Where Is The Water Magically Coming From

Seriously!!! The Indian Wells Valley is under control of the Indian Wells Valley Groundwater Authority because the State of California has said we do not have enough water in the ground and we will run out of water. The GWA has doubled the water bills for the community of Ridgecrest to try to solve our water deficit. Meanwhile some residents of neighboring San Bernardino County want to place a huge water sucking, heat generating data center in rural Inyokern, neighbor to Ridgecrest and also part of the Indian Wells Valley that has a SERIOUS water deficit. I can't believe this project has moved this far because it is serious stupidity to allow a water consuming leviathan to be placed in an area of inadequate water, located in the Mojave Desert where Summer Temperatures can reach 110 for the majority of June, July and August and the data centers have been shown to increase the outside air surrounding the data centers an additional 10 degrees. So how much more water will be required to cool the data center in the sweltering heat beyond their estimate? The better alternative would be to place the data center in neighboring San Bernardino County area of Trona whose largest employer just laid off over 300 employees.
