RE: Blythe Energy Project Transmission Line (**99-AFC-8C**) draft Construction Access Road Plan

Dear Ms. Dyas:

On behalf of Blythe Energy, LLC, we are sending you a copy of the draft Construction Access Road Plan for your records. This enclosed Access Road Plan describes measures that will be implemented by Blythe Energy and its Contractors to access the right of way (ROW) and maintain minimal disturbance as possible within the project footprint. This plan was submitted in full to Southern California Edison and Bureau of Land Management, South Coast-Palm Springs Field Office. Enclosed please find two hard copies of the draft Construction Access Road Plan for the Blythe Energy Project Transmission Line (99-AFC-8c) and a CD containing a PDF of the entire submittal, including maps.

Please call me at 425.241.0415 or Jenna Farrell at 916.853.4575 with any questions.

Sincerely,
TETRA TECH EC, Inc.

Penny Jennings Eckert, Ph.D.
Project Manager

1.0 INTRODUCTION

This Construction Access Road Plan was prepared for Blythe Energy, LLC's (Blythe Energy's) Blythe Energy Project Transmission Line (BEPTL). It has been modified for the Bureau of Land Management (BLM), Southern California Edison (SCE), Southern California Gas Company (SCGC) and the Metropolitan Water District (MWD). This Access Road Plan describes measures that will be implemented by Blythe Energy and its contractors to access the right-of-way (ROW) and maintain the minimum possible disturbance within the project footprint. This plan complies with requirements of BLM, SCE, SCGC, and MWD.

The plan is organized into seven sections. This section introduces the project and the access road plan, Section 2 describes the purpose and need for the plan and the requirements it is intended to meet, Section 3 describes the roles and responsibilities of the various agencies and the proponent, Section 4 describes the materials and equipment the access roads must be designed and built to accommodate, Section 5 estimates the amount of land that will be used for access roads and specifies whether the access road is new or a reconstruction of an existing SCE road, Section 6 details the construction sequence, and Section 7 provides the mitigation measures (Certification Conditions) that will apply during access road construction.

1.1 Project History

Blythe Energy, LLC a subsidiary of FPL Energy, is the owner of the Blythe Energy Project (BEP), a 520-megawatt combined-cycle natural-gas-fired electric generating facility. The BEP is located near the City of Blythe, California, just north of Interstate 10 (I-10), approximately 8 miles west of the California and Arizona border. An Application for Certification was submitted to the California Energy Commission (CEC) in March of 2001 (99-AFC-8). The project received final approval on March 21, 2001, and began commercial operation on July 1, 2003.

1.2 Project Description

On October 10, 2006, the CEC approved an amendment to the BEP certification for the development of a 67.4-mile, 230-kilovolt (kV) overhead transmission line located between the City of Blythe and Hayfield Road in Riverside County, California. BEPTL will extend west from BEP in Blythe to the Julian Hinds Substation located at the north end of Hayfield Road. The transmission line will be located on private lands and BLM-managed lands within a 95-foot ROW generally adjacent to and north of SCE's existing Devers-Palo Verde 500-kV transmission line (Figures 1 and 2).

The purpose of the BEPTL is to improve the availability of long-term transmission paths for delivery of the BEP facility electrical output to the Southern California electrical transmission system. The proposed transmission line would connect the BEP energy supply directly into the Southern California electrical grid for the future.

2.0 NEED FOR ACCESS ROAD PLAN

This Access Road Plan has been prepared to provide details of Access Road Construction to the BLM, public utilities, and land managers. While the details needed by each entity vary slightly, this plan is designed to serve the purposes of all entities and describe how Blythe Energy will construct and maintain access to its project area safely and with minimal impact to the environment.

2.1 BLM Requirements

The BLM requires an Access Road Plan that describes the uses of BLM lands in addition to the 95-foot-wide ROW granted to the BEPTL (see Appendix D) for construction, operation, and maintenance of its transmission line (CACA-44491). These uses include both temporary and permanent easements. Temporary easements are requested for laydown and staging areas to allow efficient handling of the poles to be installed. Permanent easements are requested for access roads which include new access roads to be constructed to some of the structures of the BEPTL as well as the use of existing access roads and their easements provided to SCE to access the remaining structures.

2.2 Southern California Edison Requirements

SCE requires an Access Road Plan that describes how Blythe Energy proposes to protect SCE's infrastructure and land rights during its use of the existing easements already granted to SCE across private and public lands for construction, operation, and maintenance of its electric transmission line. SCE's requirements are as follows:

1. Demonstrate that Blythe Energy has the permission of each of the underlying land owners or land managers (including private lands and the BLM) to use and improve the existing access road.
2. Provide plan drawings at 1 inch = 200 feet scale that clearly show property lines; parcel numbers and owner names; the SCE easements on those properties; and existing SCE infrastructure including transmission structures, substations, communications sites, and access roads. These drawings are provided in Appendix B.
3. Provide drawings of typical road reconstruction details, including proposed encroachment of new access roads on the existing SCE easements.
4. Acquire a license to cross SCE's fee-owned property with an access road.

2.3 Southern California Gas Company Requirements

SCGC requires an Access Road Plan that describes how Blythe Energy proposes to protect SCGC's infrastructure and land rights during its use of the existing easements already granted to SCGC across private and public lands for construction, operation, and maintenance of its natural gas line. SCGC requires that the plan detail any changes that Blythe Energy proposes to make in existing SCGC access roads and provide details regarding the protection of existing gas pipeline and associated facilities from any damage during construction, operation, or maintenance of the BEPTL.

SCGC is principally concerned with the potential for damage to the underground high-pressure natural gas pipelines that parallel the proposed alignment from BEPTL Structures 250 to 301. They have therefore required that Blythe Energy provide details of proposed pipeline crossings, either with existing roads or with proposed new stub roads. Existing access roads will serve every other structure along the alignment between Structures 250 and 301, as the existing SCE structures are spaced twice as far apart as the new BEPTL structures. New stub roads will be constructed between the existing roads. Both existing SCE access roads and proposed new BEPTL stub roads cross the SCGC pipeline. Vehicle weights are of particular concern for the pipeline crossings, and SCGC has stated that their crews will construct or reconstruct the actual pipe crossings themselves.

2.4 Metropolitan Water District Requirements

The BEPTL would cross MWD land owned in fee from Structure 410 to the end of the project at Structure 435. The MWD requires an Access Road Plan that describes how Blythe Energy proposes to use the MWD lands, in addition to the 95-foot-wide ROW granted to the BEPTL for construction, operation, and maintenance of its transmission line. Permanent easements or a license are requested for access roads for each of Structures 410 through 435.

3.0 ROLES AND RESPONSIBILITIES

3.1 Agencies

Agencies with responsibilities for the compliance of Blythe Energy with the terms and conditions of the FSA/FONSI and other permits include BLM, CEC, and the California Department of Fish and Game.

