2019 Building Energy Efficiency Standards

SUBCHAPTER 5

Section 140.0

NONRESIDENTIAL, HIGH-RISE RESIDENTIAL, AND HOTEL/MOTEL OCCUPANCIES—PERFORMANCE AND PRESCRIPTIVE COMPLIANCE APPROACHES FOR ACHIEVING ENERGY EFFICIENCY

Mark Alatorre, P.E.
mark.alatorre@energy.ca.gov

Simon Lee, P.E.
simon.lee@energy.ca.gov

October 4, 2017
Pre Rulemaking Workshop
§140.3(a)3– Envelope Component Requirements

• Clarified Exception 2 to §140.3(a)1Ai and Exception to §140.3(a)1Aiia is dependent on weight, not thermal mass
  – “Roof constructions with a weight of at least 25 lb/ft² over the roof membrane…”

• Updated Tables 140.3-C and 140.3-D to align with the new thermal mass definition
  – “Light mass walls are walls with a density less than or equal to 95 pounds per cubic foot. Heavy mass walls are walls with a density greater than 95 pounds per cubic foot”
§140.3(a)5 - Fenestration

• §140.3(a)5C & §140.3(a)5D – Inserted a new exception for demising walls to clarify that they are not considered exterior walls and therefore are not subject to the fenestration requirements of §140.3(a)5
  – Example:
    • “EXCEPTION 3 to §140.3(a)5c: Demising walls are not exterior walls, and therefore windows in demising walls are not subject to the SHGC requirements.”
Edits to the scope of this section to accommodate healthcare facilities including:

- Heating and cooling loads
- Indoor design conditions
- Outdoor design conditions
§140.4(c) - Fan Systems (New)

Each fan system with a total nameplate horsepower exceeding 5 hp:
Fan power limitations depending on constant or variable air volume;

Table 140.4-A – Fan Power Limitation Table
Table 140.4-B – Fan Power Limitation Pressure Drop Adjustment
§140.4(d) - Space Conditioning Zone Controls

No new requirements

Section was re-worked to bring the previous EXCEPTION 1 to 140.4(d) into the Standards

Odd to have such an extensive EXCEPTION, made more sense to include it as an option for acceptable zone controls
$§140.4(e) - Economizers (New)$

Expanded the water economizer requirements to not just forced air systems.

New water economizer requirements:
- Maximum pressure drop
  - Less than 15 feet of water; or
  - Secondary loop to bypass the heat exchanger
- Full integration to provide partial cooling
§140.4(h)5 - Cooling Tower Efficiency (New)

Open-circuit cooling towers serving condenser water loops of 900 gpm or greater:

• Minimum efficiency of 80 gpm/hp
• EXCEPTION of replacement of building mounted towers
• EXCEPTION of towers serving buildings in Climate Zone 1 and 16.
§140.4(l) - Duct Leakage (New)

- Added a requirement for duct systems serving healthcare facilities
- Directs users to the OSHPD amendments to the California Mechanical Code
- This change is consistent with current practice
§140.4(o) - Exhaust System Transfer Air (NEW)

- Sets limitations on conditioned air delivered to any space with mechanical exhaust
- Conditioned air shall not exceed the greater of:
  - Supply flow required for heating or cooling; or
  - Ventilation rate required; or
  - Mechanical exhaust flow minus the available transfer air

- Available transfer air is defined as the portion of total outdoor ventilation air that is not required to satisfy other exhaust needs or to maintain pressurization of other spaces and that is transferable according to Section 120.1(g)
§140.5(b)–Prescriptive Requirement for Service-Water Heating Systems

Add exception for High-Rise Residential and Hotel/Motel Occupancies

– Buildings of five stories and higher are not required to comply with the solar fraction requirement
§140.6 Indoor Lighting Power Allowance

• Lowered the lighting power density values for all three calculation methods to account for LED lighting

• Updated the specific terms used for types of buildings and areas under all three approaches

• Updated the formats of the tables

• For an area not defined in Table 140.6-C, allowed a reasonably equivalent type to be chosen for the area and LPD value (§ 140.6(c)2.A)
Table 140.6-B for Complete Building Method

- New values (example)

• Table 140.6-E: Modified the adjustment factors for Wall Display Lighting and Floor Display Lighting

• Table 140.6-G: Modified the Tailored Method general lighting power allowed by Room Cavity Ratio
§ 140.6 Calculation of Actual Lighting Power

• The lighting power for Portable lighting for office is now in Table 140.6-C, rather than stated as an Exception.

• §140.6(a)4B: Added for tunable-white and dim-to-warm LED luminaires
  – Qualifying luminaires include small aperture LED luminaires with color changing qualities

• §140.6(a)4C: Added for wall display and floor display luminaires
  – Qualifying luminaires as specified in Tailored Method
§ 140.6 Daylighting Devices for Power Adjustment Factors (PAF)

Table 140.6-A for Lighting Power Adjustment Factors (PAF)

(Part of the Table below)

- Clerestories PAF value: 0.05
- Horizontal Slat PAF value: 0.05
- Interior and Exterior Light Shelves PAF value: 0.10

</tr>
</tbody>
</table>
§140.9(a) Computer Rooms and (b) Commercial Kitchens (New)

• Aligned with the Fault Detection and Diagnostics requirement of §120.2(i) for computer rooms with an air economizers

• Added an EXCEPTION to both §140.9(a) and §140.9(b) for healthcare facilities
§140.9(c) Laboratory and Process Exhaust Systems (NEW)

- §140.9(c)2 Aligned with the Exhaust System Transfer Air Section of 140.4(o)

- §140.9(c)3 Fan System Power Consumption for systems greater than 10,000 CFM
  - Meet the discharge requirements in ANSI Z9.5-2012; and
  - Fan system power demand less than or equal to 0.65 w/cfm; or
  - Variable air flow rate based on wind speed and wind direction; or
  - Variable air flow rate based on measured contaminant concentration

- §140.9(c)3 include an Acceptance Test procedure to verify proper function of the exhaust system
§140.9(c) Laboratory and Process Exhaust Systems (New)

• §40.9(c)4 Fume Hood Automatic Sash Closure based on laboratories that are fume hood intensive

• Table 140.9-B lists the thresholds for fume hood intensive laboratories

• The automatic closure system must be capable of:
  – Detecting people with a dedicated zone presence sensor
  – Controls to prevent closing against a force no more than 10 lbs
  – Detecting obstructions that would prevent the sash from closing, including transparent materials

• Acceptance Test to verify proper sash function
