Responses to CEC and BLM Data
URS Project No. 27657106.00400

Dear Mr. Meyer:

On behalf of SES Solar Two, LLC, URS Corporation Americas (URS) hereby submits the Responses to CEC and BLM Data Requests 53-110 (SES Solar Two 08-AFC-5).

I certify under penalty of perjury that the foregoing is true, correct, and complete to the best of my knowledge. I also certify that I am authorized to submit the Data Responses on behalf of SES Solar Two, LLC.

Sincerely,

Angela Leiba
Project Manager

TECHNICAL AREA: AIR QUALITY

General Comment:

After reviewing the air quality comments received from CEC, SES reviewed the entire project to find opportunities to reduce air emissions from the project during construction and operation. These included considering changes to:

- Road construction
- Vehicles
- Fuels
- Construction practices, sequencing, and schedules
- Equipment types
- Operation and maintenance practices, sequencing, and schedules
- Vehicle travel patterns
- Placement of support facilities

In the following pages a revised air quality analysis is presented based on these revisions. It describes the assumptions and general approach used to estimate emissions from the operational and construction phases of the project, presents new emission estimates, and provides a summary comparison of the new results with those in the AFC. The revised analyses are presented using the same section and table numbering as the AFC.

The modifications made to the project during construction and operation lead to significant emission reductions for both the construction and operational phases. The emissions from all onsite and offsite sources associated with the operation of the project dropped between 70% to 90% from those presented in the Air Quality section of the AFC (see Table 5.2-25 of the AFC and Table 5.2-25b New of this analysis). The particulate matter emissions from all onsite and offsite sources associated with the construction of the project dropped by approximately 10% from those presented in the AFC due to the application of an unpaved road sealant, all other pollutant emissions increased due to increased vehicles and mileage (see Table 5.2-21 of the AFC and Table 5.2-21 Revised of this analysis).

These emissions resulting from the updated project were used as the basis for air quality modeling to determine if ambient air quality standards would be exceeded due to project emissions during construction and operations.

Air quality modeling predicted that the maximum operational emissions from the Project, in combination with conservative background concentrations, would not cause a violation of any state or federal air quality standard and would not significantly contribute to the existing violations of the federal and state PM_{10} and $PM_{2.5}$ standards. Air quality modeling of the construction emissions, in combination with conservative background concentrations, would not cause a violation of the state or federal air quality standards for CO, SO_2, NO_2 and $PM_{2.5}$ annual. The predicted concentrations of PM_{10} and $PM_{2.5}$ are minor compared to the existing background, which are currently above state and federal standards, if construction occurs during a period of high background concentrations, however, the project's construction emissions might have the potential to temporarily contribute to existing violations of the state and federal PM_{10} and $PM_{2.5}$ standards.

In the discussion that follows, the basis for any changes from the air quality modeling analyses in the AFC is described. Attachments AQ-1 and AQ-2 present the detailed emission calculations for construction and operations, respectively, and the basis for the assumptions used to estimate

these emissions. Attachment AQ-3 presents the maximum overlapping construction and operations emissions. Attachment AQ-4 presents a letter from ICAPCD outlining the requirements for emission reduction credits. Attachment AQ-5 presents the detailed heat balance calculations. Attachment AQ-6 presents the air permit forms submitted to the ICAPCD. All modeling files associated with the new data are provided on a DVD with these data requests. Following the new analyses discussions, responses to each data request are provided.

5.2.2 Environmental Consequences

5.2.2.1 Project Construction Emissions

In response to the extensive data requests from the CEC, project engineers and scientists thoroughly reevaluated the project construction activities in an effort to reduce the project's emissions. Changes made in construction included:

1. **Sealing or paving of all roads immediately after grading** – SES will pave on-site parking area near the administration building and apply the chemical dust suppressant Soiltac™ or a product with same or better performance to all on-site unpaved road and unpaved parking areas and use vacuum-sweeping and/or water-flushing on paved road surfaces to remove buildup of loose material to control dust emissions from travel on the paved access road (including adjacent public streets affected by construction activities) and paved parking areas.

2. **Actions to reduce fugitive dust** - Fugitive dust emissions from wind erosion of areas disturbed from construction activities (including storage piles) will be mitigated by application of either water, chemical dust suppressant, or other suppression technique. In addition SES will institute measures to: cover all trucks hauling soil, sand, and other loose materials or require all trucks to maintain at least 2 feet of freeboard; limit traffic speeds on all unpaved and/or unsealed site areas to 5 miles per hour; install sandbags or other erosion control measures to prevent silt runoff to roadways; replant vegetation in disturbed areas as quickly as possible; use wheel washers or wash off tires of all trucks exiting construction site; and minimize grading during construction of maintenance roads by just scraping the top soil.

3. **Changing the schedule and sequence of construction activities to reduce trips and vehicle miles traveled** – SES reviewed the construction plan to streamline procedures and minimize the amount of onsite travel. In minimizing grading activities as part of optimization of site activities, the use off road trucks for hauling materials was eliminated in favor of highway use vehicles. Maintenance sequences were reviewed for the fleet of mirror washing and PCU maintenance vehicles (LRU trucks). This review and planning allowed for a reduction of vehicle miles to be driven, change of fuel in vehicle from diesel to gasoline and reduction in the size of the vehicles.

4. **Confining most construction activities to sealed or paved roads** – SES will require all vehicles, such as material delivery trucks, to travel on sealed roads only.

5. **Changing the type and fuel of construction vehicles when possible** - All vehicles will use low sulfur and low aromatic fuel meeting California standards for motor vehicle diesel fuel and use low-emitting gas and diesel engines meeting state and federal emissions standards (Tiers I, II, and III) for construction equipment, including, but not limited to catalytic converter systems and particulate filter systems. Vehicles will be required to shut down equipment when idling for more than 5 minutes. Regular preventive maintenance will be implemented to prevent equipment engine emission increases due to inefficient fuel combustion. SES continues to investigate the option of using alternatively fueled pickup trucks and busses during construction and at a minimum will use gasoline to fuel these vehicles.

6. **Worker transport** - All construction workers will be required to park in the sealed laydown area and are then transported to worksites in buses.

The primary emission sources during construction of the Project still include exhaust from heavy construction equipment and vehicles and fugitive dust generated in areas disturbed by grading, excavating, road travel, and erection of Project structures. The projected construction schedule has a total duration of 40 months for full build-out of 750 megawatts produced by 30,000 SunCatchers. Different areas within the Project Site and the construction laydown areas would be disturbed at different times over this period. Construction of the SunCatchers and access roads will begin in the southwest portion of the site and continue eastward until all 30,000 SunCatchers are installed. At most 3,000 acres of the approximate 6,500-acre project site will be disturbed during construction the remainder will be undisturbed land. The land disturbance will primarily be for construction of the main service complex (MSC), assembly area, and sealed roads to access the SunCatchers.

Fugitive dust emissions from the construction of the Solar Two Project will result from:

- site grading/excavation activities;
- construction of roads, main service complex and substation;
- installation of SunCatchers;
- on-site travel paved roads, roads sealed with polymeric sealant, and the minimized but unavoidable travel on unpaved surfaces,
- off-site travel of worker vehicles and delivery trucks on paved roads.

Fuel combustion emissions during construction will result from:

- Exhaust from the off-road construction equipments, including diesel construction equipment used for site grading, excavation, and construction of on-site structures, and water/polymeric sealant trucks used to control construction dust emissions; and,
- Exhaust from on-road vehicles, including worker vehicles, busses, pickup trucks and diesel trucks used to transport workers and materials around the construction site, and from diesel trucks used to deliver concrete, equipment, and construction supplies to the construction site. Emissions from both on-site and off-site portions of trips made by these vehicles were estimated.
- Construction equipment and vehicle exhaust emissions were estimated using revised equipment lists and construction scheduling information (see Table 5.2-19 Revised).

Notes:
D = diesel
HP = horsepower
G = gasoline
P = propane
Note: Although the air quality model assumed the use of gasoline busses and gasoline pick-up trucks, SES is still investigating using alternatively fueled vehicles where possible.

This page left blank intentionally.

Below is a brief description of the planned construction activities and SunCatcher installation plan for the Solar Two site, followed by how the emissions from these activities were characterized in the AERMOD modeling.

Construction staff will arrive and park at the laydown area, from this point the construction staff will be transported via a bus to their work location. As needed port-a-lets and water stations will be distributed across the project area near construction activity to provide restrooms and water for construction staff, so that they do not need to return to the MSC for these activities. Port-a-lets and water stations will be moved as required once construction is completed in one area and relocated to another area on the project site. The port-a-lets will remain in the field after construction is completed for use during operation.

The contractor will utilize graders to construct at grade roadways, the Main Services Complex (and temporary assembly area) pad, transformer substation pads, water treatment facility pad, etc. The basic earthwork creating the roadways, pads in the energy production area will occur in the first portion of the construction phase. Trenching for the installation of the underground electrical system, water system, sanitary sewer system, and hydrogen distribution system will be done by direct burial or by utilizing three to four trenching crews.

The pipeline delivering water to the site will be constructed during months 1 and 2 of the construction schedule. Construction of the transmission line from the Imperial Valley substation will start at the substation and progress toward the Project substation lasting from months 1 through 6.

Trucks will deliver the SunCatcher components to the main assembly area at the Main Services Complex where the components will be off loaded and assembled. The trucks will be off loaded using propane fueled forklifts. The packing materials will be recycled for shipment of other SunCatcher components. As an example, the containers used to ship the mirror facets will be recycled and returned to supplier for reuse. Additional material for recycling such as wood, paper, etc. will be stored in a trash compactor which will be removed from the site to a recycling facility as required.

Installation of the SunCatchers will begin from the far southwest portion of the site and move to the east and north. The road preparations will occur before SunCatcher installations. The roads will be graded then a polymeric sealant will be applied to minimize dust emissions.

The SunCatcher pedestals will be delivered to the installation location in the project area by delivery trucks. Approximately eight pedestals will be delivered on each truck. The track mounted pedestal installation equipment (large crane) will remain in the energy production area until all the pedestals have been installed.

SunCatcher dish assemblies will be assembled onsite using cranes, aerial lifts and telehandlers. Approximately fifty SunCatcher dishes can be assembled each day. As the dishes are assembled flatbed trucks will load the dish and take it from the Main Assembly Building to a location in the project area where it will be off-loaded and attached to the pedestal. Cranes will install the SunCatchers on the previously installed pedestals. The installation cranes and aerial lifts will remain in the field.

Mass emissions of all criteria pollutants from off-road construction diesel and propane equipment were estimated using equipment and fuel specific information with the CARB OFFROAD2007 model. Operating load factors associated with each type of equipment (from SCAQMD CEQA Handbook 1993) were incorporated in the estimation of hours of operation per equipment. Emissions from the on-road vehicles were estimated using the EMFAC2007 model and estimated mileage traveled.

Exhaust equipment emissions were calculated by means of an Excel Workbook (presented in Attachment AQ-1), and were represented for modeling purposes as point sources. The exhaust emission sources were input as point sources to represent realistic plume parameterization from the equipment exhaust stacks. Generic stack parameters (exhaust temperatures and flow rates)

for 200 horsepower (hp) diesel internal combustion engines were obtained from the *Risk Management Guidance for the Permitting of New Stationary Source Diesel-Fueled Engine* (CARB 2000). These stack parameters were selected because most of the on-site construction equipment are larger hp vehicles (175-500). The 200 hp parameters were selected over the 300 hp parameters because the exhaust flow is lower for the smaller engine thus the model results are more conservative. Approximately half of the onsite equipment are large horsepower vehicles with high exhaust stack heights (equal to or greater than 10 feet), e.g., cranes, loaders, tractor trailers, dump trucks, graders, busses, water trucks, and bulldozers. Most of the remaining 50 percent of onsite equipment have exhaust stacks that are typically between 8 and 10 feet. The average stack height of all 129 (104 + 25 delivery trucks) onsite pieces of equipment (in month 6) is approximately 9.8 feet (3 meters), thus this value was used for all point source stack heights.

Emissions of fugitive dust (PM_{10} and $PM_{2.5}$) were represented as area sources in the construction modeling. The use of area sources for fugitive dust emissions is an acceptable and approved option to assess off-site impacts associated with widespread dust-generating activities like grading and bulldozing.

Fugitive dust emissions resulting from on-site soil disturbances were estimated using the *USEPA Compilation of Emission Factors AP-42* (EPA 1993) emission factors for bulldozing and grading (Section 11.9), travel on sealed or paved roads (Section 13.2.1), travel on unpaved roads (Section 13.2.2) and material handling (Section 13.2.4). Fugitive dust from the erosion of aggregate storage piles was estimated from the emission factor in SCAQMD CEQA Handbook Table A9-9-E. As the EPA AP-42 emission factors are created to be applicable for many different activities, the most appropriate or similar dust-generating activities presented in the AP-42 document were selected for use in this emission estimation. Most earthmoving activities will occur in the MSC area. Limited grading will be needed for road creation.

After the SunCatcher access roads are graded, a polymeric sealant will be applied in sufficient quantity to minimize fugitive dust emissions from vehicle travel. The sealant will be reapplied as necessary to minimize dust emissions. The sealant will create a durable bond that will act like a concrete surface, thus paved road emission factors were used to estimate the fugitive dust emissions from travel on these roads. Further description of the sealant and it's usage on the Solar Two site can be found in Data Requests 76-78.

SunCatchers will not be installed until sealed roads are in place for vehicle access the installation location. It takes approximately 24 hours for the sealant to sufficiently cure and be ready to handle vehicle traffic. The SunCatcher installation vehicles will then travel down these sealed roads with very little dust-generating activity occurring off these roads. Limited travel on unpaved surfaces will occur in the immediate vicinity around the SunCatcher installation location. Travel on unpaved surfaces will also occur during the construction of the MSC. Dust suppression by watering will occur in all areas where travel on unpaved surfaces will occur, earthmoving activities occur and on the storage piles. For these surfaces a dust control efficiency of 68 percent was assumed, per SCAQMD CEQA Handbook Table 11-4, the maximum value for watering active sites 2 times daily occur during construction. In the model, fugitive dust impacts from the access roads to the SunCatchers and the activity associated with them, were input as an area source that covers most of the Phase 1 area.

Off-site access to the MSC will be along the eastern main access road that enters the eastern side of the site, near the laydown area, travels west to the MSC, this stretch of road will be sealed with a substantial application of Soiltac™, or a product with same or better performance, as this road will primarily be used during construction. The heavy-duty application will ensure the road surface is the same as pavement for dust suppression purposes. This road and the northern main access road will be cleaned as required to ensure minimal dust emissions. After leaving the MSC, delivery vehicles will depart the site via the northern access road, this road will be paved, as this will be the main site access during operations. The emissions from travel on this entire loop were assessed using the EPA AP-42 paved road emission factor (Section 13.2.1) with rural road surface silt loading (from CARB).

The proportion of travel for each vehicle on paved, sealed and unpaved surfaces is outlined in Attachment AQ-1. Worker vehicles will travel to the laydown area where they will be shuttled to the site via busses.

Construction workers are assumed to commute to the Project Site from locations within a 20-mile radius, primarily El Centro. Additional offsite road travel associated with delivery vehicles within Imperial County was measured and included in the emission spreadsheet (and in Data Request 56). Concrete will be delivered from the greater El Centro area (20 miles one-way). Busses will be used to shuttle workers from the eastern parking area to the MSC (eliminating most worker vehicle travel onsite) and will make several round trips per day (six miles on-site, five miles off-site per round trip). It was assumed that the security vehicles that will patrol during the construction phase. In the model five security vehicles were spread around the perimeter of the site.

Assumptions used in calculating and modeling Project construction emissions included a 40-month construction period; 7 construction days per week; and 30 construction days per month. Heavy construction activities will occur during 7 am to 7 pm, and delivery of materials and assembly of SunCatchers may occur at any time during the day. In the model, off-road construction equipment exhaust and dust emissions occur from 7 am to 7 pm, all other sources occur for the entire 24 hours.

Based on a review of planned construction activities and equipment lists, highest monthly construction equipment numbers and earthmoving activities occur in month 6. During month 6 construction activity is focused on the Main Services Complex (MSC) and portions of the Phase 1 SunCatcher construction area. Therefore, in the model, the construction equipment was placed in these two areas to represent actual conditions during that time frame. As deliveries of construction and SunCatcher materials will also occur during this time period, delivery vehicles were placed along the main access roads and in the MSC and laydown area. Note that construction of the water pipeline will be completed before month 6, and the last month of transmission line construction will consist of the onsite portion of the transmission line.

The maximum short-term combustion and fugitive dust emissions were calculated using the equipment listed in Table 5.2-19 Revised, for Month 6 of the construction schedule; which is anticipated to have the heaviest equipment usage and earthmoving activities of any month. Based on the equipment usage and earthmoving schedules, emissions during Months 4 through 15 are expected to be the highest of any consecutive 12-month period during the overall 40-month construction effort. As with the short-term modeling, the water pipeline construction will be completed before month 4, and approximately half of the transmission line construction will remain. The annual emissions for the transmission line construction were scaled by 3/12 to account for construction of the transmission line only occurring in months 4-6 and none in months 7-15.

Tables 5.2-20 Revised and 5.2-21 Revised present the estimated maximum daily and annual emissions of air pollutants due to Project construction, respectively, and outline the contributions from specific activities. Detailed emission spreadsheets are provided in Attachment AQ-1, which shows the calculation of emissions from all Project construction equipment and activities, both onsite and offsite, along with the data and assumptions used in these calculations.

The particulate matter emissions from all onsite and offsite sources associated with the construction of the project dropped by approximately 10% from those presented in the AFC due to the application of the unpaved road sealant, all other pollutant emissions increased due to increased vehicles and mileage.

5.2.2.2 Operational Emissions

As with the construction phase, SES reevaluated activities associated with the operation and maintenance of the Solar Two project in an effort to reduce air emissions. The primary changes included:

1. **Switching from diesel and gasoline to electric or hybrid vehicles when possible during operation –** All diesel-fueled wash vehicles and other maintenance trucks will be replaced with new gasoline-fuel vehicles that meet California vehicle emissions standards. This will eliminate the emissions of toxic diesel particulate and reduce emissions of ozone precursors. Use propane-fuel fork lift and man lifts for maintenance activities requiring such equipment. All security vehicles used for site inspection and security will be replaced with hybrid vehicles, most likely the Toyota Highlander Hybrid sport utility vehicles (SUV) or similar vehicle. The Toyota Highlander SUV is a super ultra low emission vehicle (SULEV) that meets both Tier 2/Bin 3 Federal standards and California ULEV II standards.
2. **Changing operational activities to reduce trips and miles traveled** – SES is committed to a better travel demand management so as to reduce VMTs whenever and wherever possible. For example, each wash vehicle will wash two (2) SunCatchers at the same time. This will reduce the number of wash vehicles needed, number of maintenance trips, idling time and vehicle miles traveled. Consequently, the air pollutant emissions will reduce**.**
3. **Restricting operation and maintenance activities to sealed or paved roads -** A requirement that all vehicle travel associated with maintenance activities occur only on chemically-sealed road to reduce particulate emissions and protect habitat.
4. **Replacing the diesel fire water pump with an electric fire water pump** - The fire water pump will use power generated from the Project, grid power or power generated from the diesel emergency generator, thus no emissions will be associated with the fire water pump.
5. **Application of the chemical dust suppressant Soiltac™ or a product with same or better performance to all maintenance roads** - This will reduce particulate emissions. (see DR-78 for further product discussion).
6. **Road cleaning** - Use scheduled/well planned vacuum-sweeping and/or water-flushing on paved road surfaces to remove buildup of loose material to control dust emissions from travel on the paved access road and paved parking areas.
7. **Change of refueling systems** – The project will now use only one 5,000 gallon regular gasoline storage tank that incorporates CARB-certified Phase I & II vapor recovery systems. Furthermore, the tank will be filled only when necessary to reduce turnover. Truck refueling will also be kept to a minimum.
8. **Van pooling** - Van pooling of employees from El Centro during operations will be provided.
9. **Modified hydrogen storage and distribution system** - Hydrogen will be produced and stored onsite and distributed to each SunCatcher. The hydrogen cylinders associated with each SunCatcher will be eliminated and replaced with a central distribution system. Thus, all hydrogen cylinder delivery truck trips would be eliminated. Moreover, less maintenance of the SunCatcher hydrogen system will be needed and will be conducted from the maintenance trucks instead of cylinder delivering trucks, thus reducing trips and VMTs.

Below is a brief description of the planned operations and maintenance activities for the Solar Two site, followed by how the emissions from these activities were estimated and characterized in the AERMOD modeling.

As the SunCatcher systems are installed and connected to the grid, they will be activated to generate power, generally in 1.5 MW or larger modules. The SES Solar Two power plant facility, then, will "grow" from a few megawatts to its full scheduled build-out of 750 MW over the course of about 30 months.

