brabb 1997). These older flood-plain deposits have high paleontological resource sensitivity or potential. The terrace deposits of Watsonville, fluvial facies consist of moderately indurated, poorly to moderately sorted, silt, sand, silty clay, and gravel. The upper 5 to 15 feet is moderately lithified due to clay and iron oxide cementation. Gravel layers can be 50 feet thick and are normally found 50 feet below the ground surface (Brabb 1997). These terrace deposits have high paleontological resource sensitivity or potential (Figure 3.8-1, Paleontological Sensitivity).

Citing geological mapping of Brabb (1989) at a 1:62,500 scale and Graymer et al. (2006) at a 1:250,000 scale, the project-specific geotechnical report indicated the proposed project site is surficially mapped as terrace deposits of Watsonville, fluvial facies (Pleistocene) (map unit Qwf of Brabb [1989]) and terrace deposits of Watsonville, alluvial fan facies (map unit Qwa of Brabb [1989]) (Appendix 3.4A). The geotechnical study concluded that "…subsurface conditions consist of alluvial deposits to a depth of at least 100 ft bgs." For the purposes of this analysis, the more recent geological mapping of Brabb (1997) would be used.

3.8.2 Impact Analysis

For the units represented in Figure 3.8-1, Paleontological Sensitivity, and as expressed in Table 3.8-1, Standards for Determining Paleontological Sensitivities, the middle to early Holocene older floodplain deposits and Pleistocene

terrace deposits of Watsonville, fluvial facies, underlying the project site have high paleontological sensitivity or potential as the sediments are old enough to preserve fossils. As per SVP (2010):

> SIGNIFICANT PALEONTOLOGICAL RESOURCES are fossils and fossiliferous deposits, here defined as consisting of identifiable vertebrate fossils, large or small, uncommon invertebrate, plant, and trace fossils, and other data that provide taphonomic, taxonomic, phylogenetic, paleoecologic, stratigraphic, and/or biochronologic information. Paleontological resources are considered to be older than recorded human history and/or older than middle Holocene (i. e., older than about 5,000 radiocarbon years).

The following sections present the potential effects from the construction and operation of the project on paleontological resources.

3.8.2.1 Methodology

The standards used for determining paleontological sensitivities as set forth by the Society of Vertebrate Paleontology (SVP 2010) are listed in Table 3.8-1.

Table 3.8-1. Standards for Determining Paleontological Sensitivities

Resource Sensitivity/Potential	Definition
High	Rock units from which vertebrate or significant invertebrate, plant, or trace fossils have been recovered are considered to have a high potential for containing additional significant paleontological resources. Rock units classified as having high potential for producing paleontological resources include, but are not limited to, sedimentary formations and some volcaniclastic formations (e.g., ashes or tephras), and some low-grade metamorphic rocks that contain significant paleontological resources anywhere within their geographical extent, and sedimentary rock units temporally or lithologically suitable for the preservation of fossils (e.g., middle Holocene and older, fine-grained fluvial sandstones, argillaceous and carbonate-rich paleosols, cross-bedded point bar sandstones, fine-grained marine sandstones). Paleontological potential consists of both (1) the potential for yielding abundant or significant vertebrate fossils or for yielding a few significant fossils, large or small, vertebrate, invertebrate, plant, or trace fossils; and (2) the importance of recovered evidence for new and significant taxonomic, phylogenetic, paleoecologic, taphonomic, biochronologic, or stratigraphic data. Rock units that contain potentially datable organic remains older than late Holocene, including deposits associated with animal nests or middens, and rock units that may contain new vertebrate deposits, traces, or trackways are also classified as having high potential.
Low	Reports in the paleontological literature or field surveys by a qualified professional paleontologist may allow determination that some rock units have low potential for yielding significant fossils. Such rock units will be poorly represented by fossil specimens in institutional collections or, based on general scientific consensus, only preserve fossils in rare circumstances and the presence of fossils is the exception not the rule; e.g., basalt flows or Recent colluvium. Rock units with low potential typically will not require impact mitigation measures to protect fossils.
Undetermined Potential	Rock units for which little information is available concerning their paleontological content, geologic age, and depositional environment are considered to have undetermined potential. Further study is necessary to determine whether these rock

Table 3.8-1. Standards for Determining Paleontological Sensitivities

Resource Sensitivity/Potential	Definition
	units have high or low potential to contain significant paleontological resources. A field survey by a qualified professional paleontologist to specifically determine the paleontological resource potential of these rock units is required before a paleontological resource impact mitigation program can be developed. In cases where no subsurface data are available, paleontological potential can sometimes be determined by strategically located excavations into subsurface stratigraphy.
No Potential	Some rock units have no potential to contain significant paleontological resources; for instance, high-grade metamorphic rocks (such as gneisses and schists) and plutonic igneous rocks (such as granites and diorites). Rock units with no paleontological resource potential require neither protection nor impact mitigation measures relative to paleontological resources.

Paleontological sensitivities have been assigned to each formation found within and near the project site and can be found in Section 3.8.2.

A records search was requested from the Natural History Museum of Los Angeles County on March 21, 2024, and the Santa Cruz Museum of Natural History on September 25, 2025. The purpose of the museum records search is to determine whether there are any known fossil localities within or near the project site to assist in determining whether a paleontological mitigation program is necessary. Published geological literature and maps were reviewed to identify geological units on the project site and determine their paleontological sensitivity. A pedestrian survey covering all accessible areas of the project site was conducted by Dudek staff on November 26, 2025. The pedestrian surveys confirmed the geology, and no fossils were observed.

3.8.2.1.1 Records Search and Literature Review Results

There are no known fossil localities within a 1-mile radius of the project site. The project site is underlain by middle to early Holocene older flood-plain deposits and Pleistocene terrace deposits of Watsonville, fluvial facies. These deposits have the potential to produce fossils on the surface and at shallow depths below the surface. The Natural History Museum of Los Angeles County responded to the paleontological records search request on March 31, 2024, indicating from a preliminary review of their fossil specimen database, they had no relevant fossil localities within that region, as they had not done work within the area, (NHMLA 2024). The Santa Cruz Museum of Natural History responded to the paleontological records search request on October 30, 2025, also indicating they had no fossil localities in the area (SCMNH 2025).

A search of paleontological literature and online compilation databases revealed one locality (168016), approximately 3.6 miles southwest of the project site, where a mammoth was salvaged while digging the Watsonville (Buena Vista) Landfill in 1973. This locality was located within an unlithified terrestrial siliciclastic unit (McClennen et al. 2017). In his compilation of early Holocene to Pleistocene vertebrates from California, Jefferson (1991) reported mammoths (*Mammuthus columbi*) from Aptos and Santa Cruz, California.

3.8.2.1.2 Results of the Field Survey

A pedestrian survey that covered the project site was conducted by Dudek paleontological surveyor, Kolin Taylor, on November 26, 2025. The majority of the project site was heavily vegetated with little exposed ground surface,

which precluded an intensive pedestrian survey of much of the site. Exposed ground surfaces, including areas of bioturbation, were closely inspected for evidence of microfossils potentially brought to the surface. Lithologically, observed sediments consisted of silty clays with minor amounts of sand that were weakly to moderately indurated. Exposed ground surfaces in areas mapped as terrace deposits of Watsonville, fluvial facies tended to be more sand rich and oxidized than the terrace deposits of Watsonville, alluvial fan facies. No paleontological resources were discovered on site during the field survey. Photographs from the field survey are included in Appendix 3.8B, Paleontological Resources Constraints Assessment.

3.8.2.2 Impact Evaluation Criteria

Appendix G of the California Environmental Quality Act (CEQA) is a screening tool, not a method for setting thresholds of significance. Appendix G is typically used in the Initial Study phase of the CEQA process, asking a series of questions. The purpose of these questions is to make a determination as to whether a project requires an environmental impact report, a mitigated negative declaration, or a negative declaration. As the Governor's Office of Planning and Research stated, "Appendix G of the Guidelines lists a variety of potentially significant effects but does not provide a means of judging whether they are indeed significant in a given set of circumstances." The answers to the Appendix G questions are not determinative of whether an impact is significant or less than significant. Nevertheless, the questions presented in CEQA Appendix G are instructive.

The potential for impacts related to paleontological resources were evaluated using the relevant criteria described in the CEQA Environmental Checklist (Appendix G of the CEQA Guidelines). Specific to paleontological resources, the CEQA Checklist asks, would the project: Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

3.8.2.3 CEQA Appendix G Assessment Criteria

Criterion 3.8-1 Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Less than Significant With Mitigation Incorporated. The results of the institutional records search and desktop geological review did not identify any paleontological resources within the project site or within a 1-mile radius buffer of the project site. In addition, no paleontological resources were discovered on site during the field survey. However, intact paleontological resources may be present within the mapped middle to early Holocene older flood-plain deposits and Pleistocene terrace deposits of Watsonville, fluvial facies. Given the proximity of past fossil discoveries in the surrounding area and the underlying middle Holocene to Pleistocene deposits, the project site has a high resource sensitivity or potential for supporting paleontological resources below any topsoil or weathered deposits.

The project site is underlain middle Holocene to Pleistocene age sediments that would require monitoring. In the event that intact paleontological resources are located on the project site, ground-disturbing activities associated with construction of the project, such as grading during site preparation, large diameter (2 feet or greater) drilling, and trenching, have the potential to affect unique paleontological resources or sites. Without mitigation, the potential damage to paleontological resources during construction would have a potentially significant impact. However, upon implementation of Mitigation Measure GEO-1 (see below), impacts would be reduced to **less than significant**.

3.8.3 Cumulative Effects

Potential cumulative impacts to paleontological resources could result from projects that combine to create an environment where fossils, exposed on the surface, are vulnerable to destruction by earthmoving equipment, looting by the public, and natural causes such as weathering and erosion. The majority of impacts to paleontological resources are site-specific and are therefore generally mitigated on a project-by-project basis. Projects with potential cumulative impacts would be required to assess impacts to paleontological resources through the environmental review (CEQA) process.

Additionally, as needed, projects would incorporate individual mitigation for site-specific geological units present on each individual project site. Furthermore, the project does not directly or indirectly contribute to an increase in a cumulative impact to paleontological resources, as the implementation of MM GEO-1 provided in this analysis ensures any significant paleontological resources uncovered during project excavations would be properly analyzed and salvaged by the on-site paleontological monitor. Therefore, the project, in combination with the past, present, and reasonably foreseeable future projects adjacent to the project, would result in less than cumulatively considerable impacts to paleontological resources.

3.8.4 Mitigation Measures

GEO-1 Prior to commencement of any grading activity on site, the applicant shall retain a qualified paleontologist meeting the Society of Vertebrate Paleontology (SVP) (2010) guidelines. The paleontologist shall attend a preconstruction meeting, present a worker environmental awareness training, and prepare and implement a Paleontological Resources Mitigation and Monitoring Program for the Project.

