EXECUTIVE SUMMARY

Testimony of Christine Stora

INTRODUCTION

This Final Staff Assessment (FSA) Part A is being published by California Energy Commission (Energy Commission) staff for the proposed amendment to the Palen Solar Power Project (PSPP). The modified project, owned by Palen Solar Holdings, LLC (PSH), is now called Palen Solar Electric Generating System (PSEGS) and proposes to change the solar thermal power-generating technology of the approved project from parabolic trough technology to solar power tower technology.

This FSA Part A contains staff's independent, objective evaluation of PSH's Petition to Amend (09-AFC-7C) for all technical areas except cultural resources which will be provided in Part B, and air quality which will be provided in Part C after the South Coast Air Quality Management District completes its Preliminary Determination of Compliance (PDOC) with its rules and regulations. The staff analyses in the FSA are similar to those normally contained in an Environmental Impact Report (EIR) required by the California Environmental Quality Act (CEQA) except they also include an engineering assessment.

For an amendment for an existing power plant over which it has regulatory oversight, the Energy Commission is the lead state agency under CEQA. The Energy Commission's certified regulatory program provides the environmental analysis that satisfies CEQA requirements. In fulfilling this responsibility, Energy Commission staff provides an independent assessment of the amendment's engineering design, evaluates its potential effects on the environment and on public health and safety, and determines whether the project, if modified, would remain in conformance with all applicable local, state, and federal laws, ordinances, regulations and standards (LORS). Energy Commission staff also recommends any needed modifications to existing mitigation measures (known as conditions of certification) in the Energy Commission Final Decision and proposes additional conditions of certification to mitigate any significant adverse environmental effects of the proposed modifications.

For the ease of the reader, this FSA provides a description of the environmental setting of the entire project. However, because this is an amendment to an existing Energy Commission license, staff's analysis focuses on the technology change proposed for the PSEGS in the Petition to Amend. These specific changes are explained in detail in the **PROJECT DESCRIPTION** section. A summary of the PSEGS project is provided below.

This FSA is not the decision document for these proceedings, nor does it contain findings of the Energy Commission related to environmental impacts or the project's compliance with local, state, and federal LORS. This document will serve as staff's testimony in evidentiary hearings to be held by the assigned Committee. In the evidentiary hearings, the Committee will consider the testimony presented by staff, the applicant, and intervenors, and will also consider the comments and recommendations of governmental agencies, tribes, and the public prior to submitting its proposed decision (Presiding Member's Proposed Decision [PMPD]) to the full Commission.

Following a public hearing(s), the full Energy Commission will make a final decision on the proposed modifications.

PROPOSED PROJECT LOCATION AND DESCRIPTION

On December 17, 2012, the project owner filed a Petition to Amend with the Energy Commission requesting to modify the PSPP (http://www.energy.ca.gov/sitingcases/palen/compliance/). The PSPP, as licensed by the Energy Commission on December 15, 2010, is a 500-megawatt (MW) solar thermal power-generating facility utilizing parabolic trough technology. The project site is approximately 3,794 acres in size and is located approximately 0.25 mile north of Interstate 10, approximately 10 miles east of Desert Center and approximately halfway between the cities of Indio and Blythe, in Riverside County, California.

The modifications proposed in the 2012 Petition to Amend include replacing the parabolic trough solar collection system and associated heat transfer fluid with BrightSource's solar tower technology. Heliostats—elevated mirrors guided by a tracking system mounted on a pylon—focus the sun's rays on a solar receiver steam generator (SRSG) located atop a 750-foot tower near the center of each solar field to create steam to drive a turbine that generates electricity.

The modified project, the PSEGS, would be comprised of two adjacent solar fields and associated facilities with a total combined nominal output of approximately 500 MW. The project owner proposes to develop PSEGS in two operational phases. Each phase would consist of one solar field and power block with approximately 250 MW of generation capacity. Each solar field would have an array of approximately 85,000 heliostats for a total of 170,000 heliostats for the project. Each phase would also share common facilities, including an administration building, warehouse, evaporation ponds, maintenance complex with a meter/valve station for incoming natural gas service to the site, an on-site switchyard, and a single-circuit 230-kV generation tie-line to deliver power to the electricity grid. Other on-site facilities would include access and maintenance roads (either dirt, gravel, or paved), perimeter fencing, tortoise fencing, and other ancillary security facilities.

The PSEGS amendment does not propose to change the generating capacity of the PSPP, or the site access, or the interconnection point at the Red Bluff Substation, although there would be a slight re-routing of the generation tie-line near the western end of the route and around the newly constructed Red Bluff Substation. A new natural gas pipeline is also proposed.

PURPOSE AND NEED FOR AN AMENDMENT

PSH acquired the PSPP site in order to develop BrightSource's proprietary solar thermal tower technology on the site. This change in technology could not have been anticipated during the original permitting process because, at the time of the original licensing, the project was owned by Solar Millennium and was to use parabolic trough technology. The Energy Commission approved the change in ownership for the PSPP project on July 11, 2012.

U.S. BUREAU OF LAND MANAGEMENT COORDINATION

The PSEGS is proposed to be located entirely on public land managed by the Bureau of Land Management (BLM). A Record of Decision (ROD) and Right of Way (ROW) grant from BLM, in addition to an Energy Commission license, would be required before the proposed project could commence construction. During the PSPP proceeding in 2009 and 2010, Energy Commission staff and BLM staff worked closely together on the review and analysis of the PSPP. The Energy Commission and BLM staff issued a joint Draft Environmental Impact Statement/Staff Assessment (DEIS/SA) for the PSPP on March 18, 2010. The DEIS/SA contained the Energy Commission staff's and BLM's environmental, public health, and engineering evaluation of the PSPP.

During the original licensing case, the Energy Commission and BLM determined that they would develop and publish separate final documents. On May 13, 2011, the BLM Published a Notice Of Availability (NOA) of the Final Environmental Impact Statement for the PSPP in the Federal Register. BLM never made a final decision on the PSPP; therefore, neither a ROD nor a ROW grant was issued.

On February 8, 2013, the BLM received a Revised Plan of Development for the PSEGS from PSH. The BLM issued the PSEGS Plan Amendment/Draft Supplemental Environmental Impact Statement on July 27, 2013. If the project is approved by the BLM, the BLM will issue a ROD and a ROW grant for the PSEGS.

Currently, the project owner is preparing a draft Reclamation & Decommissioning Plan for the project and will submit the plan to BLM prior to the release of the Final EIS. This document, in conjunction with the **General Conditions** provided in this FSA, will outline the requirements for facility closure of PSEGS.

Although the Energy Commission and BLM are not publishing a joint document for the PSEGS, the Energy Commission and the BLM continue to share staff expertise, information, and documentation in order to promote intergovernmental coordination at the state, and federal levels.

CUMULATIVE IMPACTS

See **EXECUTIVE SUMMARY ATTACHMENT A** at end of the section.

ENVIRONMENTAL JUSTICE

Environmental justice communities are commonly identified as those where residents are predominantly minorities or low-income; where residents have been excluded from the environmental policy setting or decision-making process; where they are subject to a disproportionate impact from one or more environmental hazards; and where residents experience disparate implementation of environmental regulations, requirements, practices, and activities in their communities. Environmental justice efforts attempt to address the inequities of environmental protection in these communities.

An environmental justice analysis is composed of three parts:

1. identification of areas potentially affected by various emissions or impacts from a proposed project;

2. a determination of whether there is a significant population of minority persons or persons below the poverty level living in an area potentially affected by the proposed project; and

3. a determination of whether there may be a significant adverse impact on a population of minority persons or persons below the poverty level caused by the proposed project alone, or in combination with other existing and/or planned projects in the area.

CALIFORNIA RESOURCES AGENCY

California law defines environmental justice as "the fair treatment of people of all races, cultures and income with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies" (Gov. Code §65040.12; Pub. Resources Code, §72000). All departments, boards, commissions, conservancies and special programs of the Resources Agency must consider environmental justice in their decision-making process if their actions have an impact on the environment, environmental laws, or policies. Such actions that require environmental justice consideration may include:

- adopting regulations;
- enforcing environmental laws or regulations;
- making discretionary decisions or taking actions that affect the environment;
- providing funding for activities affecting the environment; and
- interacting with the public on environmental issues.

DEMOGRAPHIC SCREENING ANALYSIS

For all siting cases, Energy Commission staff uses a demographic screening tool (Socioeconomic Figure 1) as part of its CEQA analysis. Based on 2010 census block data, Socioeconomic Figure 1 shows the percentage of the minority population within the six-mile buffer of the project site. The Council on Environmental Quality's *Environmental Justice: Guidance Under the National Environmental Policy Act*, dated December, 1997, defines minority individuals as members of the following groups: American Indian or Alaskan Native; Asian or Pacific Islander; Black, not of Hispanic origin; or Hispanic.

The *Final Guidance for Incorporating Environmental Justice Concerns in USEPA's National Environmental Policy Act (NEPA) Compliance Analysis*, dated April, 1998, considers a minority population to be present when the minority population of the potentially affected area is greater than 50 percent or when the minority population percentage is meaningfully greater than the minority population in the general population or other appropriate unit of geographic analysis. That guide also provides staff with information on outreach and public involvement.

SUMMARY OF ENVIRONMENTAL CONSEQUENCES AND MITIGATION

Below is a summary of environmental consequences and mitigation proposed in this FSA. This section also provides a summary of outstanding information that will be analyzed in the FSA.

Executive Summary - Table 1
Environmental and Engineering Assessment

AIR QUALITY/GREENHOUSE GASES

Air Quality/Greenhouse Gases will be provided in Part C of the FSA. Part C will be published 30 days after staff receives the PDOC.

BIOLOGICAL RESOURCES

Staff finds that the PSEGS would have significant impacts to biological resources, impacting all of the Sonoran creosote bush scrub, sand dunes, desert washes and other native plant and wildlife communities within the PSEGS boundaries as well as along the natural gas line corridor and the proposed and approved generation tie-line corridor. The PSEGS project as proposed would leave the majority of the vegetation within heliostat fields intact, while adding roads and other improvements only where necessary for project development and operation. The PSEGS would eliminate the engineered channels of the approved PSPP and most of the natural drainage features will be maintained and any grading required will be designed to promote sheet flow where possible. However, staff is assuming a total loss of the function and value of the vegetation and habitats within the project site because perimeter fencing will exclude most terrestrial animals, and ongoing disturbance, noise, and other anthropogenic activities at the site may continue to degrade habitat functions within the project footprint. Wildlife and plants that are tolerant to disturbance may continue to occupy the site, however, staff does not consider leaving the vegetation on site a benefit to these species due to the ongoing risk of injury or mortality from construction equipment or operational work including mowing, maintenance, and washing of the heliostats.

The solar tower technology creates a new impact, solar flux. Flux is concentrated over the heliostat field, starting at the mirror face and increasing in intensity as the reflected sunlight concentrates at the top of the tower. Exposure to elevated flux may cause injury or death to various bird and bat species. Additionally, the heliostats may reflect the sky, creating a water-like mirage effect in the heliostat field for each tower. It is possible for birds to be attracted to the project site by this effect, and collide with mirrors. Mirror collision was also identified as a project impact of the PSPP project. The evaporation ponds and adjacent date-palm and jojoba agricultural operations may attract insects, bats, and birds, increasing their risk from collision or exposure to elevated levels of solar flux.

Staff finds that impacts to the sand transport corridor (critical habitat for the Mojave fringe-toed lizards and several special-status plants) would increase over the approved alternative configurations in the PSPP decision. Direct and indirect impacts to the sand transport corridor would occur. In comparison with the approved PSPP Reconfigured Alternative #3, the project would increase direct impacts to the sand transport corridor by 370 acres, and would increase indirect impacts to the sand transport corridor by 316 acres. Staff believes that implementation of Condition of Certification **BIO-20** would mitigate onsite direct impacts, as well as offsite indirect impacts.