Once up and operating, there will be the following continuous operations at the facility:

- The power generation from the up-and-operating facility will be scheduled for dispatch to the CAISO grid on an hour-by-hour basis, in concert with the CAISO PIRP (Participating Intermittent Resource Program) facility at CAISO.
- Scheduled maintenance of the operating SunCatchers will take place as prescribed – including, most significantly, washing of the mirrors, periodic augmentation of the hydrogen gas system, and servicing/replacement of wear items in the engine, such as seals. In addition, on a longer-term basis, replacement of other wear or use items, such as heater heads, crankshafts, transformer maintenance and repairs, etc. will be required.

As a general rule, however, the major routine to operate and maintain this facility consists of the following:

- Washing of the mirrors is anticipated (and so modeled) to be required, on average, about once every month. (It is expected that the SunCatchers near the perimeter of the site will incur more pollution from the surrounding environment (open desert, OHV recreation areas, highways, etc.), but the interior-sited SunCatchers should experience less soiling.) The typical washing procedure, based on McDonnell-Douglas/SCE/SES test-site work of the past 20 years at various locations and corroborated by experience at the SEGS trough plants over the past 15-plus years, requires a high-pressure spraying of water over the surface of the mirrors. This process will typically take place after sundown in order to maximize solar energy production during the day. It utilizes de-mineralized water, requiring about 14 gallons of water per dish, in a process that takes about 10 minutes per dish. Including travel time between dishes (and assuming that at any one stop), two dishes can be washed in about 25 minutes, and travel time to the next pair of dishes is less than 5 minutes. As a result, a washing crew (of 1 or 2 people) can wash 4 dishes per hour or 32 dishes per 8-hour shift.
- It is anticipated that, once a year, just prior to the "peak billing season" of June through September, a special "mechanical"-scrubbing wash will occur, requiring about three times the number of people and about 45 minutes per dish.
- Other major scheduled maintenance is focused around the power conversion unit (PCU). At around 6,000 hours of running time (about 20 months of solar operation), the main piston seals ("CGC seals") are scheduled for replacement. At that time, a service vehicle (a LRU truck, which we also sometimes describe as a "Six-Pack Truck") will replace the PCU needing maintenance with a replacement engine (a "rotable spare"). During this maintenance, other repairs, such as o-ring seal replacements, oil filtering, etc. will be performed as needed.
- General administration activities, including personnel administration, training, facility maintenance and support, scheduling, billing, accounting, and site management will also be performed at the site.

There will be 35 washing teams per shift for one shift per day, resulting in a complete washing of all 30,000 SunCatchers a month (about 28 days per month).

The only stationary source of emissions for the Project will be one emergency diesel generator. Less polluting fuels such as gasoline are still being considered for this engine, although for modeling purposes the emergency generator was assumed to remain diesel, as a diesel engine would produce the highest emissions of the different engine options. The emergency diesel generator engine will be rated at approximately 335 horsepower and will be tested 15 minutes per

week (13 hours per year) to ensure operability in the event of an emergency. Estimated hourly and annual emissions and stack parameters for the emergency diesel generator are provided in the Table 5.2-23 Revised.

Emission rates shown in Table 5.2-23 Revised are based on vendor-supplied emission factors for an EPA Tier 3 engine. The exclusive fuel for the generator will be ultra-low sulfur diesel containing a maximum of 15 ppm sulfur. Detailed emissions calculations for the emergency diesel generator are presented in Attachment AQ-2. The revisions in Table 5.2-23 Revised include lower Tier 3 NO_x emission factor and updated stack parameters.

Table 5.2-23 Revised
Backup Diesel Generator Emission Rates and Stack Parameters

Pollutant	Hourly Emissions (lb/hr)	Annual Emissions (lb/yr)
NO_x	0.85	44.30
CO	0.07	3.75
VOC	0.03	1.44
SO_X	0.02	1.15
PM_{10}	0.01	0.58
CO_2e	112.55	5,852.62

Source: Attachment AQ-2.

Source Parameters:
Rated capacity 335 horsepower
Testing duration 15 minutes per week
Expected annual non-emergency use 13 hours per year
Stack height: 6.5 feet above ground level
Stack diameter: 8 inches
Stack exhaust flow rate at full firing: 1,218 ACFM
Stack exhaust temperature at full firing: 869ºF

Notes:

Hourly emissions are based on 15 minutes of engines operation and 45 minutes without operation.

ACFM	=	actual cubic feet per minute
lb/hr	=	pounds per hour
lb/yr	=	pounds per year
NO_x	=	nitrogen oxide
CO	=	carbon monoxide
VOC	=	volatile organic compounds
SO_x	=	sulfur oxide
PM_{10}	=	particulate matter less than 10 microns in diameter
CO_2e	=	carbon dioxide equivalent
ºF	=	degrees Fahrenheit

The Proposed Project will also have a gasoline dispensing facility. The gasoline dispensing facility will have fugitive emissions of total organic compounds from working and breathing loss from one 5,000-gallon above ground gasoline storage tank and from vapor displacement and spillage from a new fueling nozzle. "*Emission Inventory Estimation Guidelines Section 4.10 Gasoline Dispensing Facilities (Revised May 1999)"* from CARB and the EPA-Tank 4.0.9d model were applied as the methodologies to estimate the emissions from this source. The estimated emissions are show in the Tables 5.2-25a New and 5.2-25b New. Detailed emissions calculations from the gasoline dispensing facility are provided in Attachment AQ-2.

Another category of emission sources on the Project Site during operations will be mobile sources that will be used for a variety of purposes as described in Table 5.2-24 Revised. The largest fleet of vehicles used during normal operations will be the 35 wash vehicles used to clean the SunCatchers to ensure maximum solar radiation capture and the 20 LRU maintenance trucks used to maintain the SunCatchers. Up to 4 van pooling vehicles will be purchased to transport workers efficiently to and from El Centro. These wash and LRU trucks and commuter vans will all have new engines that meet on-road emission standards for year 2009 or better, and will now be fueled with gasoline. The use of other alternative fuel technologies for these vehicles is still being considered. For the calculation of the exhaust emissions from these vehicles, gasoline was assumed to be the fuel, and emission factors from the Emfac2007 model for MHDT, MHDT and MDV were applied to the wash vehicles, LRU trucks, and van pooling vehicles, respectively. In the model, it was assumed that all vehicles listed in Table 5.2-24 Revised, including the wash and LRU trucks, would operate 12 months per year. As eight normal washes and one mechanical wash are anticipated per year, this ensures that enough vehicles will be used to account for the longer mechanical washes.

Table 5.2-24 Revised
On-Site Vehicle and Equipment Usage During Solar Two Project Operations

Description	Activity	Make/Model, Fuel	Quantity	Frequency
Washing vehicle	Mirror washing	12-ton truck, gasoline	35	Daily
Line replaceable unit (LRU) maintenance truck with boom	Field servicing and maintenance	10-ton truck, gasoline	20	Daily
Staff and security truck	Site inspections and security	Toyota Highlander or similar, gasoline hybrid	5	Daily
Rubber-wheeled forklift with telescoping boom	SunCatcher power conversion unit and mirror maintenance	Telehandler, propane	2	Daily
Forklift	Warehousing of supplies	Propane	2	Daily
Telescoping man lift	Facility maintenance and SunCatcher power conversion unit and mirror maintenance	Propane	7	Daily
Staff cars	Commuting to work	Passenger vehicles, gasoline & diesel	100	Daily
Van pool	Commuting to work	Passenger van, gasoline	4	Daily
Visitor cars	Sales, deliveries, and services	Passenger vehicles, gasoline & diesel	8	Daily
Delivery trucks	Operations and maintenance supplies	5-ton cargo, diesel	1	Weekly
	Waste management	20-ton, diesel	1	Weekly
	Hazardous waste	20-ton, diesel	1	Weekly
Transport tractor trailers	Spare parts, building supplies, and temporary rental equipment	40-foot, diesel	1	Weekly

Source: SES Solar Two, LLC, 2009.

To minimize combustion emissions from the security vehicles, SES will now use Toyota Highlanders or similar gasoline hybrid SUVs for these vehicles. The emissions for these gasoline hybrid SUVs comply with EPA Tire 2 – Bin 3 standards. The SO_2, CH_4, and N_2O emission factors for these vehicles were conservatively assumed to be the same as the emission factors for gasoline fueled cars (LDT2 in Emfac2007), since no emission factors are available for these

pollutants for this type of hybrid vehicles. The CO_2, emissions were calculated from the city miles per gallon proclaimed by Toyota and the CCAR emission factor for gasoline light duty trucks. Also onsite forklifts and aerial lifts that will be fueled with propane. Emissions for these lifts were estimated from the OFFROAD2007 model.

The wash vehicles, LRU trucks, security vehicles, and the forklifts will now only travel on roads sealed with a polymeric sealant such as Soiltac™, or a product with the same or better characteristics, to reduce fugitive dust emissions. The minimization of dust emissions is essential to the efficient operation of the SunCatchers as the solar radiation capture is reduced when the SunCatchers are dirty, thus, SES is dedicated to ensuring good sealed road maintenance and will not allow any off-road travel within the site. To estimate the fugitive dust emissions from travel on the sealed roads, the EPA AP-42 Section 13.2.1 Paved Roads equation 2 was used with a silt loading value of 7.4 g/m^2 (same as for a municipal solid waste landfill from Table 13.2.1-4).

The estimated daily and annual combustion and fugitive dust emissions associated with the on-site mobile sources used during normal operations of the Project are presented in Tables 5.2-25a New and 5.2-25b New. The operational onsite mobile source emissions estimated in the AFC included numerous conservative assumptions, per new operations and maintenance practices provided by the project engineers, the total operational combustion and fugitive emissions are much less than the emissions presented in the AFC. For example, the total on-site daily operational combustion and fugitive PM_{10} emissions are now estimated to be 122 pounds, which is approximately 41% of the value (296 pounds) presented in the AFC.

All offsite travel will be on paved roads varying from local roads to freeways, although the silt loading of a local road (from CARB - Emission Inventory Database - Section 7.9 Entrained Paved Road Dust - Local Streets) was conservatively used to estimate the fugitive dust emissions with the EPA AP-42 Section 13.2.1 Paved Roads equation 2. It is anticipated that the majority of the daily workforce will come from El Centro. As shown in Table 5.2-24 Revised, there will also be a few delivery trucks that service the Project weekly and few visitor cars daily. These vehicles will travel to the site from various locations, but only the emissions associated with the portion of travel within Imperial County was estimated and presented in Tables 5.2-25a New and 5.2-25b New describing the offsite project related emissions. When going to the Project Site, the worker vehicles, visitor cars, and delivery trucks will then drive on pavement from the site entrance to the parking lot. The emissions associated with the onsite travel of these vehicles were also included in Tables 5.2-25a New and 5.2-25b New. Detailed emissions calculations from the stationary, area and mobile sources are provided in Attachment AQ-2, along with the data and assumptions used in these calculations.

Due to refinements in the project operations and maintenance practices, the emissions from operational activities onsite and offsite decreased by 70-90% from those presented in the AFC. The largest reductions come from limiting VMT and sealing all of the unpaved roads.

Greenhouse Gas Emissions (GHG)

The Solar Two project would emit appreciably less GHG emissions than fossil-fueled power plants, and thus would contribute to improving the total GHG emissions from the California electricity system. As noted by CEC, Assembly Bill (AB) 32, "emphasizes that GHG emissions reductions must be "big picture" reductions that do not lead to "leakage" of such reductions to other states or countries. If a solar power plant is not built in California, electricity to serve the California load will come from another generating source. That could be renewable generation like wind or solar, but it could also be from higher carbon emitting sources such as out-of-state coal imports or old inefficient units that are a still a significant part of the resource mix that serves California." AB32 specifically exempts solar energy facilities from all reporting requirements, but requires all non-renewable electric generating facilities to report GHG if they have greater than 2,500 tonnes of CO2/year. State bill (SB) 1368 applies to electric generating facilities that operate more than 60% load capacity and requires CO_2 emissions to be less than 0.5 metric tons/MW-hour or 1100 lb/MW-hour. Neither AB32 nor SB1368 apply to the Solar Two Project. Although it should be noted that the operational onsite GHG emissions from stationary and mobiles sources per megawatt are approximately 1 lb/MW-hour, more than one thousand times smaller than the threshold outlined in SB1368.

Greenhouse gas emissions from on the project site during operation come from the diesel emergency generator, leakage of sulfur hexafluoride from the transmission breakers, and the maintenance and delivery vehicles. Offsite greenhouse gas emissions are due to mobile sources, commuter vehicles, visitor cars and delivery trucks.

To estimate the GHG emissions from the diesel emergency generator the emission factors from TableC.6 and C.7 in the California Climate Action Registry General Reporting Protocol (April 2008) were applied along with the fuel usage. The fuel usage was estimated based on engine size from CARB Table 1 of "Risk Management Guidance for the Permitting of New Stationary Diesel-Fueled Engines" (Oct 2000). The summary of the annual GHG emissions during operations from the diesel generator are provided in Table 5.2-26a New.

The GHG emission estimate from leakage of sulfur hexafluoride (SF_6) from the transmission system breakers and switches was provided in Table 5.2-27 in the AFC and has not changed. These emissions are also summarized in Table 5.2-26a New.

GHG emissions from mobile sources used for maintenance and delivery vehicles during operations were estimated and presented in Table 5.2-26a New. Table 5.2-26a New presents a summary of the maximum annual on-site and off-site Project related GHG emissions from all stationary and mobile sources during operations.

Per the request of CEC, the GHG emissions associated with the on-site and off-site mobile sources during construction were estimated and provided in the GHG summary table, Table 5.2-26b New. Similar to the methodologies used to estimate the mobile source criteria pollutant emissions, the GHG emissions factors were obtained from EMFAC2007, OFFROAD2007 and the CCAR General Reporting Protocol. The detailed emission calculations, emission factors and associated assumptions used in estimating the GHG emissions are provided in Attachments AQ-1 and AQ-2, for construction and operations, respectively.

5.2.2.2b Overlapping Construction and Operations Emissions

In response to data requests 91 and 92 from the CEC, emissions from the overlap of construction activities and operational activities are examined below. It is anticipated that at month 8 in the construction schedule, the first SunCatchers will be ready to come online and produce electricity. It is anticipated that in this first month 18 MW of generation capacity would be available, then 18 MW would be added every month through month 18, and 27 MW of capacity would be added every month thereafter until full build-out of 750 MW by month 40. As the SunCatchers come online, they will need to be maintained. The quantity of maintenance vehicles required will be proportional to the megawatts of electricity generated compared to full Project build-out. Likewise, as construction continues, less construction equipment will be required, especially large earthmoving equipment as most of these activities will occur early in the construction process.

Construction emissions were estimated using the same techniques are described in Section 5.2.2.1, for the time frame determined to have peak overlap emissions. Operational emissions were determined by scaling the full build-out emissions by the percentage of capacity online in a given month. The diesel generator and gasoline tank emissions were not scaled. Detailed overlapping construction and operations emission calculations are provided in Attachment AQ-3. Construction plus operations emissions from months 13-24 were determined to have the potential for the highest annual overlapping emissions particulate emission, although months 8-19 were determined to have the highest annual overlapping emissions for NOx, SOx, CO and VOC. Construction plus operations emissions from month 8 were determined to have the potential for the highest short-term overlapping emissions. Emissions from the peak overlap periods of construction and operations are presented in Tables 5.2-27a, 2.2-27b and5.2-27c, for peak hourly, daily and annual, respectively, and calculation details are presented in Attachment AQ-3. It should be noted that these overlap emissions are lower than the peak emissions for construction alone.

5.2.2.3 Air Quality Effects Analysis

The AERMOD model was used to predict the potential impacts from criteria pollutant emissions resulting from the Project construction and operations. Below is a discussion of the techniques used in modeling the construction and operational emission sources. Both analyses were revised from the analyses presented in the AFC, due to revisions in the data assumptions for the Project.

Construction Model and Model Option Selections

The effects of Project construction emissions impacts to off-site criteria pollutant concentrations were evaluated using the American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) (Version 07026). AERMOD was applied using the same techniques outlined in the AFC, i.e. regulatory default options were used including building and stack tip downwash, default wind speed profiles, exclusion of deposition and gravitational settling, consideration of buoyant plume rise, complex terrain, rural, and the ozone-limiting method (OLM) was used when estimate NO_2 concentrations.

Worst case modeling was conducted for short-term averaging times assuming operation of all construction equipment and fugitive dust generation from Month 6 occurred at the same time (see Section 5.2.2.1, Project Construction Emissions). Annual emissions were modeled for Months 4-15 of the construction schedule after a determination that this consecutive 12-month period will have a higher level of construction activity than any other over the full 40 months of construction accounting for the highest annual construction emissions. The modeling was performed with no downwash.

Supporting modeling files will be found on the DVD provided with this submittal.

Operations Model and Model Option Selections

For air quality permitting, only the stationary sources needs to be analyzed with air quality modeling, thus only the stationary sources were analyzed and presented in the AFC. Per the request of CEC, emissions from the on-site mobile sources during operations were included in a new air quality modeling analysis to determine if the Project would cause or contribute significantly to a violation of a CAAQS or NAAQS.

To analyze the impacts from both the stationary source and mobile sources during operations the air quality model AERMOD was utilized. The AERMOD analyses were conducted using the same techniques described in the Construction Model and Model Option Selections Section above and in the AFC. These included all regulatory default options, rural land use, and the use OLM for estimating NO_2 concentrations. The additional options used including building downwash.

The emission rate and stack parameters shown in the Table 5.2-23 Revised were used for the only stationary source, the emergency diesel generator, as a point source in the model. Mobile vehicle exhaust emissions were represented for modeling purposes as point sources and spread randomly throughout the sections of the site were maintenance activities are anticipated to occur. All point sources were given generic stack parameters representative of 50, 100, and 200 horsepower engines (CARB 2000) for forklifts, staff & visitor cars, and the rest of maintenance & delivery trucks, respectively. The assumed stack height was 0.5, 2 and 3 meters for the point sources for staff cars, off-road equipment, and maintenance trucks, respectively. Emissions of fugitive dust (PM_{10} and $PM_{2.5}$) were represented as area sources in the operations modeling.

The Solar Two facility will operate 24 hours per day, therefore emissions from all sources associated with normal project operations were assumed to occur anytime, 24 hours per day for modeling purposes. Supporting modeling files can be found on the DVD provided with these responses to the data requests.

Meteorological Data

The AERMOD modeling analyses to evaluate the potential effects of Project construction and operations used the same 5 years of hourly meteorological data described in the AFC. The data were collected at the nearest long-term meteorological station to the Project Site, the Imperial County Airport, for 1991-95.

Receptor Locations

Based on extensive experience modeling power plant construction phase effects, maximum concentrations for all pollutants due to mobile source and fugitive dust activities are expected to occur within the first 100 meters from the Project boundary. Accordingly, the receptor grids used in the AERMOD modeling analyses to evaluate construction and operational effects were as follows:

- 50-meter spacing along the fence line and extending from the fence line out to 200 meters beyond the property line, and
- 500-meter spacing from fence line to approximately 1 km beyond the property line.

Revised Figure 5.2-3 shows the placement of receptor points for the construction and operation modeling. The receptors were modified slightly from those used in the AFC so that they only extended 1 kilometer beyond the fence line and no further. Terrain heights at receptor grid points were determined from USGS digital elevation model files.

5.2.2.4 Modeling Results – Compliance with Ambient Air Quality Standards

Air dispersion modeling was performed according to the methodology described in Section 5.2.2.3, Air Quality Effects Analysis, to evaluate the maximum increase in ground-level pollutant concentrations resulting from Project stationary and mobile source emissions, and to compare the maximum predicted effects, including conservative background pollutant levels, with applicable short-term and long-term CAAQS and NAAQS. The effects from construction activities and Project operations were analyzed separately. The peak impacts for the worst construction period and total build-out normal operations were added together to show that even though this scenario would never occur, this combination would not exceed any AAQS. The entire 5-year record of hourly meteorological data was used in the AERMOD analyses of operational and construction effects.

The maximum modeled incremental increases predicted for both operations and construction for each pollutant and averaging time were added to the maximum background concentrations recorded at the most representative monitoring stations during the most recent 4 years (i.e., 2004 through 2007). These background concentrations are presented and discussed in Section 5.2.1.1, Climate and Meteorology. The resulting total pollutant concentrations were then compared with the most stringent CAAQS or NAAQS.

Construction Effects

Section 5.2.2.1, Project Construction Emissions, describes how the construction equipment schedule was used to estimate worst case emission (Month 6) conditions for the purpose of analyzing peak short-term effects to local air quality. Annual effects were modeled with all emissions that would occur during Months 4 through 15. Some notes regarding the modeling results for specific pollutants are provided below.

