Massive Desalination Toward Drought Mitigation in the Western US States

I have a concept design for a massive desalination project to mitigate the Megadrought NASA has predicted for the Western US. Although this will be classified as a US Regional Project, I anticipate the State of California being a prime candidate for participation in the program. This will also mitigate the electrical production problems attendant to water shortages in the Western US States. It is a Zero Emissions System Design. Is this something the State of California will be interested in?