A summary of biological resource impacts and mitigation proposed by staff is provided in **Executive Summary – Table 2.**

Executive Summary - Table 2
Summary of Biological Resources Impacts and Mitigation

Biological Resource	Impact/Mitigation
Sonoran Creosote Bush Scrub & Associated Wildlife Habitat	**Direct Impacts:** Permanent loss of 3,335[a] acres; fragmentation of adjacent wildlife habitat and native plant communities. **Indirect Impacts:** Disturbance (noise, lights, dust) to surrounding plant and animal communities; spread of non-native invasive plants; changes in drainage patterns downslope of project; erosion and sedimentation of disturbed soils. **Cumulative Impacts:** Contributes to cumulatively considerable loss of habitat, fragmentation, and indirect effects from past, present, and foreseeable future projects in the California Desert region of the NECO planning area. **Mitigation:** Off-site habitat acquisition and enhancement (**BIO-12**); implement impact avoidance and minimization measures (**BIO-8)** and weed control plan (**BIO-14**). **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation; Cumulative Impacts are Less than Significant with Mitigation.
Stabilized and Partially Stabilized Dunes	**Direct Impacts:** Permanent loss of 187 acres of stabilized and partially stabilized dune habitat; potential accidental direct impacts to adjacent preserved habitat during construction and operation. **Indirect Impacts:** Disruption of sand transport corridor resulting in downwind impacts to sand dune habitat; introduction and spread of non-native invasive plants; erosion and sedimentation of disturbed soils; fragmentation and degradation of remaining habitat. **Cumulative Impacts:** Contributes substantially~~100%~~ to cumulative impacts~~loss~~ from future projects within Chuckwalla Valley and NECO planning area. **Mitigation:** Implement **BIO-20,** Sand Dune Community Impact Mitigation. **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation; Cumulative Impacts are Less than Significant with Mitigation.
Waters of the State/ Sensitive Plant Communities	**Direct Impacts:** Permanent loss biological functions and values of 375.3[a] acres of state waters, including: • 206.5 [a] acres desert dry wash woodland • 168.2 [a] acres of unvegetated ephemeral dry wash **Indirect Impacts:** Indirect impacts to approximately 0.55 acres of state waters. Impacts include colonization of invasive weeds and erosion/sedimentation to downstream areas. **Cumulative Impacts:** Contributes to cumulative loss of habitat from future projects within the Chuckwalla Valley and NECO planning area. Indirect effects cumulatively considerable. **Mitigation:** Acquisition and enhancement of 788 acres of ephemeral desert washes, implementation of avoidance and minimization measures to protect state waters (**BIO-21**); implement weed management plan (**BIO-14**). **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation; Cumulative Impacts are Less than Significant with Mitigation.

Biological Resource	Impact/Mitigation
Groundwater-dependent Plant Communities	**Direct Impacts:** None. The effects of pumping may take several-to-many years to appear, depending on the degree of separation in the confining layers between the shallow aquifer (supporting plants) and deep aquifers (where pumping will occur); see below. **Indirect and Cumulative Impacts:** Potential for significant adverse effects to groundwater-dependent plant ecosystems (GDEs) near Palen Dry Lake, including loss of habitat function and value for wildlife, reduced plant cover which increases wind erosion and affects air quality, increase in weedy species, impacts to special-status species inhabiting the GDEs. Even minor individual impacts to GDEs are considered cumulatively considerable. **Mitigation:** Monitoring groundwater-dependent plant communities near the project site (**BIO-23**) and implementation of remedial action and compensatory mitigation if adverse effects are detected (**BIO-24**). **BIO-7** BRMIMP ensures enforcement of all conditions of certification. **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation Cumulative Impacts are Less than Significant with Mitigation.
Desert Tortoise	**Direct Impacts:** Potential take of individuals during operation and construction; permanent loss of 3,948[a] acres (including 228[a] acres of critical habitat) of low to moderate quality desert tortoise habitat and fragmentation of surrounding habitat. **Indirect Impacts:** Increased risk of predation from ravens, coyotes, feral dogs; disturbance from increased noise and lighting; introduction and spread of weeds; increased road kill hazard. **Cumulative Impacts:** Contributes to cumulative loss of low to moderate value desert tortoise habitat from future projects in NECO, based on USGS habitat model (Nussear et al. 2009). Impedes movement in the region. Impacts to higher quality habitat values less than cumulatively considerable. **Mitigation:** Implement avoidance and minimization measures (**BIO-6** through **BIO-11**) and acquire 4,860 acres of desert tortoise habitat (**BIO-12**). **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation; Cumulative Impacts are Less than Significant with Mitigation.

Biological Resource	Impact/Mitigation
Mojave Fringe-toed Lizard	**Direct Impacts:** Mortality to individuals during construction and permanent loss of 1,480 acres of Mojave fringe-toed lizard habitat; increased road kill hazard from construction traffic; potential accidental direct impacts to adjacent preserved habitat during construction and operation, increased risk of disturbance or mortality from vegetation management activities. **Indirect Impacts:** Disruption of sand transport (25%-100%); introduction and spread of non-native invasive plants; erosion and sedimentation of disturbed soils; fragmentation and degradation of remaining habitat; increased road kill hazard from construction and operations traffic; harm from accidental spraying/drift of herbicides and dust suppression chemicals. **Cumulative Impacts:** Contributes substantially to cumulative loss of Mojave fringe-toed lizard habitat in the Chuckwalla Valley. Project's contribution to fragmentation and indirect impacts cumulatively considerable. **Mitigation:** Implement **BIO-20,** Mojave fringe-toed lizard compensation, and **BIO-8,** impact avoidance and minimization measures; **BIO-14** weed management plan. **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation; Cumulative Impacts are Less than Significant with Mitigation.
Western Burrowing Owl	**Direct Impacts:** Permanent loss of breeding and foraging habitat for at least two pairs of resident burrowing owls; potential loss of eggs and young **Indirect Impacts:** Degradation and fragmentation of remaining adjacent habitat from edge effects; disturbance of nesting and foraging activities for nesting pairs near the plant site and linear facilities. Collisions with project features, glare, also collision, electrocution, glare, and exposure to elevated levels of solar flux. Increased road kill hazard from operations traffic and collision with mirrors; increased predation from ravens; disturbance of nesting activities from operations. **Cumulative Impacts:** Contributes to cumulative loss of habitat from future projects in the Chuckwalla Valley and NECO planning area. Indirect impacts also cumulatively considerable. **Mitigation:** Implement burrowing owl impact avoidance and mitigation measures, including a minimum acquisition of 78 acres of burrowing owl habitat (**BIO 18**). If additional breeding owls are detected additional compensatory mitigation will be required. Additionally, implement impact avoidance and minimization measures (**BIO-1** through **BIO-8**); pre-construction nest surveys (**BIO-15**); avian enhancement and conservation plan (**BIO-16a**), and avian and bat protection plans (**BIO-16b**). **Impact Significance:** Direct Impacts are Less than Significant with Mitigation; Indirect Impacts May Remain Significant After Mitigation; Cumulative Impacts May Remain Significant After Mitigation

Biological Resource	Impact/Mitigation
Golden Eagle/Bald Eagle	**Direct Impacts**: Loss of foraging habitat, potential mortality or disturbance during construction and operation, loss or fragmentation of habitat, displacement, and disruption of movement. **Indirect Impacts**: Collision, glare, electrocution, and death or injury from exposure to concentrated solar flux. Fragmentation of local population; introduction and spread of non-native invasive plants; increased risk of fire; and degradation of off-site springs or seeps. Weed abatement, mirror washing and maintenance. Glare or heat associated with the heliostats may also adversely affect bird's use of the site. **Cumulative Impacts:** The modified project would contribute to cumulative loss of foraging habitat (Sonoran creosote scrub and desert dry wash woodland) within a 140-mile radius of the project, and also would contribute to cumulatively considerable loss of habitat, fragmentation, and direct loss of these species from past, present, and foreseeable future projects within 140-mile radius of the modified project. Fragmentation and indirect impacts also would be cumulatively considerable. Mitigation: Off-site habitat acquisition and enhancement (**BIO-12** and **BIO-21**); pre-construction nest surveys (**BIO-15**); avian enhancement and conservation plan (**BIO-16a**), and avian and bat protection plans (**BIO-16b**). **Impact Significance:** Direct Impacts are Less than Significant with Mitigation; Indirect Impacts May Remain Significant After Mitigation; Cumulative Impacts May Remain Significant After Mitigation.
Special-status Avian Species	**Direct Impacts:** Permanent loss of breeding and foraging habitat, Sonoran creosote bush scrub and desert dry wash woodland); potential loss of eggs and young; disturbance of nesting and foraging activities for populations on and near the plant site and linear facilities; degradation and fragmentation of remaining adjacent habitat from edge effects; disturbance from operations. **Indirect Impacts:** Increased road kill hazard from operations traffic; increased predation from ravens; fragmentation of local population; introduction and spread of non-native invasive plants; increased risk of fire; degradation of off-site springs or seeps; weed abatement; mirror washing and maintenance; death or injury from exposure to concentrated solar flux; and glare or heat associated with the heliostats may adversely affect bird's use of the site. **Cumulative Impacts:** Contributes cumulative loss of habitat from future projects within NECO planning area desert dry wash woodland. Project's cumulative contribution to fragmentation, indirect impacts, and direct loss of special status and migratory birds from collisions and exposure to solar flux would be considerable. **Mitigation:** Implement impact avoidance and minimization measures (**BIO-1** through **BIO-8**); pre-construction nest surveys (**BIO-15**); avian protection plan (**BIO-16**) off-site habitat acquisition and enhancement (**BIO-12**). Pre-construction nest surveys (**BIO-15**); avian enhancement and conservation plan (**BIO-16a**), and avian and bat protection plans (**BIO-16b**). **Impact Significance:** Direct Impacts are Less than Significant with Mitigation; Indirect Impacts May Remain Significant After Mitigation; Cumulative Impacts May Remain Significant After Mitigation.

Biological Resource	Impact/Mitigation
Special Status Bats	**Direct Impacts**: No anticipated direct loss of maternity, day roosts, or hibernacula. Loss of foraging habitat. Bats that forage near the ground, such as the pallid bat, would also be subject to crushing or disturbance by vehicles driving at dusk, dawn, or during the night. Collision with facility structures, exposure to concentrated solar flux **Indirect Impacts**: the loss of foraging habitat due to type conversion, night time lighting that exposes bats to predation, and alteration in prey base. Degradation to groundwater dependent communities in the vicinity of the project site. **Cumulative Impacts**: Contributes to cumulatively considerable loss of habitat, fragmentation, and direct loss of these species from past, present, and foreseeable future projects in the Chuckwalla Valley. Mitigation: **BIO-1** through **BIO-8** requires avoidance and minimization measures during life of project, construction monitoring, worker training, fugitive dust control, fire prevention and weed management. pre-construction nest surveys (**BIO-15**); avian enhancement and conservation plan (**BIO-16a**), and avian and bat protection plans (**BIO-16b**). **BIO-23** requires monitoring to track the impacts of pumping to groundwater levels as they develop during the life of the project, and defines triggers for adaptive management to be implemented if data indicate impending adverse effects. **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation; Cumulative Impacts are Less than Significant with Mitigation.
Desert Kit Fox & American Badger	**Direct Impacts:** Permanent loss of 3,899[a] acres of habitat; fragmentation and degradation of remaining habitat, loss of foraging grounds, crushing or entombing of animals during construction; increased risk of road kill hazard from construction traffic. **Indirect Impacts:** Disturbance from increased noise and lighting; introduction and spread of weeds; increased risk of road kill from operations traffic; increased risk of infection from Canine Distemper Virus (CDV) during passive relocation or hazing activities conducted in an area experiencing or adjacent to distemper cases, increased risk of disturbance or mortality from vegetation management activities. **Cumulative Impacts:** Contributes to cumulative loss of habitat from future projects within the NECO planning area. Project's contribution to fragmentation and indirect impacts also cumulatively considerable. **Mitigation:** Implementation of impact avoidance and minimization measures (**BIO-17**); off-site habitat acquisition and enhancement (**BIO-12**). **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation; Cumulative Impacts are Less than Significant with Mitigation.