As reflected in the construction modeling results presented in Table 5.2-29 Revised, background concentrations of PM_{10} and $PM_{2.5}$ are above the California 24-hour standards for these pollutants and concentrations above the standards have been recorded on multiple occasions at Imperial County Monitoring Stations during recent years. Because of the land use characteristics of this area, it is highly probable that these conditions result primarily from high wind episodes,

agricultural burning or tilling activities, or other soil disturbances. The predicted contribution of the proposed construction activities would be minor by comparison with these sources, but would have the potential to temporarily contribute to existing violations of the state and federal PM_{10} and $PM_{2.5}$ standards if construction occurs during a period of high background concentrations.

Using the AERMOD air quality model with OLM predicted maximum 1-hour and annual NO_2 concentrations due to Project construction emissions which, when added to conservative background values from the nearest ICAPCD Monitoring Stations, are below the California standards for both averaging times. Likewise, the maximum predicted impacts from CO and SO_2 plus background are less than the most stringent ambient standards.

Notes:

[1]Background represents the maximum values measured during 2004-2007 at the most representative air quality monitoring stations, as described in Section 5.2.1.2, Existing Air Quality,

[2] Results for NO_2 during construction used an ozone limiting method with ambient ozone data collected at the El Centro 9th Street Monitoring Station for the years 1991 through 1995.

[3] $PM_{2.5}$ 24-hour and all PM_{10} background levels exceed state standards.

μg/m³ = micrograms per cubic meter
AAQS = most stringent ambient air quality standard for the averaging period
CO = carbon monoxide
NO_2 = nitrogen dioxide
PM_{10} = particulate matter less than or equal to 10 microns in diameter
$PM_{2.5}$ = particulate matter less than or equal to 2.5 microns diameter
SO_2 = sulfur dioxide
UTM = Universal Transverse Mercator

Operational Effects

As described previously, the estimated emissions used in the AERMOD model for Project operations were based on the assumption of weekly testing of the emergency diesel generator and on-site operation and maintenance vehicles and equipment shown in the Table 5.2-24 Revised and Attachment AQ-2. The maximum predicted operational effects of the Project are presented in Table 5.2-30a New, Maximum Modeled Criteria Pollutant Effects Due to Solar Two Project Operational On-site Stationary and Mobile Source Emissions. The table shows that the modeled effects due to these Project operational emissions, in combination with conservative background concentrations, would not cause a violation of any CAAQS or NAAQS and would not significantly contribute to the existing violations of the federal and state PM_{10} and $PM_{2.5}$ standards. Supporting modeling files can be found on the DVD provided with these responses to the data requests.

$PM_{2.5}$	=	particulate matter less than or equal to 2.5 microns diameter
SO_2	=	sulfur dioxide
UTM	=	Universal Transverse Mercator

Overlapping Construction and Operations Effects

Emissions from the overlap of construction and operations were estimated to be lower than the emissions from worst case construction alone, thus it is anticipated that the impacts from this overlapping period would also be lower than the worst-case construction impacts. Although it should be noted that if the peak impacts from the worst construction period and total build-out normal operations are added together, the impacts of this combination would not exceed any AAQS. Thus modeling of the overlapping construction and operations emissions was not conducted.

5.2.3 Cumulative Effects

CEC requirements specify that an analysis must be conducted to determine the cumulative effects of the Project and other projects within a 6-mile radius that have received construction permits but are not yet operational, or that are currently in the permitting process or expected to be in the near future. New projects with emissions less than 5 tons per year may also be excluded. There are no other such new or planned sources of criteria pollutant emissions within 6 miles of the Solar Two Project Site that have emissions greater than 5 tons per year; thus, no additional cumulative analysis will be conducted. For more information regarding the determination of potential projects for inclusion in a cumulative analysis can be found in Data Requests 107 and 108.

5.2.4 Mitigation Measures

5.2.4.1 Construction Emissions Mitigation

AIR-1

The following mitigation measures are proposed to control exhaust emissions from the diesel heavy equipment used during construction of the Solar Two Project:

- Follow a CARB requirement to shut down equipment when idling for more than minimum periods (typically five minutes);
- provide regular preventive maintenance to prevent equipment engine emission increases due to inefficient fuel combustion;
- use low sulfur and low aromatic fuel meeting California standards for motor vehicle diesel fuel; and,
- use low-emitting gas and diesel engines meeting state and federal emissions standards (Tiers I, II, and III) for construction equipment, including, but not limited to catalytic converter systems and particulate filter systems.

AIR-2

The following mitigation measures are proposed to control fugitive dust emissions during construction of the Project:

- application of the chemical dust suppressant Soiltac™ or a product with same or better performance to all on-site unpaved road and unpaved parking areas; (see DR-78 for further product discussion)
- mitigate fugitive dust emissions from wind erosion of areas disturbed from construction activities (including storage piles) by application of either water or other suppression technique;

- use vacuum-sweeping and/or water-flush paved road surfaces to remove buildup of loose material to control dust emissions from travel on the paved access road (including adjacent public streets affected by construction activities) and paved parking areas. Cleaning or resealing of the sealed roads will occur as needed to minimize potential dust emissions.;
- cover all trucks hauling soil, sand, and other loose materials or require all trucks to maintain at least 2 feet of freeboard;
- limit traffic speeds on all unpaved site areas to 5 miles per hour;
- install sandbags or other erosion control measures to prevent silt runoff to roadways;
- replant vegetation in disturbed areas as quickly as possible;
- use wheel washers or wash off tires of all trucks that traveled off-road before exiting construction site;
- minimize grading during construction of maintenance roads by just scraping the top soil;
- require SunCatcher material delivery trucks to travel on sealed roads only;
- Construction workers will park in sealed laydown area and are then transported to worksites in buses; and,
- Concrete bases are not expected to be constructed for the SunCatchers. The vibratory steel fin tube pedestals have been tested for all expected soil conditions on the site and are to be utilized on the SunCatcher foundations.

5.2.4.2 Operational Emissions Mitigation

AIR-3

The mitigation measures that will be implemented to mitigate the potentially adverse operations maintenance emissions are presented below.

- Application of the chemical dust suppressant Soiltac™ or a product with same or better performance to all maintenance roads. This will reduce particulate emissions. (see DR-78 for further product discussion).
- A requirement that all vehicle travel associated with maintenance activities occur only on chemically-sealed roads.
- It is anticipated that each wash vehicle will wash two (2) SunCatchers at the same time. This will reduce the number of wash vehicles needed, number of maintenance trips, idling time and vehicle miles traveled. Consequently, the air pollutant emissions of will be reduced compared to each SunCatcher being washed individually.
- Use of only one 5,000 gallon regular gasoline storage tank that incorporates CARB-certified Phase I & II vapor recovery systems. Furthermore, the tank will be filled only when necessary to reduce turnover. Truck refueling will also be kept to a minimum.
- All previously proposed diesel-fueled wash vehicles and other maintenance trucks will be replaced with new gasoline-fuel vehicles that meet California vehicle emissions standards. This will eliminate the emissions of toxic diesel particulate and reduce emissions of ozone precursors.
- All security vehicles used for site inspection and security are now planned to utilize hybrid vehicles, most likely the Toyota Highlander Hybrid sport utility vehicles (SUV) or similar vehicle. The Toyota Highlander SUV is a super ultra low emission vehicle (SULEV) that meets both Tier 2/Bin 3 Federal standards and California ULEV II standards.

- Van pooling of employees from El Centro during operations will be provided.
- Hydrogen will be produced and stored onsite and distributed to each SunCatcher. The hydrogen cylinders associated with each SunCatcher will be eliminated and replaced with a central distribution system. Thus, all hydrogen cylinder delivery truck trips would be eliminated. Moreover, less maintenance of the SunCatcher hydrogen system will be needed and will be conducted from the maintenance trucks instead of cylinder delivering trucks, thus reducing trips and VMTs.
- Use scheduled/well planned vacuum-sweeping and/or water-flushing on paved road surfaces to remove buildup of loose material to control dust emissions from travel on the paved access road and paved parking areas. Cleaning or resealing of the sealed roads will occur as needed to minimize potential dust emissions.
- Use propane-fuel fork lift and man lifts for maintenance activities requiring such equipment.
- SES is committed to a better travel demand management so as to reduce VMTs whenever and wherever possible.

This page left blank intentionally.

TECHNICAL AREA: AIR QUALITY

Data Request 53: Please describe the types of activities that emit combustion and fugitive dust emissions on the site currently and the quantities of those emissions that occur from those activities.

Response: Currently, the proposed Solar Two site consists of disturbed desert alluvial sands and desert flora. Current activities that emit combustion exhaust are off-road recreational vehicles and limited maintenance vehicles along the transmission line road. Off-road vehicle travel and high winds create fugitive dust emissions. Currently, the proposed project area is within a BLM limited use area. Off-road recreational vehicles are required to stay on BLM designated roads. However, it is common for vehicles to travel off-road as well. Other vehicles utilize the transmission road as well as the NAP areas. (Note: Two private parcels of land, one owned by a recreational vehicle club and one by a private landowner, are surrounded by the Project and are not a part of the Project.) One NAP area, an 80 acre parcel, is owned by a recreational vehicle club that utilizes the parcel several times during the year for intensive off-road vehicle recreational use.

The amount of off-road activity is hard to quantify, thus the fugitive dust and combustion emissions associated with these activities were not estimated.

During high wind episodes some dust may become airborne due to the natural erosion of the desert surface. The amount of dust due to erosion is primarily dependent upon the amount of disturbed surface, since this is as hard to quantify as the amount of off-road activity, fugitive dust emissions due to high wind episodes were not estimated.

TECHNICAL AREA: AIR QUALITY

Data Request 54: Please describe whether those activities will be permanently discontinued when the project is completed and estimate the reductions from the current onsite baseline emissions.

Response: Off-road vehicle use will be excluded from the entire portion of the site controlled by SES. SES however, has no control over the off-road vehicle activity in the NAP areas or along the transmission right of way located off SES property. It must be assumed that off-road activities in these areas will remain the same. In reality, it is expected that a slight reduction in off-road vehicle activity will occur in the NAP areas due to the desire of the off-road drivers to operate in open spaces away from structures that may hinder the operation of their vehicles.

A reduction in wind blown erosion of the desert will occur due to the reduction in off-road recreational vehicle travel and sealing of the road surfaces throughout the project site.

Thus at most, there will be a small net air quality benefit to the nearby area due to the reduction of the natural wind blown dust and reductions in off-road vehicle traffic.

TECHNICAL AREA: AIR QUALITY

Data Request 55: Please describe for a routine daily construction schedule the location of where the following construction materials will originate:

a. Water for fugitive dust abatement or other construction purposes,
b. Concrete for SunCatcher footings (if concrete footings used),
c. Stirling Engines for the SunCatchers,
d. SunCatcher metal support structures,
e. SunCatcher mirrors.
f. Any other raw or finished material, or waste stream, that would require more than ten truck trips per month.

Response: The daily construction routine can be considered in two overlapping stages:

- Construction of the site infrastructure including earthwork, roadways, Main Services Complex, water treatment facility and similar structures.
- Construction of the SunCatchers and their support systems.

The following identifies where the construction materials originate:

a) The primary source of water for the project will now be reclaimed water from the Seeley Waste Water Treatment Facility. This water will travel to the site through a pipeline, thus no vehicle emissions are associated with the transport of this water. (Please see the updated discussion in response to Data Requests 37 and 38.)
b) Concrete will not be used for the SunCatcher footings, although it will be used in the construction of the main services complex and miscellaneous equipment foundations. All concrete trucks will come from El Centro.
c) The Stirling engines will be manufactured in the Detroit area. These will be transported by rail to Los Angeles, then by transport truck to the SES Solar Two site.
d) The metal support structures will either come from near Phoenix or Los Angeles area.
e) The SunCatcher mirrors will originate in the Detroit area. These will be transported by rail to Los Angeles, then by transport truck to the SES Solar Two site.
f) The SunCatcher pedestals will come from Phoenix area. The azimuth and elevation drives will originate from somewhere in the Midwest. These will be transported by rail to Los Angeles, then by transport truck to the SES Solar Two site. The electrical and control systems will come from Phoenix area. General construction materials will primarily be delivered to the site during months 2-8, these will come from various locations. Occasional deliveries may occur at others times, but are expected to be less than ten truck trips per month. Note no fill removal or delivery will be needed in the construction of the Solar Two facility.

TECHNICAL AREA: AIR QUALITY

Data Request 56: For each of the materials delivery/waste removal truck trip types requested in Data Request 55a through 55f please provide the following information:

a. The types of delivery trucks that will be used to deliver these materials,
b. The number of delivery trucks on a daily basis for each of these materials, and
c. The number of miles traveled roundtrip daily for each vehicle within Imperial County for each of these materials.

Response: Table DR-56 presents the daily construction material delivery vehicle schedule and the round trip number of miles each vehicle will travel within Imperial County. It is anticipated that the same amount of delivery vehicles will arrive at the site every day for the duration of the project construction.

a) Standard container diesel powered transport trucks will deliver all of the SunCatcher materials. Diesel concrete trucks will deliver the concrete.

b) See table DR-56 below.

See table DR-56 below.

Table DR-56 Estimated Daily Construction Material Delivery Vehicles and Associated Mileage Within Imperial County

Material and Delivery Vehicle Type used within Imperial County	Number of Trucks per Day	Number of miles traveled round-trip daily per vehicle within Imperial County	Origination Location
Concrete – Concrete Truck	5 [1]	40	El Centro
Stirling Engines – Transport Truck	5	50	Detroit
SunCatcher Metal Supports– Transport Truck	10	240	Phoenix Area
SunCatcher Mirrors– Transport Truck	6	50	Detroit
Electrical and Control Systems– Transport Truck	2	240	Phoenix Area
Azimuth and Elevation Drive – Transport Truck	2	50	Midwest
SunCatcher Pedestals	3 [2]	240	Phoenix Area
General Construction Materials	3 [3]	100	Various Locations

1. Peak number of trucks per day. Concrete delivery expected to occur for 3 months.
2. Peak number of trucks per day. SunCatcher pedestal delivery expected to occur for 9 months.
3. Peak number of trucks per day. General construction materials delivery expected to occur for 7 months.

TECHNICAL AREA: AIR QUALITY

Data Request 57: Based on the calculations of truck types, number of vehicles and vehicle miles traveled within Imperial County of Data Request 56, please provide the daily criteria pollutant emissions associated with these truck emissions.

Response: A summary of the daily criteria pollutant emissions associated with the construction delivery vehicles is presented in Table 5.2-20 Revised and below in Table DR-57. Details regarding how these emissions were calculated are presented in Attachment AQ-1.

Table DR-57 Estimated Maximum Daily Emissions from Construction Material Delivery Vehicles

Activity	Daily Emission Rate (lb/day)					
	PM_{10}	$PM_{2.5}$	CO	ROC	NO_x	SO_x
On-Site Emissions						
SunCatcher Delivery Trucks Combustion Exhaust	0.77	0.69	5.63	2.64	12.56	0.01
SunCatcher Delivery Trucks Fugitive Dust	57.46	8.56				
Subtotal of On-Site Emissions	**58.23**	**9.25**	**5.63**	**2.64**	**12.56**	**0.01**
Off-Site On-Highway Emissions						
SunCatcher Delivery Trucks Combustion Exhaust	17.01	15.27	123.80	57.93	276.09	0.30
SunCatcher Delivery Trucks Fugitive Dust	130.86	0.75				
Subtotal of Off-Site Emissions	**147.87**	**16.02**	**123.80**	**57.93**	**276.09**	**0.30**
Total Maximum Daily Emissions	**206.10**	**25.27**	**129.43**	**60.56**	**288.65**	**0.31**

TECHNICAL AREA: AIR QUALITY

Data Request 58: Please describe the feasibility of significant materials deliveries, especially for the SunCatcher materials, by the rail line located on the north side of the project site. Also include in this discussion that if the current rail line is not in a usable condition for rail deliveries, what measures would need to be taken to upgrade the rail line to a usable condition.

Response: For delivery of the project components discussed in Data Request 55 that are manufactures in the Midwest, SES has discussed two rail transportation options with Union Pacific Distribution Services (UPDS) and Daniel McLaughlin, Senior Business Development Manager of Union Pacific (January 20, 2009). These are direct rail to the site and rail to the distribution center in Los Angeles with trucking to the project site.

In its current design, the existing branch line located on the north side of the Solar Two project site does not have a rail spur to accommodate the intermodal containers and rail cars that would be used for delivery of SunCatcher components. To be feasible, rail-only delivery of components to the project site would require the construction of a new rail switch and an approximate 3-mile rail spur. For SES, the construction of the new switch and rail spur for use during construction would mean the additional impacts and use of materials associated with the construction this temporary facility. This also translates into higher costs of assembling and installing the project.

An alternative proposed by Union Pacific Distribution Services is to deliver the components by rail to the existing rail container transfer facilities in Los Angeles, California. From this location, components could be offloaded, stored in a marshalling yard, and transported to the Solar Two project site by delivery truck when requested by SES. This would avoid the construction of a temporary rail spur.

One challenge to either rail option involves the question of logistics and the potential for delays in construction to bring this renewable resource on-line. Union Pacific expects the rail shipping time from the Midwest to Southern California to be about 7 days. SES is concerned that deliveries are likely to be less certain and could be delayed up to two weeks depending on the shipments on board the same train and other rail priorities over which SES would have no control or input. If there are significant delivery delays, it would make it more difficult for SES to control inventory, schedule production and insure there are no production stoppages due to material shortages. Alternatively, SES may have to maintain substantial on-site and/or drop off site inventory stockpiles that could result in inventory spoilage and pilferage which is difficult to control at a location remote from the project site.

Truck transport of the components is expected to have a shorter delivery time: 3-4 days maximum for a straight truck haul. This translates into a smaller finished goods inventory, less potential for component damage, and theft of inventory. While truck-only delivery means more control and greater likelihood of on-time delivery schedules, SES also recognizes that it is likely to result in greater emissions.

At this time, because of the need to construct a rail spur that is only required temporarily for construction, SES is opposed to using the rail-only option for shipping components to the project site.

SES would prefer not to commit to either the rail-truck or truck-only deliveries of the components discussed in Data Request 55 but to evaluate both options at the time of construction to determine which is the most effective in ensuring the project is able to come on-line in the timeframe needed by SDG&E to meet their renewable goals while having the minimal environmental impact.

TECHNICAL AREA: AIR QUALITY

Data Request 59: Please estimate the on-site unpaved road travel and corresponding unpaved road particulate emissions for all on-road construction vehicles, including employee vehicles, heavy haul delivery vehicles, crew trucks, etc. necessary to complete the construction activities throughout the project site. If the unpaved road travel increases the overall on-road vehicle travel lengths then also please estimate the additional on-site tailpipe emissions from these vehicles.

Response: The on-site fugitive dust and vehicle exhaust emissions during construction were recalculated to incorporate new construction assumptions provided by the project engineers. A summary of all construction related emissions is presented above in Tables 5.2-20 Revised and 5.2-21 Revised, and detailed construction emissions calculations are outlined in Attachment AQ-1.

TECHNICAL AREA: AIR QUALITY

Data Request 60: Please revise AFC tables 5.2-20 and 5.2-21 to reflect the additional emissions associated with construction as requested in data requests 58 and 60.

Response: AFC Tables 5.2-20 and 5.2-21 have been revised and are presented above in Section 5.2.2.1.

TECHNICAL AREA: AIR QUALITY

Data Request 61: Please identify the mitigation measures that are proposed to limit on-site operating maintenance vehicle tailpipe emissions, such as only buying new vehicles that meet California vehicle emission standards.

Response: The applicant intends to purchase only new vehicles that meet California vehicle emission standards for the on-site operational maintenance vehicles. The wash and LRU trucks and vans for car pooling will be fueled with gasoline, propane will be used for forklifts, and hybrid vehicles will be used for security. Other alternatively fueled vehicle options are still being assessed and will be considered as these vehicle types become available in the future. The applicant has also reorganized and rescheduled operational activities to reduce the number of vehicle miles traveled.

TECHNICAL AREA: AIR QUALITY

Data Request 62: Please identify why electric vehicles cannot be used in the place of diesel or gasoline on-site maintenance vehicles.

Response: Presently electric trucks, in the size required for the wash vehicles and LRU trucks are not available commercially. If electric vehicles of appropriate capacity become available, they will be considered for the wash vehicles and LRU trucks.

TECHNICAL AREA: AIR QUALITY

Data Request 63: Please identify why alternatively fueled vehicles with reduced emission profiles, cannot be used in place of diesel or gasoline on-site maintenance vehicles. In particular considering the hydrogen needs of the solar dish equipment, it would appear that hydrogen fueled equipment might be a reasonable emission reduction alternative.

Response: Presently no hydrogen fueled vehicles adequate for the wash vehicles and LRU trucks are available. As new alternative fuel vehicle technologies become available, SES will investigate the possibility of using of these for the wash vehicles and LRU trucks. Hybrid vehicles will be used by supervisory and management personnel. Electric power for larger vehicles was considered, but there are no commercially available electric large trucks.