3.1.1 Bureau of Land Management

The BLM is the federal lead agency for the purposes of compliance with the National Energy Policy Act. The BLM has issued a ROW Grant (CACA-44491, June 2007, presented in Appendix D) pursuant to the Federal Land Policy and Management Act of October 21, 1976, to Blythe Energy for the construction, operation, and maintenance of the BEPTL. BLM is responsible for assuring the project's compliance with the terms and conditions of the ROW Grant, which explicitly includes all the mitigation terms and conditions found or referenced in the FONSI (March 2007) and the Decision Record (April 2007).

3.1.2 California Energy Commission

The CEC is the lead agency for the purposes of California Environmental Quality Act compliance and has issued an amendment to the BEP license to cover the transmission line component (99-AFC-8C, amendment issued October 2006). The CEC certifies and authorizes the construction and operation of thermal power plants greater than 50 MW in California, including natural gas turbine powered power plants (such as the BEP) and their related transmission lines (such as the BEPTL) to the first point of interconnection with the grid. The amended certificate carries a series of conditions with which the BEPTL project must comply. These conditions were also adopted by the BLM in their FONSI.

The CEC will take the lead in ensuring compliance with the conditions. The CEC has appointed a Compliance Project Manager (CPM) and will appoint a Delegate Chief Building Official (CBO). The Delegate CBO reports to the CPM and is principally concerned with the technical aspects of the construction including technical specifications, engineering design, and health and safety of the workers and the public. In addition to the CPM and the Delegate CBO, there are a series of designated specialists, including an Air Quality Construction Mitigation Manager, a Designated Biologist, and a Designated Cultural Resource Specialist, all of whom must report directly to the CPM. There will also be various specialized monitors who will report to their specialist lead and will be responsible for monitoring for daily compliance with the Conditions of Certification. In addition to resource-specific reporting, a Monthly Compliance Report (MCR) that covers all aspects of compliance will be provided to the CPM during the life of the construction phase, including access roads.

3.2 Utilities

Where infrastructure owned by SCE and SCGC, and access roads constructed and maintained for operation and maintenance of that infrastructure, may be impacted, changed, or used during construction, Blythe Energy is responsible for ensuring that the infrastructure, including access roads, are not damaged, and that the utilities' use of the roads and access to their infrastructure are not impaired at any time during construction or operation of the BEPTL. In addition, Blythe Energy is proposing to install and maintain 26 structures on property belonging to the MWD. Blythe Energy is responsible for ensuring that the MWD has uninterrupted access to its property and infrastructure, including aerial access to its private landing field in Hayfield Dry Lake just south of the Julian Hinds pumping station and substation. The utilities, in turn, have the right to require preconstruction plans, to conduct inspections during construction, and to require compliance with the terms and conditions of their easement use or property use.

3.3 Proponent

Blythe Energy LLC, a wholly owned subsidiary of FPL Energy, is the owner of the BEPTL project. Blythe Energy is responsible for compliance with all laws, ordinances, rules, and statutes applicable to the construction of the BEPTL project, including access roads. Blythe Energy has retained Tetra Tech EC, Inc. to provide environmental planning, permitting, and compliance services, and has retained Power Engineers as the owner's engineer to prepare design documents for the transmission line and provide engineering support during construction. A construction contractor will be selected to prepare the access roads and to install all other parts of the project. The contractor will be responsible for compliance with the Conditions of Certification, which will be incorporated into the contract bid package and into the contract itself.

4.0 ACCESS REQUIREMENTS FOR TRANSMISSION LINE CONSTRUCTION

This section discusses the equipment and materials that will be required for the construction of the BEPTL because the access road design must take them into consideration. The structures to be installed are summarized first, followed by a description of the equipment used to transport and install them.

4.1 Transmission Line Structure Description

Concrete poles are complete upon delivery to the construction site and do not require any assembly. Concrete pole installation will be limited to areas with relatively easy access.

Concrete hybrids or steel poles will be used in areas with difficult access and steep terrain. Hybrid concrete poles are installed in sections and consist of a concrete base and a steel pole mounted above the base. The hybrid pole comes in sections and lengths that are amenable to conventional trucks and trailers. The steel poles can be shaped, welded, and bolted to meet load requirements and design challenges (e.g., steep terrain). See Table 1 located in Appendix A for a summary, listed by structure number, of the use of concrete poles, hybrid poles, all-steel poles, and specialty structures (e.g., H-frame).

Poles will be shipped by truck from the manufacturing site to project structure locations in areas where access for over-the-road trucks is suitable or to one of four designated project laydown areas where road conditions are not adequate for highway trucks and/or the long concrete poles. In the latter case, the pole trailers will be transferred from highway trucks to off-road trucks or tractors and then transported to their installation sites. A lean concrete backfill will be placed in the annulus space between the base of the poles and the hole they are placed into.

There will be up to 36 structures, depending on final design, that will be located at corners where guy wires cannot be installed. These structures are called self-supporting structures and will require poured-in-place reinforced concrete pier foundations. This process is more time consuming than direct embedment that will be used for all other structures, but will not result in any significant additional disturbed area around the structure.

4.2 Material Transport

As shown in Figure 3, the concrete poles as well as all other types of transmission line structures will be transported using semi-trucks and trailers. The concrete poles require special pole trailers because of their length, which can be as long as 130 feet, and their weight. Because of the overall length of the pole trailer as well as the long overhang at the rear, the California Department of Transportation and local jurisdictions require an escort

truck to follow the rig for safety reasons. The other structures come in segments that are bolted together on site and are transported on flat bed trailers of standard lengths; therefore, escort vehicles will not be required for these loads.

Figure 3. A 130-foot-long spun concrete pole being secured on a pole trailer for transport; note the approximately 45-foot overhang on the back

Other materials and supplies such as conductor cable, insulators, and construction equipment will be mobilized to the site using conventional semi tractor trailer rigs. The materials, including the concrete poles and other transmission line structures, will either be staged in the laydown areas or will be hauled directly to the site location where they will be used or installed. Concrete will be batched in Blythe at an existing commercial facility and hauled directly to the structure sites at the eastern end of the project in conventional concrete trucks. Because of the long distance and high temperatures that may be encountered during construction, it will be necessary to set up a batch plant at the Desert Center laydown area to provide concrete for the middle and western ends of the project.

4.3 Off-Road Equipment Needs

Many types of specialized and common construction equipment will be required for the transmission line construction. The major types and their functions are listed below:

- Heavy lift crane (195 ton class) will be required to off-load and erect the long concrete poles. A crane performing this activity is shown in Figure 4.
- One or more motor graders will be used to improve existing roads and grade new roads to structure work areas. This operation is discussed in more detail in Section 6.

