Hot water Distribution System and Waste water Solution

The project proposal provides a new technology innovative product for the new water energy technology (WET) program project to accelerate the deployment of innovative water and energy saving technologies and reduce greenhouse gas emissions. The new technology innovative product was covering almost all the criteria of the (WET) program reducing and saving energy project, and also to benefit the consumer tax payers in California.

The new innovative product will be installed into the hot water pipe line and by the design and the materials that we use to this new product, this will produce heat to the water to get hot up to water end user. So, this new innovative product will make the water to remain hot into water pipe to get the water instantly hot, and no need to keep it flow until the hot water will come out and that how many gallon of water we wasted.

The innovative product will also minimized the operation of the Water Heater because the heat of the water stays longer period of time and it saving Energy and Gas as well.