TECHNICAL AREA: AIR QUALITY

Data Request 64: Please explain the purpose and function for the LRU maintenance trucks.

Response: The line replacement unit maintenance trucks will be used to service the power conversion units. The LRU trucks will have a boom arm that can lift a worker to the PCU for inspection or replacement as needed. If the worker determines that the engine requires replacement, the engine is hooked to the truck boom and replaced with an engine from the truck bed.

TECHNICAL AREA: AIR QUALITY

Data Request 65: Please describe why an on-road (and thus less emitting) vehicle could not be employed to provide the services necessary rather than the assumed off-road LRU vehicle that is being proposed in the AFC.

Response: The LRU trucks will now use gasoline engines that meet new on-road emission standards.

TECHNICAL AREA: AIR QUALITY

Data Request 66: Please describe the assumptions used to determine the number of operating maintenance vehicles and their daily paved and unpaved vehicle miles traveled.

Response: The assumptions for determining the number of wash and LRU trucks can be found in Data Request 68. Daily miles traveled on-site were estimated from the plot plan or data provided by the project engineers. All roads accessing the Suncatchers will be sealed with a polymeric sealant. The northern main access road and the parking lot will be paved. It was assumed that the wash and LRU trucks would spread evenly across the site to conduct maintenance activities and that each vehicle would return to the main services complex daily. The average round trip mileage for each wash and LRU truck was determined to be 7 miles as ascertained from the plot plan. The distance traveled by each forklift was estimated by the project engineers. The fence-line perimeter is approximately 20.5 miles. Each security vehicle is assumed to travel from the MSC around the perimeter, plus one trip to the center of the site and back (plus 10% for miscellaneous trips) for a total of approximately 33 miles. Staff cars, vans, visitor vehicles and delivery trucks will travel round trip along the northern main access road to the MSC and back for a total of 3 miles. The transport trailers that will bring supplies are anticipated to travel along the northern main access road to the MSC out to the center of the site and back, for a total of 10 miles.

TECHNICAL AREA: AIR QUALITY

Data Request 67: Please describe in greater detail the specific design of the diesel-fueled water tanker trucks that will be used to clean the SunCatcher dishes. Describe whether water will be towed behind the vehicle or whether the water tanks and the cleaning apparatus equipment will somehow be attached to the vehicles.

Response: The wash vehicles that will be used to clean the SunCatchers will be designed specifically for this project and will be fueled with gasoline and use new engines that meet California on-road vehicle emission specifications. They will have an integral water tank that can hold up to 2,000 gallons of demineralized water. The wash wand will be connected to the vehicle and the vehicle's engine will be used to pump the water at high pressure out of the wand.

TECHNICAL AREA: AIR QUALITY

Data Request 68: Please describe the SunCatcher dish washing requirements including:

a) How the dishes are washed, both for normal and mechanical washes;
b) Time of day for washing;
c) How long it takes each dish to be washed;
d) How many dishes can be washed per hour or shift for each mirror washing tanker truck crew;
e) The size of each wash crew; and
f) The basis for the need to wash each dish monthly.

Response: SunCatchers will be placed in the "night stow position" facing east/west during cleaning. Two SunCatchers will be cleaned at a time. For a normal wash, demineralized water will be sprayed at high pressure from the wash wand on the wash vehicle into the SunCatcher. For a mechanical wash, demineralized water will be sprayed at high pressure from the wash wand onto the SunCatcher and a maintenance person will use a brush to scrub the SunCatcher. These washing techniques are based on actual experience of washing at a facility currently operating in Albuquerque, NM.

SunCatchers may be washed at any time of day, but it is preferable to wash them during non-peak sunlight hours so that the maximum amount of solar radiation can be turned into electricity. Preferred cleaning time will be twilight or night-time.

It takes 15 minutes per SunCatcher to be cleaned for a normal wash. A mechanical wash takes 45 minutes per SunCatcher.

Daily each wash crew can clean 32 SunCatchers for a normal cleaning. Mechanical wash crews can clean 10 SunCatchers per day.

Each wash crew will consist of 2 people.

The SunCatchers need to be cleaned to preserve optimum solar radiation capture, dust impedes the ability to transfer solar radiation into electricity. Each SunCatcher will be cleaned at most once per month, up to 9 times per year with 1 of these cleaning being a mechanical scrub.

TECHNICAL AREA: AIR QUALITY

Data Request 69: The fugitive dust control method is specified as watering of paved and unpaved roads; and the only water trucks are noted to be those for dish washing and that water would be demineralized water while the dust suppression water would be raw water. Please identify why no fugitive dust water tanker trucks are identified in AFC Table 5.2-24.

Response: No water trucks will be necessary for dust control during normal operations as all roads will be paved or sealed with a polymeric sealant and there will be no off-road travel. Occasional cleaning of the paved or sealed roads will be conducted as necessary to minimize dust emissions. All maintenance and cleaning operations will occur with the vehicles staying on paved or sealed roads.

TECHNICAL AREA: AIR QUALITY

Data Request 70: Please identify why the more recent U.S. EPA AP-42 Section 13.2.2 methodology was not used to determine unpaved road dust emission factors.

Response: The SCAQMD unpaved road emission factor was used to estimate the fugitive dust emissions from travel on unpaved in the AFC. This emission factor is based on the data used to derive the EPA AP-42 Section 13.2.2 emission factor calculation method. The 2006 modification to the EPA AP-42 Section 13.2.2 emission factor calculation method only accounts for recent findings on fine particulate matter ($PM_{2.5}$) percentages of PM_{10}. Both equations are based on the same research. Since new modeling needed to be conducted due to other new data refinements from the project engineers, the EPA AP-42 Section 13.2.2 emission factor calculation method was incorporated into the new emission estimates for construction. No travel on untreated or unpaved roads is anticipated during operations.

TECHNICAL AREA: AIR QUALITY

Data Request 71: Please identify if the applicant is willing to stipulate to graveling the onsite unpaved roads to reduce the silt loading, or provide surface soils sieve data that shows that the 4 percent silt content assumption is representative of the site.

Response: The applicant will stipulate to applying a polymeric sealant on all unpaved roads located onsite such as Soiltac™ or a product with the same or better performance. These polymeric sealants are superior to gravel for dust control. There will be no unpaved or untreated roads on the site and there will be no off-road travel during operations. More specific information regarding the characteristics of the Soiltac™ is provided in the responses to Data Requests 76-78.

TECHNICAL AREA: AIR QUALITY

Data Request 72: Regardless of the emission factor calculation method used, please correct the vehicle weight assumptions as representative for the vehicle types assumed.

Response: All vehicle weights utilized in the AFC have been reevaluated and modified as needed per the revised data provided from the project engineers. New vehicle weight assumptions can be found in Attachments AQ-1 and AQ-2. for the construction and operations vehicles, respectively.

TECHNICAL AREA: AIR QUALITY

Data Request 73: Please identify why the more recent U.S. EPA AP-42 Section 13.2.1 methodology was not used to determine paved road dust emission factors.

Response: Since new modeling needed to be conducted due to other new data refinements from the project engineers, the EPA AP-42 Section 13.2.1 emission factor calculation methodology was incorporated into the new emission estimates for construction and operations that are presented above and in Attachments AQ-1 and AQ-2.

TECHNICAL AREA: AIR QUALITY

Data Request 74: Please identify why the paved road dust emission factors for similar vehicle classes are not the same between the construction and operations emission estimates.

Response: The same emission factors for similar vehicle classes have been incorporated in the new emission calculations for construction and operations presented in the beginning of these data requests and in Attachments AQ-1 and AQ-2.

TECHNICAL AREA: AIR QUALITY

Data Request 75: Please show the calculation, with all input values, used to obtain the 0.149 lb/mile paved road emission factor for heavy truck travel that is shown in Appendix V-2.

Response: As noted in Data Request 73, new modeling has been conducted due to new data refinements from the project engineers, thus the paved road emission factor for heavy truck travel that was shown in Appendix V-2 has been replaced with the EPA AP-42 Section 13.2.1 paved road emission factor. The details of the emissions calculations for construction, including the input parameters for estimating the emission factor, are presented in Attachment AQ-1.

TECHNICAL AREA: AIR QUALITY

Data Request 76: Please identify the specific polymeric dust suppressants by product name and manufacturer that would be proposed to be used to control paved and unpaved road dust emissions.

Response: The polymeric sealant that is anticipated to be used to seal all onsite unpaved roads is Soiltac™, manufactured by Soil Works, or a product with the same or better performance. Please refer to DR 78 for further information about this sealant.

TECHNICAL AREA: AIR QUALITY

Data Request 77: Please specify the extent polymeric dust suppressants will be used, or the extent the applicant is willing to stipulate use, for unpaved road dust control during project construction and operation.

Response: The polymeric sealant Soiltac™, or a product with the same or better performance, will be applied to all unpaved roads throughout the Solar Two project site to control fugitive dust during operations and construction. The application of this sealant on the roads will create a surface that will resemble pavement for the purposes of dust reduction. At the beginning of the construction phase, a substantial coating will be applied to the eastern access road, as all delivery trucks will travel along this road during construction. The coating will be reapplied as needed to minimize dust emissions. The sealant will be sprayed onto the road surface from a truck not unlike a water truck that would be used for similar dust control purposes.

TECHNICAL AREA: AIR QUALITY

Data Request 78: Please provide literature on the long-term effectiveness of the specified polymeric dust suppressant use as a paved road binding material.

Response: Soiltac™ is an acrylic-based liquid copolymer used to stabilize and solidify any soil as well as control erosion and suppress dust, manufactured by SoilWorks, LLC. Once applied to the soil, the copolymer molecules coalesce to form bonds between the soil particles. As water dissipates from the soil, a durable matrix of flexible solid mass is created. Once cured, Soiltac™ becomes:

- completely transparent, leaving the natural landscape to appear untouched,
- completely odorless,
- biodegradable,
- non-flammable and non-volatile,
- non-hazardous,
- non-corrosive and safe for all equipment,
- non-slippery and safe to walk and drive on,
- ecologically and environmentally safe,
- human, animal, marine life and vegetation safe,
- water resistant (will not break down with water),
- non-tracking & non-transferable (will not be picked up onto vehicles),
- non-leaching (will not continue to seep into the soil),
- ultraviolet ray resistant (will not break down in sunlight),
- non-dissipating (will not wash away with water once cured), and
- alkaline soil resistant (will not break down in alkaline soils).

For dust suppression, a modest application creates a 3-dimensional cap or surface crust that reacts like a paved road and can remain effective for several months or years, depending on the application rate. Soiltac™ has been successfully applied to unpaved dirt roads, construction sites, aircraft runways, helipads, and parking lots for fugitive dust control, erosion control, silt loading control and road/soil stabilization. Tests conducted by ERDC in Douglas, AZ during the period from March to August 2004, showed that depending on the application rate and length between applications, dust control efficiency ranging from 79% to 93% beyond just the application of water to unpaved roads, can be achieved in a desert environment. (Reference: Evaluation of Application Methods and Products for Mitigating Dust for Lines-of-Communication and Base Camp Operations. U.S. Army Engineer Research and Development Center (ERDC), March 2005. (http://www.soiltac.com/docs/soiltact-evaluation-of-application-methods-and-products-for-mirigating-dust.pdf)) Applicant realizes that re-application may be required to maintain dust control efficiency.

TECHNICAL AREA: AIR QUALITY

Data Request 79: Please defend the selected 85 percent watering dust control efficiency during construction for unpaved roads given the very large site unpaved road network and the seasonally high evaporation and potentially high percolation rates for the applied water.

Response A polymeric sealant, such as Soiltac™, will be applied to all unpaved roads during construction, to create a concrete-like surface that reacts like a paved road, therefore these roads can effectively be treated as paved roads to estimate fugitive dust emissions. The sealant will be reapplied as necessary to ensure a complete bond, with no gaps on the sealed road surfaces, and to ensure minimal dust emissions. Periodic washing with water of the sealed roads will occur as needed to control dust emissions, although no additional watering dust control efficiency was applied when calculating the dust emissions from these roads.

All other unpaved surfaces that construction equipment may travel over, where earthmoving activities occur or on storage piles will be watered to control fugitive dust emissions. For these surfaces a dust control efficiency of 68 percent was assumed, per SCAQMD CEQA Handbook (1993) Table 11-4, the maximum value for watering active sites 2 times daily occur during construction.

TECHNICAL AREA: AIR QUALITY

Data Request 80: Please defend the selected 90 percent watering dust control efficiency during operations for unpaved roads given the very large site unpaved road network and the seasonally high evaporation and potentially high percolation rates for the applied water.

Response: A polymeric sealant, such as Soiltac™, will be applied to all unpaved roads during operations, to create a concrete-like surface that reacts like a paved road, therefore these roads can effectively be treated as paved roads to estimate fugitive dust emissions. The sealant will be reapplied as necessary to ensure a complete bond, with no gaps on the sealed road surfaces, and to ensure minimal dust emissions. Periodic washing with water of the sealed roads will occur as needed to control dust emissions, although no additional watering dust control efficiency was applied when calculating the dust emissions from these roads.

TECHNICAL AREA: AIR QUALITY

Data Request 81: Please identify the dust control measures that will be used during operation to limit the site's paved road fugitive dust emissions, such as vacuum sweeping, water flushing, track-out controls from adjacent unpaved roads, etc.

Response: There will be approximately 2.5 miles of paved roads onsite to access the main service complex and parking area from the north site entrance. The parking lot is included in these 2.5 miles. All other roads onsite will be sealed with Soiltac™ or a product with the same or better performance, essentially paving these roads, thus track-out from these sealed roads will not occur. No regular cleaning of the paved surfaces is scheduled, but if dust from these paved or sealed roads becomes noticeable, the roads will be cleaned as needed.

TECHNICAL AREA: AIR QUALITY

Data Request 82: Please explain and defend the source of the 5 percent control efficiency applied to the on-site paved road dust emission calculations.

Response: As new detailed information was provided by the project engineers, it has become apparent that no regularly scheduled dust control activities will occur on the on-site paved roads. Periodic sweeping, washing or watering may occur on an as needed basis to reduce dirt buildup and dust emission on the on-site paved roads. Thus a control efficiency of zero percent is used in the on-site paved road dust emission calculations.

TECHNICAL AREA: AIR QUALITY

Data Request 83: Please describe how the trip distance assumptions for construction were determined for each vehicle type/use.

Response: Based on subsequent discussions with project engineers all trip distances utilized in estimating construction emissions have been revised as necessary. Distances associated with specific pieces of equipment were re-evaluated based on conversations with SES or re-measured as necessary. The onsite distances were determined from the plot plan, the offsite distances were determined using Google Earth. Detailed travel and usage assumptions for each piece of construction equipment are outlined in Attachment AQ-1 which presents the detailed construction emissions estimates.

TECHNICAL AREA: AIR QUALITY

Data Request 84: Please describe how the trip distance assumptions for operation were determined for each vehicle type/use.

Response: Based on subsequent discussions with project engineers all trip distances utilized in estimating operations emissions have been revised as necessary. Distances associated with specific vehicles and pieces of equipment were re-evaluated based on conversations with SES or re-measured as necessary. The onsite distances were determined from the plot plan, the offsite distances were determined using Google Earth. Detailed travel and usage assumptions for each vehicle and piece of equipment used during operations are outlined in Data Request 66 and in Attachment AQ-2 which presents the detailed operational emissions estimates.

TECHNICAL AREA: AIR QUALITY

Data Request 85: Please identify the increase in disturbed land within the project site and within any off-site construction laydown areas during project construction and estimate the corresponding increase in wind erosion fugitive dust emissions at the site.

Response: During the construction phase the earthmoving activities associated with constructing the main service complex will cause some land disturbance. The fugitive dust from disturbance of this land is accounted for in the construction dust emissions. Each unpaved road will be completely sealed with a polymeric sealant shortly after it is graded, as will the 25 acre off-site laydown area. The remainder of the site will remain in a natural state with limited off-road construction activities expected. Fugitive dust from these limited off-road construction activities and from the earthwork will be reduced by the application of water. The detailed emission calculations for all earthmoving, and unpaved, off-road construction travel are presented in Attachment AQ-1.

The wind erosion emissions associated with the land disturbance before construction is difficult to quantify as this disturbance comes from unauthorized recreational vehicle travel (see DR-53). All onsite recreational off-road travel will cease before construction begins, thus reducing dust emissions from land disturbance. In all, approximately 3,000 acres will be temporarily disturbed during the construction phase. The emissions from the disturbed land during construction are quantified and presented in Attachment AQ-1. Emissions from erosion of undisturbed land during the construction of project were not estimated, and will be minor compared to all other dust sources.

TECHNICAL AREA: AIR QUALITY

Data Request 86: Please identify the increase or decrease in disturbed land within the project site during operation and estimate the corresponding increase in wind erosion fugitive dust emissions at the site.

Response: In all, approximately 2,747 acres will be permanently disturbed, although most of this area will consist of roads to access the SunCatchers and will be sealed with a polymeric sealant. Therefore a decrease in land that is disturbed during operations and wind erosion fugitive dust emissions is anticipated during operations. During normal operations, no off-road activities are expected on SES properties. All onsite travel will be on unpaved roads sealed with a polymeric sealant that will act like pavement. The remainder of the site will remain in a natural, undisturbed state with no off-road activity expected during normal operations.

All onsite recreational off-road travel will cease before construction begins, thus reducing dust emissions from land disturbance from these vehicles. Fugitive dust from wind erosion will also decrease since a portion of the site will be covered by roads that are sealed where no wind erosion will occur, leaving less area in a natural state, where wind erosion may occur. The wind erosion emissions associated with the land disturbance during the project were not estimated as no land disturbance is anticipated. Emissions from erosion of undisturbed land during the operation of project were not estimated and will be minor compared to all other dust sources.

TECHNICAL AREA: AIR QUALITY

Data Request 87: Please identify methods that will be used to complete a conformity determination for the proposed project's operating PM10 emissions.

Response: The only pollutant the General Conformity regulations apply to in Imperial County is PM10 and the applicability threshold for PM10 is 70 tons per year. The revised annual project operational emissions from both onsite and offsite sources are presented in Table 5.2-25b New. The annual combined onsite and offsite operational PM10 emissions were estimated to be 23.2 tons per year, well below the Federal Conformity thresholds. The revised maximum annual construction emissions from both onsite and offsite sources are presented in Table 5.2-21 Revised, and were estimated to be 60.8 tons per year for PM10, also below the Federal Conformity thresholds. It is anticipated that there will be some overlap of construction and operational activities as discussed in Section 5.2.2.2b above. The peak annual PM10 emissions from a combination of construction emissions with some operations emissions are presented in Table 5.2-27c New, and are 58.7 tons per year, which also falls below the Federal Conformity thresholds. Therefore a Federal Conformity analysis will not be required for the Solar Two Project.

TECHNICAL AREA: AIR QUALITY

Data Request 88: Please identify the measures and mitigation that will be used to ensure that the proposed project's construction PM10 emissions do not exceed 70 tons per year, or if a revised construction emissions estimate, based on addressing staff's other data requests, indicates that the project's PM10 emissions would exceed 70 tons per year, please identify methods that will be used to complete a conformity determination for the proposed project's construction PM10 emissions.

Response: Revised maximum annual construction emissions are presented in Table 5.2.-21 Revised, and show that the onsite and offsite PM10 emissions are estimated to be 60.8 tons per year. Detailed emission calculations can be found in Attachment AQ-1.

To reduce exhaust emissions, propane will be used to fuel the forklifts and man lifts and gasoline will be used for the busses to transport worker and for the onsite pickup trucks, and SES is still investigating the use of alternatively fueled vehicles where possible for these and other construction related equipment.

The following mitigation measures are proposed to control exhaust emissions from the diesel construction equipment used during construction of the Project:

- A requirement to shut down equipment when idling for more than 5 minutes,
- Regular preventive maintenance to prevent equipment engine emission increases due to inefficient fuel combustion,
- Use of low sulfur and low aromatic fuel meeting California standards for motor vehicle diesel fuel, and
- Use of low-emitting gas and diesel engines meeting state and federal emissions standards (Tiers I, II, and III) for construction equipment, including, but not limited to catalytic converter systems and particulate filter systems.

The following mitigation measures are proposed to control fugitive dust emissions during construction of the Project.

- Application of the chemical dust suppressant Soiltac™ or a product with same or better performance to all on-site unpaved road and unpaved parking areas.
- Mitigate fugitive dust emissions from wind erosion of areas disturbed from construction activities (including storage piles) by application water or other suppression technique.