Figure 4. Concrete pole being lifted off delivery truck/trailer

- A large-diameter caisson type auger rig will be used to excavate the holes into which the structures will be placed. Typically, the diameter of the hole will be 6 to 8 feet and the depth will be 20 to 26 feet; however, the angle and dead end structures may require holes as large as 10 feet in diameter and up to 40 feet deep.
- A D-8 or similar size dozer will be used to rough-grade new roads or improve rocky sections of existing roads prior to blading smooth with the motor grader. The dozer may also be required to pull trucks through soft sand, dune areas or across washes.
- An excavator will be used in rocky areas to assist the caisson auger rig as necessary by removing large boulders.
- A front-end loader will be used to move dune sand out of the way, as an assist vehicle to pull equipment when needed, and to transport heavy items between work areas.
- Water trucks will be used to provide dust control and to improve the stability of the sandy soils which is prevalent over much of the eastern end of the transmission line. Water will be loaded into the trucks from overhead tanks that are filled from wells or

canals. Water will be purchased from entities holding existing water rights. No new water rights will be developed or needed. The water tanks will be located adjacent to water sources if possible.

- Compactors may be required to compact loose soil to provide better access for heavy construction equipment. Because the desert soil is dry, compaction will require application of water.
- Off-road tractors that have sufficient traction and low gearing to handle the loose dune sands and rough terrain may be necessary to transport concrete poles and possibly other loads of equipment and materials from the semi-truck to each site.

4.4 Over-the-Road Construction Vehicle Types

Several different types of construction vehicles that are primarily designed for over-the-road travel will be used during the transmission line construction. Construction access roads will need to be able to accommodate these vehicles. Transmission line construction will involve the use of pickup trucks, utility vehicles, service vehicles, electrical service trucks (splicing and tensioning at pull sites), and standard over-the-road semi-trucks with trailers for pole, structure, and materials transport. The roads, as discussed in more detail in Section 6, will be graded and compacted as required to accommodate travel by these vehicles. Where necessary, assist equipment such as dozers or front-end loaders may be used to pull these vehicles through loose sand and rough or steep terrain.

4.5 Truck and Equipment Weights

Equipment and loaded transport weights will vary from a few thousand pounds in the case of pickup trucks to a fully loaded 12-yard concrete truck with a 46-ton load between the two rear axles. The heaviest piece of construction equipment is likely to be a CAT 980 or equivalent front-end loader with a maximum axle weight of 20 tons.

5.0 LAND OCCUPANCY REQUIREMENTS

Access road construction will impact land inside and outside the project ROW. The overall project footprint includes new access and spur roads, project lay-down areas, tensioning and splicing sites, and work areas around each pole. Only access and spur roads and project laydown areas will be disturbed during access road construction. It is probable that pole work area preparation may occur during or immediately after the access road construction; however, that work is conducted entirely within the 95-foot ROW.

New access roads will be designed to be 12 feet wide as constructed. A minimum 50-foot radius will be designed where the new branch road leaves the main access road, as well as at turning points from roads onto access roads, or at right angle turns of the access roads. Access roads and turning radii are shown in Appendix B on the drawings. Typical details for access roads and gas pipeline crossings are shown on Figure 5. As shown in the figures, the work area around each structure will be contained within the ROW width of 95 feet and will be 150 feet long centered on the structure.

The four laydown sites are shown on the maps in Appendix C. Two of the sites (Blythe Airport and Desert Center) are previously disturbed, graveled, or paved areas at least 5 acres in size. These areas will not require any further ground preparation. Two of the sites (Ford Dry Lake north of the freeway measuring approximately 5 acres, and Hayfield south of the freeway measuring approximately 2 acres) will require minimal grading and leveling prior to use. The types of construction equipment that will be used to prepare the latter two laydown sites will include motor graders, water trucks, compactors, and front-end loaders. Provisions at each laydown site will be provided for personal vehicle parking, heavy equipment parking and light maintenance, fueling, storage of supplies, and an overhead water tank (camel) for loading water trucks. Each area will be located as close as practical to the interstate exits.

Table 2 (located in Appendix A) shows the length and width of reconstructed existing access roads, and Table 3 (also located in Appendix A) provides details for the proposed new stub roads. Because SCE is conducting its periodic maintenance of its access roads, Blythe Energy anticipates that little, if any, additional work will be needed for the existing access roads, but lists them here for reference. For each access road, both tables provide estimates for land occupancy and indicate the underlying land ownership, whether the access road is also an SCE or SCGC access road, and whether it crosses or is within an easement previously granted to those utilities.

6.0 CONSTRUCTION SEQUENCE FOR ACCESS ROADS

6.1 General Requirements

Improvements to existing access roads and construction of new access (stub) roads that branch off existing access roads to each structure location or work area location will both be required. In general, the existing access roads are 14 to 20 feet wide. They include surfaced (paved, oiled, or graveled) and unsurfaced roads in Blythe and in Riverside County near Blythe, and existing transmission line or gas line access roads that cross both federal and private land with an easement from the property owners. Existing surfaced and unsurfaced county and BLM roads will be used to access the transmission or gas line access roads. Table 4 lists the existing roads that will be used for site access, and Appendix A contains detailed information on each structure's location, access route, and stub road construction.

6.2 Riverside County and BLM Surfaced Roads

No reconstruction or grading will be required for existing surfaced roads; however, there are several weight-limited bridges on the Chuckwalla Road that cannot be crossed by the heavy pole or concrete transport trucks. Although all sites can be reached without using this portion of Chuckwalla Road, the construction contractor may find it advantageous to use this road. Doing so will require a temporary use permit from Riverside County, and the construction contractor will need to install "jump bridges" or other approved means that span the bridges and improve their weight-carrying capacity to allow the heavier equipment to cross safely and without damage to the underlying bridge structure.

6.3 Road Reconstruction for Existing Unsurfaced Roads

Generally, the existing SCE, SCGC, and Electrical Distribution Service Roads listed in Table 4 can be used with little improvement other than grading to smooth the surface, application of water for dust control, and compaction to support the heavy truck and equipment traffic. Any grading, smoothing, or compaction of these existing roads will take place within the existing disturbed area and will not require any new disturbance. Work will be performed in compliance with environmental and cultural requirements, and biologists and cultural resource personnel will be on site during road construction activity in accordance with the mitigation measures specified in Section 7.

6.3.1 SCE Periodic Maintenance of Existing Roads

SCE is currently completing maintenance of its access roads for their DPV-1 transmission line. The majority of the existing access roads that the BEPTL project will use are these

same SCE access roads. SCE currently plans to complete their maintenance in fall 2008, which is prior to when BEPTL construction is scheduled to begin. SCE is using equipment similar to that described in Section 6.3.2, except they are not using water trucks nor compactors, because their maintenance does not require heavy truck traffic. Their maintenance benefits the BEPTL project by reducing, or even eliminating, most of the reconstruction work that would otherwise be required for these existing roads, and also reduces the footprint of the BEPTL project since these roads already exist and are of sufficient width for BEPTL project use.

