Reduce Global Warming and Conserve Water

What if Condensing Economizers were to be installed in the exhaust and the heat energy was recovered from the combusted natural gas and supplied to a neighboring company. Cool exhaust would be vented into the atmosphere. The water recovered from the exhaust could be utilized by the power plant or injected into the ground to replenish ground water supply.

For every 1 million Btu's recovered from the exhaust that gets utilized, 117 lbs of CO₂ will not be put into the atmosphere.

Might this help the cause to allow the power plant?