Verification: The Paleontological Resources Mitigation and Monitoring Program shall be consistent with the guidelines of the SVP (2010) and include the following elements: project description, requirements for preconstruction worker environmental awareness training, frequency of monitoring, salvage protocols, reporting, and collections management. The qualified paleontologist or a qualified monitor meeting the SVP (2010) guidelines shall be on site during all rough grading and other significant ground-disturbing in previously undisturbed middle Holocene and Pleistocene-age deposits. If excavations are not impacting previously undisturbed deposits, as determined by the qualified paleontologist, spot-check monitoring shall ensue. In the event that paleontological resources (e.g., fossils) are unearthed during grading, the paleontological monitor shall temporarily halt and/or divert grading activity to allow recovery of the paleontological resources. The area of discovery shall be roped off with a 50-foot-radius buffer, or at a safe distance as determined by the monitor and construction personnel, to document and collect the fossils. Once documentation and collection of the find is completed, the monitor shall remove the rope and allow grading to recommence in the area of the find. Costs for laboratory work and curation fees are the responsibility of the project applicant. No monitoring is required during excavations that the paleontologist determines are within artificial fill, previously disturbed sediments or younger alluvium (e.g., Holocene age Quaternary alluvium, younger than approximately 11,700 years) as these sediments are generally too young to preserve fossils and have low sensitivity.

3.8.5 Laws, Ordinances, Regulations, and Standards

Federal, state, and local laws, ordinances, regulations, and standards applicable to paleontological resources are discussed below and summarized in Table 3.8-2.

Table 3.8-2. LORS Applicable to Paleontological Resources

Jurisdiction	LORS	Applicability	Project Conformity	Opt-In Application Reference
State	CEQA	Requires state and local government agencies to inform decision makers and the public about the potential environmental impacts of the project, including to paleontological resources, and to reduce environmental impacts to the extent feasible.	**Yes.** CEC would act as CEQA lead agency, per the CEC's Opt-in Application process.	Section 3.8.2.2 Section 3.8.2.3 Section 3.8.5.1
State	California PRC Section 5097.5	Provides protection for paleontological resources on public lands.	**Not applicable** to this project because it is located entirely on private property.	Section 3.8.5.1
Local	2024 Santa Cruz County General Plan	Includes goals and policies that are intended to address paleontological resources in Santa Cruz County.	**Yes.** Siting of the project would comply with the General Plan with respect to areas of potential paleontological resources.	Section 3.8.4 Section 3.8.5.2
Local	Santa Cruz County Code Chapter 16.44, Paleontological Resource Protection	Provides methods and regulations for the identification and treatment of paleontological resources within the Santa Cruz County	**Yes.** Siting of the project would comply with the Santa Cruz County Code Chapter 16.44 with respect to areas of potential paleontological resources.	Section 3.8.4 Section 3.8.5.2

Notes: LORS = laws, ordinances, regulations, and standards; CEQA = California Environmental Quality Act; CEC = California Energy Commission; PRC = Public Resources Code.

Paleontological resources are protected on state lands under CEQA and on Santa Cruz County lands according to goals and policies outlined in the Santa Cruz County General Plan (2024) and Santa Cruz County Code Chapter 16.

The project, as currently planned, does not cross any Federal lands and is subject only to state and local regulatory conditions.

3.8.5.1 State

California Environmental Quality Act

Paleontological resources are afforded consideration under the California Environmental Quality Act of 1970. Appendix G of the State of California CEQA Guidelines (14 CCR 15000 et seq.) includes the following as one of the questions to be answered in the Environmental Checklist (Appendix G, Section VII, Part f): "Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?"

The CEQA lead agency (California Energy Commission) is responsible for ensuring that potential impacts to paleontological resources are analyzed.

California Public Resources Code Section 5097.5

California Public Resources Code Section 5097.5 provides that any knowing and willful excavation, removal destruction, injury, or defacement of vertebrate paleontological sites or paleontological features located on public lands is prohibited without the express permission of the public agency having jurisdiction over the lands.

Section 5097.5 does not apply to the project because it lies entirely on private property.

3.8.5.2 Local

Santa Cruz County General Plan

The Agriculture, Natural Resources, and Conservation Element of the Santa Cruz County General Plan discusses the importance of non-renewable paleontological resources and outlines policies to mitigate negative impacts (Santa Cruz County 2024). The goals and policies relevant to paleontological resources are outlined below:

Goal ARC-5 Visual Resources. Identify and protect the visual resource areas in the County that have regional public importance for their natural beauty or rural agricultural character.

Policy ARC-5.1.1 (LCP) Designation of Visual Resources. Designate on the General Plan/LCP Resources and Constraints Maps (Appendix F) and define visual resources as areas having regional public importance for their natural beauty or rural agricultural character. Include the following areas when mapping visual resources: vistas from designated scenic roads, Coastal Special Scenic Areas, and unique hydrologic, geologic, and paleontologic features identified in Goal 6. Ocean views, agricultural fields, wooded forests, open meadows, ridgetops, and mountain hillside views are also public scenic assets that should be identified and considered during development review permit processes.

Goal ARC-6 Hydrological, Geological + Paleontological Resources. Protect hydrological, geological, and paleontological resources that stand out as rare or unique and representative in Santa Cruz County because of their scarcity, scientific or educational value, aesthetic quality, or cultural significance.

Policy ARC-6.1.1 (LCP) Protection and Designation of Significant Resources. Protect significant geological features such as caves, large rock outcrops, inland cliffs and special formations of scenic or scientific value, hydrological features such as karst topography, major waterfalls or springs, and paleontological features, through the environmental review process. Designate such sites on the General Plan/LCP Resources and Constraints Maps where identified.

Policy ARC-6.1.2(LCP) Protecting Significant Resources Through Easements and Land Dedications. Encourage and obtain where possible Open Space Easements or other forms of land dedication to conserve as open space those areas containing hydrological, geological, or paleontological features of significant scenic or scientific value.

Siting of the project would comply with the General Plan with respect to areas of potential paleontological resources.

Santa Cruz County Code Chapter 16.44, Paleontological Resource Protection

This chapter of the Santa Cruz County Code is intended to protect paleontological resources and provides methods and regulations for the identification and treatment of paleontological resources within the county. Section 16.44.040 requires preparation of a paleontological survey for specified developments in areas of known paleontological resources, and measures must be included to protect resources during ground-disturbing development activities. Specifically, this chapter requires that a paleontological report shall be required if the County Environmental Coordinator determines on the basis of the paleontological survey that further information is required to ensure protection of paleontological resources. Pursuant to section 16.44.060, in granting the required permit(s) for a project on the site of a significant paleontological resource, the Planning Director shall attach reasonable conditions to ensure compliance with the purposes of this chapter. Such conditions could include, but are not limited to, having a qualified paleontologist approved by the County present to observe, to examine and to evaluate the site during ground disturbing development activities; and to convey fossil finds to an appropriate museum or research institute. Section 16.44.070 provides procedures to follow if a paleontological resource is discovered during construction.

3.8.6 Agencies and Agency Contacts

Applicable agency contacts are shown in Table 3.8-3. The Natural History Museum of Los Angeles County was contacted on March 21, 2024, and the Santa Cruz Museum of Natural History was contacted on September 25, 2025, to request the paleontological resources records searches. The Natural History Museum of Los Angeles County responded on March 31, 2024, and the Santa Cruz Museum of Natural History responded on October 30, 2025 (see Appendix 3.8A).

Table 3.8-3. Agencies and Agency Contacts

Topic	Agency	Contact
Paleontological Resources Documentation and Specimen Repository	Natural History Museum of Los Angeles County	Alyssa Bell, PhD 900 Exposition Blvd. Los Angeles, California 90007 Ph. 213.763.3466 paleorecords@nhm.org

3.8.7 Permits and Permit Schedule

No permit related to paleontological resources is required by any federal, state, or county agency to allow for the recovery of fossil remains discovered as a result of construction-related ground-disturbance on the project site.

SUBJECT: Public Health Assessment for the Seahawk Battery Energy Storage System Project

MNS Engineers, Inc. has prepared this report to evaluate public health impacts of the Seahawk Battery Energy Storage System (BESS) Project (project). This analysis is supported by emissions modeling found in **Appendix A**, *Public Health Modeling Data*, prepared by Dudek in September 2024, the *Construction Health Risk Assessment for the Seahawk BESS Project*, prepared by Dudek in December 2024, and the *Hazardous Consequence Analysis for the Seahawk BESS Project*, prepared by Dudek in December 2024. This report is in compliance with California Environmental Quality Act (CEQA) Guidelines and the requirements of California Energy Commission's (CEC) Opt-In Certification Program under the Assembly Bill (AB) 205.

1 Introduction

1.1 Project Location

The project is located in unincorporated area of the County of Santa Cruz (County), California. The project site is generally south of Paulsen Road, north of Grimmer Road, and east of Minto Road; refer to **Figure 1**, *Project Site Location*. Local access to the site is provided from Green Valley Road to Minto Road.

1.2 Project Description

The project would construct a 200 megawatts (MW) BESS that would deliver and receive power from the existing Pacific Gas and Electric Company (PG&E) Green Valley Substation to the northwest of the project site. The project site plan is shown as **Figure 2**, *Site Plan*.

The BESS would consist of battery modules housed in purpose-built metal enclosures, with integrated power conversion equipment and fire suppression systems, in compliance with all applicable standards. In addition, the BESS would have on-site interconnection equipment including transformers and would be completely enclosed within a 7-foot-high perimeter fence. Where appropriate, sound walls would be provided in certain locations in place of the 7-foot-high perimeter fence. Interconnection to the PG&E substation would also require on- and off-site 115 kilovolts (kV) transmission poles for the overhead generation transmission line ("gen-tie") wires. The total project area including the gen-tie is estimated to be no more than 16 acres.

Once constructed, the project would operate 7 days per week, 365 days per year. Typical operation of the system would include charging from the grid during the day and discharging during peak electric demand

at night. The system would have minimal lighting for safety at night. Project operations would be monitored remotely through the supervisory control and data acquisition (SCADA) system. The project would include one single story control enclosure for the SCADA system near the project substation.

Regular operations and maintenance would be conducted using maintenance trucks, including but not limited to equipment testing, monitoring, repair, routine procedures to ensure service continuity, and standard preventative maintenance.

During construction and operations, access to the site would be via a proposed 20-foot-wide gravel access road onto the property from Minto Road. There would be adequate area on the property for vehicle parking and equipment staging during both the construction and operational phases. No supplies are required to be stored on site.