- Use vacuum-sweeping and/or water-flushing on paved road surfaces to remove buildup of loose material to control dust emissions from travel on the paved access road (including adjacent public streets affected by construction activities) and paved parking areas. Cleaning or resealing of the sealed roads will occur as needed to minimize potential dust emissions.
- Cover all trucks hauling soil, sand, and other loose materials or require all trucks to maintain at least 2 feet of freeboard.
- Limit traffic speeds on all unpaved and/or unsealed site areas to 5 miles per hour.
- Install sandbags or other erosion control measures to prevent silt runoff to roadways
- Replant vegetation in disturbed areas as quickly as possible.
- Use wheel washers or wash off tires of all trucks that traveled off-road before exiting construction site.
- Minimize grading during construction of maintenance roads by just scraping the top soil.
- Construction workers will park in sealed laydown area and are then transported to worksites in buses.
- Pave on-site parking area near the administration building.
- Require SunCatchers material delivery trucks to travel on sealed roads only.
- Concrete bases are not expected to be constructed for the SunCatchers, vibratory steel fin tube pedestals have been tested for all expected soil conditions on the site and are to be utilized on the SunCatcher foundation.

TECHNICAL AREA: AIR QUALITY

Data Request 89: Please provide a mitigation proposal for the proposed project's direct operating criteria pollutant emissions (annual emissions of 42.4 tons of NOx, 12.6 tons of VOC, and 120.2 tons or PM10, from Table 5.2-25).

Response: The annual Project criteria pollutant operating emissions have been greatly reduced by modifications to operation procedures, vehicles, and equipment. The new emissions are presented in Table 5.2-25b New. Emissions from the only sources that need air permits, the emergency generator and the gasoline storage tank, are 0.0003 tons per year (tpy) PM10, 0.0003 tpy PM2.5, 0.022 tpy NOx, 0.001 tpy of SOx and 0.65 tpy VOC. ICAPCD does not require emission reduction credits for these sources, as they are exempt. Daily fugitive emissions from the operation of the onsite maintenance vehicles are estimated to be 121.8 pounds per day, less than the offset threshold of 137 pounds per day, therefore emission reduction credits are not required for these sources.

The revised site operations design improved the travel demand assumptions for the maintenance and delivery vehicles by drastically reducing of the trips and miles traveled by these vehicles and using more fuel-efficient and low emitting trucks. Consequently, NOx, VOC, PM10, and PM2.5 emissions from the operations maintenance will drastically decrease as compared to the first estimates. These annual operations emissions are emissions are presented in Table 5.2-25b New. Detailed emission calculations are presented in Attachment AQ-2.

The mitigation measures that will be proposed to mitigate the potentially adverse operations maintenance emissions of NOx, VOC, SOx, PM10 and PM2.5 are presented below.

- Application of the chemical dust suppressant Soiltac™ or a product with same or better performance to all maintenance roads. This will reduce particulate emissions. (see DR-78 for further product discussion).
- A requirement that all vehicle travel associated with maintenance activities occur only on chemically-sealed road.
- It is anticipated that each wash vehicle will wash two (2) SunCatchers at the same time. This will reduce the number of maintenance trips, idling time and vehicle miles traveled. Consequently, the emissions of PM10, PM2.5, NOx, SOx and VOCs will be reduced.
- Use of only one 5,000 gallon regular gasoline storage tank that incorporates CARB-certified Phase I & II vapor recovery systems. Furthermore, the tank will be filled only when necessary to reduce turnover. Truck refueling will also be kept to a minimum.
- All previously proposed diesel-fueled wash vehicles and other maintenance trucks will be replaced with new gasoline-fuel vehicles that meet California vehicle emissions standards. This will eliminate the emissions of toxic diesel particulate and reduce ozone precursor emissions.

- All security vehicles used for site inspection and security -will now be hybrid vehicles, most likely the Toyota Highlander Hybrid sport utility vehicles (SUV) or similar vehicle. The Toyota Highlander SUV is a super ultra low emission vehicle (SULEV) that meets both Tier 2/Bin 3 Federal standards and California ULEV II standards.
- Bussing of employees from the laydown areas during construction and from El Centro during operations will be provided.
- Hydrogen will be produced and stored onsite and distributed to each SunCatcher. The hydrogen will be generated from water and project or grid generated electricity. The previously proposed hydrogen cylinders associated with each SunCatcher will be eliminated and replaced with a central distribution system. Thus, all hydrogen cylinder delivery truck trips would be eliminated. Moreover, less maintenance of the SunCatcher hydrogen system will be needed and will be conducted from the maintenance trucks instead of cylinder delivering trucks, thus reducing trips and VMTs and total emissions.
- Use scheduled/well planned vacuum-sweeping and/or water-flushing on paved road surfaces to remove buildup of loose material to control dust emissions from travel on the paved access road and paved parking areas. Cleaning or resealing of the sealed roads will occur as needed to minimize potential dust emissions.
- Use propane-fuel fork lift and man lifts for maintenance activities requiring such equipment.
- Finally, SES is committed to a better travel demand management so as to reduce VMTs whenever and wherever possible and to using alternatively fueled vehicles as they become available for maintenance activities.

TECHNICAL AREA: AIR QUALITY

Data Request 90: Please provide written confirmation from the District regarding what criteria pollutant operating emissions that they will require to be mitigated with emission reduction credits

Response: On March 6, 2009, the ICAPCD provided written confirmation to the CEC regarding what criteria pollutant operating emissions they require to be mitigated with emission reduction credits. The letter is provided in Attachment AQ-4. It states that ICAPCD requires emission reduction credits from a new stationary source that has the Potential to Emit 137 pounds per day or more of nitrogen oxides, reactive organic compounds, carbon monoxide, sulfur oxides or PM10. Only the emissions in excess of 137 pounds per day require offsets. Project related stationary source emissions, including fugitive emissions, are included in the offset assessment. If the emergency generator meets the exemption requirements in Rule 207, these emissions will be exempt from the offset assessment.

TECHNICAL AREA: AIR QUALITY

Data Request 91: Please provide an integrated schedule of project construction and operation and describe what construction and operation activities would overlap.

Response: As described in Section 5.2.2.2b above, starting at approximately month 8 in the construction schedule, the first 18 MW group of SunCatchers will come online. Each month after that through month 18, an additional18 MW will come online, then until completion of construction in month 40, 27 MW groups of SunCatchers per month will come online. Operational maintenance vehicles will be needed to maintain these SunCatchers, but at a reduced quantity from full operations. The maximum annual emissions from overlapping construction and operational activities would occur during the first year of operations. These annual emissions are presented in Table 5.2-27c New and show that they are below the Federal Conformity threshold for PM10.

TECHNICAL AREA: AIR QUALITY

Data Request 92: Please provide a maximum construction and operation overlap emission estimate for maximum hourly, daily and annual emissions.

Response: As described in Section 5.2.2.2b, and presented in Tables 5.2-27a New, 5.2-27b New and 5.2-27c New, the maximum emissions from overlapping construction and operational activities were predicted to occur during the first year of operations, during months 8-19 for NOx, SOx, CO and VOC and during months 13-24 for particulate matter. In month 8 of construction, operations will begin while there is still earth moving equipment onsite, and the peak short-term overlap emissions is predicted to occur in that month.

TECHNICAL AREA: AIR QUALITY

Data Request 93: Please estimate the gasoline tank filling and vehicle refueling VOC emissions (daily and annual).

Response: The VOC emissions from the gasoline tank filling and vehicle refueling were estimated using CARB emission factors and a maximum gasoline usage of 18,000 gallons per year to be 0.65 tons per year. Table DR-93 presents the estimated VOC emissions associated with the tank venting and vehicle refueling.

Table DR-93 Estimated VOC Emissions from the Gasoline Tank and Vehicle Refueling

Description	VOC Emission Factor[1]	VOC Emissions	
	(lbs/1000 gal)	(tons/year)[2]	(lbs/day)
Working Loss[3]		0.063	0.345
Breathing Loss[3]		0.575	3.152
Vehicle Refueling - Vapor Displacement	0.74	0.007	0.036
Vehicle Refueling - Spillage	0.42	0.004	0.021
Total Vehicle Refueling		0.010	0.057
Total TOG Emissions		**0.649**	**3.555**

Note:

[1] Emission factors from CARB Emission Inventory Estimation Guidelines Section 4.10 GASOLINE DISPENSING FACILITIES (Revised May 1999).

[2] Emission estimate based on 18,000 gallon per year tank throughput.

[3] Emission estimate from EPA Tank4.0.9d model results.

TECHNICAL AREA: AIR QUALITY

Data Request 94: Please provide a description of the permitting requirements and applicable ICAPCD rules for the fuel tanks.

Response: The ICAPCD requires the filing of a Supplemental Application form for Gasoline Dispensing Facilities. This form has been filed with the ICAPCD. The application is used to comply with ICAPCD Rule 415.

From the new design information provided by the project engineers to comply with many of these Data Requests to reduce project emissions, there will be no need for diesel except for the emergency generator, which has its own tank, thus no diesel tank will be required.

TECHNICAL AREA: AIR QUALITY

Data Request 95: Please identify what emission controls will be used for tank filling (Phase I vapor recovery) and vehicle refueling (Phase II vapor recovery).

Response: The gasoline tank will have Phase I (G-70-200-C and G-97-A) vapor recovery to control emissions from tank filling and Phase II (G-70-200-C) vapor recovery to control emissions from vehicle refueling.

TECHNICAL AREA: AIR QUALITY

Data Request 96: Please identify the source and period of the ozone data (filename ElCentroOzone91to95) used in the construction emissions modeling analysis.

Response: Ozone data from 1991 through 1995 recorded at the El Centro monitoring station were used in this analysis. The text is incorrect and will be corrected.

TECHNICAL AREA: AIR QUALITY

Data Request 97: Please defend the selection of the point source locations used in the modeling analysis for the determination of maximum short-term emissions impacts.

Response: Based on information from SES and an evaluation of what activities will be occurring during the peak month (month 6), two main areas were identified as containing significant construction activity. These two areas are the Main Services Complex (MSC) where building construction will occur, and the portion of the Phase 1 area where erection of SunCatchers will occur. The SunCatcher area will incorporate site improvement (some grading and trenching) and travel of vehicles to and from the MSC. There will also be travel on the paved roads from delivery vehicles, busses, and related construction vehicles. Several structures will be erected at the MSC in months 4-7 allowing for the assembly and erection of SunCatchers onsite, thus approximately half of the equipment will be located at the MSC and the remaining equipment will be in the Phase 1 area. The transmission line will be in it's last month of construction, thus point and area sources were spread out over the final approximately 2 miles of the transmission line. There will be little to no activity on other portions of the site during Month 6 other than the eastern laydown/parking area, thus the point source locations where estimated based on the areas where these source were assumed to be operating.

TECHNICAL AREA: AIR QUALITY

Data Request 98: Please defend the stack heights used for the point sources used in the modeling analysis.

Response: Approximately half of the onsite equipment are large horsepower vehicles with high exhaust stack heights (equal to or greater than 10 feet), e.g., cranes, loaders, tractor trailers, dump trucks, graders, busses, water trucks, and bulldozers. Most of the remaining 50 percent of onsite equipment have exhaust stacks that are typically between 8 and 10 feet. The average stack height of all 129 (104 + 25 delivery trucks) onsite pieces of equipment (in month 6) is approximately 9.8 feet (3 meters), thus this value was used for all point source stack heights.

TECHNICAL AREA: AIR QUALITY

Data Request 99: Please describe if the daily emission estimates match the AFC noted daily heavy equipment construction period of 7 am to 7 pm and defend the selection of the 7 am to 4 pm period used for the construction emissions modeling.

Response: Due to changes in the project description that were added after the construction modeling analysis was completed the construction period described in the project description was different than in the modeling analysis. Since new construction modeling will be conducted to incorporate new project data and comments from other Data Requests, the appropriate daily heavy equipment construction period of 7 am to 7 pm will be used in the modeling. It should also be noted that delivery of materials, assembly and installation of the SunCatchers may occur at any time, thus emissions from these activities will be analyzed over the full 24 hour period in the model.

TECHNICAL AREA: AIR QUALITY

Data Request 100: Please provide a revised annual modeling analysis with appropriately distributed site-wide distributed construction emissions.

Response: Per the discussion in Section 5.2.2 above, the annual construction modeling analysis was revised. The results from the new analysis are presented in Table 5.2-29 Revised. The construction modeling files are included on the modeling DVD attached to these data request responses.

TECHNICAL AREA: AIR QUALITY

Data Request 101: Please provide a revised operations modeling analysis, using the AERMOD model, which includes all on-site operations emission sources.

Response: As described in Section 5.2.2 above, new operational modeling was conducted to include both the stationary source and the mobile sources expected during normal operations using AERMOD. The results of this analysis are presented in Table 5.2-30 Revised. The operational modeling files are included on the modeling DVD attached to these data request responses.

TECHNICAL AREA: AIR QUALITY

Data Request 102: Please provide calculations for the project construction greenhouse gas emissions in CO2-equivalent tons for the entire construction period, and include estimates of total fuel use by type of fuel.

Response: The greenhouse gas emissions for the maximum annual construction period are presented in Table 5.2-26b New. The maximum annual fuel use for each fuel burning type of equipment is presented in Table DR-102. The fuel usage was estimated from the total CO2e emissions per type of fuel burning equipment and the CCAR General Reporting Protocol Table C.6 (April 2008) emission factors for CO2 per gallon of fuel. Detailed emission calculations are presented in Attachment AQ-1.

Table DR-102 Maximum Annual Construction Fuel Usage Estimation Based on CO2e Emissions

Fuel Type	Annual Maximum CO_2 Emissions (tons/year)	Emission Factor (lb CO_2 /gallon fuel)	Annual Maximum Fuel Usage (gallons/year)
On-site			
Gasoline	103	19.4	10,613
Diesel (Distillate Fuel #1,2&4))	3,470	22.4	310,110
Propane	347	12.7	54,773
Off-site			
Gasoline	4,571	19.4	470,723
Diesel (Distillate Fuel #1,2&4))	4,931	22.4	440,686
Propane	0	12.7	0
Total			
Gasoline	4,674	19.4	481,336
Diesel (Distillate Fuel #1,2&4))	8,400	22.4	750,795
Propane	347	12.7	54,773

Notes:

1. Assumed 2% of worker passenger vehicles CO_2 emissions are from burning diesel; the rest of them from burning gasoline.
2. Greenhouse gas emission factor from CCAR General Reporting Protocol April 2008 Table C.6.

TECHNICAL AREA: AIR QUALITY

Data Request 103: Please provide the calculations used to derive the operating GHG emission estimate shown in Table 5.2-25, and include estimates of total fuel use by type of fuel.

Response: The annual greenhouse gas emissions from operations are presented in Table 5.2-26a New. The annual operational fuel use for each fuel burning type of equipment is presented in Table DR-103. The fuel usage was estimated from the total CO2e emissions per type of fuel burning equipment and the CCAR General Reporting Protocol Table C.6 (April 2008) emission factors for CO2 per gallon of fuel. Detailed emission calculations are presented in Attachment AQ-2.

Table DR-103 Maximum Annual Operational Fuel Usage Estimation Based on CO2e Emissions

Fuel Type	Annual Maximum CO_2 Emissions (tons/year)	Emission Factor (lb CO_2 /gallon fuel)	Annual Maximum Fuel Usage (gallons/year)
On-site			
Gasoline	806	19.4	82,995
Diesel (Distillate Fuel #1,2&4))	9	22.4	761
Propane	290	12.7	45,800
Off-site			
Gasoline	683	19.4	70,307
Diesel (Distillate Fuel #1,2&4))	29	22.4	2,611
Propane	-	12.7	-
Total			
Gasoline	1,489	19.4	153,301
Diesel (Distillate Fuel #1,2&4))	38	22.4	3,372
Propane	290	12.7	45,800

Notes:

1. Assumed 2% of worker passenger vehicles CO_2 emissions are from burning diesel; the rest of them from burning gasoline.
2. Greenhouse gas emission factor from CCAR General Reporting Protocol April 2008 Table C.6.

TECHNICAL AREA: AIR QUALITY

Data Request 104: Please provide an estimate of the annual net generation in megawatt-hours for the facility that shows the calculations and assumptions for the dish generating capacity factor and all on-site power consumption sources including dish unstowing, the water treatment plant, the administration building, the maintenance building, etc. In this estimate please also show the annual generation and annual consumption separately.

Response: Power production from the SunCatchers at the Solar Two project is based on solar insolation data published by NREL from the nearest relevant observation station, in Daggett, California. Satellite data for the Daggett area were compared to satellite observations for the Imperial Valley. NREL reported that, on average, the solar insolation in the Imperial Valley is about 4% lower than in Daggett. So the Daggett hourly solar insolation values were reduced by 4% for the Solar Two project. Then the incoming solar insolation was converted into output electricity based on data collected from the test facility at Sandia. At the Solar Two plant, each dish is estimated to produce 54 MWh per year. The Solar Two project is a 750 MW plant, thus the total annual output would be 30,000 x 54 MWh or 1,620,000 MWh.

Onsite annual power consumption for the support buildings, water treatment system and hydrogen conversion system are provided in Table DR-104. The energy needed to stow and unstow the SunCatchers will be provided from batteries located throughout the site. A trickle charge from the SunCatcher electricity production will charge these batteries.

Table DR-104 Power Consumption per Support Building or System

Power Consumption Source	MWh / year
Administration Building	1286.7
Maintenance Building	504.6
PCU Repair	2270.6
Assembly Building 1	336.4
Assembly Building 2	336.4
Assembly Building 3	336.4
Fuel Storage	52.6
Guard Shack	473
Water Treatment	252.3
Hydrogen Generation	87.6
Total	**5936.6**

TECHNICAL AREA: AIR QUALITY

Data Request 105: Please identify whether the applicant would be willing to stipulate to using a Tier 3 compliant fire pump engine if such engines are available in time for purchase.

Response: Per new project engineering data, the diesel fire water pump has been electrified. It will use power generated from the Project, grid power or power generated from the diesel emergency generator. Thus no emissions will be associated with the fire water pump. Also note that a Tier 3 engine was proposed for the diesel emergency generator in the AFC. SES is still investigating the possibility of using gasoline, or other alternative fuels for the emergency generator to further reduce emissions. For modeling purposes the emergency generator was assumed to remain diesel, as a diesel engine would produce the highest emissions of the different engine options.

TECHNICAL AREA: AIR QUALITY

Data Request 106: Please provide a localized solar heat balance for existing conditions versus the proposed project that indicates whether the project would create a new heat sink or new heat source in comparison to existing conditions.

Response: Solar radiation data collected by SES at the Solar Two site was used to estimate the annual insolation falling on the entire 6,500 acre production field, this is the total area where SunCatchers will be located. Then the fraction of this solar power that will be delivered as electricity to the grid is calculated based on the number and size of SunCatchers arrayed across the site, the insolation intercepted and reflected by these units and the various factors that govern the efficiency of the conversion to electrical energy

Solar radiation measurements at the Solar Two site were recorded at 10-minute intervals from June 27, 2008 to January 4, 2009. The accumulated insolation over this 186-day period was found to be equivalent to 2,401,283 watt/m^2/year. The portion of this solar power that occurred above the 250 watt/m^2 threshold and would thus be usable for electric power production is slightly lower, 2,353,422 watt/m^2/year. Over a site production area of 6,500 acres (26,135,641 m^2), the total incoming radiation per year is estimated as 62,759,076,131 kW-hour/year.

Each individual SunCatcher would have a diameter of 38 feet and would provide shading at ground level over an area of 105.4 square meters, including the supporting structure. Based on the measured annual incident solar power per square meter per year presented above, the usable solar energy falling on each SunCatcher is 205,689 kW-hr/dish/year and the total over all 30,000 SunCatchers would be 6,170,672,431 kW-hour/year. This is about 9.8% of the solar radiation over the entire production field. Additional efficiency factors that need to be applied to estimate the portion of this energy that would actually be converted to electrical energy include the following:

Field efficiency:	96%
Average dish efficiency:	27.5%
Dish O&M availability:	98%
High wind availability	96%
Field transmission losses	98%.

Taking these factors into account, the fraction of the usable incoming solar energy over the entire Solar Two production field that will actually be delivered as electrical energy to the grid is about 2.4%. The remaining 97.6% will be rejected as waste heat. Obviously, the fraction of conversion to electrical energy diminishes rapidly as the area considered in the calculation is expanded to include lands adjacent to the site. This simple calculation is sufficient to demonstrate that the amount of conversion from solar to electrical energy that will occur on the Solar Two site will have only a small effect on the heat balance of the site itself and a quite insignificant effect over larger areas of Imperial County.

An Excel spreadsheet showing the details of the calculations described above is provided as Attachment AQ-5.

TECHNICAL AREA: AIR QUALITY

Data Request 107: Please provide a copy of the cumulative modeling analysis, as proposed in the cumulative modeling protocol provided in the July 22nd letter regarding the air quality data adequacy items, with the addition that this modeling analysis shall include all on-site emission sources, such as the operations and maintenance tailpipe and fugitive dust emission sources. Please provide electronic copies of the cumulative impact modeling files.