6.3.2 Reconstruction Equipment Requirements and Methodology

The types of equipment that will perform maintenance on the existing access roads will be motor graders, water trucks, compactors where needed to firm up the subgrade and front-end loaders to move dune sand if necessary. The networks of existing roads that will be used to support the BEPTL construction are shown on the drawings in Appendices B and C.

Reconstruction of existing roads will start with an application of water to mitigate dust followed by a motor grader to smooth the existing surface and remove debris and rocks that may have accumulated. In loose sandy areas, additional water may be applied and the section compacted. However, the application of water and compaction will be limited to the areas actively being used because water evaporates quickly in the hot, dry desert environment.

In dune areas, mats or other means in addition to watering may be employed to provide greater accessibility for the construction equipment. Depending on the condition of the roads in dune areas at the time of construction, it may be necessary to move dune sand out of the way with front-end loaders. The sand will be moved to adjacent areas where dune sand is already present rather than onto undisturbed area. Also, dunes may be avoided by approaching sites from another direction if necessary, but still using existing access roads.

6.4 New Stub Road Construction

The location, size, and configuration of each new stub road, and where it will branch off the existing access roads, is shown on the drawings in Appendix B. For the majority of the project alignment, the new stub roads will only require smoothing of the existing ground surface with a motor grader to remove rocks, debris, and vegetation. The excavation into the subgrade will be limited to 6 inches or less and the soil will be bermed on either side of the road. Water will be applied for dust control and the road compacted as necessary. As shown on Figure 5, the width of these stub roads will be 12 feet, and where they branch off the main access roads, a 50-foot radius of curvature will be allowed for truck and off-road equipment to turn onto the stub roads. The approach to the work areas at each pole site is angled in the

direction of approach to the site to 1) facilitate access to the site, 2) minimize land disturbance, especially from the long pole trucks and other large pieces of construction equipment, and 3) avoid interference with existing or proposed new structures in cases where there are structures already in place or where they are planned and permitted for placement between the proposed BEPTL and the existing access road. The stub roads will be left in place after the transmission line construction is complete to facilitate access for periodic maintenance.

For the new stub roads located within the hilly and rocky terrain (generally Structure 281 thru Structure 357) more grading may be required at some locations. Because of the roughness or size of boulders, this will in some cases require initial passes with a dozer outfitted with a ripper attachment before a motor grader can finish grading the road. Except where the road may require some fill for grading or a small cut through a high spot, the width of these roads will also be limited to 12 feet. These new access roads will be permanent because after construction is completed they will be used for periodic maintenance of the transmission line. The same types of equipment used for improving or maintaining the existing roads will be used for the stub roads.

6.4.1 Equipment Requirements

The equipment requirements for construction of the new stub roads are identical to the equipment that will be used for the reconstruction and improvements to the existing access roads. These types of equipment and their uses are described in Section 6.3.2.

7.0 APPLICABLE MITIGATION MEASURES

7.1 Mitigation and Monitoring Program

Table 5 describes the mitigation measures that apply to construction of the access roads. Note that other measures, including but not limited to compensatory mitigation, also apply to the entire project. These measures must be in place prior to construction, including access road construction. Table 5 is intended as a practical guide to field measures and provides only a summary of the Conditions of Certification. All Conditions of Certification continue to apply to the project, and the full text can be found in the Final Staff Assessment (see http://www.energy.ca.gov/sitingcases/blythetline/documents/CEC-700-2005-003-FSA-REV1.PDF).

Table 5. Mitigation and Monitoring Program Measures Applicable During Access Road Construction

Mitigation Number	Impact	Mitigation	Monitor Responsible	Reporting
Air Quality				
AQ-SC1 and AQ-SC2	During construction, a temporary, short-term reduction of local ambient air quality due to fugitive dust and emissions generated by construction equipment will occur. This short-term impact will occur only in the immediate vicinity of the T-line ROW.	Blythe Energy will follow its Air Quality Construction Mitigation and Monitoring Plan (AQ-SC2), and appoint an Air Quality Construction Mitigation Monitor (AQCMM) (AQ-SC1).	AQCMM	Monthly compliance report (MCR) will detail air quality compliance; will be submitted to Compliance Project Manager (CPM).
AQ-SC3 and AQ-SC4	Fugitive dust emissions will be generated from grading and excavation activities, wind erosion of temporary spoil piles, material handling, and equipment traveling on paved and unpaved roads.	Speed limits will be enforced at 15 mph throughout the project. Dust control will be achieved primarily through application of water or mechanical covering (for piles). If necessary, dust control for construction activities and wind erosion will be supplemented in desert habitats by the application of water-based organic polymers or wood derivative compounds (AQ-SC3). Blythe Energy's contractors will implement dust control if dust remains in the air more than 5 minutes or reaches 20 feet in height in areas of active construction within 1,000 feet of highways, residences, and other occupied areas. As part of the dust plume response requirement, the AQCMM has the authority to actively implement additional dust mitigation strategies and temporarily stop construction if deemed necessary.	AQCMM	MCR will detail air quality compliance; will be submitted to CPM.