2 Existing Setting

2.1 Toxic Air Contaminants

Toxic air contaminants (TACs) are pollutants which may be expected to result in an increase in mortality or serious illness, or which may pose a present or potential hazard to human health. Health effects include cancer, birth defects, neurological damage, damage to the body's natural defense system, and diseases which lead to death. They include both organic and inorganic chemicals released from common activities such as vehicle use, gas stations, dry cleaning, industrial processes, painting, and operations at research or educational facilities. California Air Resources Board (CARB) has formally identified over 200 substances and groups of substances as TACs. No ambient air quality standards exist for TACs, and even very low concentrations may still pose health risks, making it challenging to determine safe exposure levels. TAC impacts are evaluated in terms of carcinogenic risk as well as chronic (long-term) and acute (short-term, severe) health effects. Individuals exposed to sufficiently high concentrations for extended periods may face a greater risk of cancer or other serious outcomes, including asthma, respiratory issues, and reduced lung function.

In California, a major source of TACs is diesel engine exhaust, which contains diesel particulate matter (DPM). Over 90 percent of DPM particles are smaller than one micron, placing them within the fine particulate matter with a diameter of 2.5 micrometers or less ($PM_{2.5}$) size range. Because these particles are so small, they can be inhaled deeply into the bronchial and alveolar regions of the lungs. DPM consists mainly of carbon particles (“soot,” or black carbon) along with numerous organic compounds, including more than 40 substances known to cause cancer. These chemicals include polycyclic aromatic hydrocarbons, benzene, formaldehyde, acetaldehyde, acrolein, and 1,3-butadiene. In August 1998, CARB designated “particulate emissions from diesel-fueled engines” (i.e., DPM) as a TAC. DPM is released from a wide variety of diesel engines, including on-road vehicles such as trucks, buses, and cars, as well as off-road sources such as locomotives, marine vessels, and heavy construction equipment. Roughly 70 percent of all airborne cancer risk in California is linked to DPM. To address this risk, CARB adopted a diesel risk reduction plan in 2000. Health impacts of DPM include premature death; hospital and emergency visits for worsened heart and lung disease, including asthma; increased respiratory symptoms; and reduced lung function in children. Children with developing lungs and older adults with chronic conditions are especially vulnerable to these non-cancer effects.

2.2 Health Risk

Cancer Risk

Cancer risk refers to the increased lifetime probability that a person will develop cancer as a result of exposure to a carcinogenic substance, typically expressed as the added chance per one million people. To estimate cancer risk from inhaling a TAC, the inhalation dose (and, when applicable, ingestion or dermal dose) is calculated in milligrams per kilogram of body weight per day. This calculation is based on the ambient concentration in micrograms per cubic meter ($\mu g/m^3$), the breathing rate, and the duration of exposure. The resulting dose is then multiplied by the inhalation cancer potency factor. Cancer risks for all carcinogenic TACs are usually estimated and then added together to determine an individual's total increased risk. This method assumes cancer risk is proportional to exposure at any concentration and that risks from multiple carcinogens are additive. These assumptions are intentionally conservative for low exposures and align with current Office of Environmental Health Hazard Assessment (OEHHA) guidelines. Importantly, exposure to carcinogenic TACs does not mean a person will develop cancer; rather, it represents a probability that may be influenced by additional factors such as genetics, other environmental exposures, immune function, and overall health.

Non-Cancer Risk

Non-cancer health effects are generally categorized as either chronic or acute. When evaluating the potential risks of non-cancerous air toxics, it is assumed that there is a threshold dose below which no adverse health effects occur. The air concentration that corresponds to this threshold is known as the Reference Exposure Level (REL). Non-cancer risks are expressed as a hazard quotient, calculated by dividing a contaminant's estimated exposure by its REL. Hazard quotients of individual TACs are then summed for each target organ system to obtain a hazard index. No acute REL values are established for DPM.

2.3 Battery Technology

Lithium-ion batteries were introduced commercially by Sony in 1991 for use primarily in consumer products. Since then, they have become the most widely used battery technology for grid-scale energy storage. Lithium-ion batteries have the versatility to handle smaller-scale applications, such as powering electric vehicles, as well as grid-scale applications requiring megawatts of power for hours at a time.

The name lithium-ion battery is derived from the transfer of lithium ions between the electrodes during operation. Instead of metallic lithium (a reactive substance), lithium-ion batteries use safer lithiated metal oxides as the cathode and carbon as the anode. When a lithium-ion battery cell is charging, lithium ions migrate from the cathode through a lithium-salt organic solvent catalyst that facilitates ionic movement (the electrolyte) to the anode. The process happens in reverse when discharging. Cathodes have a more positive electrode potential than anodes (versus the standard lithium reference), thus, they are considered to be the positive terminal of the battery. Similarly, anodes have a more negative electrode potential than cathodes (versus the standard lithium reference), thus, they are considered to be the negative terminal of a battery. The anode and cathode are divided by a separator, often microperforated plastic which is soaked in the electrolyte. The separator allows ions to pass through while maintaining electrical isolation between the electrodes. The entire battery is protected by a sealed metallic casing.

The most common lithium-ion batteries in BESS facilities are either lithium nickel manganese cobalt (NMC) or lithium iron phosphate (LFP), which have been widely studied and used. Of particular importance to hazardous consequence analysis, the higher the thermal runaway temperature, the less likely thermal runaway is to occur. For these two battery types, LFP batteries have a higher thermal runaway onset temperature of 195°C (383°F) and lower thermal runaway heat increase of up to 210°C (410°F), whereas NMC batteries have a lower thermal runaway onset threshold of 170°C (338°F), are more flammable, and burn hotter at up to 500°C (932°F). Notably, it is anticipated that the proposed project would use LFP batteries for the BESS facility.

2.4 Sensitive Receptors

Some populations are more vulnerable to air pollution, including children, the elderly, and those with cardio-respiratory conditions. These "sensitive receptors" are of particular concern when located near sources of pollutants like particulate matter, air toxics, and carbon monoxide. According to the *Monterey Bay Air Resources District CEQA Air Quality Guidelines*, sensitive receptors include residences, education resources, daycare centers, and health care facilities.[1] The nearest sensitive receptors to the project site are rural residential homes located to the north and east, the closest of which would be approximately 285 feet north of the project boundary.[2] More dense residential communities are located to the east of the Green Valley Substation. All these receptors were accounted for in the health risk assessment. In addition, although employees would only present on-site for a few hours per day, the Transportation Office of Pajaro Valley Unified School District located approximately 1,220 feet to the southeast of the closest BESS cabinet was analyzed in the hazard consequence analysis, as the release of pollutants into the atmosphere due to malfunction of the battery cells would occur within a relatively short and concentrated period of time (i.e., one hour or less).

3 Regulatory Setting

International, national, State, and regional regulations and guidelines pertaining to public health are discussed below.

3.1 International

Underwriters Laboratories

Underwriters Laboratories (UL) is a global safety science company that develops and provides safety, security, and sustainability services, including testing, certification, and auditing, for products and systems. UL9540A (Test Method for Evaluating Thermal Runaway Fire Propagation in Battery Energy Storage Systems) evaluates the fire characteristics of battery cells, modules, and installations that are purposefully induced into thermal runaway. The data generated can be used to determine the fire and explosion protection required for the installation of a BESS. UL1973 (Standard for Batteries for Use in Stationary, Vehicle Auxiliary Power and Light Electric Rail Applications) evaluates the battery system's ability to safely withstand simulated abuse conditions. This standard evaluates the system based upon the manufacturer's specified charge and discharge parameters, and requires that a BESS is not allowed to be an explosion hazard when exposed to an external fire source and that a single cell failure will not result in

[1] Monterey Bay Air Resources District (MBARD). *CEQA Air Quality Guidelines*. Last revised February 2008. https://www.mbard.org/ceqa. Accessed November 2025.

[2] There is also an on-site residence on the western edge of the project site that will be vacated and no longer used for residential purposes. The residence will remain vacant for the duration of the operational period of the project.

a cascading thermal runaway of cells. UL1741 (Inverters, Controllers, Converters, and Interconnection Equipment Standards) covers inverters, converters, charge controllers, and interconnection system equipment (ISE) intended for use in stand-alone (not grid-connected) or interactive (grid-connected) power systems. Interactive inverters, converters, and ISE are intended to be operated in parallel with an electric power system (EPS) to supply power to common loads. UL9540 (Energy Storage Systems and Equipment) requires compliance with key UL sub-standards as well as standards from other recognized parties to certify safety of an integrated energy storage system.

3.2 National

Clean Air Act

The USEPA is responsible for administering the nation's air quality programs, drawing its authority primarily from the Federal Clean Air Act. Originally enacted by Congress in 1963, this law has been amended several times to address evolving air quality concerns. Major amendments in 1970 established the foundation for modern air quality regulation and authorized the USEPA to set National Ambient Air Quality Standards (NAAQS). Subsequent amendments in 1977 introduced non-attainment requirements for areas failing to meet NAAQS and created the Prevention of Significant Deterioration program. The 1990 amendments were the latest major effort to update federal regulation, addressing issues such as acid rain and air toxics. Importantly, while establishing a federal floor for air quality, the Clean Air Act also permits states to adopt more stringent standards or regulate additional pollutants.

International Fire Code

The International Fire Code (IFC) establishes the minimum requirements consistent with nationally recognized good practice for providing a reasonable level of life safety and property protection from the hazards of fire, explosion or dangerous conditions in new and existing buildings, structures and premises, and to provide safety to firefighters and emergency responders during emergency operations. Although it is called the “International Fire Code”, these standards are only adopted in the U.S., where they were established. IFC specifies minimum size requiring permits (Lithium, all types, 20 kWh), specifies maximum limits on sizing for battery systems (Lithium, all types, 50 kWh each array), seismic and structural design, spacing (minimum 3 feet separation of arrays), vehicle impact protection, testing, maintenance and repairs, maximum quantities within a building (Lithium of 600 kWh), battery management system (BMS) monitoring, shutdown and notification requirements, automatic smoke detector requirements, automatic fire sprinkler systems, and ventilation specifications.

Institute of Electrical and Electronics Engineers

The Institute of Electrical and Electronics Engineers (IEEE) is a global professional organization that advances technology for humanity’s benefit. IEEE C2 code covers basic provisions for safeguarding of persons from hazards arising from the installation, operation, or maintenance of conductors and equipment in electric supply stations, and overhead and underground electric supply and communication lines. It also includes work rules for the construction, maintenance, and operation of electric supply and communication lines and equipment. The code is applicable to the systems and equipment operated by utilities, or similar systems and equipment, of an industrial establishment or complex under the control of qualified persons.