Response: Through cooperation with by the Imperial County Air Pollution Control District (ICAPCD) and Imperial County Department of Planning & Building (ICDPB), the applicant identified a list of potential projects for inclusion in the cumulative analysis. The list of projects near the Solar Two Project that have recently applied for or received a new air permit or a change to an existing air permit was submitted to CEC on Feb 11, 2009, and is presented in Table DR-108. Of these projects, most (24) are farther than six miles from any portion of the Solar Two Project, as confirmed by conversations with ICAPCD and ICDPB staff. Figure DR-107 shows the locations of the projects that are closest to the Solar Two site, this includes all projects located in Seeley and Ocotillo. ICAPCD was specifically asked about the sources in Seeley and Ocotillo and sources were eliminated based on ICAPCD recommendations.

Further investigation of the Granite-Carroll project showed that Granite Construction has submitted a Conditional Use Permit and Reclamation Plan application proposing to operate a sand and gravel operation south of their existing Jimenez operation located in Ocotillo. Discussions with staff determined that the project expansion will produce less than 5 tons per year of particulate matter. Note that ICAPCD requires fugitive emissions to be estimated when determining the requirement for emission reductions credits, thus the dust emissions from this project were accounted for in this estimation. (see Data Request 90 discussion).

The remainder of the projects were for permits for temporary or emergency ICE engines or have emissions less than 5 tons per year of any criteria pollutant. Lastly, due to the proximity of the Plaster City facility, ICAPCD was asked if this facility had filed any permits to increase any emission sources, only a minor VOC source was identified as a potential new source. As VOC is not modeled, this source will not be included in a cumulative analysis. Existing facilities are not examined in the cumulative analysis since the emissions from these facilities are already accounted for in the ambient air quality data collected from nearby ARB monitoring stations, which is added to the operational modeling predictions.

The projects identified by ICAPCD and ICDPB, and listed in Table DR-108, were too far from Solar Two or had emissions less than 5 tons per year of any pollutant, thus a cumulative analysis will not be conducted for the Solar Two Project.

TECHNICAL AREA: AIR QUALITY

Data Request 108: Please provide a copy of cumulative project list to be provided by ICAPCD as noted in the July 22nd letter on the air quality data adequacy items.

Response: Table DR-108 below presents the list of projects near the Solar Two Project that have recently applied for or received a new air permit or a change to an existing air permit as provided by ICAPCD. None of these projects fell within the CEC criteria for inclusion in a cumulative analysis, thus a cumulative analysis was not conducted.

Table DR-108 Projects Considered for the Cumulative Modeling Analysis

Project Number	Project Name	Location	Note (December 2008 status)	Reason to be Eliminated from Cumulative Analysis
1	Pyramid (CUP08-0001, RP08-0001)	Imperial County	Being reviewed, resource existing water well or install a new water well utilizing approximately 1/2 acre around the existing or new well.	Outside 6 miles as determined by ICAPCD
2	Becker Properties (EXT07-0017/CUP000367)	Imperial County	Sand mining operation extension for CUP03-0036, Ext. Letter granted	Outside 6 miles as determined by ICAPCD
3	Felicity RV Storage (CUP07-0018)	Imperial County	Covered R.V. storage facility and water well installation	Outside 6 miles as determined by ICAPCD
4	BLM (CUP08-0011)	Imperial County	LTVA water well	Outside 6 miles as determined by ICAPCD
5	BLM-WATER WELL (CUP07-0016)	Imperial County	Waiting for CUP to be recorded	Outside 6 miles as determined by ICAPCD
6	DS-GP. Inc. (Sanchez Ranch) IM3-06	Imperial	Under review, Park / retention basin Elementary School Middle School Public Facilities	Outside 6 miles
7	Barioni Lake Estates, LLC IM1-05	Imperial		Outside 6 miles
8	HNR Farming IM3-05	Imperial		Outside 6 miles
9	Encanto Estates IM2-06	Imperial		Outside 6 miles
10	City of Imperial IM8-06	Imperial		Outside 6 miles
11	Castle Arch, LLC IM1-07	Imperial		Outside 6 miles
12	IID Administration District IM1-05	Imperial		Outside 6 miles
13	City of Imperial SAP Update IM1-08	Imperial		Outside 6 miles

Table DR-108 Projects Considered for the Cumulative Modeling Analysis (Continued)

Project Number	Project Name	Location	Note (December 2008 status)	Reason to be Eliminated from Cumulative Analysis
14	Allied Imperial Landfill EIR - [J&S] (GP07-0009, ZC07-0011, CUP07-0027,	Imperial	DEIR in progress	Outside 6 miles
15	Desert Spring Oasis (SP07-005, GP07-0007, TR0980, ZC07-0009)	Imperial	Recreational vehicle lot sales, water sports lot sales, estate lot sales, estate lot sales, commercial lots sales, operation of resort amenities	Outside 6 miles
16	Imperial Valley Bio Refining (TR00977)	Imperial	Major subdivision for an ethanol production facility.	Outside 6 miles
17	SO. CAL. GAS (CUP08-0015)	Imperial	Temporary construction storage yard for equipment and materials used for the construction of a 22 mile long underground natural gas pipeline	Outside 6 miles
18	Nextel (CUP06-0012)	Imperial	Approved, not recorded; consultant notified	Outside 6 miles
19	Seym-addl dwelling (CUP 06-0025)	Imperial	Approved, not recorded; consultant notified	Outside 6 miles
20	Mendez (CUP07-0020)	Imperial	Approved, awaiting CUP recordation	Outside 6 miles
21	DH Springs, LLC/Sunbeam Lake Estates SCWD1-05	Seeley, The project is located north of Ross Road and east of Drew Road, El Centro.		Residential Project and outside 6 miles
22	Mt. Signal Solar Hybrid Plant EIR- [BRG] (CUP08-0007)	2161 West Diehl Road, Seeley	EIR in progress	Project on hold indefinitely
23	DH SPRINGS LLC (EXT07-0008)	1700 West Ross Road, Seeley	One year time extension for TR00958	Residential Project and outside 6 miles
24	Wind Zero (GP08-003, SP08-0001, ZC08-0003)	334 West Highway 98, Ocotillo	Training facility for law enforcement, college, government and public with related support facilities	Training facility development, de minimis emissions
25	Granite-Carroll (RP08-004)	1352 West Imperial Highway, Ocotillo	Submitted a Conditional Use Permit for Sand & gravel operation	Annual emission increases are less than 5 tpy
26	Ocotillo RV Storage-Reynolds (GP06-009, ZC06-0010, CUP06-0041))	1085 N. Imperial Highway, Ocotillo	Storage facility for RVs and other recreational vehicles	RV storage facility, de minimis emissions

Table DR-108 Projects Considered for the Cumulative Modeling Analysis (Continued)

Project Number	Project Name	Location	Note (December 2008 status)	Reason to be Eliminated from Cumulative Analysis
27	Jr-Simplot (CUP08-0003)	Ocotillo, The project is located in a parcel located in the Mesquite Lake Specific Plan area on Harris Road boarding the Union Pacific Railroad tracks on the west side.	public noticing period	Existing fertilizer facility relocation, outside 6 miles
28	ORNI 18, LLC-ORMAT Nevada, Inc.	North of Brawley	ATC permit number: 3731A	outside 6 miles
29	Granite Construction Company	Various locations in the Imperial County	ATC permit number: 3791A Temporary PTO permit number: 3804 Temporary	Annual emission increases are less than 5 tpy for a few temporary ICE engines permitted to operate between 4 and 102 days total
30	Ocotillo Mutual Water Company	1281 4th Ave., Ocotillo, CA 92259	PTO permit number: 3819	In use ICE, emission decrease
31	Coyote Valley Mutual Water Company	1161 N. Imperial Highway, Ocotillo, CA 92259	ATC permit number: 3870	Annual emission increases are less than 5 tpy for 1 emergency generator

TECHNICAL AREA: AIR QUALITY

Data Request 109: Please provide copies of any permit application materials, other than AFC materials, submitted to the District.

Response: Copies of all material related to the permit application that have been submitted to the ICAPCD are provided in Attachment AQ-6. This material includes the general Authority to Construction application form, internal combustion engine form for the diesel emergency generator and the gasoline dispensing facility form for the gasoline tank.

TECHNICAL AREA: AIR QUALITY

Data Request 110: Please provide copies of any subsequent official submittals and correspondence to or from the District within 5 days of their submittal to or their receipt from the District.

Response: The applicant will provide CEC staff with copies of any subsequent official submittals and correspondence to or from the District within 5 days of their submittal to or their receipt from the District.

(March 20, 2009)	347	12.65	54,773

Notes:

[1.] Assumed 2% of worker passenger vehicles CO_2 emissions are from burning diesel; the rest of them from burning gasoline.

[2.] Greenhouse gas emission factor from CCAR General Reporting Protocol April 2008 Table C.6.

	Suncatcher Mirrors	transport truck	Diesel	6	Daily	250	20	6	0%	0%	100%	50	Detroit
	Electrical and Control Systems	transport truck	Diesel	2	Daily	250	20	6	0%	0%	100%	240	Phoenix Area
	Azimuth and Elevation Drive	transport truck	Diesel	2	Daily	250	20	6	0%	0%	100%	50	Midwest

Note:

Vehicles with variable quantities, the quantity per month can be found in Table 5.2-19 Construction Equipment Projection
Deliveries coming from Midwest (Detroit and elsewhere) will travel by rail to Los Angeles then by transport truck to the site
Average distance from main service complex to center of east or west portion of the site is 3.5 miles thus the average round trip distance each maintenance vehicle travels is 7 miles
Bus circuit is 11 miles (6 miles onsite, 5 miles offsite) - each bus does this loop twice a day
East access road will be heavily sealed and is 3.5 miles, the sealant will be applied in sufficient quantity that the road can be washed as needed. Thus this road will be considered the same as the paved northern access road for emissions estimates.
North access road and MSC parking area will be paved, route is 1.5 miles
All deliveries will travel an onsite loop starting near east laydown area traveling to the MSC then to the north exit, the loop will consist of 3.5 miles eastern access road + 1 (delivery area) miles + 1.5 miles northern
Construction laydown area is sealed
Each flatbed truck is assumed to make 4 trips per day to SunCatcher instalation locations delivering assembled dishes and misc parts
The fenceline perimeter is approximately 20.5 miles. Each security vehicle is assumed to travel from the MSC around the perimeter plus one trip to the center of the site and back (plus 10% for misc trips) = 33 mile

Annual Onsite Combustion Emissions

Maximum annual construction equipment activity occurs in months 4-15.

Construction Assumptions - 30 days per month

Equipment	Number of Vehicles per year	Hours/Day	Emission rate per piece of equipment (lb/hr)										Annual Emissions (ton/year)									
			PM_{10}	$PM_{2.5}$	CO	VOC	NO_x	SO_2	CO_2	CH_4	N_2O	CO_2e	PM_{10}	$PM_{2.5}$	CO	VOC	NO_x	SO_2	CO_2	CH_4	N_2O	CO_2e

Number of Vehicles per year = sum of monthly daily maximum vehicle usage for the peak 12 months
delivery trucks can arrive at the site anytime during the day or night

Short-term Onsite Combustion Emissions

Highest activity occurs in month 6.

construction schedule = 12 hours per day 7 am to 7 pm pedestal installation = 16 hours per day

delivery trucks can arrive at the site anytime during the day or night

Annual Offsite Combustion Emissions

Maximum annual construction activity occurs in months 4-15.

Construction Assumptions - 30 days per month

Equipment	Number of Vehicles per year	Offsite Miles per Day Travelled per Vehicle	Offsite Miles per Year Travelled all Vehicle	Emission factors (g/mile)										Annual Emissions (ton/year)									
				PM_{10}	$PM_{2.5}$	CO	VOC	NO_x	SO_2	CO_2	CH_4	N_2O	CO_2e	PM_{10}	$PM_{2.5}$	CO	VOC	NO_x	SO_2	CO_2	CH_4	N_2O	CO_2e

Notes:
Emission factors from CARB Off-road Mobile Source Emission Factors (2006-2020) for diesel and propane equipment. (2009 data used).
Dozer = Crawler Tractor
Loaders = Rubber tired loaders
Backhoe = Tractors/Loaders/Backhoes
Light Tower = Other Construction Equipment
Utilization Load Factors from SCAQMD
PM2.5 emission factors obtained by multiplying the PM10 emissions by PM2.5 fraction in CEIDARS list for onroad or offroad diesel vehicles.
For propane equipment assumed PM2.5 and PM10 Fraction of total PM is 1.000
Onroad vehicle emissions from EMFAC2007 model
CH_4 and N_2O emission factors for the onroad vehicles are from reference source 2: Table C.5, California Climate Action Registry General Reporting Protocol Version 3.0, April 2007

CO_2 GWP (SAR, 1996) =	1
CH_4 GWP (SAR, 1996) =	21
N_2O GWP (SAR, 1996) =	310

Solar Two
Fugitive Dust Emissions (on-site)
Peak month = 6 Maximum annual construction equipment activity occurs in months 4-15.

Travel on sealed roads (paved)

$E = [k * (sL/2)^{0.65} * (W/3)^{1.5} - C] (1 - P/4N)$ EPA AP-42 Section 13.2.1 Paved Roads Equation 2
E = particulate emission factor (lb/VMT),
k = particle size multiplier for particle size range and units of interest
7.4 sL = road surface silt loading (grams per square meter) (g/m^2), from Table 13.2.1-4 for Municipal solid waste landfill
W = average weight (tons) of the vehicles traveling the road, and
C = emission factor for 1980's vehicle fleet exhaust, brake wear and tire wear.

constants

	$PM_{2.5}$	PM_{10}
k	0.0024	0.016
C	0.00036	0.00047

12 P = Mean number of days per year with at least 0.01 inches of precipitation (from EL CENTRO 2 SSW COOP Station)
365 N = number of days in the year (averaging period)

Vehicle Type	Number of Vehicles (month 6)	Max Daily Distance per Vehicle (mile/day)	Assumed distance percentage to drive on sealed roads	Max Daily Distance per Vehicle to drive on sealed roads (mile/day)	Max Daily VMT (all vehicles)	Mean Vehicle Weight (tons)	Max. Operating Hours / Day	Number of Vehicles per year (months 4-15)	Max Annual VMT (all vehicles)	$PM_{2.5}$ EF (lbs/VMT)	PM_{10} EF (lbs/VMT)

Travel on paved road

$E = [k * (sL/2)^{0.65} * (W/3)^{1.5} - C] (1 - P/4N)$ EPA AP-42 Section 13.2.1 Paved Roads Equation 2

E = particulate emission factor (lb/VMT),
k = particle size multiplier for particle size range and units of interest

1.6 sL = road surface silt loading (grams per square meter) (g/m^2),
W = average weight (tons) of the vehicles traveling the road, and
C = emission factor for 1980's vehicle fleet exhaust, brake wear and tire wear.

Rural roads CARB - Emission Inventory Database - Section 7.8 SJV - Entrained Paved Road Dust - Rural Roads (emission inventory code: 640-643-5400-0000), June 2006.

Water efficiency from CEQA Table 11-4 maximum value for watering active sites 2 times daily
Assume 50% soil movement from loaders and 50% from backhoes

4,033 yd3/day 5,608 ton/day
1,452,000 yd3/project 2,019,006 tons/project 2781 density of soil (lb/yd3) (USDA NRCS Physical Soil Properti 0.5 depth of disturbance (yards) for Niland Fine Sand and Rositas Fine Sand soil)
total project
600 acres = 1,452,000 cubic yds, assume depth of soils moved is
3000 total acres disturbed as described in Table 3-17 of Project Description
only a small portion of this soil is picked up and moved via dump druck

Cover Storage Pile

$E = 1.7 * G/1.5 * (365-H)/235 * I/15 * J$ SCAQMD Table A9-9-E

PM10 Emission factor from wind erosion of storage piles per day per acre

15 G = Silt content (%) (from CEQA Handbook Table A9-9-E-1 for blended ore and dirt)
12 H = Number of days with >= 0.01 inches of precipitation per year (from El Centro 2 SSW weather station WRCC)
2.5 I = Percentage of time that the unobstructed wind speed exceeds 12 mph at mean pile height
0.5 J = Fraction of TSP that is PM10 = 0.5
2.128 lb/acre/day

wind speed percentage based on 2005 wind speed data as recorded at El Centro 2 SSW station

Source	Quantity	Size of Pile (acre)	Hours/Day	Days/Year per Pile	Watering Control Efficiency	PM10 Emissions (lb/day)	PM2.5 Emissions (lb/day)	PM10 Emissions (tons/yr)	PM2.5 Emissions (tons/yr)
Cover Storage Pile	2	1	24	182.5	68%	1.36	0.30	0.12	0.03

Water efficiency from CEQA Table 11-4 maximum value for watering active sites 2 times daily
pile size assumed
piles present only for 6 months

Solar Two
Fugitive Dust Emissions (offsite)
Peak month = 6
Maximum annual construction equipment activity occurs in months 4-15.

Travel on paved road

$E = [k * (sL/2)^{0.65} * (W/3)^{1.5} - C] (1 - P/4N)$ EPA AP-42 Section 13.2.1 Paved Roads Equation 2
E = particulate emission factor (lb/VMT),
k = particle size multiplier for particle size range and units of interest

0.32 sL = road surface silt loading (grams per square meter) (g/m^2), Local CARB - Emission Inventory Database - Section 7.9 Entrained Paved Road Dust -
0.02 sL = road surface silt loading (grams per square meter) (g/m^2), Freeway Local Streets & Freeways (emission inventory code: 640-641-5400-0000), July 1997
W = average weight (tons) of the vehicles traveling the road, and
C = emission factor for 1980's vehicle fleet exhaust, brake wear and tire wear.

constants (March 20, 2009)

	$PM_{2.5}$	PM_{10}
k	0.0024	0.016
C	0.00036	0.00047

12 P = Mean number of days per year with at least 0.01 inches of precipitation (from EL CENTRO 2 SSW COOP Station)
365 N = number of days in the year (averaging period)

Vehicle Type	Number of Vehicles (month 6)	Number of Vehicles per year (months 4-15)	Max Daily Offsite Round-trip Distance per Vehicle within Imperial County (mile/day)	Max Daily VMT (all vehicles)	Max Annual VMT (all vehicles)	Mean Vehicle Weight (tons)	Max. Operating Hours / Day	Max. Operating Days / Month	$PM_{2.5}$ EF (lbs/VMT)	PM_{10} EF (lbs/VMT)

Title : solar two 2010
Version : Emfac2007 V2.3 Nov 1 2006
Run Date : 2008/04/29 13:46:11
Scen Year: 2010 -- All model years in the range 1970 to 2010 selected
Season : Annual
Area : Imperial County APCD

****

Year: 2010 -- Model Years 1970 to 2010 Inclusive -- Annual
Emfac2007 Emission Factors: V2.3 Nov 1 2006

District Average District Average Imperial County APCD

Table 1: Running Exhaust Emissions (grams/mile; grams/idle-hour)

Vehicle Types/Model Years	CH_4 (g/mile)	N_2O (g/mile)
Passenger Cars - Gasoline		
Model Year 1966-1972	0.22	0.02
Model Year 1973-1974	0.19	0.02
Model Year 1975-1979	0.11	0.05
Model Year 1980-1983	0.07	0.08
Model Year 1984-1991	0.06	0.08
Model Year 1992	0.06	0.07
Model Year 1993	0.05	0.05
Model Year 1994-1999	0.05	0.04
Model Year 2000– present	0.04	0.04
Passenger Cars - Alternative Fuels and Diesel		
CNG Model Year 2000– present	0.04	0.04
LPG Model Year 2000– present	0.04	0.04
E85 Model Year 2000– present	0.04	0.04
Diesel all model years	0.01	0.02
Light Duty Truck (<5750 GVWR*) - Gasoline		
Model Year 1966-1972	0.22	0.02
Model Year 1973-1974	0.23	0.02
Model Year 1975-1979	0.14	0.07
Model Year 1980-1983	0.12	0.13
Model Year 1984-1991	0.11	0.14
Model Year 1992	0.09	0.11
Model Year 1993	0.07	0.08
Model Year 1994-1999	0.06	0.06
Model Year 2000– present	0.05	0.06

Table C.5: Methane and Nitrous Oxide Emission Factors for Mobile Sources by Vehicle and Fuel Type (continued)

Vehicle Types/Model Years	CH_4 (g/mile)	N_2O (g/mile)
Light Duty Truck - Alternative Fuels and Diesel		
CNG Model Year 2000– present	0.05	0.06
LPG Model Year 2000– present	0.05	0.06
E85 Model Year 2000– present	0.05	0.06
Diesel all model years	0.01	0.03
Heavy-Duty Vehicle (>5751 GVWR) - Gasoline		
Model Year 1981 and older	0.43	0.04
Model Year 1982-1984	0.42	0.05
Model Year 1985-1986	0.20	0.05
Model Year 1987	0.18	0.09
Model Year 1988-1989	0.17	0.09
Model Year 1990-present	0.12	0.20
Heavy Duty Trucks - Diesel and Alternative Fuels		
Model Year 1966-1982	0.10	0.05
Model Year 1983-1995	0.08	0.05
Model Year 1996 to present	0.06	0.05
CNG, LNG	3.48	0.05
FTD, Biodiesel	0.06	0.05
Motorcycles		
Model Year 1966-1995	0.42	0.01
Model Year 1996-present	0.09	0.01
Off-Road Vehicles/Construction Equipment by Fuel Type		
	CH_4 (kg/gallon)	N_2O (kg/gallon)
Butane	9.1×10^{-5}	4.1×10^{-4}
Distillate Fuel	.0014	.0001
Liquefied Petroleum Gas (LPG)	.0010	.0001
Motor Gasoline	.0013	.0001
Propane	9.1×10^{-5}	4.1×10^{-4}

Attachment AQ-2
Operational Emissions
(March 20, 2009)

Table DR-103
Estimated Annual Maximum Operation Emissions of Greenhouse Gases by Fuel Type

Fuel Type	Annual Maximum CO_2 Emissions (tons/year)	Emission Factor (lb CO_2 /gallon fuel)	**Annual Maximum Fuel Usage (gallons/year)**
On-site			
Gasoline	806	19.42	82,995
Diesel (Distillate Fuel #1,2&4))	9	22.38	761
Propane	290	12.65	45,800
Off-site			
Gasoline	683	19.42	70,307
Diesel (Distillate Fuel #1,2&4))	29	22.38	2,611
Propane	-	12.65	-
Total			
Gasoline	1,489	19.42	153,301
Diesel (Distillate Fuel #1,2&4))	38	22.38	3,372
Propane	290	12.65	45,800

Notes:

1. Assumed 2% of worker passenger vehicles CO_2 emissions are from burning diesel; the rest of them from burning gasoline.