Mitigation Number	Impact	Mitigation	Monitor Responsible	Reporting
AQ-SC5	Local ambient air quality will be temporarily impacted by the compression ignition engines of construction vehicles used to construct the BEPTL.	All construction equipment will use low-sulfur diesel fuel and, where possible, be fitted with particulate matter filters to reduce PM10 and PM2.5 emissions.	AQCMM	MCR will detail air quality compliance and include copies of all diesel fuel purchases records, a list of all heavy equipment used on site during that month including the owner's name and a letter indicating the equipment has been properly maintained, and any additional documentation deemed necessary by the Monitor and/or CPM. MCR will be submitted to CPM.
Biological Resources				
BIO-16	Construction of the transmission lines is expected to impact up to 272.8 acres of desert tortoise habitat as well as habitat for other sensitive desert species.	Only approved access roads will be used. Disturbance will be limited to the ROW and approved tensioning sites, laydown areas, and access roads only. Project owner will take aerial photographs of the project line prior to project construction and after SCE scheduled road maintenance in fall 2008, and an additional set of photographs will be taken post construction.	Designated Biologist	Implementation of the mitigation measures are reported in monthly and annual compliance reports. CPM approves BRMIMP and WEAP. MCR contains running total and monthly list of persons trained. Designated Biologist to report all encounters with threatened and endangered (T&E) species in MCR.
BIO-14	Construction of the transmission lines is expected to impact up to 272.8 acres of desert tortoise habitat as well as habitat for other sensitive desert species.	The Biological Resources Mitigation Implementation and Monitoring Program (BRMIMP) will be implemented, including biological monitoring and desert tortoise preconstruction clearances.	Designated Biologist	CPM approves BRMIMP and WEAP. MCR contains running total and monthly list of persons trained. Designated Biologist to report all encounters with T&E species in MCR.
BIO-5	Desert tortoise habitat and lives can be impacted by improper handling, careless operation of machinery, or other ignorance of tortoise habitat monitoring requirements.	All personnel on the job will be trained according to the Workers Environmental Awareness Program (WEAP). As part of this training, workers will be informed of sensitive resources associated with the project area.	Designated Biologist	CPM approves BRMIMP and WEAP. MCR contains running total and monthly list of persons trained. Designated Biologist to report all encounters with T&E species in MCR.
BIO-1, BIO-2, and BIO-3	Desert tortoise could be injured or killed, their activities altered, and their habitat degraded during construction and maintenance activities associated with this transmission line.	Qualified biologists will monitor all work where prior Blythe Energy surveys have documented the occurrence of one or more listed species; all workers will inspect areas under vehicles and/or equipment for the presence of protected species prior to movement.	Designated Biologist	Implementation of the mitigation measures are reported in MCR and annual compliance reports. Designated biologist submits names and resumes of qualified tortoise handlers to USFWS for approval.
BIO-1, BIO-2, and BIO-3	Temporary and permanent loss of Mojave Fringed Toed Lizard (MFTL) habitat and direct mortality to MFTL could occur.	Biologists will conduct a final clearance survey prior to construction activities to excavate potential burrows and relocate lizards to nearby suitable habitat. A biological monitor will be present in each area of active construction within MFTL habitat throughout the work day from initial clearing through habitat restoration.	Designated Biologist	Implementation of the mitigation measures are reported in MCR and annual compliance reports.

Mitigation Number	Impact	Mitigation	Monitor Responsible	Reporting
BIO-1, BIO-2, and BIO-3	Direct impacts to burrowing owls could occur during construction, and owl burrows could be destroyed during construction.	Biologists will look for burrowing owls along with desert tortoises during pre-construction surveys.	Designated Biologist	Implementation of the mitigation measures are reported in monthly and annual compliance reports.
Cultural Resources				
CUL-17	Various types of cultural resources exist within the impact area/Area of Potential Effects of the project. Construction activities could have an adverse effect on the significance of cultural and historic resources.	The Cultural Resources Monitoring and Mitigation Plan (CRMMP) identifies general and specific measures to minimize potential impacts to sensitive cultural resources; the CRMMP will be implemented and followed during construction.	Designated Cultural Resource Specialist (DCRS)	CRMMP daily monitoring reports, summarized in MCR.
CUL-17, CUL-19, and CUL-20	Various types of cultural resources exist within the impact area/Area of Potential Effects of the project. Construction activities could have an adverse effect on the significance of cultural and historic resources.	Impacts and/or effects to cultural resources will be avoided wherever practical. Where resources cannot be avoided, the project will employ restrictive fencing and monitoring to mitigate disturbances.	DCRS, Designated Cultural Resource Monitor (CRM), and Native American Monitors (NAM)	Daily reports regarding cultural resources, summaries in the MCR.
CUL-5	Construction activities could have an adverse effect on the significance of cultural and historic resources.	Monitors have the authority to halt construction if previously unanticipated resources are encountered during construction activities to access the significance of the resource. Construction will be redirected to another location until the resource is assessed.	DCRS, CRM, and NAM	DCRS, to CPM, and construction manager within 24 hours of find.
Hazardous Materials Management				
HAZ-1	A number of hazardous chemicals will be used during construction of access roads in small quantities, mostly petroleum products.	Hazardous materials will be stored in proper containers in material yards and designated construction areas. No reportable quantities will be used.	Project owner	Project owner will provide in annual report a statement that no hazardous materials in reportable quantities were stored or used on the project.
Noise and Vibration				
NOISE-8	Noise impacts associated with the project can be created by short-term construction activities, and by normal long-term operation of the BEPTL.	Heavy equipment use and noisy activities are limited to 6 a.m. to 6 p.m. within one-quarter mile of an occupied residence.	Project Owner	Project owner shall provide a statement to CPM prior to construction acknowledging these limitations.
NOISE-2	Noise impacts associated with the project can be created by short-term construction activities, and by normal long-term operation of the BEPTL.	All project-related noise complaints will be investigated and evaluated, and attempts will be made to reach resolution in accordance with the Noise Complaint Resolution Form.	Project Owner	Noise Complaint Resolution Form to local jurisdiction and CPM.
NOISE-3	Construction will expose employees and contractors to occupational noise hazards.	Blythe Energy will implement a Hearing Conservation Program and Personal Protective Equipment Program (CP&PPEP) to protect construction workers.	Project Owner	CP&PPEP submitted to CPM.
Soil and Water Resources				
Soil and Water 12	Reduction in vegetative cover and topsoil resulting from construction-related access road improvement, such as grading and excavation activities, would likely cause some increase in water and wind erosion.	Access Road Use Plan submitted for approval to the CEC and BLM. Approved plan followed during construction.	Project Owner	BLM approved plan submitted to CPM.

Mitigation Number	Impact	Mitigation	Monitor Responsible	Reporting
Soil and Water 13	Use of water to support project construction may have the potential to impact the quantity of the local water supply if water is scarce in the community or if excess water is used.	Water Supply Service Agreements with water purveyor/entities supplying water will be in 60 days place prior to construction. Blythe Energy will track and meter water use to ensure that the requirements of the agreements are met.	Project Owner	Copies of metering data, summaries of daily and monthly water use, change in supply, violations, and any other reports required by the service agreement will be submitted to CPM in MCR.
Soil and Water-1, Soil and Water-2 and Soil and Water-3	Areas of new ground disturbance will be more likely to erode and transport or deposit sediment downstream within the ephemeral drainage.	Implement and comply with DESCP/SWPP during construction.	Project Owner	Project owner to provide a summary of the effectiveness of the implementation activities of the DESCP/SWPP in the MCR submitted to the CPM.
Soil and Water-2	Reduction in vegetative cover and topsoil resulting from construction-related access road improvements, such as grading and excavation activities, would likely cause some increase in water and wind erosion.	Contractors will dispose of excavated soils from the pole foundations at the Blythe Sanitary Landfill or use the fill in access road construction and maintenance. In general, Blythe Energy will minimize initial land disturbance and clearing within the working area; segregate, stockpile, and replace topsoil; apply temporary and permanent erosion control measures; and restore disturbed areas (DESCP/SWPP).	Project owner	The project owner will provide a summary of the effectiveness of the implementation activities of the DESCP/SWPP in the MCR submitted to the CPM.
Traffic and Transportation				
Trans-1	Overweight and oversized trucks will be driving the I-10 route to project access areas during construction, and may impact the quality of the road and the speed and flow of traffic.	Blythe Energy will comply with Caltrans, Riverside County, and the City of Blythe vehicle size and weight limitations and requirements and obtain appropriate transportation permits for use of roadways.	Project owner	Project owner will submit certification of all required overweight and oversized transportation permits in the MCR.
Trans-2	Access to project areas crosses various right-of-ways and/or easements.	Project owner will obtain necessary encroachment permits from Caltrans and all relevant jurisdictions.	Project owner	Project owner will submit copies of encroachment permits in the MCR.
Trans-3	Transportation of hazardous materials may be necessary for project construction.	Project owner will comply with all state and federal regulations pertaining to hazardous waste transportation and acquire any necessary permits.	Project owner/ Construction Contractor	Project owner will submit in the MCR and annual report copies of all licenses and permits required for hazardous waste.
Trans-8	Overweight and oversized trucks will be driving the I-10 route to project access areas during construction, and may impact the quality of the road and the speed and flow of traffic.	Project owner will meet with and provide photographs to CEC, BLM, City of Blythe, County of Riverside, MWD, and Caltrans (as needed) to determine any actions necessary and a schedule to complete and repair roads deemed damaged by construction.	Project Owner	Once roads are repaired, the project owner will provide a letter to the CPM from all parties stating their approval of repairs.