National Fire Protection Association

National Fire Protection Association (NFPA) is an international nonprofit organization devoted to eliminating death, injury, property and economic loss due to fire, electrical and related hazards. NFPA 70 (National Electrical Code) addresses electrical design, installation, and inspection. NFPA 550 (Guide to Fire Safety Concepts Tree for Protecting Energy Systems) addresses issues such as utilizing BMS and compatible equipment, ventilation as needed, fire resistive separation, array spacing, and signage. NFPA 855 (Standard for the Installation of Stationary Energy Storage Systems) offers comprehensive criteria for the fire protection of BESS installations based on the technology used in BESS, the setting where the technology is being installed, the size and separation of BESS installations, and the fire suppression and control systems in place. Additional considerations include ventilation, detection, signage, listings, and emergency operations responding to BESS emergencies.

3.2 State

Office of Environmental Health Hazard Assessment

OEHHA's most recent guidance is the *Air Toxics Hot Spots Program Risk Assessment Guidelines – Guidance Manual for Preparation of Health Risk Assessments* (2015 Risk Assessment Guidelines Manual).[3] The Children's Environmental Health Protection Act of 1999 (Senate Bill 25), which requires explicit consideration of infants and children in assessing risks from air toxics, requires revisions of the methods for both non-cancer and cancer risk assessment and of the exposure assumptions in the 2003 Risk Assessment Guidelines Manual. In response to Senate Bill 25, OEHHA released three technical support documents addressing RELs, cancer potency, and exposure assessment and stochastic analysis and adopted the 2015 Risk Assessment Guidelines Manual.[4] The technical support document for RELs and continuing work to re-evaluate TACs to ensure adequate protection for infants and children has led to revisions of RELs for approximately 10 chemicals and chemical families. The basic methodology for evaluating acute and chronic health effects using the RELs otherwise remained the same as in the previous guidance manual. Moreover, RELs are designed to protect the most sensitive individuals in the population, including infants and children, by selecting appropriate toxicological data and including margins of safety. Accordingly, the evaluation methods are assumed to protect children and other sensitive subpopulations (groups of more highly susceptible individuals) from adverse health effects in the event of exposure.

The cancer risk methodology described in the exposure assessment and stochastic analysis technical support document and the 2015 Risk Assessment Guidelines Manual accounts for the higher sensitivity of infants and children by applying age-specific daily breathing rates (DBRs) and age-sensitivity factors (ASFs). According to the technical support document, "accounting for effects of early-in life exposure requires accounting for both the increased potency of early in life exposure to carcinogens and the greater exposure on a per kilogram body weight that occurs early in life due to behavioral and physiological differences between infants and children, and adults". In the absence of chemical-specific data, OEHHA recommends a default ASF of 10 for the third trimester to age 2 years and an ASF of 3 for ages 2 through 15 years to account for potential increased sensitivity to carcinogens during childhood. The ASF for adults is 1. In addition to the ASFs, children have higher DBRs per unit of body weight than adults. The 2015 Risk Assessment Guidelines Manual considers the age-specific breathing rates in the cancer risk calculations.

[3] Office of Environmental Health Hazard Assessment. *Air Toxics Hot Spots Program Risk Assessment Guidelines – Guidance Manual for Preparation of Health Risk Assessments*. February 2015. https://oehha.ca.gov/sites/default/files/media/downloads/crnr/2015guidancemanual.pdf. Accessed November 2025.
[4] Office of Environmental Health Hazard Assessment. *Air Toxics Hot Spots*. https://oehha.ca.gov/air/air-toxics-hot-spots. Accessed November 2025.

In addition, OEHHA and CARB evaluated information from activity patterns databases to estimate the fraction of time at home (FAH) during the day. From the third trimester to age <2 years, 85 percent of time is spent at home. From age 2 through <16 years, 72 percent of time is spent at home. From age 16 years and greater, 73 percent of time is spent at home. However, for facilities with any school within the 1 in a million or greater isopleth, the OEHHA recommends using an FAH of 100 percent for children under 16 years old.

California Air Resources Board

In April 2005, CARB released its *Air Quality and Land Use Handbook*.[5] This guidance document encourages local land-use agencies to consider air pollution risks from nearby sources—such as major roads, commercial centers, and industrial facilities—when approving the siting of sensitive land uses like residences. The handbook provides advisory recommendations, including setback distances. However, unlike regulations for stationary sources, these are non-binding guidelines and do not require air quality permits or approval from air districts for new sensitive land uses.

In 2000, CARB adopted a comprehensive Diesel Risk Reduction Plan aimed at cutting emissions from both new and existing diesel-powered vehicles and engines.[6] The plan is expected to reduce the statewide diesel health risk by about 80 percent in 2020 compared with 2000 levels. Additional rules apply to new trucks and diesel fuel, including the On-Road Heavy-Duty Diesel Vehicle (In-Use) Regulation, the On-Road Heavy-Duty (New) Vehicle Program, the In-Use Off-Road Diesel Vehicle Regulation, and the New Off-Road Compression-Ignition Engines and Equipment program. These regulations establish schedules for manufacturer compliance and for operators to upgrade their diesel equipment. Several Airborne Toxic Control Measures also help reduce diesel emissions, such as those for In-Use Off-Road Diesel-Fueled Fleets (13 CCR 2449 et seq.) and In-Use On-Road Diesel-Fueled Vehicles (13 CCR 2025).

California Fire Code

California Fire Code (CFC) is promulgated in the California Code of Regulations Title 24, Part 9, and contains regulations consistent with nationally recognized and accepted practices for safeguarding life and property from the hazards of fire and explosion, dangerous conditions arising from the storage, handling, and use of hazardous materials and devices, and hazardous conditions in the use or occupancy of buildings or premise. The CFC also contains provisions to assist emergency response personnel. The CFC is a fully integrated code based on the IFC. CFC Chapter 12 (Energy Systems) was added to the CFC to address standby and emergency power, portable generators, photovoltaic systems, fuel cell energy systems, and energy storage systems. From CFC Chapter 12, a BESS must meet the provisions and requirements of Sections 1201 (General) and 1207 (Electrical Energy Storage Systems).

3.3 Regional

Monterey Bay Air Resources District (MBARD)

The project falls under the jurisdiction of the MBARD, which regulates air pollutant emissions throughout the Monterey Bay area of the North Central Coast Air Basin (Basin). The MBARD has established thresholds

[5] California Air Resources Board. *Air Quality and Land Use Handbook*. April 2005. https://files.ceqanet.lci.ca.gov/221458-6/attachment/UNr-g159CW-r0G4DR8q6daNdAKT3RJTd8gGQCfz4wqFfl-eNdZNQEqjf8tfls1x6Gsae7YqpXwtFIZBd0. Accessed November 2025.

[6] California Air Resources Board. *Diesel Risk Reduction Plan*. September 2000. https://ww2.arb.ca.gov/our-work/programs/diesel-risk-reduction-plan. Accessed November 2025.

of significance for TAC emissions from construction and operations in the *CEQA Air Quality Guidelines*. To limit air pollutants from construction and operation, projects must adhere to several MBARD rules. These include:

- Rule 400 (Visible Emissions): Provides limits for the visible emissions from sources within MBARD.
- Rule 402 (Nuisances): Prohibits the discharge of contaminants that cause a public nuisance or endanger public health and safety.
- Rule 403 (Particulate Matter): Provides particulate matter emission limits for sources operating within the MBARD.
- Rule 426 (Architectural Coating): Limits the emissions of VOC from the use of architectural coatings.

4 Thresholds of Significance

4.1 CEQA Thresholds of Significance

Section VIII of Appendix G to the CEQA Guidelines addresses typical adverse effects relative to air quality and includes the following threshold question to evaluate the project's impacts related to public health. Would the project:

- Expose sensitive receptors to substantial pollutant concentrations?

4.2 Monterey Bay Air Resources District Thresholds of Significance

MBARD has established thresholds of significance for TACs during project construction and operations.[7] The following thresholds are used to evaluate human health impacts in accordance with MBARD Rules 1000 and 1003. A project would have a significant impact if:

- The hazard index is greater than 1 for acute or chronic impacts.
- The cancer risk is greater than 10 in one million.

4.3 Thermal Runaway Thresholds of Significance

Battery cell malfunctions, such as thermal runaway events, can result in the release of toxic emissions and/or flammable gas mixtures to the atmosphere. Generally, the battery cell will start to off gas through pressure relief vents (or pouch seams) if the temperature exceeds 120°C; however, the battery will not enter thermal runaway until it exceeds the thermal runaway onset temperature, which is usually between 170°C and 220°C, depending on the cathode chemistry. The emission composition of a potential battery composition was based on information provided by the Project Applicant as well as literature review.

Reference Exposure Levels (RELs) are defined as the airborne concentration of a substance at or below which it is predicted that no adverse health effects are expected in the general population, including sensitive individuals, when exposed over a specified duration. RELs are developed by the California Office

[7] Monterey Bay Air Resources District (MBARD). *Guidelines for Implementing the California Environmental Quality Act*. Adopted April 1996, revised February 2016. https://www.mbard.org/ceqa. Accessed November 2025.

of Environmental Health Hazard Assessment (OEHHA) and typically represent chronic or occupational exposure limits. Exposures above the REL may increase the risk of non-lethal health effects, ranging from mild sensory irritation to more serious but reversible health impacts, depending on the magnitude and duration of exposure. The Acute Exposure Guideline Levels (AEGL) values are defined as the airborne concentration of a substance above which it is predicted that the general population, including susceptible individuals, could experience notable discomfort, irritation, or certain asymptomatic non-sensory effects, without the effects of disabling and are transient and reversible upon cessation of exposure (AEGL-1), experience irreversible or other serious, long-lasting adverse health effects or an impaired ability to escape (AEGL-2), or experience life-threatening health effects or death (AEGL-3).

Table 1, *Chemical Constituents REL and AEGL Values* showcases the REL and/or AEGL for the pollutants that may be emitted during a thermal runaway scenario. For this assessment, AEGL-1 was selected because it represents the lowest of the three AEGL thresholds, providing the most conservative basis for evaluating potential health effects. If the 1-hour REL and/or AEGL values shown in **Table 1** are exceeded at sensitive receptors, there would be a potentially significant impact during a thermal runaway scenario.

Table 1: Chemical Constituents REL and AEGL Values

Pollutant	REL (µg/m^3)	AEGL-1 (µg/m^3)
Hydrogen Chloride	2100	2684
Hydrogen Fluoride	240	818
Hydrogen Cyanide	340	2210
Hydrogen Bromide	-	3309
Methane	-	-
Acetylene	-	-
Ethylene	-	-
Ethane	-	-

Notes: REL = Reference Exposure Levels; AEGL = Acute Exposure Guideline Levels

A hazard quotient (HQ) is calculated by comparing the estimated exposure for a single substance to its corresponding health-based reference value. To calculate the HQ, the projected exposure level is divided by the applicable REL. A HQ less than 1.0 indicates that exposure is below the level at which adverse noncancer health effects are expected, while an HQ equal to or greater than 1.0 suggests that the exposure may exceed the health-based threshold and could warrant further evaluation.