2. Greenhouse gas emission factor from CCAR General Reporting Protocol April 2008 Table C.6.

Engine parameters

Flow Rate (acfm)	1218	17.726 m/s
Exhaust Temp (degrees C)	465	738.15 K
Stack Diameter (feet)	0.6667	0.2032 m
Stack height (feet) above ground	6.5	1.981 m
Fuel Use (gal/hr)[2]	20	20.000 gal/hr

Note:

1. The stack will be in outdoor enclosures, not in buildings.
2. Fuel use value is based on the engine parameter data in CARB Table 1 of "Risk Management Guidance for the Permitting of New Stationary Diesel-Fueled Engines", Oct 2000.
3. Emission rates for the criteria pollutant are based on vendor data (to meet Tier 3 requirements).
4. The stack will be in outdoor enclosures, not in buildings.
5. Greenhouse gas emission factors from CCAR General Reporting Protocol April 2008 Tables C.6 and C.7
6. Greenhouse Gas Global Warming Potential (GWP) - Intergovernmental Panel on Climate Change, Second Assessment Report (1996)

- CO_2 GWP (SAR, 1996) = 1
- CH_4 GWP (SAR, 1996) = 21
- N_2O GWP (SAR, 1996) = 310

Solar Two

Equipment = 5000-gal above ground storage tank
Fuel = Gasoline
Dimension= 88" W x 299" L x 67" H
Throughput (gal/year) = 18,000
Days of Operations (days/year) = 365

Description	TOG Emission Factor* (lbs/1000 gal)	TOG Emissions (tons/Year)	TOG Emissions (lbs/day)
Working Loss		0.063	0.345
Breathing Loss		0.575	3.152
Vehicle Refueling - Vapor Displacement	0.74	0.007	0.036
Vehicle Refueling - Spillage	0.42	0.004	0.021
Total Vehicle Refueling		0.010	0.057
Total TOG Emissions		**0.649**	**3.555**

Note:

1. Emission estimate based on 18,000 gallon per year tank throughput.
2. Emission factors from CARB Emission Inventory Estimation Guidelines Section 4.10 GASOLINE DISPENSING FACILITIES (Revised May 1999)
3. Emission estimates from EPA Tank4.0.9d model results

Solar Two

Table 5.2-27

Estimated maximum potential sulfur hexafluoride (SF_6) emissions leakage emissions from proposed circuit breakers and other transmissions system equipment

Breaker	Qty	Typical Make	Typical Model	SF6 Lbs/Bkr	Leakage Rate	Leakage Lbs/Yr (per Bkr)	Leakage Lbs/Yr (All Bkrs)	CO_2e emissions (metric tons/Yr)
230kV Main Breaker (2000A)	2	GE-Hitachi HVB	HP Series	240	1%	2.4	4.8	52.04
230kV Transformer Breaker (2000A)	5	GE-Hitachi HVB	HP Series	240	1%	2.4	12	130.09
34.5kV Capacitor Breaker (1200A)	10	GE-Hitachi HVB	HS Series	31	1%	0.31	3.1	33.61
34.5kV Solar Group Breaker (1200A)	15	GE-Hitachi HVB	HS Series	31	1%	0.31	4.65	50.41
48.3kV Capacitor Switcher	15	Southern States	CapSwitcher	7	0.50%	0.035	0.525	5.69
							CO_2e emissions (metric tons/Yr)	271.83

Note:

Greenhouse Gas Global Warming Potentials (GWPs) - Intergovernmental Panel on Climate Change, Second Assessment Report (1996)

Greenhouse Gas	GWP (SAR, 1996)
SF_6	23,900

OPERATIONS AND MAINTENANCE VEHICLES REQUIREMENTS

Description	Activity	Make / Model	Fuel	Quantity	Frequency	Horse-power	Vehicle Weight (tons)	Assumed idle time on site during washing & maintaining the sunchachers per vehicle (idle hr/day)	Max Daily Onsite Distance per Vehicle (mile/day)	Assumed distance percentage to drive on onsite sealed roads	Max Daily Offsite Round-trip Distance per Vehicle within Imperial County (mile/day)	Travel to and from	Max Daily Total Distance per Vehicle (mile/day)	Max. Operating Hours / Day	Max. Operating Days / Month
Washing Vehicle	Mirror Washing	12 ton Truck	Gasoline	35	Daily	225	12	4.0	7	100%	0	on-site only	7	8	30
LRU Maintenance Truck with Boom	Field Servicing & Maintenance	10 ton Truck	Gasoline	20	Daily	200	10	4.0	7	100%	0	on-site only	7	8	30
Staff & Security Truck	Site Inspections & Security	Toyota Highlander or similar	Gasoline - Hybrid	5	Daily	187	2.25		33	100%	0	on-site only	33	24	30
Rubber-wheeled forklift with telescoping boom	SunCatcher PCU & Mirror Maintenance	Telehandler	Propane	2	Daily	50	4		10	100%	0	on-site only	10	8	30
Forklift	Warehousing of supplies		Propane	2	Daily	50	3		10	100%	0	on-site only	10	8	30
Telescoping Man Lift	Facility Maintenance and SunCatcher PCU & Mirror Maintenance		Propane	7	Daily	50	3		10	100%	0	on-site only	10	8	30
Staff Cars	Community to Work	Passenger vehicles	Gasoline & diesel	100	Daily	100	2		3	0%	40	El Centro	43	2	30
Van Pooling	To be Defined	Passenger Truck/Van	Gasoline	4	Daily	150	4		3	0%	40	El Centro	43	2	30
Visitor Cars	Sales, Deliveries, Services	Passenger vehicles	Gasoline & diesel	8	Daily	100	2		3	0%	50	San Diego	53	8	22
Delivery Trucks	Operations and Maintenance Supplies	5 ton Cargo	Diesel	1	Weekly	200	5		3	0%	50	El Centro / Detroit	53	2	5
	Waste Management	20 ton	Diesel	1	Weekly	250	20		3	0%	50	Class III sites	53	2	5
	Hazardous Waste	20 ton	Diesel	1	Weekly	250	20		3	0%	50	Class I sites	53	2	5
Transport Tractor Trailers	Spare Parts, Building Supplies, Temporary Rental Equipment	40-foot	Diesel	1	Weekly	250	20		10	70%	40	El Centro	50	2	5

Note:

1. **Bold** are offroad equipment
2. All other vehicles and equipment will use on-road engines
3. 70% of the time the Project will get the supplies from the El Centro, CA area and 30% of the time the Project will get the supplies from Detroit, MI.
4. Two CLASS I sites are: (1) Clean Harbors Buttonwillow Landfill (Solid Waste Facility) Lokern Road Kern County, CA - 340 miles to Solar Two site; (2) Chemical Waste Management Kettleman Hills Landfill (Solids Waste Facility) 36251 Old Skyline Road Kettleman City, CA 93239 - 400 miles to Solar Two site
5. The fenceline perimeter is approximately 20.5 miles. Each security vehicle is assumed to travel from the MSC around the perimeter plus one trip to the center of the site and back (plus 10% for misc trips) = 33 miles
6. Average distance from main service complex to center of east or west portion of the site is 3.5 miles thus the average round trip distance each maintenance vehicle travels is 7 miles

Solar Two - Operation and Maintenance Equipment Emissions (on-site)

Emission Factors For Combustion Exhaust Emissions

Equipment Description	Horse-power	Vehicle Weight (lbs)	Fuel	Emission Factors (unit: g/mile or g/idle-hr for on-road vehicle and lb/hr for off-road equipment)

Note:

1. Vehicle description in EMFAC2007 model
   - Washing vehicle is Medium-Heavy-Duty (MHD-CAT)
   - LRU Maintenance Truck with Boom is Light-Heavy-Duty (MHD-CAT)
   - Staff & Security Truck (gasoline) is Light-Heavy-Duty (LDT2-CAT)
   - Staff Car is Passenger Cars (LDA-ALL)
   - Van Pooling is Medium-Duty Trucks (MDV-CAT)
   - Visitor Cars is Passenger Cars (LDA-ALL)
   - Hydrogen Delivery Trucks is Heavy-Heavy-Duty (HHD-DSL)
   - Operations and Maintenance Supplies Delivery Truck is Light-Heavy-Duty (LHD1-DSL)
   - Waste Management Delivery Truck is Heavy-Heavy-Duty (HHD-DSL)
   - Hazardous Waste Delivery Truck is Heavy-Heavy-Duty (HHD-DSL)
   - Transport Tractor Trailer is Heavy-Heavy-Duty (HHD-DSL)
2. Criteria pollutant emission factors for propane fuel off-road equipment obtained from CARB OFFROAD2007.
3. Rubber-wheeled forklift with telescoping boom and telescoping man lift are all forklifts
4. PM emission factors determined using guidance from SCAQMD Final - Methodology to Calculate PM_{10} and $PM_{2.5}$ Significance Thresholds 10/1/2006, Appendix A - Updated CEIDARS Table with $PM_{2.5}$ Fractions

   On-road vehicles
   - $PM_{2.5}$ Fraction of PM_{10}, Brake wear: 0.429
   - $PM_{2.5}$ Fraction of PM_{10}, Diesel: 0.920
   - $PM_{2.5}$ Fraction of PM_{10}, Gasoline-catalyst: 0.928
   - $PM_{2.5}$ Fraction of PM_{10}, Tire wear: 0.250
   - Assume $PM_{2.5}$ and PM_{10} Fraction of total PM for gasoline hybrid car is: 1.000

   Off-road equipment
   - Assume $PM_{2.5}$ and PM_{10} Fraction of total PM for propane fuel equipment is: 1.000
5. The emissions of "Toyota Highlander Hybrid" meet the Tier 2/Bin 3 Federal emissions standard (reference source 3) and its performance is 27 mile/gallon in city (from Toyota website)
6. SO_2 emission factors for the Toyota Highlander Hybrid are from EMFAC2007- Light-Duty Trucks (LDT2-CAT).
7. N_2O emission factors for propane fuel off-road equipment are from reference source 1: Table C.4, California Climate Action Registry General Reporting Protocol Version 3.0, April 2008
8. CO_2 emission factors for gasoline and diesel fuel on-road vehicles are from EMFAC2007 model.
9. CH_4 and N_2O emission factors for the running vehicles (non-hybrid) are from reference source 2: Table C.5 (highest EF from model year 1993 to present), California Climate Action Registry General Reporting Protocol Version 3.0, April 2007
10. CH_4 and N_2O emission factors for the idling vehicles are scaled from the same type of running vehicle emission factor.
11. Greenhouse Gas Global Warming Potential (GWP) - Intergovernmental Panel on Climate Change, Second Assessment Report (1996)
    - CO_2 GWP (SAR, 1996) = 1
    - CH_4 GWP (SAR, 1996) = 21
    - N_2O GWP (SAR, 1996) = 310

Solar Two
Fugitive Dust Emissions (on-site)

Travel on sealed roads (paved)

$E = [k * (sL/2)^{0.65} * (W/3)^{1.5} - C] (1 - P/4N)$ EPA AP-42 Section 13.2.1 Paved Roads Equation 2

E = particulate emission factor (lb/VMT),
k = particle size multiplier for particle size range and units of interest

7.4 sL = road surface silt loading (grams per square meter) (g/m^2), from AP-42 Table 13.2.1-4 for Municipal solid waste landfill
W = average weight (tons) of the vehicles traveling the road, and
C = emission factor for 1980's vehicle fleet exhaust, brake wear and tire wear.

constants

	$PM_{2.5}$	PM_{10}
k	0.0024	0.016
C	0.00036	0.00047

12 P = Mean number of days per year with at least 0.01 inches of precipitation (from EL CENTRO 2 SSW COOP Station)
365 N = number of days in the year (averaging period)

   - Hazardous Waste Delivery Truck is Heavy-Heavy-Duty (HHD-DSL)
   - Transport Tractor Trailer is Heavy-Heavy-Duty (HHD-DSL)
2. PM emission factors determined using guidance from SCAQMD Final - Methodology to Calculate PM_{10} and $PM_{2.5}$ Significance Thresholds 10/1/2006, Appendix A - Updated CEIDARS Table with $PM_{2.5}$ Fractions

   On-road vehicles
   - $PM_{2.5}$ Fraction of PM_{10}, Brake wear: 0.429
   - $PM_{2.5}$ Fraction of PM_{10}, Diesel: 0.920
   - $PM_{2.5}$ Fraction of PM_{10}, Gasoline-catalyst: 0.928
   - $PM_{2.5}$ Fraction of PM_{10}, Tire wear: 0.250
   - Assume $PM_{2.5}$ and PM_{10} Fraction of total PM for gasoline hybrid car is: 1.000
3. CO_2 emission factors for gasoline and diesel fuel on-road vehicles are from EMFAC2007 model.
4. CH_4 and N_2O emission factors for the running vehicles (non-hybrid) are from reference source 2: Table C.5 (highest EF from model year 1993 to present), California Climate Action Registry General Reporting Protocol Version 3.0, April 2007
5. Greenhouse Gas Global Warming Potential (GWP) - Intergovernmental Panel on Climate Change, Second Assessment Report (1996)
   - CO_2 GWP (SAR, 1996) = 1
   - CH_4 GWP (SAR, 1996) = 21
   - N_2O GWP (SAR, 1996) = 310

Solar Two
Fugitive Dust Emissions (off-site)

Travel on paved road

$E = [k * (sL/2)^{0.65} * (W/3)^{1.5} - C] (1 - P/4N)$ EPA AP-42 Section 13.2.1 Paved Roads Equation 2
E = particulate emission factor (lb/VMT),
k = particle size multiplier for particle size range and units of interest
0.32 sL = road surface silt loading (grams per square meter) (g/m^2), From CARB - Emission Inventory Database - Section 7.9 Entrained Paved Road Dust - Local Streets (emission inventory code: 640-641-5400-0000)
W = average weight (tons) of the vehicles traveling the road, and
C = emission factor for 1980's vehicle fleet exhaust, brake wear and tire wear.

constants

	$PM_{2.5}$	PM_{10}
k	0.0024	0.016
C	0.00036	0.00047

12 P = Mean number of days per year with at least 0.01 inches of precipitation (from EL CENTRO 2 SSW COOP Station)
365 N = number of days in the year (averaging period)

Note:

Vehicles with variable quantities, the quantity per month can be found in Table 5.2-19 Construction Equipment Projection
Deliveries coming from Midwest (Detroit and elsewhere) will travel by rail to Los Angeles then by transport truck to the site
Average distance from main service complex to center of east or west portion of the site is 3.5 miles thus the average round trip distance each maintenance vehicle travels is 7 miles
Bus circuit is 11 miles (6 miles onsite, 5 miles offsite) - each bus does this loop twice a day
East access road will be heavily sealed and is 3.5 miles, the sealant will be applied in sufficient quantity that the road can be washed as needed. Thus this road will be considered the same as the paved northern access road for emissions estimates.
North access road and MSC parking area will be paved, route is 1.5 miles
All deliveries will travel an onsite loop starting near east laydown area traveling to the MSC then to the north exit, the loop will consist of 3.5 miles eastern access road + 1 (delivery area) miles + 1.5 miles northern
Construction laydown area is sealed
Each flatbed truck is assumed to make 4 trips per day to SunCatcher instalation locations delivering assembled dishes and misc parts
The fenceline perimeter is approximately 20.5 miles. Each security vehicle is assumed to travel from the MSC around the perimeter plus one trip to the center of the site and back (plus 10% for misc trips) = 33 mile

Annual Onsite Combustion Emissions

annual construction activity for months 8-19

Construction Assumptions - 30 days per month

Equipment	Number of Vehicles per year	Hours/Day	Emission rate per piece of equipment (lb/hr)										Annual Emissions (ton/year)

Number of Vehicles per year = sum of monthly daily maximum vehicle usage for the peak 12 months
delivery trucks can arrive at the site anytime during the day or night

Short-term Onsite Combustion Emissions

construction schedule = 12 hours per day 7 am to 7 pm pedestal installation = 16 hours per day
delivery trucks can arrive at the site anytime during the day or night

Notes:
Emission factors from CARB Off-road Mobile Source Emission Factors (2006-2020) for diesel and propane equipment. (2009 data used).
Dozer = Crawler Tractor
Loaders = Rubber tired loaders
Backhoe = Tractors/Loaders/Backhoes
Light Tower = Other Construction Equipment
Utilization Load Factors from SCAQMD
PM2.5 emission factors obtained by multiplying the PM10 emissions by PM2.5 fraction in CEIDARS list for onroad or offroad diesel vehicles.
For propane equipment assumed PM2.5 and PM10 Fraction of total PM is 1.000
Onroad vehicle emissions from EMFAC2007 model
CH_4 and N_2O emission factors for the onroad vehicles are from reference source 2: Table C.5, California Climate Action Registry General Reporting Protocol Version 3.0, April 2007

CO_2 GWP (SAR, 1996) =	1
CH_4 GWP (SAR, 1996) =	21
N_2O GWP (SAR, 1996) =	310

Solar Two
Fugitive Dust Emissions (on-site)
Short-term month = 8
annual construction activity for months = 8-19
Travel on sealed roads (paved)

$E = [k * (sL/2)^{0.65} * (W/3)^{1.5} - C] (1 - P/4N)$ EPA AP-42 Section 13.2.1 Paved Roads Equation 2

E = particulate emission factor (lb/VMT),
k = particle size multiplier for particle size range and units of interest
7.4 sL = road surface silt loading (grams per square meter) (g/m^2), from Table 13.2.1-4 for Municipal solid waste landfill
W = average weight (tons) of the vehicles traveling the road, and
C = emission factor for 1980's vehicle fleet exhaust, brake wear and tire wear.

constants

	$PM_{2.5}$	PM_{10}
k	0.0024	0.016
C	0.00036	0.00047

12 P = Mean number of days per year with at least 0.01 inches of precipitation (from EL CENTRO 2 SSW COOP Station)
365 N = number of days in the year (averaging period)

Vehicle Type	Number of Vehicles (month 8)	Max Daily Distance per Vehicle (mile/day)	Assumed distance percentage to drive on sealed roads	Max Daily Distance per Vehicle to drive on sealed roads (mile/day)	Max Daily VMT (all vehicles)	Mean Vehicle Weight (tons)	Max. Operating Hours / Day	Number of Vehicles per year (months 8-19)	Max Annual VMT (all vehicles)	$PM_{2.5}$ EF (lbs/VMT)	PM_{10} EF (lbs/VMT)

Travel on paved road

$E = [k * (sL/2)^{0.65} * (W/3)^{1.5} - C] (1 - P/4N)$ EPA AP-42 Section 13.2.1 Paved Roads Equation 2

E = particulate emission factor (lb/VMT),

k = particle size multiplier for particle size range and units of interest

1.6 sL = road surface silt loading (grams per square meter) (g/m^2), Rural roads CARB - Emission Inventory Database - Section 7.8 SJV - Entrained Paved Road Dust - Rural Roads

W = average weight (tons) of the vehicles traveling the road, and (emission inventory code: 640-643-5400-0000), June 2006.