Mitigation Number	Impact	Mitigation	Monitor Responsible	Reporting
Waste Management				
Waste-6	Existing contamination from previous activity along project area is limited to military unexploded ordnance (UXO).	Sub-surface surveying will be completed in all project areas that require boring or excavation before the start of construction. Blythe Energy will implement the UXO plan; any unexploded ordnance disposal (UOD) will be directed by the BLM, the BLM will notify the proper agency for removal of the UXO.	Project owner, environmental monitors, construction workers	UXO plan submitted to CPM prior to construction activities. Any UXO encounter and actions will be summarized in the MCR.
See also Soil and Water-2 and HAZ-1	Non-hazardous solid waste components of the access road construction will be limited to excess soil that will be generated by grading and excavation activities. Petroleum products used to fuel machinery will be the only hazardous materials used in access road construction.	Soil will be used for access road grading, or disposed of at the Blythe Sanitary landfill. In the event of a petroleum product spill, refer to the hazardous materials section. Blythe Energy will implement the DECSP/SWPP	Project owner	Project owner will provide information about disposal of any waste, hazardous or non-hazardous; owner will report any spills to the CPM in the MCR.
Worker Safety and Fire Protection				
Worker Safety-1	Workers on construction sites will be exposed to loud noises and moving equipment. The workers may experience falls, trips, burns, lacerations, and other possible injuries. They have the potential to be exposed to falling equipment or structures, chemical spills, hazardous waste, fires, explosions, and electrical sparks and electrocution.	Blythe Energy will implement a Safety and Health Program to ensure worker safety, including Injury and Illness Prevention Program (IIPP), Personal Protective Equipment (PPE) Program, and Emergency Action Plan (EAP).	Construction Safety Supervisor, project owner, environmental monitors, safety monitors, construction workers	Any safety violations will be summarized in the MCR and submitted to CPM.
Worker Safety-2	On construction sites, electrical sparks, combustion of fuel oil, flammable liquids, explosions, and over-heated equipment, may cause small fires.	The project will rely on both on-site fire protection procedures and local fire protection services from the County of Riverside Fire Department.	Construction Safety Supervisor, project owner, environmental monitors, safety monitors, construction workers	Project owner/ Construction Safety Supervisor will report and summarize any fire-related incidents in the MCR and submitted to CPM.

AQCMM = Air Quality Construction Mitigation Monitor
BRMIMP = Biological Resources Mitigation Implementation and Monitoring Program
CP& PPEP = Conservation Program and Personal Protective Equipment Program
CPM = Compliance Project Manager
CRM = Cultural Resource Monitor
CRMMP = Cultural Resources Monitoring and Mitigation Plan
DCRS = Designated Cultural Resource Specialist
DESCP/SWPP = Drainage, Erosion, Sedimentation Control Plan/Storm Water Implementation Plan
EAP = Emergency Action Plan
IIPP = Injury and Illness Prevention Program
MCR = monthly compliance report
MFTL = Mojave Fringed Toed Lizard
NAM = Native American Monitors
PPE = personal protective equipment
ROW = right-of-way
UOD = unexploded ordnance disposal
UXO = unexploded ordnance
WEAP = Workers Environmental Awareness Program

NOTE # 2: RIVERSIDE COUNTY AND BLM SURFACE ROADS
NO RECONSTRUCTION OR GRADING WILL BE REQUIRED FOR EXISTING SURFACED ROADS. HOWEVER, THERE ARE SEVERAL WEIGHT-LIMITED BRIDGES ON THE CHUCKWALLA ROAD THAT CANNOT BE CROSSED BY THE HEAVY POLE OR CONCRETE TRANSPORT TRUCKS. ALTHOUGH ALL SITES CAN BE REACHED WITHOUT USING THIS PORTION OF CHUCKWALLA ROAD, THE CONSTRUCTION CONTRACTOR MAY FIND IT ADVANTAGEOUS TO USE THIS ROAD. DOING SO WILL REQUIRE A TEMPORARY USE PERMIT FROM RIVERSIDE COUNTY, AND THE CONSTRUCTION CONTRACTOR WILL NEED TO INSTALL "JUMP BRIDGES" OR OTHER APPROVED MEANS THAT SPAN THE BRIDGES AND IMPROVE THEIR WEIGHT-CARRYING CAPACITY TO ALLOW THE HEAVIER EQUIPMENT TO CROSS SAFELY AND WITHOUT DAMAGE TO THE UNDERLYING BRIDGE STRUCTURE.

IN REPLY REFER TO:
2800
CACA-44491
(CA-66.62)

JUN 18 2007

Blythe Energy, LLC
Attention: John Goodwin Business Manager
700 Universe Boulevard
Juno Beach, Florida 33408

Dear Mr. Goodwin

Enclosed are two copies of an unsigned right-of-way (ROW) grant (BLM Form 2800-14) for your proposed 230 kV transmission line, serial number CACA 46331. Please review the document and if it meets with your approval, sign and date both copies and return to the P.O. Box address shown above. Upon our receipt of the signed documents and the fees discussed below, we will issue the ROW grant, absent any other unresolved issues.

Rent for use of public lands must be paid in advance of such use and prior to issuance of the ROW grant. Rent for a linear right-of-way is based on a schedule that is adjusted annually based on the Implicit Price Deflator (IPD), an inflation index. You may obtain a copy of the rent schedule from this office or by accessing www.blm.gov/ca/palmsprings.