In addition to the HQ, a hazard index (HI) is a metric used to evaluate the potential for noncancer health effects resulting from exposure to one or more chemical substances. It is calculated by summing individual HQs based on the organ(s) that are impacted from exposure to substances. Similar to the HQ, a combined HI less than 1.0 indicates that exposure is below the level at which adverse noncancer health effects are expected, while an HI equal to or greater than 1.0 suggests that the exposure may exceed the health-based threshold and could warrant further evaluation.

5 Project Impacts

This section discusses potential impacts associated with the development of the project and provides mitigation measures where appropriate.

5.1 Construction Health Risk Impacts

Construction Emissions

Construction associated with the project would generate short-term construction-related emissions of exhaust PM_{10}, which is a major source of TAC. Emissions were estimated using California Emissions Estimator Model (CalEEMod) Version 2022.1. The project would be constructed over approximately 24 months, including site preparation, substation site preparation, grading, substation site grading, battery and container installation, substation installation, gen-tie foundation and tower erection, gen-tie stringing and pulling, commissioning, and decommissioning. It should be noted that at the time of the preparation of the modeling, construction activities were assumed to start in June 2025. Although it is outdated, it represents the worst-case scenario for criteria air pollutant emissions because equipment and vehicle emission factors for later years would be slightly less due to more stringent standards for in-use off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles in later years. The project was assumed to be operational for 30 years and then be decommissioned and removed at the end of its lifetime. Because CalEEMod only has emission factors out to 2050, 2050 was used as the surrogate year for decommissioning, which is projected for 2057. The majority of the construction phases would occur concurrently and would not occur sequentially in isolation. Construction duration, equipment list, and vehicle trips were provided by the Project Applicant based on past experiences constructing similar projects of similar scale; refer to **Attachment A** for detailed construction schedule, equipment list, and vehicle trips. According to the Project Applicant, it is anticipated that soils would be balanced on-site and therefore no hauling truck trips would be generated. For this analysis, it was assumed all vehicles would travel 0.25-miles per trip to account for localized DPM only. In addition, during commissioning, two 4,828 horsepower (hp) generators were assumed to each operate for two hours per day, which were estimated in a spreadsheet model.

Table 2, *Construction Diesel Particulate Matter Emissions* presents the project's DPM emissions during construction. It should be noted that the project would implement project design features PDF-AQ-1 and

PDF-AQ-2, which requires using CARB-certified Tier 4 Final engines for diesel generators during commissioning phase of construction, watering site twice per day, and limiting vehicle speeds to 25 mph on unpaved roads. These project design features would reduce DPM emissions and have been reflected in **Table 2**. PDF-AQ-1 and PDF-AQ-2 would be required as County-imposed Conditions of Approval to ensure they are implemented during construction of the project.

Table 1: Construction Diesel Particulate Matter Emissions

Source/Construction Phase	Diesel Particulate Matter Emissions[1]	
	pounds/year	pounds/hour
On-Site Equipment and Trucks for Construction	76.75	0.037
Gen-Tie Equipment and Trucks	48.79	0.023
Diesel Generators for Commissioning	180.21	0.087
Equipment and Trucks for Decommissioning	76.13	0.037

Source: Refer to modeling details included in **Attachment A**.
Notes: 1. Modeling incorporated project design features PDF-AQ-1 (using CARB-certified Tier 4 Final engines for diesel generators during commissioning phase of construction) and PDF-AQ-2 (watering site twice per day and limiting vehicle speeds to 25 mph on unpaved roads). Emissions from diesel generators were estimated in a spreadsheet model.

Dispersion Modeling

An air dispersion modeling was conducted of DPM emitted from diesel vehicles and construction equipment on the project site to assess the health risk impacts of the construction on proximate existing off-site sensitive receptors. The dispersion modeling was performed using the American Meteorological Society/EPA Regulatory Model (AERMOD) Version 23132, with the Lakes Environmental Software implementation/user interface, AERMOD View, Version 12.0.0. AERMOD is a steady-state Gaussian plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of surface and elevated sources, building downwash, and simple and complex terrain. The maximum concentrations were determined for the 1-hour and period averaging periods.

The latest 5-year meteorological data for the Watsonville Municipal Airport Station were obtained from CARB and used in the analysis as the most representative data set, based on surrounding terrain and proximity to the project.[8] Digital elevation model files were imported into AERMOD so that complex terrain features were evaluated as appropriate, and elevations were assigned to the emission sources and receptors. Digital elevation data were obtained through AERMOD View in the U.S. Geological Survey's National Elevation Dataset format with an approximately 1 arc-second resolution. Based on the land use procedure from the OEHHA *2015 Risk Assessment Guidelines Manual*, the rural dispersion was selected for the project site.

Off-road equipment and trucks were modeled as a line of adjacent volume sources across the project site and gen-tie alignment with a release height of 5 meters, a plume height of 10 meters, and plume width of 10 meters.[9] The diesel generators were modeled as a point source with a capped vertical stack height

[8] California Air Resources Board. *HARP AERMOD Meteorological Files*. https://ww2.arb.ca.gov/resources/documents/harp-aermod-meteorological-files. Accessed November 2025.
[9] South Coast Air Quality Management District. *Final Localized Significance Threshold Methodology*. Revised July 2008. http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/final-lst-methodology-document.pdf?sfvrsn=2.docs/. Accessed November 2025.

of 3.4 meters, inside stack diameter of 0.3 meters, gas exhaust temperature of 744.3 Kelvin, and gas exhaust velocity of 280.2 cubic meters per minute.[10] Emissions were assumed to occur 8 hours per day, 5 days per week.

To evaluate off-site receptor exposure to DPM from project construction, a nested receptor grid was input with 50-meter spacing at bounding box around construction and 100-meter spacing from 0 to 500 meters from construction boundary.

Health Risk Modeling

Dispersion model plotfiles from AERMOD were then imported into CARB's Hot Spots Analysis and Reporting Program Air Dispersion Modeling and Risk Tool (HARP2) to determine health risk from exposure to TAC emissions based on the OEHHA *2015 Risk Assessment Guidelines Manual*. The mandatory minimum pathways were selected in HARP2, which includes inhalation and additional pathways; however, inhalation is the only applicable pathway for DPM. Exposure was assumed to start during the 3rd trimester of pregnancy for residential uses, per OEHHA *2015 Risk Assessment Guidelines Manual*. The project's potential cancer and noncancer health impacts at the maximally exposed individual resident (MEIR) from the construction sources and phases were summed based on the following exposure parameters:

- On-Site Equipment and Trucks for Construction: exposure was assumed to begin in the 3rd trimester of pregnancy (assumed to be the worst-case scenario for cancer risk) for a duration of 2 years.
- Gen-Tie Equipment and Trucks: exposure was assumed to begin at year 0.75 for a duration of 0.26 years.
- Diesel Generators for Commissioning: exposure was assumed to begin at year 1.5 for a duration of 0.5 years.
- Equipment and Trucks for Decommissioning: exposure was assumed to begin at year 30 for a duration of 0.59 years.

The following equations were used in HARP2 to calculate the cancer risk using the model output data and estimated TAC emissions:

$$\text{Cancer risk} = DOSE * CPF * ASF * ED/AT * FAH,$$
$$DOSE = (C_{air} * DBR * A * EF * 10^{-6}),$$
$$C_{air} = ER * X/Q,$$

Where:

DOSE = daily inhalation dose (mg/kg-day),
CPF = cancer potency factor $(\text{mg/kg-day})^{-1}$,
ASF = age sensitivity factor for a specified age group (unitless),
ED = exposure duration (in years) for a specified age group,
AT = averaging time for lifetime cancer risk (years),
FAH = Fraction of time spent at home (unitless),
C_{air} = average air concentration of TAC from the air dispersion model ($\mu g/m^3$),
DBR = daily breathing rate (L/kg body weight-day),

[10] Santa Barbara County Air Pollution Control District. *Modeling Guidelines for Health Risk Assessments*. *Form-15i.* December 2023. https://www.ourair.org/wp-content/uploads/apcd-15i.pdf. Accessed November 2025.

EF = exposure frequency (unitless), days/365 days,
A = inhalation absorption factor (unitless),
10^{-6} = micrograms to milligrams conversion, liters to cubic meters conversion,
ER = emission rates (grams/second),
X/Q = model output data ($\mu g/m^3$)/(grams/second).

The chronic hazard quotients were calculated for TACs using the following equations as assumed in HARP2:

$$HQ_C = (C_{air} / REL),$$

Where:

HQ_C = chronic hazard quotient,
C_{air} = annual average concentration ($\mu g/m^3$),
REL = chronic reference exposure level ($\mu g/m^3$).

Modeling Results

TACs that would potentially be emitted during construction activities would be DPM emitted from heavy-duty construction equipment and trucks. It should be noted that no short-term, acute RELs are established and regulated for DPM, and are therefore not addressed in this assessment. **Table 3**, *Construction Health Risk Assessment Results* summarizes the cancer risk and chronic hazard index at MEIR during project construction and comparison with MBARD thresholds. The MEIR would be at the nearest existing residence to the north of the project site.

Table 2: Construction Health Risk Assessment Results

Impact	Unit	Project Impact	MBARD Threshold	Exceed Threshold?
Cancer Risk	Per Million	9.21	10	No
Chronic Hazard Index	Not Applicable	0.011	1	No

Source: Refer to modeling details included in **Attachment A**.

As shown in **Table 3**, project construction would result in a potential incremental increase in cancer risk and chronic hazard index below the respective MBARD thresholds at the MEIR. Further, all other receptors in the area would be exposed to potential health risk less than these levels.

The results reflect reasonable estimates of source emissions and exhaust characteristics, available meteorological data near the project site, and the use of currently approved air quality models. Given the limits of available tools for such an analysis, the actual impacts may vary from the estimates in this assessment. However, the combined use of the AERMOD dispersion model and the health impact calculations required by the OEHHA and the MBARD tend to overpredict impacts, such that these analyses produce conservative results. Accordingly, the health impacts are not expected to be higher than those estimated in this assessment, and the impacts would be less than significant.

Conditions of Approval

During construction, the project would implement the following project design features intended to reduce emissions of criteria air pollutants and TACs.

- **PDF-AQ-1**: Prior to the commencement of construction, the Project Applicant or its designee shall demonstrate in the construction contract the requirement of using California Air Resources Board (CARB)-certified Tier 4 Final engines for any diesel generators to be used during the commissioning phase of construction. In addition, any diesel generators during construction shall be located a minimum of 500 feet from off-site residences.

- **PDF-AQ-2**: Prior to the commencement of construction, the Project Applicant or its designee shall demonstrate in the construction contract the requirement of implementing standard construction practices that would be employed to reduce fugitive dust emissions, including watering of the active sites two times per day, depending on weather conditions, as well as limiting vehicle speeds on unpaved roads to 25 miles per hour.

