Why won't you consider using safer technology

Lithium Iron Phosphate Batteries have a proven dangerous track record with fires on airplanes, EV Cars and trucks, other EV devices such as scooters, bikes and skateboard. Safer technology exist that will make Lithium Batteries obsolete due to the inherent fire danger they pose in as few as five years, so not get ahead of the power curve and switch to safer technology now and eliminate the danger. I even saw a recent news report on a new Technology by a start up in Sacramento the is making super capacitors to store energy in lieu of battery storage. This sounds like the future to me. So what is your answer to this as it was not considered in your report