Biological Resource	Impact/Mitigation
Special Wildlife Management Areas	**Desert Wildlife Management Areas:** A portion of the proposed generation tie-line would be located in the Chuckwalla DWMA south of I-10. **Areas of Critical Environmental Concern:** None. **Wildlife Habitat Management Areas:** Contributes to the loss of Sonoran creosote scrub and desert dry wash woodland habitat from future projects within Palen-Ford WHMA. Project would not contribute to the loss of sand dune communities within the WHMA. Contributes to the loss to the DWMA Connectivity WHMA. No cumulative contribution to habitat loss in Big Maria Mountains WHMA. **Desert Tortoise Critical Habitat:** Approximately 228 acres of the southwestern corner of the project overlaps the northern boundary of the Chuckwalla Desert Tortoise Critical Habitat Area. **Mitigation:** Mitigate loss of critical habitat with acquisition and preservation of suitable desert tortoise at a 5:1 ratio (**BIO-12**). **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation; Cumulative Impacts are Less than Significant with Mitigation.
Special-status Plants	**Direct Impacts:** – • Harwood's milk-vetch: Less-than-significant direct loss of approximately six in Project Disturbance Area; • Harwood's eriastrum: No direct impacts; • California ditaxis: Loss of 11 plants significant; • Ribbed cryptantha: abundant throughout the vicinity; less-than-significant direct effect; • New taxon of saltbush: No direct impacts. • Late-season plants: no direct impacts within approved PSPP project footprint. Potentially significant impacts to fall-blooming plants not detected during spring surveys along new PSEGS features, including modified generation tie-line corridor (Sonoran creosote bush scrub and dry desert wash woodland). **Indirect Impacts:** Minor to potentially significant indirect impacts to all plants in close proximity to site from introduction and spread of non-native invasive plants; increased risk of fire; altered drainage patterns downstream of site; erosion and sedimentation of disturbed soils; accidental chemical and herbicide drift; disruption of photosynthesis and other metabolic processes from dust; fragmentation of population and impaired gene flow and increased vulnerability to local extinctions, and accidental impacts to avoided plants during construction. **Cumulative Impacts:** Project's contribution to spread of weeds, fragmentation, altered hydrology, and risk of fire is cumulatively considerable, however these effects would be reduced through the implementation of staffs proposed conditions of certification. **Mitigation:** Implement impact avoidance and minimization measures (**BIO-8**); Avoidance and minimization measures (**subsection A, BIO-19**); conduct fall surveys (subs**ection B, BIO-19**) and mitigate according to thresholds in **BIO-19**); implement avoidance and compensation mitigation according to performance standards in subs**ection D, BIO-19**; implement weed management plan (**BIO-14**); implement worker training in fire prevention (**BIO-8**). **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation; Cumulative Impacts are Less than Significant with Mitigation.

Staff finds that the PSEGS will comply with LORS, but is uncertain that mitigation for avian species will mitigate the potential impacts to less than significant.

CULTURAL RESOURCES

Cultural Resources will be published in Part B of the FSA. It is anticipated that Part B will be published the week of September 16, 2013.

HAZARDOUS MATERIALS

Staff proposed Hazardous Materials Management conditions of certification are slightly modified from the existing conditions of certification to account for the discontinuation of the project's use of heat transfer fluid (HTF) and propane, and the addition of natural gas and a gas pipeline.

Revised Condition of Certification **HAZ-2** ensures that local emergency response services are notified of the amounts and locations of hazardous materials at the facility and safety plans, existing Condition of Certification **HAZ-3** requires the development of a Safety Management Plan that addresses the delivery of all liquid hazardous materials during the construction, commissioning, and operation of the project would further reduce the risk of any accidental release not specifically addressed by the proposed spill prevention mitigation measures, and further prevent the mixing of incompatible materials that could result in the generation of toxic vapors. Revised Condition of Certification **HAZ-4** addresses the use of natural gas and prohibits its use to clear pipes. Site security during both the construction and operation phases is addressed in existing Condition of Certification **HAZ-5** and revised Condition of Certification **HAZ-6.**

Staff concludes that there is insignificant potential for a hazardous materials release to have an impact beyond the facility boundary, and therefore concludes there is also insignificant potential for significant impacts to the environment.

LAND USE

Staff concludes the modifications proposed for the PSEGS would not disrupt or divide an established community, or convert farmland to non-agricultural use or forest land to non-forest use. Staff has made minor clarifying edits to the single land use Condition of Certification from the Energy Commission PSPP Final Decision.

NOISE AND VIBRATION

Because construction and operational noise for PSEGS would be the same or less than for the PSPP, staff does not propose any changes to the noise and vibration Conditions of Certification.

PUBLIC HEALTH

According to the results of staff's health risk assessment, emissions from PSEGS would not contribute significantly to morbidity or mortality in any age or ethnic group residing in the project area. Only clarifying changes to **PUBLIC HEALTH-1** are proposed.

SOCIOECONOMICS

Staff concludes that the construction and operation of the PSEGS would not cause a significant adverse direct or indirect impact on the area's housing, schools, law enforcement services, or parks. The project would not directly or indirectly induce a substantial population growth or displacement of population, or induce substantial increases in demand for housing, parks, or law enforcement services. However, when considered cumulatively with the other proposed and approved projects, temporary lodging may be constrained in the local and regional study areas, thus contributing to a cumulative impact. PSEGS operations would not create a significant adverse socioeconomic cumulative impact on the area's housing, schools, law enforcement services, or parks.

Staff concludes the population in the six-mile project buffer does not constitute an environmental justice population as defined by *Environmental Justice: Guidance under the National Environmental Policy Act*, and would not trigger further scrutiny for purposes of an environmental justice analysis. Staff notes that the BLM July 2013 PSEGS Draft Supplemental Environmental Impact Statement used different demographic metrics and identified an environmental justice population, where Energy Commission staff did not. However, the BLM found no disproportionate adverse impacts from the PSEGS to the BLM-identified environmental justice population.

SOIL & WATER RESOURCES

Staff determined that construction, operation, non-operation and closure of the proposed PSEGS could potentially impact soil and water resources. The PSEGS would be located on an alluvial fan where flash flooding and mass erosion could impact the project. Project-related changes to the alluvial fan hydrology could result in impacts to adjacent land users. Five PSPP conditions of certification were deleted because of changes to the drainage design for the PSEGS. A Draft Drainage, Erosion, and Sedimentation Control Plan (DESCP) has been developed, by the project owner to mitigate the potential storm water and sediment project-related impacts by implementing Best Management Practices (BMPs) during construction and operations. A new condition of certification was also added for the PSEGS to address potential impacts from storm damage to the heliostats. Additional conditions are proposed to reduce damage and injury caused by potential flash flooding.

The PSEGS project would use less water during construction and operation than the PSPP, and the PSPP conditions of certification have been updated to reflect these changes. Changes to the conditions reduce the maximum limit of water usage and construction duration to match the PSEGS project description. The waste discharge requirements for wastewater disposal to lined evaporation ponds have also been revised to reflect the smaller ponds now needed for the reduced wastewater volume. The requirements for a Land Treatment Unit would also be removed since no heat transfer fluid requiring bioremediation would be used for PSEGS operation.

A summary of proposed modifications to the **Soil and Water Resources** Conditions of Certification is shown in **Executive Summary Table 3**.

Executive Summary Table 3
Summary of Proposed Modifications to Conditions of Certification

Condition of Certification	Proposed Modification(s) to Condition
SOIL&WATER-1	DRAINAGE EROSION AND SEDIMENTATION CONTROL PLAN (DESCP): Edit to items C and N.
SOIL&WATER-2	PROJECT GROUNDWATER WELLS, PRE-WELL INSTALLATION: No change.
SOIL&WATER-3	CONSTRUCTION AND OPERATION WATER USE: Reduce maximum limit of water usage and construction duration to match the project description.
SOIL&WATER-4	GROUNDWATER LEVEL MONITORING, MITIGATION AND REPORTING: No change.
SOIL&WATER-5	COMPENSATION FOR WELL IMPACTS: No change.
SOIL&WATER-6	WASTE DISCHARGE REQUIREMENTS: Delete a typo. Revise requirements specified in Appendix B, C, and D to match the modified project.
SOIL&WATER-7	SEPTIC SYSTEM AND LEACH FIELD REQUIREMENTS: No change.
SOIL&WATER-8	REVISED PROJECT DRAINAGE REPORT AND PLANS: Delete.
SOIL&WATER-9	DETAILED FLO-2D ANALYSIS: Delete.
SOIL&WATER-10	DRAINAGE CHANNEL DESIGN: Delete.
SOIL&WATER-11	CHANNEL EROSION PROTECTION: Delete.
SOIL&WATER-12	CHANNEL MAINTENANCE PROGRAM: Delete.
SOIL&WATER-13	CLOSURE PLAN: Text changed to match language in the GENERAL CONDITIONS section.
SOIL&WATER-14	MITIGATION OF IMPACTS TO THE PALO VERDE MESA GROUNDWATER BASIN: No change.
SOIL&WATER-15	GROUNDWATER PRODUCTION REPORTING: No change.
SOIL&WATER-16	GROUND SUBSIDENCE MONITORING AND ACTION PLAN: Change “applicant” to “project owner”.
SOIL&WATER-17	ESTIMATION OF SURFACE WATER IMPACTS: Edit to verification.
SOIL&WATER-18	GROUNDWATER QUALITY MONITORING AND REPORTING PLAN: Change “applicant” to “project owner”.
SOIL&WATER-19	NON-TRANSIENT, NON-COMMUNITY WATER SYSTEM: No change.
SOIL&WATER-20	STORM WATER DAMAGE MONITORING AND RESPONSE PLAN: New.

TRAFFIC & TRANSPORTATION

Staff concludes that with proposed changes to the conditions of certification that impacts to traffic level of service on Corn Springs Road and the Corn Springs Road and Interstate 10 (I-10) ramp intersections that traffic impacts would be less than significant.

Staff also determined that there is no risk for either photothermal or photochemical retinal damage to motorists, pilots or the general civilian population outside of the PSEGS site from either the heliostats or solar power tower solar receiver steam generators (SRSGs). However, without mitigation, direct solar reflections from the heliostats (DSRH) would cause drivers on I-10 to experience discomfort glint and glare, and potentially disability glint and glare. Implementation of proposed Condition of Certification **TRANS-7** requires a Heliostat Positioning and Monitoring Plan that would minimize the frequency of DSRH events during the testing, calibration and operational phases of the PSEGS, resulting in less than significant impacts to motorists and pilots.

Sustained glare from the solar power tower solar receiver steam generators (SRSGs) during nominal operating conditions (where luminance would be less than 1×10^6 candelas per meter squared [cd/m^2]) would not produce discomfort or disability glare that would interfere with motorists' or pilots' abilities to operate their vehicles and planes, respectively. However, at higher luminance levels, the SRSGs could produce discomfort or disability glare that would significantly impact drivers on I-10. To ensure that the SRSGs operate at acceptable luminance levels that would not impact the traveling public, staff has proposed Condition of Certification **TRANS-8** to require a solar power tower receiver luminance and monitoring plan. **TRANS-8** would provide procedures for the identification and mitigation of visual distraction, discomfort glare, or disability glare effects with the potential of causing significant impacts to motorists.

TRANSMISSION LINE SAFETY AND NUISANCE

Since the proposed PSEGS transmission line would be operated to minimize health, safety, and nuisance impacts and would be routed through an area with no residences in its immediate vicinity, staff considers the proposed design, maintenance, and construction plan as complying with the applicable LORS. Staff does not propose any changes to the PSPP conditions of certification for the proposed PSEGS modifications.

VISUAL RESOURCES

Energy Commission staff identified significant unmitigatable impacts in the Visual Resources technical area.

Staff concludes that the PSEGS would result in a substantial adverse impact to existing scenic resource values, as seen from several viewing areas and Key Observation Points in the project vicinity and Chuckwalla Valley area, including:

- Eastbound and westbound Interstate 10 (I-10), which is located immediately south of the project site and transmission line;
- State Route 177, to the west and northwest of the project site;
- Joshua Tree National Park to the west and northwest of the project site;
- Palen McCoy Wilderness to the northeast of the project site;
- Chuckwalla Mountains Wilderness to the south of the project site; and
- Corn Springs Road in the immediate vicinity of the project site.

Staff concludes that these visual impacts would be significant in terms of three of the four criteria of CEQA Appendix G, could not be mitigated to less than significant levels, and would thus result in significant and unavoidable impacts under CEQA. Staff also concludes that the project's contribution to significant cumulative visual effects would be cumulatively considerable when combined with the effects of other renewable and development projects along the I-10 corridor, within the Chuckwalla Valley, and within the California Desert Conservation Area as a whole.

In addition, staff concludes that the project would not be consistent with several applicable goals and policies of the Riverside County Integrated Plan. Staff proposes modification to the PSPP conditions of certification to minimize PSEGS impacts to the greatest feasible extent.

WASTE MANAGEMENT

Based on estimates provided by the project owner, disposal of non-hazardous PSEGS wastes would be approximately the same as the original project, and would not adversely impact Class III landfill capacity and disposal of project-related hazardous wastes would not adversely impact Class I landfill capacity.