Mitigation Measures: None.

5.2 Operational Thermal Runaway Impacts

AERMOD Methodology

Based on the requirements in California Fire Code and National Fire Protection Association, the risk of fire, explosion, and toxic release is minimized by the installation of energy management systems, fire detection and protection systems, explosion control systems, and ventilation. Further protection of the surrounding properties can be provided through proper pre-planning and coordination with local emergency agencies. Pre-planning for BESS facilities is accomplished through the preparation of an Emergency Response and Emergency Action Plan (ERP), which is required by California Public Utilities Code Section 761.3. ERPs consider responses to potential offsite impacts, including poor air quality, and include procedures that provide for the safety of surrounding properties.

During normal operations, there would be no TAC emissions from the project. However, to determine the worst-case public health impacts, it is assumed that these multiple safety and ventilation systems fail and do not control the battery cell malfunction. It is also assumed that the battery cell malfunction continues until the reaction is sufficiently abated (e.g., via suppression or water cooling) or ceases once stored energy has been expended.

Similar to the construction methodology, air dispersion modeling was conducted of the gases emitted from a hypothetical thermal runaway event and subsequent ignition. The dispersion modeling was performed with Lakes Environmental Software implementation/user interface, AERMOD View, Version 13.0.0. A thermal runaway event would result in the combustion of the proposed battery containers, but such events are short-term in nature. To capture a worst-case scenario, it is assumed that the release of pollutants into the atmosphere would occur within a relatively short and concentrated period of time (i.e., one hour or less). The actual rate of release would be dependent on energy stored within the system and how the local fire department chooses to address the fire (e.g., a passive management approach vs. the application of water). Thus, the maximum concentrations were determined for the 1-hour averaging period.

As mentioned above, as part of UL testing compliance, battery systems must be designed to limit thermal propagation. The proposed project's potential thermal propagation was based on information contained in the *CATL EnerC+ Large Scale Burn Test – Document No.: 10520137-HOU-R-01*. During the controlled

burn of a representative BESS, three adjacent BESS were placed near the target BESS undergoing the controlled thermal runaway event (distance ranging from 0.2 meters to three meters away). The recommended installation distance is 3.5 meters. After the thermal runaway event, the three surrounding BESS were tested and no abnormalities were observed in the electrical room, no voltage variations were observed in the battery racks, and no cells vented gas or underwent thermal runaway. Therefore, it is highly unlikely that surrounding modules or units from an adjacent BESS would become involved in a separate thermal runaway event. Accordingly, the following evaluation would assume the scenario in which one battery container undergoes thermal runaway. A single battery container would house five racks. Each rack would contain eight modules, and each module would consist of 104 battery cells, resulting in a total of 4,160 cells in one battery container.

A thermal runaway event was modeled as a buoyant line source in AERMOD. To utilize the buoyant line source in AERMOD, a buoyancy parameter would be calculated from the acceleration of gravity, length of the source, width of the source, flow rate, gas exit temperature, and ambient air temperature. The buoyancy parameter formula is as follows:

$$\text{Buoyancy Parameter} = (g * l * w * v_s (T_s - T_a))/T_s)$$

Where:

- g = acceleration of gravity (9.81 m/s^2)
- l = length of the line source (m)
- w = width of the line source (m)
- v_s = gas flow rate or exit velocity (m/s)
- T_s = gas exit temperature (K)
- $T_{a_}$ = ambient air temperature (K)

During a thermal runaway event, gases would be released from the BESS through pressure relief vents along the top length of the battery container. As such, the linear release of gases was modeled as a buoyant line source of approximately 6.058 meters in length (length of one container of the proposed BESS). Additionally, due to the small size of the vents, the following would conservatively assume that the source width would be one meter wide. The exit velocity was assumed to be one meter per second to conservatively limit the amount of plume rise. During the controlled burn of the representative battery, the adjacent BESS reported that the maximum temperature recorded was approximately 781.5 ^oC or 1054.65 Kelvin. Ambient air temperature was assumed to be 25^oC or 298.15 Kelvin. Thus, the average buoyancy parameter was calculated to be approximately 42.628 m^4/s^3. Detailed buoyancy parameter calculations are provided in **Attachment A**.

All meteorological, terrain, and land use designations were identical to the selections for the air dispersion modeling conducted for construction, as discussed above. To evaluate off-site receptor exposure to gases emitted from a hypothetical thermal runaway event, a nested receptor grid was input with 50-meter spacing at bounding box around the property line of the project site and 100-meter spacing from 0 to 500 meters from property line. Since the hypothetical thermal runaway event can occur at any of the battery containers on the project site, multiple model runs were conducted to determine the container that would result in the highest concentration at the closest sensitive receptors. The following evaluation assume thermal runaway event occurring at the container that would result in the highest concentration at existing sensitive receptors. The nearest sensitive receptors to the project site are rural residential homes

located to the north and east, the closest of which would be approximately 285 feet north of the project boundary.

Emission Composition Assumptions

The project Applicant provided information on primary pollutants from a battery combustion malfunction based on a Contemporary Amperex Technology Co., Ltd unit (as a surrogate for the battery chemistry used at the project). The measured volumetric percentages for each pollutant were converted to a mass emission rate. Detailed emissions calculations are provided in **Attachment A**. The compounds were determined by proprietary testing performed by Contemporary Amperex Technology Co., Ltd as part of the UL9540A testing protocol.

In addition to the compounds identified by Contemporary Amperex Technology Co., Ltd, a variety of other pollutants would be emitted during a potential thermal runaway event. For these pollutants, the following evaluation would rely on available emissions data (e.g., hydrogen chloride, hydrogen cyanide, etc.) and corresponding emission factors provided in Data Request Response #4 for the Corby Battery Energy Storage System Project (24-OPT-05), prepared by Tetra Tech in October 2025.

The following discussion addresses other tests and additional pollutants identified in the literature review that are relevant to the proposed project.

Large Scale Burn Test

A large scale burn test (LSBT) was conducted on a BESS where the entire unit was forced into a thermal runaway.[11] Ambient conditions during the LSBT included wind speeds ranging from 0 and 2.7 meters per second, varying wind directions (blowing south, west, and then east throughout the duration of the LSBT), ambient temperatures ranging from 13 to 25 degrees Celsius, and humidity varying from 45 to 87 percent. During the LSBT, continuous gas sampling was conducted to determine benzene, formaldehyde, toluene, sulfur dioxide, and nitrogen dioxide emissions. Gas concentrations from the LSBT were averaged based on 10-meter and 20-meter distances from the BESS undergoing thermal runaway. Gas concentrations measured during the LSBT that were not included in the total volumetric results from the UL9540A testing for Contemporary Amperex Technology Co., Ltd. (specifically formaldehyde, sulfur dioxide, and nitrogen dioxide) were incorporated into the following analysis to address gaps in the available pollutant data.

Hydrogen Fluoride

Hydrogen fluoride originates from fluorine-based materials, not stored energy.[12] Cell-level results do not scale proportionally with nominal energy capacity but instead, hydrogen fluoride gases scale with electrolyte mass, electrode surface area, and total materials mass. Experimental studies of battery fires and industrial hydrogen fluoride releases show that only a small percentage of hydrogen fluorides generated from these sources remain airborne. Additionally, depending on the cell type (pouch versus cylindrical cells), a 0.75 reduction factor was standard in hydrogen fluoride emissions was observed due to differing mechanical confinement, vents, and partial retention or internal recombination of fluorinated species.

[12] Larson et al., *Toxic Fluoride Gas Emissions from Lithium-ion Battery Fires*, https://www.nature.com/articles/s41598-017-09784-z, August 30, 2017.

Acrolein

Acrolein was detected during full-scale fire testing on a battery pack and electric vehicle; however, no exact measurements were recorded.[13] Additionally, battery packs and electric vehicles have differing physical characteristics which would affect the quantity of acrolein released compared to a BESS. Due to the uncertainty of battery cell type, differing physical characteristics, and lack of reported concentration, data from the experiments are not applicable to a BESS thermal runaway event. Further literature review did not discover any studies that indicate acrolein is emitted during a BESS thermal runaway event. Thus, the following analysis would not evaluate acrolein.

Carbonyl Fluoride

Literature review did not discover any studies that indicate the presence of carbonyl fluoride during a BESS thermal runaway event. The lack of reported carbonyl fluoride in thermal runaway experiments is chemically consistent, since carbonyl fluoride is highly reactive and rapidly hydrolyzes to hydrogen fluoride and carbon dioxide in the presence of moisture.[14] During a thermal runaway event, battery cells are exposed to water vapor, combustion radicals, and hot surfaces which all encourage the hydrolyzation process. Thus, even though carbonyl fluoride is present, it would not be a measurable airborne gas and thus, the following analysis would not evaluate for carbonyl fluoride.

Particulate Matter

Emission rates for particulate matter were identified in a test; however, these emission rates are not representative of a full BESS thermal runaway event since the experiment was conducted on individual lithium iron phosphate batteries and cells.[15] Additionally, testing conditions during this experiment relied on external heat from hot plates rather than internal heat and overcharge typical of a thermal runaway event. Additionally, the experiment was conducted in an open ventilated chamber rather than a confined, restricted airflow environment standard of a BESS. The differing environment influences the amount of particulate matter emitted and thus, the measured particulate matter emission rates would not be applicable for a container BESS thermal runaway scenario.

Phosphoryl Fluoride

During experiments, phosphoryl fluoride was not detected during burn tests.[16] Based on the ratio between hydrogen fluoride and phosphoryl fluoride, estimated phosphoryl fluoride would be below the quantification limits of the utilized measuring equipment. Phosphoryl fluoride was detected in small scale tests using pure electrolyte, however no phosphoryl fluoride was detected in the tests on battery cells. Since no phosphoryl fluoride was detected, the following analysis would not evaluate for phosphoryl fluoride.

Emission Composition Methodology

UL9540A Testing Protocol Emissions Calculations

Applicant provided information on primary pollutants included the measured volume percentage and total sample volume for each gas. Based on the pollutant molecular weight, molecular weight of air, and air density, the approximate gas density of each pollutant was calculated. Afterwards, the total mass (kilograms and pound) of each pollutant was calculated based on the sample volume and number of cells undergoing thermal runaway (4,160 cells). The total mass was then divided by the reference burn test duration (14.5 hours) and the resulting output was converted into grams per second; refer to **Attachment A**.

Weight Based Calculations

Based on literature review, additional pollutants that were not included in the UL9540A Testing Protocol Emissions were identified. Additional pollutants (i.e., hydrogen chloride, hydrogen cyanide, etc.) were provided by their measured emission weight (milligrams) per each kilogram of BESS undergoing thermal runaway. The total calculated weight of the project's BESS was based on information from the *CATL EnerC+ Large Scale Burn Test* report (5.5 kilograms per cell * 4,160 cells per container = 22,880 kilograms per container). The pollutant's measured weight was converted from milligrams per kilograms (mg/g) into pound per pound (lb/lb) and then multiplied by the total calculated weight of the project's BESS to approximate the total emission of each pollutant. The total emission was then divided by the reference burn test duration (14.5 hours) and the resulting output was converted into grams per second; refer to **Attachment A**.

