Docket Number: 24-TIRE-01

Unfounded assumptions

In your bill, it is described as - "The tires that come on new cars are designed to give you better mileage, so you spend less time and money filling up your car. Unfortunately, replacement tires are often less efficient." The reality is that car manufacturers equip their new vehicles with the most cost effective tires so as to keep the cost of the overall vehicle as low as possible, not because they are special or impart a greater performance enhancement. It meets the basic need to sell the vehicle. It is like using a component that is "C" grade as opposed to the more performative "A" grade that both costs more and performs better. California, being a large consumer market might influence entire industries to the disadvantage of consumers nationally. Perhaps it is best not to try to change something that has worked for over 20 years. It isn't broken, don't try to fix it!