Because the proposed amended project would employ the BrightSource power tower technology, which would eliminate parabolic trough technology and the need for HTF, staff is recommending the deletion of Waste Discharge Requirement stipulations for treatment of HTF-contaminated soils (**WASTE-8**). PSPP waste management Conditions of Certification Waste-1 through 7 will still apply and only editorial edits are proposed.

WORKER SAFETY AND FIRE PROTECTION

Staff has considered the position of Palen Solar Holdings LLC and the Riverside County Fire Department (RCFD) and all relevant information as well as past and current experience at other solar power plants in California and has determined that the modified project would cause a significant direct impact on local fire protection services, but not cause a significant cumulative impact. A direct impact is caused by the need to equip and train the fire department to respond to the specific unique hazards posed by solar tower technology which would be new to the county. No significant cumulative impact would occur because the construction and operation of this solar power plant is not likely to change the overall hazard profile of facilities requiring emergency response in the county, emergency events at this solar power plant are not likely to escalate within or beyond the power plant site, and emergencies are not likely to occur simultaneously with other facilities.

Therefore, staff is proposing mitigation to reduce the direct impact to less than significant by requiring payment to the RCFD for capital improvements and annual support (see proposed revised Condition of Certification **WORKER SAFETY-7**). Staff is also proposing a new condition (**WORKER SAFETY-10**) that would clarify the requirement for the project owner to submit plans for all fire detection and suppression systems to the RCFD and to pay the fire department’s usual and customary fee for those reviews and subsequent inspections.

And, in order to protect workers from potential exposure to Valley Fever, staff proposes a revision to an existing condition of certification, now numbered **WORKER SAFETY-8**, that would require enhanced dust control measures. Additionally, staff proposes **WORKER SAFETY-12**, which would require reporting of confirmed VF cases (along with heat stress incidences) to the Energy Commission staff.

Staff proposes a new condition of certification (**WORKER SAFETY-11)** that would require a Tower Access and Safety Plans, one for construction and one for commissioning and operations, be prepared and implemented to control access to the towers, address fire detection and suppression systems, and ensure that the emergency hoist systems and backup power supply for the elevators and hoists are in place. Lastly, staff deleted and revised various conditions that pertained to design features of the previously-approved Palen project.

With these modifications, staff believes the project would incorporate sufficient measures to ensure adequate levels of industrial safety and comply with applicable LORS. **WORKER SAFETY-8** (enhanced dust control measures) would minimize the potential impacts of Valley Fever, and would not significantly impact the provision of emergency services.

FACILITY DESIGN

Staff concludes that the design, construction, and eventual closure of the PSEGS and its linear facilities would comply with applicable engineering laws, ordinances, regulations, and standards. The proposed PSEGS modifications, as described in the Petition to Amend, would not change staff's analysis or the conditions of certification in the December 2010 Energy Commission Final Decision for the approved PSPP.

GEOLOGY AND PALEONTOLOGY

Staff believes that the potential is low for significant adverse impacts to the proposed project from geologic hazards during its design life. The potential for significant adverse impacts to potential geologic and mineralogic resources from the construction, operation, and closure of the proposed project is also low.

In areas where soils are exposed by conventional excavation operations, potential impacts to paleontologic resources would be mitigated through worker training and monitoring by qualified paleontologists, as required by the existing PSPP conditions. Existing studies indicate the soils beneath the solar field are likely to contain Pleistocene-age vertebrate fossils. Based on existing information, the proposed method of construction would create a significant impact to paleontological resources in the area where heliostat pylons are proposed. Staff has proposed conditions of certification to reduce the impacts to less than significant.

POWER PLANT EFFICIENCY

The PSEGS would use solar energy to generate a minimum 98 percent of its annual electrical energy production. Fossil fuel, in the form of natural gas, would be used only to reduce startup time and to keep the temperature of the steam generation system above freezing. Compared to the project's expected overall production rate of approximately 1,412,300 MWh (megawatt-hours) per year, and compared to a typical fossil fuel-fired power plant of equal capacity, the amount of the annual power production from fossil fuel is insignificant, at less than 2 percent.

The project would decrease reliance on fossil fuel and would increase renewable energy generation. It would not create significant adverse effects on fossil fuel energy supplies or resources, would not require additional sources of energy supply, and would not consume fossil fuel energy in a wasteful or inefficient manner. No efficiency standards apply to this project. Staff therefore concludes that this project would present no significant adverse impacts on fossil fuel energy resources.

The PSEGS, as proposed, would occupy approximately 7.6 acres per MW of capacity, which approximates that of other solar power technologies.

POWER PLANT RELIABILITY

Staff concludes that the PSEGS would be built and would operate in a manner consistent with industry norms for reliable operation. The project owner predicts an availability factor of between 92 and 98 percent for the modified project, which staff believes is achievable and comparable to that of the PSPP. No conditions of certification are proposed.

TRANSMISSION SYSTEM ENGINEERING

The proposed interconnection facilities, including the PSEGS 230-kV switchyard, generators, 230-kV overhead gen-tie line, and its termination at the new SCE Red Bluff substation, are acceptable and would comply with applicable LORS. No changes to the PSPP conditions of certification are proposed.

ALTERNATIVES

Staff reviewed the previous alternatives analysis for the licensed PSPP during the initial work to determine the scope of the analysis for the proposed modified project. The alternatives analysis for the PSPP retained three reconfigured alternatives, a reduced acreage alternative, and one off-site alternative for detailed analysis and comparison to the PSPP. Of the three reconfigured alternatives, the Commission Decision for the PSPP determined that Reconfigured Alternatives #2 and #3 would reduce impacts on Mojave fringe-toed lizard, sand dune habitat, and the sand transport corridor. Thus the Commission decision approved either Reconfigured Alternative #2 or #3 using the parabolic trough technology proposed for the PSPP and this has become the No-Project Alternative for the purposes of the PSEGS alternatives analysis.

For PSEGS staff has selected three project alternatives for full analysis and comparison to the proposed modified project:

- No-Project Alternative
- Solar Photovoltaic Alternative with Single-Axis Tracking Technology
- Reduced Acreage Alternative with Solar Power Tower (SPT) Technology

Staff concludes that constructing and operating Reconfigured Alternative #2 or #3 (i.e., the No-Project Alternative) would avoid or substantially reduce certain impacts on **Biological Resources**, **Cultural Resources**, **Paleontological Resources**, and **Visual Resources**.

If reducing or avoiding several direct and indirect environmental impacts is a critical factor, then either Reconfigured Alternative #2 or #3 would be environmentally superior to the proposed modified project.

For the Solar PV Alternative with Single-Axis Tracking Technology, staff concludes that this Alternative would avoid or substantially reduce several impacts on **Biological Resources**, **Cultural Resources**, **Traffic and Transportation**, and **Visual Resources**.

If reducing or avoiding several direct and indirect environmental impacts and improving the effectiveness of mitigation measures are the critical factors, then the Solar PV Alternative with Single-Axis Tracking Technology would be environmentally superior to the proposed modified project.

For the Reduced Acreage Alternative with SPT Technology, staff identifies several impacts on **Biological Resources** that would be "much less than PSEGS," and staff considers this to be the primary benefit of this alternative compared to the proposed modified project.

If lessening several impacts on biological resources is the critical factor, then the Reduced Acreage Alternative would be somewhat superior to the proposed modified project.

EXECUTIVE SUMMARY ATTACHMENT A

CUMULATIVE IMPACTS

Preparation of a cumulative impact analysis is required under CEQA. In the CEQA Guidelines, "a cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the EIR together with other projects causing related impacts" [14 Cal. Code Regs., §15130(a)(1)]. Cumulative impacts must be addressed if the incremental effect of a project, combined with the effects of other projects is "cumulatively considerable" [14 Cal. Code Regs., §15130(a)]. Such incremental effects are to be "viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects" [14 Cal. Code Regs., §15164(b)(1)]. Together, these projects comprise the cumulative scenario which forms the basis of the cumulative impact analysis.

CEQA also states that both the severity of impacts and the likelihood of their occurrence are to be reflected in the discussion, "but the discussion need not provide as great detail as is provided for the effects attributable to the project alone. The discussion of cumulative impacts shall be guided by standards of practicality and reasonableness, and shall focus on the cumulative impact to which the identified other projects contribute rather than the attributes of other projects which do not contribute to the cumulative impact" (14 Cal. Code Regs., §15130(b)).

DEFINITION OF THE CUMULATIVE PROJECT SCENARIO

Cumulative impacts analysis is intended to identify past, present, and probable future actions that are closely related either in time or location to the project being considered, and consider how they have harmed or may harm the environment. Most of the projects listed in the cumulative projects tables (**Executive Summary Attachment A – Tables 1, 2, and 3)** have, are, or will be required to undergo their own independent environmental reviews under CEQA. The cumulative project list was developed by staff in the fall of 2012 during the Rio Mesa Solar Electric Generating Facility AFC process and will be updated in the FSA.

Executive Summary Attachment A – Table 1
Existing Projects

OID	Project Name	Location	Ownership	Status	Project Description	Distance (Mile)	Feature
1	2012 Air Quality Management Plan	Orange, Los Angeles, Riverside, and San Bernardino Counties	South Coast Air Quality Management District	Lead agency approved the project on 12/12/2012, and will have significant impacts	The 2012 AQMP identifies control measures to be implemented by state, federal and local agencies to demonstrate that the region will attain the federal standard for particulate matter less than 2.5 microns in diameter (PM2.5) by the applicable target dates and provides Clean Air Act S182(e)(5) proposed implementation measures to assist in achieving the 8-hour ozone standard	0.00	Polygon
15	Blythe Energy Project	City of Blythe, north of I-10, 7 miles west of the CA/AZ border	Blythe Energy, LLC	Existing	520 MW combined-cycle natural gas-fired electric-generating facility. Project is connected to the Buick Substation owned by WAPA	30.78	Point
17	Blythe Energy Project Transmission Line	From the Blythe Energy Project to Julian Hinds Substation	Blythe Energy , LLC	Existing	Transmission line modifications including upgrades to Buck Substation, approximately 67.4 miles of new 230 kV transmission line between Buck Substation and Julian Hinds Substation, upgrades to the Julian Hinds Substation, installation of 6.7 miles of new 230 kV transmission line between Buck Substation and SCE's DPV 500 kV transmission line	1.92	Line
19	Blythe PV Project	Blythe	First Solar	Existing	21 MW solar photovoltaic project located on 200 acres	27.82	Polygon
28	Chuckwalla Valley State Prison	19025 Wiley's Well Rd., Blythe, CA	CA Dept. of Corrections & Rehabilitation	Existing	State prison providing long-term housing and services for male felons classified as medium and low-medium custody inmates jointly located on 1,720 acres of state owned property	19.95	Polygon

OID	Project Name	Location	Ownership	Status	Project Description	Distance (Mile)	Feature
43	Devers-Palo Verde No. 1 Transmission Line	From Palo Verde (Arizona) to Devers Substation	SCE	Existing	Existing 500 kV transmission line parallel to I-10 from Arizona to the SCE Devers Substation, near Palm Springs. DPV1 will loop into the approved Midpoint Substation, which will be located 10 miles southwest of Blythe	1.87	Line
49	Eagle Mountain Pumping Plant	Eagle Mountain Rd, west of Desert Center	Metropolitan Water District of Southern California	Existing	144-foot pumping plant that is part of the Metropolitan Water District of Southern California's facilities	21.36	Point
78	Interstate 10	Linear interstate highway running from Santa Barbara to Blythe	Caltrans	Existing	Interstate 10 is a major east-west route for trucks delivering goods to and from California. It is a four-lane divided highway in the project region	1.28	Line
81	Ironwood State Prison	19005 Wiley's Well Rd., Blythe, CA	CA Dept. of Corrections & Rehabilitation	Existing	ISP jointly occupied with Chuckwalla Valley State Prison 1,720 acres of state-owned property, of which ISP encompasses 640 acres. The prison complex occupies approximately 350 acres with the remaining acreage used for erosion control, drainage ditches, and catch basins	18.81	Polygon
84	Kaiser Mine	Eagle Mountain, north of Desert Center	Kaiser Ventures, Inc	Existing	Kaiser Street mined iron ore at Kaiser Mine in Eagle Mountain and provided much of the Pacific Coast steel in the 1950s. Mining project also included the Eagle Mountain Railroad, 51 miles long. Closed in 1980s	23.84	Point
121	Recreational Opportunities	Eastern Riverside County	BLM	Existing	BLM has numerous recreational opportunities on lands in eastern Riverside County along the I-10 corridor, including the Corn Spring's Campground, Wiley's Well Campground, Coon Hollow Campground, and Midland Long-Term Visitor Area	23.07	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (Mile)	Feature
167	West-wide Section 368 Energy Corridors	Riverside County, parallel to DPV corridor	BLM, Department of Energy (DOE), U.S. Forest Service	Approved by BLM and U.S. Forest Service	Designation of corridors on federal land in the 11 western states, including California, for oil, gas, and hydrogen pipelines and electricity transmission and distribution facilities (energy corridors). One of the corridors runs along the southern portion of Riverside County	0	Polygon