Since the rent for your ROW grant is estimated to be greater than $100 per year, the Bureau of Land Management will require you to pay rent at ten year intervals. Your annual rent is estimated to be $651.16. Provided you remit payment by July 30, 2007, your rent is estimated to be $271.31 for the first partial year from (July 30, 2007) to (December 31, 2007). Rent for the next nine years, or the remainder of the 10 year period, will be $5,860.44.

Please return **BOTH** signed copies of the grant, along with the rent payment, as discussed above by July 30, 2007. If these requirements are not met, your application may be denied.

Please be aware that you may not conduct any activities related to your right-of-way project on public land until you have received an authorized grant from this office. If you have any questions contact Claude Kirby, Realty Specialist, at (760) 251-4852.

Sincerely,

John Kalish

John Kalish

Form 2800-14
(August 1985)

UNITED STATES
DEPARTMENT OF THE INTERIOR
BUREAU OF LAND MANAGEMENT

RIGHT-OF-WAY GRANT/TEMPORARY USE PERMIT

Issuing Office

Palm Springs - South Coast Field Office, Palm Springs, CA

Serial Number

CACA 44491

1. A right-of-way and temporary use permit are hereby granted pursuant to Title V of the Federal Land Policy and Management Act of October 21, 1976 (90 Stat. 2776;43 U.S.C 1761).

2. Nature of Interest:

   a. By this instrument, the Holder:

   Blythe Energy, L.L.C.
   700 Universe Blvd.
   Juno Beach, FL 33408

   receives a right to construct, operate, maintain, and terminate a 230 kV single-circuit overhead electric transmission line using primarily single-column concrete/steel hybrid pole structures, together with related facilities and approved ingress and egress thereto, as described in the approved Plan of Development (POD). The project encompasses the Federal lands described in Exhibit A and depicted on maps set forth in Exhibit B

   b. The total federal right-of-way or permit area granted herein is 95 feet wide and approximately 44.6 miles long, and contains 513 acres, more or less. The Temporary Use Permit (TUP) authorized herein encompasses an additional 57 acres, more or less.

   The temporary work space authorized by the TUP is for use and occupancy only during construction and restoration of the disturbed lands. These areas include, but are not limited to, work areas used to erect the structures, pull sites, laydown areas, and access roads. The Temporary Use Permit will terminate one year from the effective date of the Notice to Proceed issued for construction for this project, unless prior thereto, it is relinquished, terminated or modified. All temporary work areas shall be reclaimed to the satisfaction of the Authorized Officer within 90 days of completion of construction.

   c. This instrument shall terminate 30 years from the date of the grant, unless, prior thereto, it is relinquished, abandoned, terminated, or modified pursuant to the terms and conditions of this instrument or of any applicable Federal law or regulation.

   d. This instrument may be renewed. If renewed, the right-of-way or permit shall be subject to the regulations existing at the time of renewal and any other terms and conditions that the Authorized Officer deems necessary to protect the public interest.

   e. Notwithstanding the expiration of this instrument or any renewal thereof, early relinquishment, abandonment, or termination, the provisions of this instrument, to the extent applicable, shall continue in effect and shall be binding on the Holder, its successors, or assigns, until they have fully satisfied the obligations and/or liabilities accruing herein before or on account of the expiration, relinquishment, abandonment, or prior termination, of the grant.

3. Rental

For and in consideration of the rights granted, the Holder agrees to pay the Bureau of Land Management fair market value rental as determined by the Authorized Officer unless specifically exempted from such payment by regulation. Rental fees for 2007 will be based on the linear right-of-way schedule for transmission lines for Riverside County, California, at $14.60/acre. *Provided, however, that the rental may be adjusted by the Authorized Officer, whenever necessary, to reflect changes in the fair market rental value as determined by the application of sound business management principles, and so far as practicable and feasible, in accordance with comparable commercial practices.

*Each year the Authorized Office will adjust the rental rates according to the Implicit Price Deflator-Gross Domestic Product (IPD-GDP). Adjustments to rental rates may also occur pursuant to changes in regulations. The Bureau of Land Management will provide Holder with written notice of any such rent rate increase at least thirty (30) days prior to the date upon which such increased rent payment is due. Holder shall have the right to appeal any rent increase resulting from changes to the applicable regulations to the Interior Board of Land Appeals pursuant to 43 CFR 2806.21 et seq.

4. Terms and Conditions

a. This grant is subject to all valid rights existing on the effective date of this grant. This grant and permit is issued subject to the Holder's compliance with all applicable regulations, contained in Title 43 Code of Federal Regulations Parts 2800, and with all applicable statutes, and in particular with Title V of the Federal Land Policy and Management Act, 43 USC 1761, and the Endangered Species Act, 16 USC 1531 et seq.

b. Upon grant termination by the Authorized Officer, all improvements shall be removed from the public lands within 180 days, or otherwise disposed of as provided in paragraph (4)(d) or as directed by the Authorized Officer.

c. Each grant issued for a term of 20 years or more shall at a minimum, be reviewed by the Authorized Officer at the end of the 20th year and at regular intervals thereafter not to exceed 10 years. Provided, however, that a right-of-way or permit granted herein may be reviewed at any time deemed necessary by the Authorized Officer.

d. The stipulations, plans, maps, or designs set forth in Exhibit A (Legal Description), Exhibit B (Maps), attached hereto, and Exhibit C (Plan of Development), to be provided no later than fifteen days prior to proposed start of construction and approved in writing by the Authorized Officer before construction may proceed, are incorporated into and made a part of this grant instrument as fully and effectively as if they were set forth herein in their entirety.

e. Failure of the Holder to comply with applicable law, regulation or any provision of this right-of-way grant or permit shall constitute grounds for suspension or termination thereof.

f. The Holder shall perform all operations in a workmanlike manner so as to ensure protection of the environment and the health and safety of the public.

g. Noncompliance with any term or condition of this right-of-way grant will be grounds for an immediate temporary suspension of activities if such noncompliance is not cured within fifteen (15) days from the date of written notice of such default to Holder, and such noncompliance constitutes a threat to public health and safety or the environment.

h. Grant holder shall comply with all mitigation and monitoring to include the terms and conditions within the approved Record of Decision dated April 2, 2007 and the Finding of No Significant Impact and Floodplain Statement of Findings, approved March, 2007.

i. Vegetation removal would be limited to only that necessary for the installation of the poles. No grading or vegetation removal for vehicle access is permitted.

j. The Holder shall be responsible for weed control on disturbed areas within the limits of the right-of-way and the Temporary Use Permit in accordance with the approved restoration plan found in Exhibit C, (Plan of Development) to be provided no later than fifteen days prior to proposed start of construction and approved in writing by the Authorized Officer before construction may proceed.

