Diablo Canyon

Nuclear power is the safest source of electricity generation ever invented. And it also supplies California with a carbon neutral source of electricity. Natural gas, on the other hand, has consistently proven itself to be dangerous to the public and is, of course, a greenhouse gas polluter through both CO₂ and methane production.

Clean electricity from Diablo Canyon should never be terminated. In fact, it should actually be increased by gradually adding the next generation of SMR to the site (small underground nuclear reactors) that would enhance safety even further.

In theory, the Diablo Canyon site could eventually accommodate as much as 8000 MWe of capacity by adding small nuclear reactors to the site over the next 20 or 30 years. A significant portion of this carbon neutral electricity could also be used to power coastal desalination plants in Southern and Central California.