Foreseeable Projects in the Project Area

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
2	6th Street/CA Avenue/Maple Ave Sewer Line Extension Project	6th St and Xeni, Maple Ave and 1st St, CA Ave and 1st St, Beaumont	City of Beaumont	Negative declaration filed on 11/5/2012	Extension of an 8" sewer line	102.53	Point
3	ACI Residential Project	Citrus St and Cleveland Ave, Eastvale	City of Eastvale	Lead agency approved the project on 2/1/2013, and will not have significant impacts	Streambed Alteration Agreement, limited to the preparation of 38.1 acres of the 85.4 acre APN 152-040-034 for medium-density residential development	136.74	Point
4	Adoption of Rule 1406 Generation of ERCs for Paving Unpaved Public Roads	Various locations in Riverside County	Mojave Desert Air Quality Managemen t District	Lead agency approved the project on 2/11/2013, and will not have significant impacts	The objectives of this Project (rule adoption) are to codify existing District procedures, making their application federally enforceable, and to allow PM10 emission reductions generated by unpaved public road paving to be used as offsets for specifically identified permit applications subject to federal New Source Review requirements.	136.12	Point
5	Agua Caliente Indian Reservation	Knowles Property, eastern slope of the San Jacinto Mts. APN: 513-040-021-2	Bureau of Indian Affairs	Review period ends 6/5/2013	Land acquisition	81.63	Point
6	Agua Caliente PV	Between Yuma and Phoenix	First Solar	Under Construction	290 MW solar PV plant on 2,400 acres	110.87	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
7	Annex 114, SIA 12-001, GPA 12-004, CZ12-002 & ZTA12-002	Unincorporated Temescal Valley, Riverside County	City of Corona	Mitigated negative declaration filed on 12/6/2012	Annexation 114 is an application of the City of Corona to annex the unincorporated area of Temescal Valley in Riverside County into the city. The Temescal Valley SOI is 15.58 square miles and entirely covers the city's southern sphere of influence	130.06	Point
8	Aqua Caliente Roadway and Drainage Improvements Project	Tahquitz Canyon Way and Hermosa Dr, Palm Springs	City of Palm Springs	Mitigated Negative Declaration filed 2/14/2013	Widening of Hermosa Drive (east half) between Tahquitz Canyon Way and Hermosa Drive to its full-width 40-foot-wide (curb to curb) collector street designation	76.54	Point
9	Beaumont Avenue Recharge Facility and Pipeline	Beaumont Ave and Brookside Ave, Beaumont	San Gorgonio Pass Water Agency	Notice of Preparation filed on 11/30/2012	The recharge facility is proposed to be located on a ~44 acre parcel and consists of a series of five tiered basins, separated by berms. The perimeter of the recharge facility is proposed to include raised embankments. The pipeline is proposed to extend from the recharge facility to the service connection facility. The pipeline will be 24-inches in diameter and will extend north from the recharge facility along Beaumont Avenue for ~5,600 linear feet and west along Orchard Street for ~1,400 feet	103.16	Point
10	Beaumont Distribution Center (City Project No. 12-PP-05, 12-RZ-02, and 12-GPA-01)	First St and Beaumont Ave, Beaumont	City of Beaumont	Notice of Preparation filed on 2/14/2013	The proposed Project entails the development of an approximately 38 acre site with an 803,600 square foot high cube distribution warehouse facility with a maximum building height of 50 feet.	102.77	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
11	Bella Linda General Plan Amendment, Zone Change/Planned Development Overlay	Pechanga Parkway (west), Loma Linda (south), Temecula Lane (east), Temecula	City of Temecula	Draft EIR filed on 12/3/2012	The project is a two-phase residential development. Phase one will consist of 325 apartment units totaling 462,622 s.f. Phase two of the project will consist of creating lots for 49 senior single-family units. The project will feature a meandering trail along Loma Linda Road and Pechanga Parkway. An additional 0.91 acres of project area is located off-site immediately to the north of the project site	111.02	Point
12	Belle Terre Specific Plan	Washington St and Keller Rd, Riverside County	County of Riverside	Notice of preparation filed on 11/21/2012	The Project includes a split foundation Specific Plan that would allow for the development of up to 1,326 residential units and open space and/or recreational features	108.02	Point
13	Big Maria Vista Solar Project	North of I-10, 12 miles N/W Blythe	Bullfrog Green Energy	POD in to BLM	500 MW PV project on 2,684 acres	28.69	Polygon
16	Blythe Energy Project II	Near Blythe Airport	Blythe Energy	Approved	520 MW combined-cycle power plant located entirely within the Blythe Energy Project site boundary, located on 30 acres of a 76 acre site	30.82	Polygon
18	Blythe Mesa Solar I	Blythe	Renewable Resources Group	Under review	A planned 485 MW solar PV project on private land in Blythe	32.78	Point
20	Blythe Solar Power Generation Station 1	Blythe	Southwestern Solar Power	Approved	A planned 4.76 MW solar PV facility, including 69 PV panels that stand 50 feet tall and 72 feet ride	32.61	Point
21	Blythe Solar Power Project	North of I-10, north of Blythe Airport	Solar Millennium	Approved	1,000 MW solar trough facility on 7,540 acres	26.33	Polygon

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
22	Bundy Canyon Road and Orange Street Tentative Parcel Map No. 30522	Bundy Canyon Rd and Orange St, Wildomar	City of Wildomar	MND comment period ended 5/1/2013, with no updates as of 5/17/2013	The proposed project includes a TPM 30522 to subdivide two existing parcels, totaling approximately 10.3 acres, into seven parcels (numbered parcels 1-7) for future commercial development. Existing parcels include APN 367-100-026, which the proposed project would dedicate approximately 0.75 acres along both Bundy Canyon Road and Orange Street of the project site to the City of Wildomar for right-of-way necessary to accommodate access to/from the future commercial development.	119.02	Point
23	Bundy Canyon/Scott Road Improvement Project	Bundy Cyn Rd/Scott Rd from I-15 to I-215, Lake Elsinore	County of Riverside	Draft EIR submitted on 1/14/2013	The proposed project would widen and realign portions of a six mile segment of Bundy Canyon Road/Scott Road (from Cherry Street near I-15 on the west to Haun/Zelders Road near I-215 on the east) from its existing two lanes to a four lane cross-section	118.71	Point
24	Cactus Avenue PUD	Cactus Ave, Quincy, Brodiaea Ave, Moreno Valley	City of Moreno Valley	Mitigated negative declaration filed 12/13/2012	43.52 acres into 159 single family residential lots within a Planned Unit Development, modifying the zoning from Residential single family 10 (RS10), Residential 10 (R10) and Residential 15 (R15) multi-family to Residential 5 (R5) with lots ranging from 6,000 to 15,298 square feet	113.26	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
25	Canyon Lake Hybrid Treatment Process-Phase I	Canyon Lake	City of Canyon Lake, CA	Expected start date of September 2013	The proposed Project consists of application of alum to Canyon Lake to remove nutrients that contribute to algal blooms. A wide-range of management options, ranging from oxygenation, aeration, mixing, and dredging to application of alum, Phoslock, and other nutrient binders have been considered.	118.84	Point
26	Chuckwalla Solar I	1 mile north of Desert Center	Chuckwalla Solar I	POD in to BLM	200 MW solar PV project on 4,083 acres	6.40	Polygon
27	Chuckwalla Valley Raceway	Desert Center Airport	Developer Matt Johnson	Approved by County of Riverside	5.8 mile racetrack located on 400 acres of land that used to belong to Riverside County and was used as the Desert Center Airport	8.12	Polygon
29	Circulation Element General Plan Amendment	Banning	City of Banning	Project approved 3/26/2013, will not have significant impacts	The City is proposing to amend the General Plan Circulation Element. The proposed General Plan Amendment (GPA) includes a change to the acceptable Level of Service (LOS) for roadway operating conditions from LOS C to LOS D.	99.43	Point
30	Coachella General Plan Update	Coachella	City of Coachella	Notice of Preparation filed 3/8/2013	The City of Coachella Comprehensive General Plan update encompasses future community development plans from now, until 2035. The General Plan will provide long term planning guidelines for the City's growing population and projected development.	55.27	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
31	College of the Desert West Valley Campus Facilities Master Plan & Phase I Project	Indian Canyon Drive and Tramview Road, Palm Springs	Desert Community College District	Draft EIR Submitted 3/15/2013	West Valley Campus Facilities Master Plan and Phase 1 Project. Total planned development of 650,000 sf on 119+ acres. Also includes 30 on-campus dwelling units and 10,000 sf of campus related retail. Phase 1 development of 50,000 sf.	77.33	Point
32	Colorado River Substation Expansion	10 miles southwest of Blythe	SCE	Approved 7/2011	500/230kV substation, constructed in an area approximately 1000 ft by 1900 ft	35.72	Point
33	Corona Regional Medical Center Expansion	S. Main St and W. Eight St, Corona	City of Corona	Notice of Preparation filed 3/7/2013	Expansion and renovation of the 47-year-old Corona Regional Medical Center	136.05	Point
34	Crystal View Terrace/Green Orchard Place/Overlook Parkway Project	Crystal View Terrace/Green Orchard Place/Overloo k Parkway/Kingd om Dr/Victoria/Wa shington, Riverside	City of Riverside	Draft EIR filed on 12/3/2012	The Project includes four scenarios, each of which represents an alternative set of actions intended to help resolve potential vehicular circulation issues associated with the gates on Crystal View Terrace and Green Orchard Place; address the connection of Overlook Parkway easterly to Alessandro Boulevard; and potentially provide for a future connection to the SR-91	127.53	Point
35	Dawson Road Contractor's Storage Yard Plot Plan #2010-049	North of McLaughlin Rd, south of Ethanac Rd, west of Antelope Rd and east of Dawson Rd, Menifee	City of Menifee	Lead agency approved the project on 12/11/2012, and will not have significant impacts	5.01 acres of land which includes 5,000 s.f. of office and 10,000 s.f. of shop building; Construction of a 6,000 s.f. office building in proposed Parcel 2; Construction of a 10,000 s.f. shop	113.00	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
36	Desert Center 50	Desert Center	US Solar Holdings	Under review	A planned 49.5 MW fixed flat panel photovoltaic solar power plant	7.95	Polygon
38	Desert Harvest Solar Project	6 miles north of Desert Center	EnXco	Final document submitted on 11/7/2012	Project would be a 150-megawatt solar photovoltaic facility sited on 1,208 acres of BLM-managed lands north of the community of Desert Center in Riverside County, CA. An associated 220-kilovolt generation-intertie transmission line would be sited within a 204-acre right-of-way on BLM-managed land and 52 acres of non-BLM managed land, which would extend from the solar facility site to the planned Red Bluff Substation.	11.78	Polygon
39	Desert Lily Soleil Project	6 miles north of Desert Center	EnXco	POD in to BLM	100 MW PV plant on 1,216 acres of BLM land	6.87	Polygon
40	Desert Quartzite	South of I-10, 8 miles southwest of Blythe	First Solar	POD in to BLM	600 MW solar PV project located on 7,724 acres, adjacent to DPV transmission line and SCE Colorado Substation	27.55	Polygon
41	Desert Southwest Transmission Line	118 miles primarily parallel to DPV	Imperial Irrigation District	Approved	118 mile 500 kV transmission line from a new substation/switching station near the Blythe Energy Project to the existing Devers Substation located approximately 10 miles north of Palm Springs	24.09	Line
42	Desert Sunlight Project	6 miles north of Desert Center	First Solar	Approved	550 MW PV project on 4,144 acres of BLM land, requiring a 12 mile transmission to the planned Red Bluff Substation	13.53	Polygon