As discussed above, a small percentage of hydrogen fluoride remains airborne during a thermal runaway event. Additionally, a hydrogen fluoride reduction factor of 0.75 was observed when cylindrical cells are utilized. Since the proposed project utilizes prismatic cells, a hydrogen fluoride reduction factor of 0.5 would be utilized. The measured emission weight hydrogen fluoride and hydrochloric acid were multiplied by the hydrogen fluoride reduction factor of 0.5 prior to the conversion discussed above.

Distance Based Calculations

Reference gas concentrations from the LSBT were averaged based on 10-meter and 20-meter distances from the BESS undergoing thermal runaway. A secondary AERMOD model was created with a uniform polar receptor grid with two rings at 10-meter and 20-meter from the emission source and 10-meter intervals and modified meteorological data (wind speeds from 0 to 2.7 meters per second) to be consistent with the conditions during the LSBT. Additionally, a discrete cartesian receptor was placed at the identified sensitive receptor. The concentration at the identified sensitive receptor was divided by the maximum 1-hour concentration at 10 and 20 meters (downwind from the source) to identify the distance scaler. The distance scaler was then multiplied by the reference gas concentrations to approximate the concentrations at the identified sensitive receptor.

Modeling Results

Since a thermal runaway scenario may occur at any location of the project site, four separate scenarios were modeled, each representing a single BESS unit undergoing thermal runaway at different locations across the site; refer to **Figure 3**, *Locations of BESS Undergoing Thermal Runaway.* As shown in **Figure 3**,

two scenarios were placed near the existing rural residences located approximately 285 feet north of the project while the remaining two scenarios were placed on the northernmost and southernmost portion of the project site. Based on the 1-hour and 8-hour maximum pollutant concentrations predicted by AERMOD for each of the four separate scenarios, BESS 3 undergoing a thermal runaway would result in the highest maximum pollutant concentrations at the nearest sensitive receptor; refer to **Figure 3** for the location of this BESS and **Attachment B**, *Thermal Runaway Scenarios,* for the maximum output of each thermal runaway scenario. As shown in **Attachment B**, BESS 3 would emit the highest concentration at the nearest identified sensitive receptor (based on concentration contours). Accordingly, the following evaluation would utilize the concentration at the identified sensitive receptor from this scenario to determine potential health risk impacts.

Table 4, *AERMOD Maximum Concentration Results*, presents the maximum pollutant concentration predicted by AERMOD from the thermal runaway scenario. The BESS was assumed to emit pollutants at a unit rate of one gram per second. As shown in **Table 4** and **Figure 4**, *Thermal Runaway Scenario 1-Hour Concentration*, the maximum concentration would occur at the residential receptor to the north of the project site and would be approximately 588.32 µg/m^3 over a 1-hour period. Additionally, **Table 4** and **Figure 5**, *Thermal Runaway Scenario 8-Hour Concentration* display that the maximum concentration would occur at the same residential receptor location and be approximately 355.45 µg/m^3 over an 8-hour period.

Table 4: AERMOD Maximum Concentration Results

Averaging Period[1]	Sensitive Receptor Location (UTM East [meters])		Maximum Concentration (µg/m^3)[2]
	X-Axis	Y-Axis	
1-Hour	610788.00	4090061.65	588.32
8-Hour	610788.00	4090061.65	355.45

Source: Refer to modeling details included in **Attachment A**.
Notes: µg/m^3 = micrograms per cubic meter
1. The maximum concentration at either northern sensitive receptor, across all four thermal runaway scenarios, was used as the worst case result.
2. To facilitate pollutant-specific risk evaluation, AERMOD was modeled using a normalized emission rate of one gram per second for all four sources (thermal runaway and ignition scenario of four battery containers).

The emission composition of a potential battery composition was based on information provided by the project Applicant as well as literature review. Based on the composition provided, the projected emission rate of each pollutant was calculated based on project specific information; refer to **Attachment A**. **Table 5**, *Operational Health Risk Assessment Results*, summarizes the projected maximum acute exposure concentration for each pollutant and if it would exceed applicable California REL or EPA AEGL thresholds. The projected concentration for each pollutant is based on the maximum concentration predicted by AERMOD for the thermal runaway scenario as well as the calculated emission rate specific to that pollutant.

Table 5: Operational Health Risk Assessment Results

Pollutant[1]	Modeled Emission Rate (g/s)[2]	Projected Acute 1-Hour Concentration (µg/m³)[3,4]	Applicable REL Threshold[5]	Applicable AEGL Threshold[5]	Acute Hazard Quotient[6]
Hydrogen Chloride	0.000	0.088	2100	-	0.000
Hydrogen Fluoride	0.277	162.936	240	-	0.679
Hydrogen Cyanide	0.075	43.837	340	-	0.129
Hydrogen Bromide	0.161	94.637	-	3309	0.029
Propane	0.074	43.825	-	9920	0.004
Butane	0.164	96.263	-	13074	0.007
Hexane	0.037	21.830	-	10222	0.002
Ammonia	0.009	5.157	3200	-	0.002
Formaldehyde	-	8.662	55	-	0.157
Benzene	0.013	7.610	27	-	0.282
Toluene	0.000	0.000	5000	-	0.000
Carbon Monoxide	2.275	1338.346	23000	-	0.058
Nitrogen Dioxide	-	1.062	470	-	0.002
Sulfur Dioxide	-	2.957	600	-	0.005

Source: Refer to modeling details included in **Attachment A**.

Notes: g/s = grams per second; µg/m³ = micrograms per cubic meter

1. Only pollutants that have applicable REL and/or AEGL thresholds were included.
2. Modeled Emission Rate based on Applicant provided data and literature review.
3. Maximum 1-hour concentration obtained from the AERMOD modeling with sources emitting at 1 g/s and was manually scaled using pollutant-specific emission rates. Specifically, maximum 1-hour concentration was calculated based on the maximum concentration (588.319 ug/m³) from the BESS 3 thermal runaway scenario multiplied by the corresponding pollutant emission rate.
4. Maximum 1-hour concentrations for formaldehyde, nitrogen dioxide, and sulfur dioxide were based on parts per million concentrations at 10 and 20 meters, secondary AERMOD output with filtered meteorological data (0 to 2.7 meters per second wind), and maximum downwind concentrations.
5. Only pollutants that have applicable REL and/or AEGL thresholds were included. Some pollutants have established REL threshold while others do not have an REL threshold but have an AEGL threshold. As a conservative analysis, the lower of the two established thresholds was used in this analysis. Refer to **Table 1**.
6. Acute Hazard Quotient was calculated by the maximum projected 1-hour concentration divided by the applicable REL threshold.

As shown in **Table 5**, pollutants emitted from the thermal runaway scenario would not exceed applicable REL or AEGL-1 thresholds. Additionally, **Table 5** showcases the acute HQ which is calculated by the maximum projected 1-hour concentration divided by the applicable REL threshold. As discussed, a HQ of less than 1.0 would have a less than significant impact. However, when multiple pollutants affect the same target organ or system, their HQs are summed to estimate combined risks for that organ system. **Table 6**, *Hazard Quotient and Index Summary* display the pollutants' HQs for their corresponding organs they affect and the total HI.

Table 6: Hazard Quotient and Index Summary

Pollutant[1]	Acute Respiratory Hazard Quotient	Acute Eye Hazard Quotient	Acute Nervous Hazard Quotient	Acute Development, Immune System, Hematologic System Hazard Quotient
Hydrogen Chloride	0.0000	0.0000	-	-
Hydrogen Fluoride	0.6789	0.6789	-	-
Hydrogen Cyanide	-	-	0.1289	-
Ammonia	0.0016	0.0016	-	-
Formaldehyde	-	0.1575	-	-
Benzene	-	-	-	0.2819
Toluene	0.000	0.000	0.0000	-
Hazard Index[2]	0.6806	0.8380	0.1289	0.2819

Source: Refer to modeling details included in **Attachment A**.
California Office of Environmental Health Hazard Assessment. *OEHNA Acute, 8-hour and Chronic Reference Exposure Level (REL) Summary*. https://oehha.ca.gov/air/general-info/oehha-acute-8-hour-and-chronic-reference-exposure-level-rel-summary. Accessed January 2026.
Notes: 1. Acute hazard quotient was not calculated for pollutants that do not have an applicable REL.
2. Hazard index is based on the total sum of pollutants' hazard quotient that affect the same organ.

As shown in **Table 6**, the pollutants emitted from the thermal runaway scenario would not result in a HI greater than 1.0 for acute respiratory, eye, nervous system, and immune system exposure. As such, the sensitive receptor that would experience the maximum pollutant concentration (residence to the north) during the thermal runaway scenario would not be exposed to pollutant concentrations exceeding applicable health-based thresholds and thus, would not experience a significant health risk.

Ambient Air Quality Standards

Criteria air pollutants, including nitrogen dioxide (NO_2), carbon monoxide (CO), and sulfur dioxide (SO_2), are regulated under both federal and state ambient air quality standards. For the proposed project, the following evaluation would assess whether maximum short-term concentrations of NO_2, CO, and SO_2 would cause or contribute to an exceedance of the applicable ambient air quality standards at the sensitive receptor with the highest pollutant concentration from the thermal runaway scenario. Short-term exposure to these pollutants is evaluated using 1-hour averaging periods for NO_2, CO, and SO_2, with an additional 8-hour averaging period applicable only to CO. **Table 7**, *Ambient Air Quality Analysis* displays if the thermal runaway scenario would cause or contribute to any exceedance of ambient air quality standards.

Table 7: Ambient Air Quality Analysis

Criteria Pollutant	Averaging Period	Maximum Concentration ($\mu g/m^3$)[1]	Background ($\mu g/m^3$)[2]	Total Sum	California Ambient Air Quality Standards ($\mu g/m^3$)[2]
CO	1-Hour	1,338.3	2,519.0	3,857.3	22,900
	8-Hour	710.9	687.0	1,397.9	10,305
NO_2	1-Hour	1.1	94.1	95.2	339
SO_2	1-Hour	3.0	52.4	53.4	655

Source: Refer to modeling details included in **Attachment A**.

Environmental Protection Agency. *Interactive Map of Air Quality Monitors*. https://www.epa.gov/outdoor-air-quality-data/interactive-map-air-quality-monitors. Accessed January 2026.

California Air Resources Board. *Air Quality and Meteorological Information System*. https://www.arb.ca.gov/aqmis2/aqdselect.php. Accessed January 2026.

