Energy Efficiency Programs for Scale

Standards for openness and interoperability should be aligned with utility needs and regulations so that EE and/or DR programs can be leveraged to include load flex requirements for end-use equipment. EE programs have a long history of transforming markets by influencing manufacturers, designers, contractors and consumers through multi-faceted efforts to deliver energy efficiency. These approaches can have the same effect of enabling load flex capabilities at scale. The Consortium for Energy Efficiency is working to identify emerging specification frameworks, aggregator and program models to better understand what can be done to standardize and scale.
