Desalination

Projects that use existing technologies in new and innovative ways should be considered eligible for this rebate program. For example, 2-stage desalination that increases yield without increasing ocean withdrawals while also reducing the energy intensity of the water supplies produced, and thereby, the associated GHG emissions, should be eligible for this grant. In addition, the solicitation also allow grant funds to be used towards ancillary facilities, such as desalinated water storage tanks and pipelines which, in the proper configuration, can improve the efficient production and use of desalinated water.