Notes: $\mu g/m^3$ = micrograms per cubic meter

1. Refer to **Table 5** for 1-hour maximum concentrations for each criteria pollutant (concentration was rounded to the nearest decimal). The 8-hour maximum concentration for Carbon Monoxide was based on the AERMOD maximum concentration over an 8-hour period. Based on AERMOD, an 8-hour exposure period would have a concentration of 355.45 $\mu g/m^3$ at the nearest sensitive receptor when sources are emitting at 1 g/s. The 8-hour CO maximum concentration was manually scaled using pollutant-specific emission rate.
2. Background concentrations are based on the reported concentrations from the California Air Resources Board's Air Quality and Meteorological Information System for the year 2025 and EPA AirData for the year 2025. The closest monitoring station was used to present the background concentration. As a conservative analysis, the highest reported background concentration would be utilized. CO and NO_2 1-hour data are based on reported data from the CARB Salinas-High School Monitoring Station, and CO 8-hour data was based on reported data from the EPA's Salinas 3 Monitoring Station. The North Central Coast currently does not have a monitoring station that reports background SO_2. Thus, SO_2 1-hour data was based on reported data on the neighboring Santa Clara County monitoring station (San Jose – Jackson Street).
3. California Ambient Air Quality Standards established by the California Air Resource Board. Conversion of ambient air quality standards from parts per million (ppm) to $\mu g/m^3$ were based on the criteria pollutants' molecular weight, assumption of a temperature of 25°C, and an atmospheric pressure of 1.

As shown in **Table 7**, the thermal runaway scenario would not cause or contribute to any exceedance of ambient air quality standards. Thus, a less than significant impact would occur in this regard.

Emergency Response Plan

As discussed above, pollutants emitted from a thermal runaway event would not exceed any applicable health risk thresholds. Nevertheless, to further minimizes the acute exposure of pollutants from a potential thermal runaway scenario, the Applicant will prepare an Emergency Response Plan as a project design feature. The Emergency Response Plan will outline the potential hazards (chemical, electrical, explosion, etc.) and response tactics associated with a thermal runaway scenario. Specifically, the Emergency Response Plan will require active air monitoring of an active thermal runaway scenario to address the safety of nearby residences. In the event that measured gases are monitored to exceed applicable thresholds, evacuation orders would be carried out to remove nearby residents that may be impacted by pollutants. Additionally, the Emergency Response Plan will identify proper water use procedures to minimize the existing thermal runaway event and the potential for fire propagation. Water should not be applied as a straight stream but instead, be angled upwards to have a rain down effect which will provide a cooling effect. The use of water will help reduce the emissions of pollutants from a thermal runaway event since the water will help reduce the fuel below ignition temperatures and will smother

flames to interrupt combustion. With incorporation of the evacuation orders and proper water use procedures as outlined in the Emergency Response Plan, health risks associated with a thermal runaway scenario would be minimized.

Mitigation Measures: None.

5.3 Hazardous Materials Impacts

Hazardous materials may be used and stored at the project site during construction of the proposed project. Use of chemicals at the project site would follow standard practices for storage and management of hazardous materials. The normal use of hazardous materials, therefore, would not pose significant effects on public health. While measures would be in place to prevent releases, accidental releases that migrate off-site could result in potential effects to the public. The hazardous materials stored in significant quantities on-site, the descriptions of their uses, and the full discussion of effects related to hazardous materials are presented in the Hazardous Materials Handling technical report prepared for the project.

5.4 Odors

Potential odor impacts vary in occurrence and severity based on several factors, including the character, frequency, and strength of the odor source; local wind speed and direction; and the sensitivity of nearby receptors. While unpleasant odors rarely cause physical harm, they can be bothersome, create stress for nearby communities, and lead to public complaints.

Potential temporary and intermittent odors may result from construction equipment exhaust. Temporary and intermittent construction-source emissions are controlled through existing requirements and industry Best Management Practices (BMPs), including CCR Title 13 Sections 2449(d)(3) and 2485, which require the project to minimize idling time of construction equipment either by shutting it off when not in use or by reducing the time of idling to no more than five minutes. Therefore, any impacts to existing adjacent land uses would be short-term and are less than significant.

Land uses associated with odor complaints typically include landfills, rendering plants, chemical plants, agricultural uses, wastewater treatment plants, and refineries. The operation of the proposed project does not include any uses typically identified as being associated with odors. The use of off-road equipment for battery swaps may generate odors from exhaust. However, the usage would be approximately one day every two to three years, which is infrequent and would generate minimal levels of odors. Therefore, impacts would be less than significant.

5.5 Electromagnetic Field Exposure

Electromagnetic fields (EMFs) consist of both electric and magnetic components, which occur independently. At the project site, EMFs would be generated by electric charges operating at the 60-hertz frequency typical of transmission lines. Electric fields are present when charges are stationary, while magnetic fields are produced when charges are in motion. The strength of both fields decreases quickly with distance from the source, following an inverse-square relationship.

Because transmission lines generally do not pass through residential areas, and based on findings from the National Institute of Environmental Health Sciences (NIEHS), EMF exposure is not expected to pose a significant public health risk.[17] The NIEHS report to Congress concluded that "the probability that EMF exposure is truly a health hazard is currently small", noting that weak epidemiological evidence and the absence of supporting laboratory results provide only limited scientific basis for concern.

Although California does not regulate EMF exposure, estimated values for transmission lines similar to those proposed are well below limits set by states that do. These states typically regulate EMF levels between 150 and 250 milligauss at the edge of the right-of-way, depending on line voltage. The CEC currently does not specify magnetic-field limits for standard transmission line designs.

5.6 Legionella

Legionella bacteria occur naturally in freshwater bodies such as lakes and streams but can become a health risk when they grow and spread in human-made water systems, including industrial cooling towers or centralized cooling equipment. Humans can be exposed by inhaling tiny water droplets that contain Legionella bacteria. The proposed project would not use a cooling tower or wet surface air cooler capable of supporting Legionella growth or dispersal. As a result, no water treatment program aimed at reducing potential Legionella-related health risks is required.

6 Cumulative Impacts

TACs emissions are a localized issue. In general, TACs concentrations are typically highest near the emissions sources and decline with increased distance. CARB recommends distances that should be incorporated when siting new sources or sensitive receptors near a source of TACs in its *Air Quality and Land Use Handbook*, which generally ranges from 500 to 1,000 feet depending on the source category. Based on CARB's Pollution Mapping Tool, the nearest tracked facility is the Ameresco Santa Cruz Energy Buena Vista Landfill approximately 3.8 miles southwest of the project site, and there are no other tracked facilities within six miles of the project site.[18] According to CARB, the Ameresco Santa Cruz Energy Buena Vista Landfill is not a generator of diesel exhaust particulate matter, and health risks from all other TACs emissions are below the thresholds.[19] Therefore, there were no tracked sources within 500 to 1,000 feet of the project site, and no cumulative impacts from nearby sources are anticipated. As such, the project would not have a cumulatively considerable public health impact, and cumulative impacts would be less than significant.

7 Agencies and Agency Contacts

No agencies were contacted directly to specifically discuss public health impacts related to the proposed project.

8 Permits and Permit Schedules

Pursuant to Assembly Bill 205 subsection 25545.1(b)(1), the CEC retains exclusive authority over permitting and supersedes any applicable statute, ordinance, or regulation of a local air quality management district. The Project Applicant and CEC would collaborate with the MBARD on review of this report to ensure compliance with MBARD rules and regulations. No further permits related to public health are required.

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Seahawk BESS - Construction HRA
Construction Start Date	6/1/2025
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	1.80
Precipitation (days)	37.2
Location	90 Minto Rd, Watsonville, CA 95076, USA
County	Santa Cruz
City	Unincorporated
Air District	Monterey Bay ARD
Air Basin	North Central Coast
TAZ	3126
EDFZ	6
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.28

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Unrefrigerated Warehouse-No Rail	1.00	1000sqft	14.0	1,000	0.00	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

2. Emissions Summary

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	6.75	annual days of extreme heat
Extreme Precipitation	8.90	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	15.1	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	0	0	0	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	1	1	1	2

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	17.6
AQ-PM	3.36
AQ-DPM	22.8
Drinking Water	60.1
Lead Risk Housing	58.8
Pesticides	98.4
Toxic Releases	7.49
Traffic	18.1
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	32.4
Haz Waste Facilities/Generators	35.6
Impaired Water Bodies	93.4
Solid Waste	63.7

Sensitive Population	—
Asthma	54.5
Cardio-vascular	32.5
Low Birth Weights	16.8
Socioeconomic Factor Indicators	—
Education	87.0
Housing	83.3
Linguistic	81.9
Poverty	70.4
Unemployment	52.5

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	48.60772488
Employed	61.79905043
Median HI	48.13293982
Education	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	53.0

Healthy Places Index Score for Project Location (b)	41.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Seahawk BESS: assumed building to account for routine maintenance workers. Total acreage of 14 acres disturbed with no landscaping anticipated per applicant.
Construction: Construction Phases	Adjusted default construction schedule based on information provided by the applicant.
Construction: Off-Road Equipment	Default equipment revised based on information provided by the applicant.
Construction: Off-Road Equipment EF	—
Construction: Trips and VMT	Default on-road vehicle assumptions revised based on applicant input. 0.25 miles assumed per trip to account for localized travel only.
Construction: On-Road Fugitive Dust	Unpaved portion of Minto Road modeled separately for construction.
Operations: Road Dust	% paved based on assumption of 20-mile trip length on average with 0.4 miles unpaved on Minto Road
Operations: Consumer Products	Facility will be unmanned. No consumer products assumed.
Operations: Architectural Coatings	No architectural coatings anticipated.
Operations: Energy Use	Conservatively assumed 10% of capacity would be needed for any lighting and container cooling.

Operations: Water and Waste Water	Facility would be unmanned. No water/wastewater assumed.
Operations: Solid Waste	Facility would be unmanned. No solid waste assumed.
Operations: Off-Road Equipment	1 crane and 1 forklift assumed to operate for 8 hours for 1 day every 2 or 3 years for battery swaps.
Operations: Landscape Equipment	No landscaping anticipated.
Operations: Refrigerants	Conservatively assumed 600 pounds of SF6 for the project substation equipment.

 ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses RURAL Dispersion Only.
      * Option for Capped & Horiz Stacks Selected With:
          1 Capped Stack(s); and         0 Horizontal Stack(s)
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
```

```
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: PM_10

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates PERIOD Averages

 **This Run Includes:    319 Source(s);       4 Source Group(s); and     491
Receptor(s)

                with:      1 POINT(s), including
                           1 POINTCAP(s) and      0 POINTHOR(s)
                 and:    318 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  21112

 **Output Options Selected:
          Model Outputs Tables of PERIOD Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    48.80 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.9 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out
```
