The BIC-1000 Will
Save Water & Money

Why Use ACV's & Not Direct Acting Regulators?

- A directing acting regulator has to be set at about 90PSI in order to regulate down to 70PSI. It will constantly fluctuate as the pressure coming in fluctuates.
- A directing acting regulator is normally buried underground, which allows it to be susceptible to constant damage from dirt and gravel. It can become extremely time consuming for the maintenance personnel to fix these valves.
- ACV's are installed above ground for easy maintenance.
- ACV's will constantly stay at their set pressure. If you want 70PSI, then you set the ACV for 70PSI. This will conserve a lot of water for your park or facility and you will also see a change in your water bill.
- An ACV can handle the volume of running numerous clocks at the same time, but directing acting regulators can normally only run one or possibly two clocks at the same time. So, an ACV can help cut down on your watering cycle time dramatically.

Proof an ACV is the Right Solution