k. The Holder shall construct, operate, and maintain the facilities, improvements, and structures within this right-of-way in strict conformity with the Blythe Energy Transmission Line Plan of Development and with the environmental protection measures set forth in the Environmental Assessment for the Blythe Energy Project Transmission Line Amendment. Any relocation, additional construction, or use that is not in accord with the approved Plan of Development shall not be initiated without the prior written approval of the Authorized Officer. A copy of the complete right-of-way grant, including all stipulations and approved Plan of Development, shall be made available on the right-of-way area during construction to the Authorized Officer.

l. The Holder shall not initiate any construction on the right-of-way or permit areas without the prior written authorization of the Authorized Officer. Such authorization shall be a written Notice to Proceed (Form 2800-15, or other written notice) issued by the Authorized Officer or representative. Any Notice to Proceed shall authorize construction or use only as therein expressly stated and only for the particular location or use therein described.

m. The Authorized Officer may modify, suspend, or terminate in whole or in part, a Notice-to-Proceed which has been issued when, in his judgment, unforeseen conditions arise which result in the approved terms and conditions being inadequate to protect public health or safety or the environment.

n. Specific sites (i.e. archaeological sites, areas with sensitive species) as identified by the Authorized Officer through the environmental analysis where construction equipment and vehicles shall not be allowed shall be clearly marked onsite by the Holder before any construction or surface disturbing activities begin. The Holder shall be responsible for assuring that construction personnel are well trained to recognize these markers and understand the equipment movement restrictions involved.

o. The Holder shall provide a bond in the amount of $100,000.00 to be maintained until restoration of disturbed areas and other requirements relative to the construction phase of the project have been accepted by the BLM Authorized Officer. Upon completion, or partial completion of these construction-related requirements, the Authorized Officer may terminate or reduce the amount of the bond. Should the bond delivered under this grant become unsatisfactory to the authorized office, the Holder, shall, within 30 days of demand, furnish a new bond.

p. The Holder shall protect all survey monuments found within the right-of-way. Survey monuments include, but are not limited to, General Land Office and Bureau of Land Management Survey Corners, reference corners, witness points, U.S. Coastal and Geodetic benchmarks and triangulation stations, military control monuments, and recognizable civil (both public and private) survey monuments. In the event of

obliteration or disturbance of any of the above, the Holder shall immediately report the incident, in writing, to the Authorized Officer and the respective installing authority if known. Where General Land Office or Bureau of Land Management right-of-way monuments or references are obliterated during operations, the Holder shall secure the services of a registered land surveyor or a Bureau surveyor to restore the disturbed monuments and references using survey procedures found in the Manual of Surveying Instruction of the Survey of the Public Lands in the United States, latest edition. The Holder shall record the survey in the appropriate county and send a copy to the Authorized Officer. If the Bureau surveyors or other Federal surveyors are used to restore the disturbed survey monument, the Holder shall be responsible for the survey cost.

q. The Holder shall comply with all applicable Federal laws and regulations existing or hereafter enacted or promulgated. In any event, the Holder shall comply with the Toxic Substances Control Act of 1976, as amended (15 U S C 2601 et seq. with regard to any toxic substances that are used, generated by, or stored on the right-of-way or on facilities authorized under this right-of-way grant (See 40 CFR, Part 702-799 and especially, provisions on polychlorinated biphenyls, 40 CFR, Part 761) Additionally, any release of hazardous substances, pollutants, or contaminants (leaks, spills, etc) in excess of the reportable quantity established by 40 CFR 302.4 shall be reported as required by the Comprehensive Environmental Response, Compensation and Liability Act of 1980, Section 102(b) (42 USC 9602(b)). A copy of any report required or requested by any Federal agency or State government as a result of a reportable release or spill of any hazardous substances, pollutants, or contaminants shall be furnished to the Authorized Officer concurrent with the filing of the reports to the involved Federal agency or State government.

r. Within 120 days of completion of construction, the Holder will submit to the Authorized Officer as-built drawings and a certification of construction verifying that the facility has been constructed (and tested) in accordance with the design, plans, specifications, and applicable laws and regulations.

s. There is reserved to the Authorized Officer the right to grant to third parties additional rights-of-way or permits for compatible uses on, over, under, or adjacent to the land involved in this grantor permit. The Holder will be notified and have an opportunity to comment on any applications for grants or authorizations to third parties to use the land covered by and adjacent to this grant.

t. The Holder shall comply with all local, state, and Federal ordinances, regulations, statutes, and laws in the construction, operation and maintenance of the project. In addition, the Holder shall comply with all requirements of other authorizing agencies for the project including obtaining Federal, state, and local permits, licenses, and approvals.

u. The Holder shall construct, operate, and maintain the facilities, improvements, and structures within this right-of-way and permit in such a manner as not to impair, hamper, or obstruct the operation and maintenance of Interstate Freeway 10, and to ensure the safe use of the traveling public. Relevant permits shall be obtained from California Department of Transportation.

v. Ninety days prior to termination of the right-of-way, the Holder shall contact the Authorized Officer to arrange a joint inspection of the right-of-way This inspection will be held to agree to an acceptable termination (and rehabilitation) plan The Authorized Officer must approve the plan in writing prior to the Holder's commencement of any termination activities.

6. **Definitions:**

Access Road means any road on Federal lands constructed or used by the Holder for construction and/or ingress and egress to the transmission line system.

Act means the Federal Land Policy and Management Act of October 21, 1976 (43 US C 1701 et seq.)

Authorized Officer means any employee of the Department of the Interior to whom has been delegated the authority to perform the duties described in 43 CFR Part 2800 In respect to this grant or permit this authority has been delegated to the Field Manager, Palm Springs-South Coast Field Office, Bureau of Land Management.

Holder means any applicant who has received a right-of-way grant or temporary use permit

Notice to Proceed (NTP) means a written authorization to initiate right-of-way construction or use for the particular location or use therein described.

Plan of Development is a plan developed by the Holder that sets forth in sufficient detail sequential events and site specific actions at given periods of time during construction and/or any surface disturbing activity so that the Authorized Officer may determine compliance with the terms and conditions of this grant or permit.

Related Facilities means those structures, devices, improvements and sites, the substantially continuous use of which is necessary for the operation or maintenance of the transmission line, which are located on Federal lands, including but not limited to: switches and other control devices, buried communication lines, metering facilities, substation, access roads, supporting structures, and temporary work areas.

Right-of-way means the public lands authorized to be used or occupied pursuant to a right-of-way grant

Right-of-way Grant means an instrument issued pursuant to Title V of the Act, or issued on or before October 21, 1976, pursuant to then existing statutory authority, authorizing the use of a right-of-way over, upon, under, or through public lands for construction, operation, maintenance and termination of a project.

Temporary Use Permit means a revocable nonpossessory privilege to use specified Federal lands in the vicinity of the right-of-way in connection with the construction, operation, maintenance, or termination of the transmission line.

IN WITNESS WHEREOF, The undersigned agrees to the terms and conditions of this right-of-way grant or permit.
