Not sustainable

The desert is a fragile ecosystem. These out of town firms that come in pretending to be part of the community do not care about the sustainability of our limited resources. There are large resource using firms already here, one more would be too many. The base already uses quite a large amount of resources., but also provides a sustainable economy. LADWP is another large draw on the local resources. They also are a large boon to the economy. The proposed data center will not create enough jobs to justify the resources used and the increase in temperature. This data center is coming in late in the game. There is a market cap on the investment capital and need for the data. If this is approved and it fails from lack of investment or limited market cap. We will then be stuck with an eyesore that is as useful as a giant paperweight.