C = emission factor for 1980's vehicle fleet exhaust, brake wear and tire wear.

constants

	$PM_{2.5}$	PM_{10}
k	0.0024	0.016
C	0.00036	0.00047

12 P = Mean number of days per year with at least 0.01 inches of precipitation (from EL CENTRO 2 SSW COOP Station)

365 N = number of days in the year (averaging period)

Water efficiency from CEQA Table 11-4 maximum value for watering active sites 2 times daily
Assume 50% soil movement from loaders and 50% from backhoes

4,033 yd3/day 5,608 ton/day
1,452,000 yd3/project 2,019,006 tons/project 2781 density of soil (lb/yd3) (USDA NRCS Physical Soil Properti 0.5 depth of disturbance (yards)
total project 600 acres = 1,452,000 for Niland Fine Sand and Rositas Fine Sand soil)
3000 total acres disturbed as described in Table 3-17 of Project Description 1,452,000 cubic yds, assume depth of soils moved is
only a small portion of this soil is picked up and moved via dump druck

Cover Storage Pile

$E = 1.7 * G/1.5 * (365-H)/235 * I/15 * J$ SCAQMD Table A9-9-E

PM10 Emission factor from wind erosion of storage piles per day per acre

15 G = Silt content (%) (from CEQA Handbook Table A9-9-E-1 for blended ore and dirt)
12 H = Number of days with >= 0.01 inches of precipitation per year (from El Centro 2 SSW weather station WRCC)
2.5 I = Percentage of time that the unobstructed wind speed exceeds 12 mph at mean pile height
0.5 J = Fraction of TSP that is PM10 = 0.5
2.128 lb/acre/day

wind speed percentage based on 2005 wind speed data as recorded at El Centro 2 SSW station

Source	Quantity	Size of Pile (acre)	Hours/Day	Days/Year per Pile	Watering Control Efficiency	PM10 Emissions (lb/day)	PM2.5 Emissions (lb/day)	PM10 Emissions (tons/yr)	PM2.5 Emissions (tons/yr)
Cover Storage Pile	2	1	24	182.5	68%	1.36	0.30	0.12	0.03

Water efficiency from CEQA Table 11-4 maximum value for watering active sites 2 times daily
pile size assumed
piles present only for 6 months

Fugitive Dust Emissions (offsite)

Short-term month = 8
annual construction activity for months = 8-19

Travel on paved road

$E = [k * (sL/2)^{0.65} * (W/3)^{1.5} - C] (1 - P/4N)$ EPA AP-42 Section 13.2.1 Paved Roads Equation 2
E = particulate emission factor (lb/VMT),
k = particle size multiplier for particle size range and units of interest

0.32 sL = road surface silt loading (grams per square meter) (g/m^2), Local CARB - Emission Inventory Database - Section 7.9 Entrained Paved Road Dust -
0.02 sL = road surface silt loading (grams per square meter) (g/m^2), Freeway Local Streets & Freeways (emission inventory code: 640-641-5400-0000), July 1997
W = average weight (tons) of the vehicles traveling the road, and
C = emission factor for 1980's vehicle fleet exhaust, brake wear and tire wear.

constants

	$PM_{2.5}$	PM_{10}
k	0.0024	0.016
C	0.00036	0.00047

12 P = Mean number of days per year with at least 0.01 inches of precipitation (from EL CENTRO 2 SSW COOP Station)
365 N = number of days in the year (averaging period)

Vehicle Type	Number of Vehicles (month 8)	Number of Vehicles per year (months 8-19)	Max Daily Offsite Round-trip Distance per Vehicle within Imperial County (mile/day)	Max Daily VMT (all vehicles)	Max Annual VMT (all vehicles)	Mean Vehicle Weight (tons)	Max. Operating Hours / Day	Max. Operating Days / Month	$PM_{2.5}$ EF (lbs/VMT)	PM_{10} EF (lbs/VMT)

Title : solar two 2010
Version : Emfac2007 V2.3 Nov 1 2006
Run Date : 2008/04/29 13:46:11
Scen Year: 2010 -- All model years in the range 1970 to 2010 selected
Season : Annual
Area : Imperial County APCD

****

Year: 2010 -- Model Years 1970 to 2010 Inclusive -- Annual
Emfac2007 Emission Factors: V2.3 Nov 1 2006

District Average District Average Imperial County APCD

Table 1: Running Exhaust Emissions (grams/mile; grams/idle-hour)

Pollutant Name: Reactive Org Gases Temperature: 90F Relative Humidity: 10%

Note:

Vehicles with variable quantities, the quantity per month can be found in Table 5.2-19 Construction Equipment Projection
Deliveries coming from Midwest (Detroit and elsewhere) will travel by rail to Los Angeles then by transport truck to the site
Average distance from main service complex to center of east or west portion of the site is 3.5 miles thus the average round trip distance each maintenance vehicle travels is 7 miles
Bus circuit is 11 miles (6 miles onsite, 5 miles offsite) - each bus does this loop twice a day
East access road will be heavily sealed and is 3.5 miles, the sealant will be applied in sufficient quantity that the road can be washed as needed. Thus this road will be considered the same as the paved northern ac
North access road and MSC parking area will be paved, route is 1.5 miles
All deliveries will travel an onsite loop starting near east laydown area traveling to the MSC then to the north exit, the loop will consist of 3.5 miles eastern access road + 1 (delivery area) miles + 1.5 miles northern
Construction laydown area is sealed
Each flatbed truck is assumed to make 4 trips per day to SunCatcher instalation locations delivering assembled dishes and misc parts
The fenceline perimeter is approximately 20.5 miles. Each security vehicle is assumed to travel from the MSC around the perimeter plus one trip to the center of the site and back (plus 10% for misc trips) = 33 miles

Annual Onsite Combustion Emissions

annual construction activity for months 13-24

Construction Assumptions - 30 days per month

Equipment	Number of Vehicles per year	Hours/Day	Emission rate per piece of equipment (lb/hr)										Annual Emissions (ton/year)

																							Total	136	5.03

Notes:
Emission factors from CARB Off-road Mobile Source Emission Factors (2006-2020) for diesel and propane equipment. (2009 data used).
Dozer = Crawler Tractor
Loaders = Rubber tired loaders
Backhoe = Tractors/Loaders/Backhoes
Light Tower = Other Construction Equipment
Utilization Load Factors from SCAQMD
$PM_{2.5}$ emission factors obtained by multiplying the PM emissions by $PM_{2.5}$ fraction in CEIDARS list for onroad or offroad diesel vehicles.
For propane equipment assumed $PM_{2.5}$ and PM_{10} Fraction of total PM is 1.000
Onroad vehicle emissions from EMFAC2007 model
CH_4 and N_2O emission factors for the onroad vehicles are from reference source 2: Table C.5, California Climate Action Registry General Reporting Protocol Version 3.0, April 2007
The emissions of "Toyota Highlander Hybrid" meet the Tier 2/Bin 3 Federal emissions standard (reference source 3) and its performance is 27 mile/gallon in city (from Toyota website)
SO_2 emission factors for the Toyota Highlander Hybrid are from EMFAC2007- Light-Duty Trucks (LDT2-CAT).

CO_2 GWP (SAR, 1996) = 1
CH_4 GWP (SAR, 1996) = 21
N_2O GWP (SAR, 1996) = 310

Monthly Comparison of Construction Equipment Emissions:

Month of Contruction	Total Equipment Quantity	PM10	PM2.5	CO	VOC	NOx	SO2	CO2	CH4	N2O	CO2e

Notes:
Emission factors from CARB Off-road Mobile Source Emission Factors (2006-2020) for diesel and propane equipment. (2009 data used).
Dozer = Crawler Tractor
Loaders = Rubber tired loaders
Backhoe = Tractors/Loaders/Backhoes
Light Tower = Other Construction Equipment
Utilization Load Factors from SCAQMD
PM2.5 emission factors obtained by multiplying the PM10 emissions by PM2.5 fraction in CEIDARS list for onroad or offroad diesel vehicles.
For propane equipment assumed PM2.5 and PM10 Fraction of total PM is 1.000
Onroad vehicle emissions from EMFAC2007 model
CH_4 and N_2O emission factors for the onroad vehicles are from reference source 2: Table C.5, California Climate Action Registry General Reporting Protocol Version 3.0, April 2007

CO_2 GWP (SAR, 1996) = 1
CH_4 GWP (SAR, 1996) = 21
N_2O GWP (SAR, 1996) = 310

Monthly Comparison of Construction Equipment Emissions:

Solar Two
Fugitive Dust Emissions (on-site)
Short-term month = 13
annual construction activity for months = 13-24
Travel on sealed roads (paved)

$E = [k * (sL/2)^{0.65} * (W/3)^{1.5} - C] (1 - P/4N)$ EPA AP-42 Section 13.2.1 Paved Roads Equation 2

E = particulate emission factor (lb/VMT),
k = particle size multiplier for particle size range and units of interest
7.4 sL = road surface silt loading (grams per square meter) (g/m^2), from Table 13.2.1-4 for Municipal solid waste landfill
W = average weight (tons) of the vehicles traveling the road, and
C = emission factor for 1980's vehicle fleet exhaust, brake wear and tire wear.

constants

	$PM_{2.5}$	PM_{10}
k	0.0024	0.016
C	0.00036	0.00047

12 P = Mean number of days per year with at least 0.01 inches of precipitation (from EL CENTRO 2 SSW COOP Station)
365 N = number of days in the year (averaging period)

Vehicle Type	Number of Vehicles (month 13)	Max Daily Distance per Vehicle (mile/day)	Assumed distance percentage to drive on sealed roads	Max Daily Distance per Vehicle to drive on sealed roads (mile/day)	Max Daily VMT (all vehicles)	Mean Vehicle Weight (tons)	Max. Operating Hours / Day	Number of Vehicles per year (months 13-24)	Max Annual VMT (all vehicles)	$PM_{2.5}$ EF (lbs/VMT)	PM_{10} EF (lbs/VMT)

Travel on paved road

$E = [k * (sL/2)^{0.65} * (W/3)^{1.5} - C] (1 - P/4N)$ EPA AP-42 Section 13.2.1 Paved Roads Equation 2

E = particulate emission factor (lb/VMT),
k = particle size multiplier for particle size range and units of interest
1.6 sL = road surface silt loading (grams per square meter) (g/m^2),
W = average weight (tons) of the vehicles traveling the road, and
C = emission factor for 1980's vehicle fleet exhaust, brake wear and tire wear.

Rural roads CARB - Emission Inventory Database - Section 7.8 SJV - Entrained Paved Road Dust - Rural Roads (emission inventory code: 640-643-5400-0000), June 2006.

				Total	**0.79**	**0.12**			**0.14**	**0.02**

Water efficiency from CEQA Table 11-4 maximum value for watering active sites 2 times daily
Assume 50% soil movement from loaders and 50% from backhoes

4,033 yd3/day 5,608 ton/day
1,452,000 yd3/project 2,019,006 tons/project 2781 density of soil (lb/yd3) (USDA NRCS Physical Soil Properti 0.5 depth of disturbance (yards)
total project for Niland Fine Sand and Rositas Fine Sand soil)
600 acres = 1,452,000 cubic yds, assume depth of soils moved is
3000 total acres disturbed as described in Table 3-17 of Project Description
only a small portion of this soil is picked up and moved via dump druck

Cover Storage Pile

$E = 1.7 * G/1.5 * (365-H)/235 * I/15 * J$ SCAQMD Table A9-9-E

PM10 Emission factor from wind erosion of storage piles per day per acre

15 G = Silt content (%) (from CEQA Handbook Table A9-9-E-1 for blended ore and dirt)
12 H = Number of days with >= 0.01 inches of precipitation per year (from El Centro 2 SSW weather station WRCC)
2.5 I = Percentage of time that the unobstructed wind speed exceeds 12 mph at mean pile height
0.5 J = Fraction of TSP that is PM10 = 0.5
2.128 lb/acre/day

wind speed percentage based on 2005 wind speed data as recorded at El Centro 2 SSW station

Source	Quantity	Size of Pile (acre)	Hours/Day	Days/Year per Pile	Watering Control Efficiency	PM10 Emissions (lb/day)	PM2.5 Emissions (lb/day)	PM10 Emissions (tons/yr)	PM2.5 Emissions (tons/yr)
Cover Storage Pile	2	1	24	182.5	68%	1.36	0.30	0.12	0.03

Water efficiency from CEQA Table 11-4 maximum value for watering active sites 2 times daily
pile size assumed
piles present only for 6 months

Solar Two
Fugitive Dust Emissions (offsite)

Short-term month = 13
annual construction activity for months = 13-24

Travel on paved road

$E = [k * (sL/2)^{0.65} * (W/3)^{1.5} - C] (1 - P/4N)$ EPA AP-42 Section 13.2.1 Paved Roads Equation 2

E = particulate emission factor (lb/VMT),
k = particle size multiplier for particle size range and units of interest

0.32 sL = road surface silt loading (grams per square meter) (g/m^2), Local CARB - Emission Inventory Database - Section 7.9 Entrained Paved Road Dust -
0.02 sL = road surface silt loading (grams per square meter) (g/m^2), Freeway Local Streets & Freeways (emission inventory code: 640-641-5400-0000), July 1997
W = average weight (tons) of the vehicles traveling the road, and
C = emission factor for 1980's vehicle fleet exhaust, brake wear and tire wear.

constants

	$PM_{2.5}$	PM_{10}
k	0.0024	0.016
C	0.00036	0.00047

12 P = Mean number of days per year with at least 0.01 inches of precipitation (from EL CENTRO 2 SSW COOP Station)
365 N = number of days in the year (averaging period)

Vehicle Type	Number of Vehicles (month 13)	Number of Vehicles per year (months 13-24)	Max Daily Offsite Round-trip Distance per Vehicle within Imperial County (mile/day)	Max Daily VMT (all vehicles)	Max Annual VMT (all vehicles)	Mean Vehicle Weight (tons)	Max. Operating Hours / Day	Max. Operating Days / Month	$PM_{2.5}$ EF (lbs/VMT)	PM_{10} EF (lbs/VMT)

	Azimuth and Elevation Drive	transport truck	Diesel	2	Daily	250	20	6	0%	0%	100%	50	Midwest

Note:

Vehicles with variable quantities, the quantity per month can be found in Table 5.2-19 Construction Equipment Projection
Deliveries coming from Midwest (Detroit and elsewhere) will travel by rail to Los Angeles then by transport truck to the site
Average distance from main service complex to center of east or west portion of the site is 3.5 miles thus the average round trip distance each maintenance vehicle travels is 7 miles
Bus circuit is 11 miles (6 miles onsite, 5 miles offsite) - each bus does this loop twice a day
East access road will be heavily sealed and is 3.5 miles, the sealant will be applied in sufficient quantity that the road can be washed as needed. Thus this road will be considered the same as the paved northern ac
North access road and MSC parking area will be paved, route is 1.5 miles
All deliveries will travel an onsite loop starting near east laydown area traveling to the MSC then to the north exit, the loop will consist of 3.5 miles eastern access road + 1 (delivery area) miles + 1.5 miles northern
Construction laydown area is sealed
Each flatbed truck is assumed to make 4 trips per day to SunCatcher instalation locations delivering assembled dishes and misc parts
The fenceline perimeter is approximately 20.5 miles. Each security vehicle is assumed to travel from the MSC around the perimeter plus one trip to the center of the site and back (plus 10% for misc trips) = 33 miles

Annual Onsite Combustion Emissions

annual construction activity for months 13-24

Construction Assumptions - 30 days per month

Equipment	Number of Vehicles per year	Hours/Day	Emission rate per piece of equipment (lb/hr)										Annual Emissions (ton/year)

Notes:
Emission factors from CARB Off-road Mobile Source Emission Factors (2006-2020) for diesel and propane equipment. (2009 data used).
Dozer = Crawler Tractor
Loaders = Rubber tired loaders
Backhoe = Tractors/Loaders/Backhoes
Light Tower = Other Construction Equipment
Utilization Load Factors from SCAQMD
$PM_{2.5}$ emission factors obtained by multiplying the PM_{10} emissions by $PM_{2.5}$ fraction in CEIDARS list for onroad or offroad diesel vehicles.
For propane equipment assumed $PM_{2.5}$ and PM_{10} Fraction of total PM is 1.000
Onroad vehicle emissions from EMFAC2007 model
CH_4 and N_2O emission factors for the onroad vehicles are from reference source 2: Table C.5, California Climate Action Registry General Reporting Protocol Version 3.0, April 2007
The emissions of "Toyota Highlander Hybrid" meet the Tier 2/Bin 3 Federal emissions standard (reference source 3) and its performance is 27 mile/gallon in city (from Toyota website)
SO_2 emission factors for the Toyota Highlander Hybrid are from EMFAC2007- Light-Duty Trucks (LDT2-CAT).

CO_2 GWP (SAR, 1996) = 1
CH_4 GWP (SAR, 1996) = 21
N_2O GWP (SAR, 1996) = 310

Monthly Comparison of Construction Equipment Emissions:

Notes:
Emission factors from CARB Off-road Mobile Source Emission Factors (2006-2020) for diesel and propane equipment. (2009 data used).
Dozer = Crawler Tractor
Loaders = Rubber tired loaders
Backhoe = Tractors/Loaders/Backhoes
Light Tower = Other Construction Equipment
Utilization Load Factors from SCAQMD
PM2.5 emission factors obtained by multiplying the PM10 emissions by PM2.5 fraction in CEIDARS list for onroad or offroad diesel vehicles.
For propane equipment assumed PM2.5 and PM10 Fraction of total PM is 1.000
Onroad vehicle emissions from EMFAC2007 model
CH_4 and N_2O emission factors for the onroad vehicles are from reference source 2: Table C.5, California Climate Action Registry General Reporting Protocol Version 3.0, April 2007

CO_2 GWP (SAR, 1996) = 1
CH_4 GWP (SAR, 1996) = 21
N_2O GWP (SAR, 1996) = 310

Monthly Comparison of Construction Equipment Emissions:

Month of Contruction	Offroad Equipment Quantity	PM_{10}	$PM_{2.5}$	CO	VOC	NO_x	SO_2	CO_2	CH_4	N_2O	CO_2e
		Daily Emissions (lb/day)

Solar Two
Fugitive Dust Emissions (on-site)
Short-term month = 13
annual construction activity for months = 13-24
Travel on sealed roads (paved)

$E = [k * (sL/2)^{0.65} * (W/3)^{1.5} - C] (1 - P/4N)$ EPA AP-42 Section 13.2.1 Paved Roads Equation 2

E = particulate emission factor (lb/VMT),
k = particle size multiplier for particle size range and units of interest
7.4 sL = road surface silt loading (grams per square meter) (g/m^2), from Table 13.2.1-4 for Municipal solid waste landfill
W = average weight (tons) of the vehicles traveling the road, and
C = emission factor for 1980's vehicle fleet exhaust, brake wear and tire wear.

constants

	$PM_{2.5}$	PM_{10}
k	0.0024	0.016
C	0.00036	0.00047

12 P = Mean number of days per year with at least 0.01 inches of precipitation (from EL CENTRO 2 SSW COOP Station)
365 N = number of days in the year (averaging period)

Vehicle Type	Number of Vehicles (month 13)	Max Daily Distance per Vehicle (mile/day)	Assumed distance percentage to drive on sealed roads	Max Daily Distance per Vehicle to drive on sealed roads (mile/day)	Max Daily VMT (all vehicles)	Mean Vehicle Weight (tons)	Max. Operating Hours / Day	Number of Vehicles per year (months 13-24)	Max Annual VMT (all vehicles)	$PM_{2.5}$ EF (lbs/VMT)	PM_{10} EF (lbs/VMT)

Christopher Meyer
Siting Project Manager
California Energy Commission
1516 Ninth Street, MS 15
Sacramento, CA 95814

Dear Mr. Meyer,

An Authority to Construct application has been received by the Imperial County Air Pollution Control District on behalf of SES Solar Two LLC Project. The proposed Project will be located on an approximate 6,500 acres near Plaster City in Imperial County. This application is currently under review.

The ICAPCD requires emission reduction credits from a new stationary source that has the Potential to Emit 137 pounds per day or more of nitrogen oxides, reactive organic compounds, carbon monoxide, sulfur oxides, or PM10. Excess emissions will be required offsetting. Project related stationary emissions, including fugitive emissions, will be included in the offset assessment. The Air Pollution Control Officer may exempt emergency standby equipment used for non-utility electrical power generation (per Rule 207C.2.f) from the offset requirements in Rule 207.

If you have any questions regarding this Project, please call the undersigned at 760 482 4606.

Sincerely,

Jaime Hernandez
APCD Senior Engineer