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
44	Devers-Palo Verde No. 2 Transmission Line Project	From the Midpoint Substation to Devers Substation	SCE	CPUC petition to modify request to construct CA-only portion approved by CPUC 11/2009	New 500 kV transmission line parallel to the existing Devers-Palo Verde Transmission Line from Midpoint Substation, approximately 10 miles southeast of Blythe, to the SCE Devers Substation, near Palm Springs. The ROW for the 500 kV transmission line would be adjacent to existing DPV ROW	1.86	Line
45	District Community Education Support Complex	Church St at Polk St, Coachella	Coachella Valley Unified School District	Notice of Preparation filed 3/1/2013	The proposed project involves the demolition of the existing of District Community Education Support Complex and its reconstruction and expansion to consolidate all District administrative operations at the project site	53.98	Point
46	Eagle Canyon Dam and Debris Basin Project	Canyon Plaza Dr and E. Palm Canyon Dr, Riverside County	Riverside County Flood Control and Water Conservation	DWR approved the project on 1/31/2013, and will have significant impacts	Construction of a zoned earth embankment dam and reservoir and its appurtenant structures for flood control use	73.35	Point
48	Eagle Mountain Pumped Storage Project	Eagle Mountain iron ore mine, north of Desert Center	Eagle Crest Energy	FERC draft EIS published in 12/2010	1,300 MW pumped storage project on 2,200 acres of public and private land, designed to store off-peak energy to use during peak hours	19.54	Point
51	East County Detention Center	Existing Riverside County Jail, Indio	Riverside County	EIR filed, review period ends 6/4/2013	1,273 bed expansion of existing 353 bed detention center	58.15	Point
52	EIR No. 512, Specific Plan No. 376 (Thoroughbred Farm)	Bellgrave Ave and Wineville Ave, Riverside County	City of Jurupa Valley	Lead agency approved the project on 11/15/2012, and will have significant impacts	The proposed project includes approximately 42.6 acres of light industrial uses, 36.5 acres of business park uses, 11.5 acres of commercial/retail uses, and 7.6 acres of commercial/tourist uses. The project also includes approximately 10.0 acres of potential roads	135.45	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
53	EnXco	North of Wiley's Well Rd, east of Genesis Solar Project	EnXco	POD in to BLM	300 MW solar PV project	17.21	Polygon
54	Expanded Gage Exchange Project	Kansas Ave, Spruce St, Chicago Ave, Iowa Ave, Watkins Dr, Blaine St, Riverside	City of Riverside	Ca Dept of Public Health approved the project on 11/30/2012, and states that the project will not have significant impacts	The City of Riverside proposes to install approximately 12,285 feet of 18-inch ductile iron pipe and booster station which will reduce the amount of imported Colorado River water, and will enable the City to increase the supply of irrigation water	123.79	Point
55	Fernando Child Care Center	Limonite Avenue and Wineville Avenue, Jurapa Valley	City of Jurupa Valley	Lead agency approved the project on 3/11/2013, and will not have significant impacts	Proposal to establish a day care center for up to 44 children and five (5) staff on 0.51 acre parcel.	131.21	Point
56	First Inland Logistics Center II	San Michele Rd, Perris Blvd, Nandina Ave, Moreno Valley	City of Moreno Valley	Notice of preparation filed on 12/4/2012	Review Per Lead Plot Plan PA12-0023 proposes 400,130 SF warehouse building on 17.3 acres at the southwest corner of San Michele Avenue and Perris Boulevard. A 8.4 acre portion of the site is an existing truck storage facility with the northern vacant 8.9 acres currently entitled with a truck storage facility	116.61	Point
57	Foothill Parkway Westerly Extension	Foothill Pkwy between Skyline Dr and Green River Rd, Corona	City of Corona	California Transportation Commission approved the project on 12/6/2012, and stated will have significant impacts.	The project will extend Foothill Parkway for approximately two miles by constructing a four-lane roadway with bicycle and pedestrian facilities from 600 feet west of Skyline Drive to Green River Road in the vicinity of Paseo Grande	138.71	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
58	Four Commercial Projects	Blythe	Various	Approved	Four commercial projects have been approved by the Blythe Planning Department, including the Agate Road Boar & RV Storage, Riverway Ranch Specific Plan, Subway Restaurant and Motel, and Agate Senior Housing Development. Dates of construction are unknown at this time	36.48	Point
59	Fred Waring Drive Improvement Project	Fred Waring Drive, between Adams Street to Port Maria Rd, Riverside	Riverside County Transportation Commission	Lead agency approved the project on 3/6/2013, and will not have significant impacts	The project will widen Fred Waring Drive from four to six lanes for a distance of .65 miles, install a bike lane on the south side of the roadway and construct a raised median with left turn lanes between Adams Street and Port Maria Road	59.94	Point
60	General Plan Amendment No. 778, Change of Zone No. 7270, Tentative Tract Map No. 33248	S. of Indiana Avenue, E. of Lincoln Street in the Home Gardens Community of unincorporated Riverside County	County of Riverside	Mitigated negative declaration filed on 1/4/2013	The Change of Zone proposes to amend the zoning for the site from residential Agriculture- Two Acre Minimum (R-A-2) and areas with no previous zoning (previous Right of Way) to One Family Dwelling- 10,000 sf Minimum (R-1-10,000), Residential Agricultural Two Acre Minimum (R-A-2) and Open Area Combining Zone Residential Developments (R-5). The Tentative Track Map proposes a Schedule 'A' subdivision of 18 acres into 16 single family residential lots with a minimum lot size of 7200 sf and one (1) 6.73 acre lot for open space	132.27	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
61	General Plan Update	Various locations in Calimesa	City of Calimesa	Notice of Preparation filed on 2/14/2013	The update will include the addition of new sustainability-related goals and policies, a review of existing goals and policies, and an overall streamlining of the existing General Plan	108.42	Point
62	General Plan Update	City-wide, La Quinta	City of La Quinta	Final document submitted on 12/6/2012	Update of the La Quinta General Plan, to encompass all mandated Elements, and add a Sustainable Community and an Economic Development Element. The Update will include modifications to the Land Use Map, but will not significantly change land use patterns in the City	62.32	Point
63	Genesis Solar Energy Project	North of I-10, 25 miles west of Blythe, 27 miles east of Desert Center	NextEra (FPL)	Approved, under construction	250 MW solar power project on 1,950 acres north of the Ford Dry Lake. 6 mile natural gas pipeline and 5.5 mile gen-tie line to the Blythe Energy Center to Julian Hindes Transmission Line	12.47	Polygon
64	Gestamp Asetym Solar	Northwest of Blythe	Gestamp Asetym Solar	EPA review	37 MW solar power plant	352.62	Point
65	Gilman Home Channel Lateral A, Stage 3 Project	Wilson Street, Williams Street, 4th Street, and 12th Street, Banning	Riverside County Flood Control and Water Conservation District	Lead agency approved the project on 2/6/2013, and will not have significant impacts	Flood control as part of the 100-year storm runoff plan	96.41	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
66	Grading Environmental Assessment-EA42558	Northerly of Upper Valley Rd and easterly of Bautista Rd, unincorporated Riverside	County of Riverside	Mitigated negative declaration filed on 1/8/2013	EA No. 42558, is an application by Tricia Napolitano for an initial study for a grading permit (BGR120054) on APNs 573-040-001 and 573-040-002 project is located northerly of Upper Valley Road, easterly of Bautista Road, and westerly of Polliwog Road within unincorporated Riverside CA	86.06	Point
68	Grant for LCNG Fueling Facility	East Side of South Willow Street between West 14th Avenue, Blythe	Energy Commission	Lead agency approved the project on 1/9/2013, and will not have significant impacts	This grant agreement will fund a project by Blackhawk Logistics LLC to construct a publicly accessible liquefied natural gas station to fuel goods movement trucks along the I-10 connection between California and Arizona.	35.55	Point
69	Green Energy Express Transmission Line Project	Eagle Mountain Sub to So. California	Green Energy Express	Approved	70 mile double circuit 500 kV transmission line from Eagle Mt. Sub to So. California	1.88	Line
70	Green River Communication Site	82695 Doctor Carreon Blvd., Indio	US Army Corps of Engineers	Lead agency approved the project on 3/12/2013, and will have significant impacts	Relocation of an existing communication site	58.19	Point
71	Hwy 111 Beautification and Improvement Project	Hwy 111, Riverside County	California State Transportation Commission	Lead agency approved the project on 3/5/2013, and will not have significant impacts	The project will widen Highway 111 from four to six lanes for a distance of approximately 4 miles	65.94	Point
72	Hwy 86 Domestic Water Transmission Main Phase 2 and Pump Station	Avenue 80 and Hwy 86, Riverside and Imperial Counties	Coachella Valley Water District	Lead agency approved the project on 11/13/2012, and will not have significant impacts	The proposed 30-inch-diameter pipeline is approximately 7.2 miles long and will connect to an existing 30-inch-diameter pipeline located on the west side of Highway 86 at Avenue 74	52.60	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
73	I-215/Newport Road Interchange Improvement Project	I-215 at Newport Rd, Menifee	Caltrans #8	Lead agency approved the project on 3/6/2013, and will not have significant impacts	Intersection improvements on I-215 at Newport Road in the city of Menifee	113.00	Point
74	Imperial Solar Energy Center West	El Centro	CSOLAR Development	ROW granted	250 MW solar facility located on 65 acres of BLM land	73.11	Polygon
75	Imperial Wind	Black Mountain, CA	Imperial Wind	Authorized	48-65 MW	46.87	Polygon
76	Indian Wells Tennis Garden	Washington St and Miles Ave, Indian Wells	City of Indian Wells	Lead agency approved the project on 2/21/2013, and will have significant impacts	The proposed project includes various renovations to the existing Indian Wells Tennis Garden and the expansion of tennis facilities to the east. Major components of the proposal include a second tennis stadium, signalized main entry, grassed and paved parking lots, onsite circulation and bus queuing areas, landscaped pedestrian corridors, shade canopies, new practice tennis courts, and driveway improvements.	63.00	Point
77	Intake Shell	Blythe	Shell	Under Construction	Reconstruction of a Shell facility located at Intake & Hobson Way	37.44	Point
79	Interstate 10/Jefferson St Interchange Improvement Project	Indio	Caltrans #8	Project start summer 2014, completion expected fall 2016	Hwy interchange improvements	60.63	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
80	Interstate 10/Monterey Avenue Interchange Improvement Project	I-10 at Monterey Ave near the city of Thousand Palms	Cal Trans #8	Lead agency approved the project on 3/5/2013, and will not have significant impacts	Intersection improvements on I-10 at Monterey Avenue near the city of Thousand Palms	69.30	Point
82	Joshua Palmer Realignment	Joshua Palmer Way and Highland Springs Ave, Banning	City of Banning	Negative declaration filed on 11/19/2012	The Project is a realignment of Joshua Palmer Way to the north and west of its current location and which includes the construction of a new four way intersection including traffic signal improvements at Highland Springs Avenue approximately 340 feet south of West Ramsey Street	101.11	Point
83	Jurisdictional Delineation and Permits for Operations and Maintenance of Whitewater River Stormwater Channel and Coachella Valley Stormwater Channel	Various locations through Coachella Valley	Coachella Valley Water District	Lead agency approved the project on 2/21/2013, and will not have significant impacts	Operation and maintenance activities include mowing, mulching, grading, tree removal, disking, excavating, dredging, filling, armoring of banks, and water monitoring to allow the WWRSC/CVSC system to operate under optimal conditions per design	50.63	Line
85	La Paz Solar Tower	La Paz County, AZ	EnviroMission	Pre-construction	200 MW power station on 11.000 acres	60.63	Point
88	Longview Tank and Pipelines and Watson Booster Station and Pipelines	Longview Ln and Alerich St, Perris	Eastern Municipal Water District	Lead agency approved the project on 2/11/2013, and will not have significant impacts	EMWD proposes to construct a 5.63-million-gallon water storage tank and associated 24-inch diameter underground potable water transmission pipeline and booster pump	111.51	Point

119	Ramona 49	Bridge Rd and Ramona Blvd, San Jacinto	City of San Jacinto	Lead agency approved the project on 2/11/2013, and will not have significant impacts	Second reading of Ordinance No. 12-13 for Change of Zone 1-11, adopting a zone change from the Residential Medium Density (RM) and Specific Plan (SP Getaway) Zoning Districts to the General Commercial (CG), Industrial Light (IL), Open Space (OSR), and Residential Medium High (RMH) Zoning Districts	107.34	Point
120	Ramona Creek Specific Plan (SP-12-001)	Florida Ave and Myers St, Hemut	City of Hemet	Notice of Preparation filed 2/22/2013	The Project is a Specific Plan to allow for development of the Project Site with a multiple-use commercial and residential community concentrated around open space amenities.	104.43	Point
122	Recycled Water Ponds Expansion and Optimization Project	Trumble Rd, Case Rd, Simpson Rd, Riverside	Eastern Municipal Water District	Lead agency approved the project on 3/20/2013, and will have significant impacts	EMWD is planning on the construction, operation and maintenance of additional recycled water storage facilities at its North Trumble Recycled Water Storage Ponds site.	111.50	Point
123	Recycled Water Program	River Road and the Santa Ana River	Western Riverside County Regional Wastewater Authority	Lead agency approved the project on 11/14/2012, and will have significant impacts	WRCRWA intends to provide recycled water to its member agencies for non-portable uses in accordance with the terms of its Resolution No. 97-38. The agencies utilizing the recycled water would provide for the ultimate use under their individual permits	116.90	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
124	Rice Solar Energy Project	Rice Valley, Eastern Riverside County	Rice Solar Energy	Approved, construction date unknown at this time	150 MW solar power tower project with liquid salt storage. Project located on 1,410 acres and includes a power tower approximately 650 feet tall and 10 miles long interconnection with the WAPA Parker-Blythe transmission line	34.55	Polygon
126	Riverside County Regional Medical Center, Nursing and Allied Health Education Building Project	South of State Road 60 and East of I-215, at 26520 Cactus Avenue, Moreno Valley	Riverside County Economic Development Agency	Lead agency approved the project on 3/19/2013, and will not have significant impacts	Nursing and Allied Health Education Building (Education Building) as a three-story structure with approximately 34,749 square feet.	115.13	Point
127	RPT Centerpointe West Project	Frederick St and Cactus Ave, Moreno Valley	City of Moreno Valley	Final document filed on 11/16/2012	The proposed project consists of construction and operation of a warehouse facility with two individual warehouses of varying sizes and an expansion of an existing warehouse for a total of 1,281,000 sf on 56.2 acres	118.83	Point
128	San Gorgonio Pass Campus Master Plan	Westward Ave and Sunset Ave, Banning	Mt. San Jacinto Community College District	Draft EIR filed 1/22/2013	Buildings on the Campus are planned to total ~250,000 gross sf of laboratory, lecture, and other space including physical fitness facilities, library, and miscellaneous administrative office and support space. The total parking provided would be 2,203 spaces	99.30	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
129	San Jacinto Master Drainage Plan Line C	Santa Fe St and Midway St, San Jacinto	Riverside County Flood Control and Water Conservation	Project approved on 4/4/2013, will not have significant impacts	The project will construct, operate and maintain Line C, Line C-5, C-4, and Line B underground storm drain facilities pursuant to the District's adopted San Jacinto Master Drainage Plan. The project includes relocation of existing utilities, repaving disturbed areas, and purchasing permanent and temporary construction easements on multiple properties	100.96	Point
130	San Jacinto Valley Master Drainage Plan and Amendment	San Jac. Riv to the N. Meridian St to the E, Florida Ave to the S, & Warren Rd to the W., San Jacinto	City of San Jacinto	Lead agency approved the project on 1/14/2013, and will have significant impacts	The project consists of the revision and consolidation of two existing and previously adopted Master Drainage Plans located in portions of the cities of San Jacinto and Hemet and unincorporated Riverside County, California.	98.96	Point
131	San Joaquin Rail Corridor 2035 Vision Project	Several counties within the San Joaquin Valley	Caltrans #7	Notice of Preparation filed on 11/13/2012	The proposed San Joaquin Rail Corridor (Corridor) Project infrastructure upgrades would generally be installed within the existing track rights-of-way, with limited rights-of-way acquisition if any, and would not change the existing land use of the rail corridor or the surrounding parcels	176.58	Line
132	Santa Ana River Bridge Seismic Retrofit	Near the intersection Wilderness and Jurupa Ave, east of Van Buren Ave, Riverside	Metropolitan Water District of Southern California	Lead agency approved the project on 3/12/2013, and will not have significant impacts	The Project proposes to provide seismic retrofit upgrades to the Santa Ana River bridge crossing to accommodate lateral displacement in the transverse direction of the bridge	130.02	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
133	SCE Red Bluff Substation	South of I-10 at Desert Center	SCE	Approved	A proposed new 500/220 kV substation, 2 new parallel 500 kV transmission lines of about 2,500 to 3,500 feet each	5.80	Polygon
134	Sierra Bella Specific Plan/Annexation	Green River Rd beyond Calle Del Oro, Corona	City of Corona	Addendum to Specific Plan filed on 3/20/2013	Application to amend the Sierra Bella Specific Plan (SP04-001) by reducing the minimum lot size requirement for the LDR 1 (Low Density Residential, minimum lot size, 9,000 sf) and LDR 2 (Low Density Residential, minimum lot size, 14,000 sf) designation to 7,200 sf and 9,000 sf, respectively.	139.23	Point
136	Sol Orchard	Desert Center	Sol Orchard	Approved	A planned 1.5 MW fixed flat panel PV solar power plant north of I-10, east of SR-177, west of Desert Center Airport	107.01	Polygon
137	Starwood Solar 1	75 miles west of Phoenix	Lockheed Martin	Under Construction	290 MW concentrated solar power plant	119.10	Point
138	State Route 60/Potrero Boulevard New Interchange	Potrero Blvd, Beaumont	Cal Trans #8	Lead agency approved the project on 3/1/2013, and will not have significant impacts	The proposed SR-60/Potrero Blvd New Interchange project features construction of a new full access interchange and bridge overcrossing on SR-60 for Potrero Blvd	101.01	Point
139	State Route 79 Realignment Project	Domenigoni Pkwy, Hemet to Gilman Springs Rd, San Jacinto	Cal Trans #8	Draft EIR Submitted 2/8/2013	The realigned highway would be a limited access, four-lane expressway, with two travel lanes in each direction separated by a median. The alternatives evaluated in the DEIR are four Build alternatives, two Design Options, and a No Build Alternative	103.30	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
140	State Route 91 Corridor Improvement Project	SR-91 and I-15, Anaheim, Corona, Riverside	Caltrans #8	Riverside County Transportation Commission approved the project on 11/14/2012, and will have significant impacts	The SR-91 CIP proposes capacity, operational, and safety improvements on SR-91 and I-15.	135.30	Point
141	Stratford Ranch Industrial Project	Redlands Ave and Perry St, Perris	City of Perris	Lead agency approved the project on 11/17/2012, and will have significant impacts	Development of a high-cube logistics warehouse site in two buildings totaling up to 1,725,411 square feet. Infrastructure improvements including 2.4 acres for dedication and construction of Redlands Avenue street frontage improvements. Improvements to the Perris Valley Strom Drain (PVSD) channel encompassing 45.7 net acres	115.95	Point
142	Temescal Canyon and Dawson Canyon Pipelines and Non-Potable Water Tank Project	Temescal Cyn Rd and Dawson Cyn Rd, Corona	Lee Lake Water District	Mitigated negative declaration filed on 12/19/2012	The LLWD proposes construction of a Non-Potable Water System, which includes the Temescal Canyon Pipeline, the Dawson Canyon Pipeline, and a 1.5 MG non-potable water tank in unincorporated Riverside County, CA	131.20	Point
143	Tentative Tract Numbers 30386 and 30387	California St, Bryant St, and Fremont St, Calimesa	City of Calimesa	Project approved by CDFW on 4/10/2013, will not have significant impacts	Construction of an approximate 210-unit senior housing subdivision on 72.23 acres of which 23.9 acres will remain open space.	107.11	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
144	The Triangle Specific Plan (SP0-007-2452)	I-15, I-215, Murrieta Hot Springs Rd, Murrieta	City of Murrieta	Draft EIR Submitted 2/8/2013	The Triangle Specific Plan Project involves implementation of a mixed-use development consisting of approximately 1.77 million gsf within an open-air retail commercial district. Proposed uses include restaurant (125,258 gsf), commercial/retail (640,914 gsf), theater (74,660 gsf), office (779,082 gsf), and 220-room hotel (148,000 gsf)	113.16	Point
145	Three Residential Developments	Blythe	Various	Under Construction	3 residential development projects are under construction: River Estates at Hidden Beaches, The Chanslor Place, Mesa Bluffs. 125 single family homes are currently being built	35.53	Point
146	Trails of Eastvale Residential Development	Archibald Ave and 65th St, Eastvale	City of Eastvale	Mitigated negative declaration filed 2/4/2013	The proposed project consists of a General Plan Amendment from Light Industrial to Medium Density Residential, a Change of Zone from A-2-10 to PRD, and a Tentative Tract Map to subdivide a 50.48-acre site into 224 single family residential lots and 13.69-acres of parkland and open space	138.34	Point
147	Travertine Point Specific Plan	St. Rte 86, between 81st Ave and Coolidge Spring Rd, Riverside and Imperial County	County of Riverside	Lead agency approved the project on 1/15/2013, and will have significant impacts	The project proposes the construction of a total of 16,665 residential units and 5,029,500 square feet of non-residential development. This includes approximately 1,410 acres of TMDCI lands of which 647 acres are in Imperial County.	52.10	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
148	Trumble Road Recycle Water Storage Expansion Project	Trumble Rd and Case Rd, Perris	Eastern Municipal Water District	Final document submitted 3/26/2013. Currently in comment period	EMWD is planning on the construction, operation and maintenance of additional recycled water storage facilities at its North Trumble Recycled Water Storage Ponds site	114.20	Point
149	Twelve Residential Developments	Blythe	Various	Approved or under construction	12 residential development projects have been approved by the Blythe Planning Department: Vista Palo Verde, Van Weelden, Sonora South, Ranchette Estates, Irvine Assets, Chanslor Village, St. Joseph's Investments, Edgewater Lane, The Chanslor Place Phase IV, Cottonwood Meadows, Palo Verde Oasis. A total of 1,005 single family residences are proposed	36.18	Point
150	Upper Valle de Los Caballos Recharge Basins	Temecula	Rancho California Water District	Lead agency approved the project on 3/14/2013, and will not have significant impacts	The project consists of infrastructure improvements to RCWD's existing Upper Valle de Los Caballos Recharge Basins	106.10	Point
151	Van Buren Commercial Center Project Site	Van Buren Blvd and Gamble Ave, Riverside	City of Riverside	Mitigated negative declaration filed on 11/20/2012	Mass grading on 4.55 acres, located at the southeast corner of Van Buren Blvd and Gamble Ave, in the Woodcrest neighborhood, City of Riverside	123.87	Point
152	Van Horn Youth Treatment & Education Center	County Farm Road and Harrison Street, Riverside	Riverside County Redevelop ment Agency	Lead agency approved the project on 3/12/2013, and will not have significant impacts	The proposed treatment and education center will be approximately 75,000 sf and comprise of a 10 bed assessment unit, a 20 bed transitional housing component, and four, 20-single cell living units (with the potential for a future 20 bed transitional housing component and a 20-single cell living unit with recreation areas for an additional 11,692 sf.	129.91	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
153	Waite Street 1467 Zone Reservoir and Pipeline	Pointe Circle & Waite Street, Wildomar	Elsinore Valley Municipal Water District	Mitigated Negative Declaration filed 3/4/2013	The proposed Waite Street 1467 Zone Reservoir and Pipeline Project is located within the City of Wildomar in Riverside County	118.83	Point
154	Wake Rider Beach Resort	Grand Ave between Macy St and Serena, Lake Elsinore	City of Lake Elsinore	Mitigated negative declaration filed 12/13/2012	A commercial mixed use project, which consists of five buildings totaling 62,437 square feet, with associated on-site and off-site improvements, including hardscape and landscaping	124.89	Point
155	Water Reclamation Facility #2-Tertiary Filtration Project	E. Harrison St and Le Roy Dr, Corona	City of Corona	Addendum Note: Review Per Lead An EIR for the Groundwater Management Plan was adopted by the City Council of the City of Corona in 2012. The GWMP identified eight categories of management strategies and defined 25 specific management strategies for implementation of the GWMP, which are intended to facilitate a sustainable groundwater resource supply for the City. The PEIR (incorporated herein by this reference) analyzed the environmental impacts of the GWMP and imposed mitigation measures set forth in a Mitigation Monitoring and Reporting Program	The City wishes to ensure a long-term sustainable supply of groundwater resources and has therefore proposed its AB 3030-compliant Groundwater Management Plan (GWMP)	135.52	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
156	Well Number 31 for Temescal Desalter	Buena Vista Avenue and Sixth Street, Corona	City of Corona	Project approved on 3/22/2013, and will not have significant impacts	Domestic water supply well (Well 31) to serve the City's potable water system. Well 31 will connect to the existing Temescal Desalter Well Collection Pipeline.	136.74	Point
157	Wenzlaff Elementary School Conversion	11625 West Drive, Desert Hot Springs	Palm Springs Unified School District	Review period ended 5/13/2013. No updates as of 5/17/2013	The existing buildings would be renovated and modernized to accommodate the new programs and students. Project and possibly an area for future ground-mounted solar panel integration. Other site improvements would include mechanical, electrical, and plumbing equipment and facility upgrades	77.15	Point
159	Wildomar 2014-2021 Housing Element Update and EIR	Wildomar	City of Wildomar	NOP for EIR filed, with review period ending 6/3/2013	Land use change and re-zoning of 25.96 acres of residential and business land	118.51	Point
160	Wileys Well Communication Tower	East of Wiley's Well Road just south of I-10	Riverside County	Final EIR	Expansion of Riverside County's fire and law enforcement agencies approximately 20 communication sites to provide voice and data transmission	18.86	Point
161	Wine County Infrastructure Sewer Project	Monte De Oro Road, Rancho California Road and Calle Contento Road, Temecula	Eastern Municipal Water District	Lead agency approved the project on 12/19/2012, and will not have significant impacts	45,200 lineal feet of sewer lines and two lift stations. The Wine Country Infrastructure Project would connect into EMWD's existing wastewater collection system on Butterfield Stage Road adjacent to the Roripaugh Ranch Development	108.92	Point

OID	Project Name	Location	Ownership	Status	Project Description	Distance (mile)	Feature
162	World Logistics Center Project	Redlands BLVD and Eucalyptus Ave, Moreno Valley	City of Moreno Valley	Draft EIR submitted 2/5/2013	The proposed World Logistics Center project (WLC) site covers 3,918 acres in eastern Moreno Valley. A General Plan Amendment is proposed to designate 2,635 acres for logistics warehousing including up to a maximum of 41.4 million sf of "Logistics Development" and 200,000 sf of warehousing-related uses classified as "Light Logistics"	113.14	Point
163	WR-34 Hydroelectric Power Generation Facility	Pujol Street, Temecula	Rancho California Water District	Construction expected to begin 8/15/2013, and expected to last 6 months	Construction of a hydroelectric power generation facility at the existing WR-34 Turnout Facility.	112.48	Point
164	Wyle Laboratories Inc-Norco Facility	Hillside Ave and Second St, Norco	Department of Toxic Substances Control	Negative declaration filed on 11/27/2012	DTSC is considering approval of a Draft Remedial Action Plan (RAP) to address volatile organic compounds (VOCs) in subsurface soil and groundwater at the former Wyle Laboratories site in Norco, CA	135.02	Point
165	Yuma Crude Oil Refinery	100 miles SW of Phoenix and 48 miles E of Yuma	Arizona Clean Fuels Yuma	Under review	Oil refinery on 1,400 acres	105.79	Point
166	Sol Orchard	Desert Center	Sol Orchard	Approved	A planned 1.5-MW fixed, flat-panel solar PV project north of I-10, east of SR-177, west of Desert Center Airport	107.01	Point

Executive Summary Attachment A – Table 3
Projects Submitted and On Hold

OID	Project Name	Location	Ownership	Status	Project Description	Distance (Mile)	Feature
67	Graham Pass Wind Project	Riverside County	Graham Pass Inc	Pending	175 MW Wind Project	14.60	Polygon
86	La Posa Solar Thermal	Stone Cabin, AZ	Pacific Solar Investments	Pending	2,000 MW Solar	60.04	Polygon
87	LH Renewables Riverside County Type II	Eagle Mountain, CA	LH Renewables	Pending	Unknown	17.71	Polygon
97	Mule Mountain III	Chuckwalla Valley	EnXco	Pending	200 MW Solar PV	22.04	Polygon
102	Nextlight Quartzsite	Quartzsite, AZ	Nextlight Renewable Power	Pending	50 MW CSP Trough	57.91	Polygon
111	Oro Valley Wind	Black Mountain, CA	Oro Valley Power	Pending	180 MW Wind Project	47.58	Polygon
135	Silverado Power I, II, III	West of SR-177, North of I-10	Silverado Power	On hold	3 solar PV projects with a 400 MW total capacity.	342.12	Point
158	Wildcat Quartzsite	Quartzsite, AZ	Wildcat Quartzsite Solar	Pending	800 MW CSP Tower	62.34	Polygon

Under CEQA, there are two acceptable and commonly used methodologies for establishing the cumulative impact setting or scenario: the “list approach” and the “projections approach.” The first approach would use a “list of past, present, and probable future projects producing related or cumulative impacts.” [14 Cal. Code Regs., §15130(b)(1)(A)]. The second approach is to use a “summary of projections contained in an adopted general plan or related planning document, or in a prior environmental document which has been adopted or certified, which described or evaluated regional or area wide conditions contributing to the cumulative impact.” [14 Cal. Code Regs., §15130(b)(1)(B)]. This FSA uses the “list approach” for purposes of state law to provide a tangible understanding and context for analyzing the potential cumulative effects of the proposed project.

In order to provide a basis for cumulative analysis for each discipline, this section provides information on other projects in both maps and tables. All projects used in the Cumulative Impacts Analysis for this FSA are provided in cumulative projects tables. **Executive Summary Attachment A – Figure 1,** presented at the end of this section, shows projects within 50 miles of the PSEGS site. However, within the desert region, the specific area of cumulative effect varies by resource. For this reason, each discipline has identified the geographic scope for the discipline’s analysis of cumulative impacts, which may exceed the 50-mile buffer shown in Figure 1.

APPROACH TO CUMULATIVE IMPACT ANALYSIS

This FSA evaluates cumulative impacts within the analysis of each resource area, following these steps:

- Define the geographic scope of cumulative impact analysis for each discipline, based on the potential area within which impacts of the PSEGS could combine with those of other projects.
- Evaluate the effects of the PSEGS in combination with past and present (existing) projects within the area of geographic effect defined for each discipline.
- Evaluate the effects of the PSEGS with foreseeable future projects that occur within the area of geographic effect defined for each discipline. This section is divided into Foreseeable Future Projects and Foreseeable Renewable Projects in the California Desert for ease of the reader.

Note:
The distances from all the cumulative projects are calculated to the centroid of PSEGS. The distances between the line features of the cumulative projects are calculated by the shortest distance between the PSEGS centroid to the line features segments. The distances between the polygon features of the cumulative projects are calculated between the PSEGS centroid to the centroids of all the polygon features.

All distances are estimated.

Note:
The distances from all the cumulative projects are calculated to the centroid of PSEGS. The distances between the line features of the cumulative projects are calculated by the shortest distance between the PSEGS centroid to the line features segments. The distances between the polygon features of the cumulative projects are calculated between the PSEGS centroid to the centroids of all the polygon features.

All distances are estimated.

INTRODUCTION

Testimony of Christine Stora

On December 17, 2012, Palen Solar Holdings, LLC (PSH), filed the petition with the California Energy Commission requesting to modify the Palen Solar Power Project (PSPP). The PSPP, as licensed by the Energy Commission on December 15, 2010 (Order No. 10-1215-19, the “Final Decision,” 09-AFC-7), was a 500-megawatt (MW) solar thermal power-generating facility utilizing parabolic trough technology. The PSPP encompassed approximately 4,366 acres located approximately one-quarter mile north of Interstate 10, approximately 10 miles east of Desert Center, and approximately halfway between the cities of Indio and Blythe, in Riverside County, California.

The modifications proposed in the petition include replacing the parabolic trough solar collection system with BrightSource’s solar tower technology. Heliostats—elevated mirrors guided by a tracking system mounted on a pylon—focus the sun’s rays on a solar receiver steam generator tower near the center of each solar field to create steam to drive a turbine that provides electricity.

In the petition, PSH also requested that the project name be changed from Palen Solar Power Project to Palen Solar Electric Generating System (PSEGS). In this document, the acronym, “PSPP,” refers to the approved project, and the acronym, “PSEGS,” refers to the proposed modified project.

AMENDMENT PROCESS

The purpose of the Energy Commission’s review process is to assess the impacts of the proposed PSEGS on environmental quality and public health and safety. The Energy Commission will evaluate the impacts caused by the proposed changes to the approved project and will determine if the PSEGS would remain in compliance with applicable laws, ordinances, regulations, and standards (LORS) (Title 20, Calif. Code of Regulations, section 1769).

The petition will be processed as an amendment to the PSPP Final Decision.

PURPOSE OF THIS REPORT

This Final Staff Assessment (FSA) is being published by the Energy Commission staff and is staff’s final independent analysis of the petition to amend the Palen Solar Power Project (PSPP). This FSA is a staff document. It is neither a Committee document, nor a draft Decision. The FSA describes the following:

- the proposed modified project (PSEGS);
- the updated existing environment from the original decision;
- whether the modified facilities can be constructed and operated safely and reliably in accordance with applicable LORS;
- the environmental consequences of the modified project in conjunction with other existing and known planned developments;

- the potential cumulative impacts of the modified project in conjunction with other existing and known planned developments;
- modified and/or new conditions of certification proposed by the project owner, staff, interested agencies, local organizations, tribes, and intervenors which may lessen or eliminate potential impacts of the PSEGS;
- modified and/or new conditions of certification under which the project should be construction and operated, if the modified project is certified; and,
- project alternatives.

The analyses contained in this FSA are based upon information from the: 1) Petition to Amend and Supplements to the Petition to Amend provided by the project owner, 2) responses to energy commission staff data requests, 3) supplementary information from local, state, and federal agencies, interested organizations and individuals, 4) existing documents and publications including the record from the approved PSPP, 5) independent research, 6) comments at public workshops, 7) comments received on the PSA and 8) other docketed communications. The analyses for most technical areas include discussions of proposed modifications to conditions of certification and new conditions of certification. Each condition of certification is followed by a proposed means of “verification.” All changes to conditions to certification in the original decision are shown in this document so the reader can easily identify the changes being made to the project license. Deleted text to the conditions of certification is shown as ~~strikethrough~~, new text is **bold and underlined**.

The FSA serves as staff’s testimony in evidentiary hearings to be held by the PSEGS Committee of two Commissioners who oversee this case. The Committee will hold evidentiary hearings and will consider the testimony presented by staff, the applicant, intervenors and the recommendations and comments provided by governmental agencies, tribes, and the public prior to proposing its recommended decision to the full Commission. Energy Commissioners will make a final decision on PSEGS, including findings, after the Committee’s publication of the Presiding Member’s Proposed Decision (PMPD).This FSA is intended to be a complete review of the modified project and in many cases relies on analysis that was prepared for the original PSPP. This information has been reviewed and updated to reflect current conditions and the setting that exists today. Although this document provides a full analysis of the project as a whole, this petition will be processed as an amendment to the PSPP Final Decision. Thus a Decision will only be made by the Energy Commission on the proposed changes to the existing PSPP certification.

ORGANIZATION OF THE FINAL STAFF ASSESSMENT

The sections in this FSA include an Executive Summary, Introduction, Project Description, and a Project Analysis. The Project Analysis contains an Environmental Assessment, Engineering Assessment, Alternatives and General Conditions. The Environmental Assessment contains the following chapters: 1) Air Quality (to be provided in Part C of this FSA); 2) Biological Resources; 3) Cultural Resources (to be provided in Part B of this FSA); 4) Hazardous Materials Management; 5) Land Use; 6) Noise and Vibration; 7) Public Health; 8) Socioeconomics; 9) Soil and Water Resources;

10) Traffic and Transportation; 11) Transmission Line Safety and Nuisance; 12) Visual Resources; 13) Waste Management; and 14) Worker Safety and Fire Protection. The Engineering Assessment contains the following sections: 15) Facility Design; 16) Geology and Paleontology; 17) Power Plant Efficiency; 18) Power Plant Reliability; and 19) Transmission System Engineering. The Environmental Assessment, Engineering Assessment and General Conditions are followed by a discussion of facility closure, project construction, and operation compliance monitoring plans and a list of staff that prepared this report.

All of the sections under the Environmental Assessment, Engineering Assessment, and the General Conditions sections include a discussion of: laws, ordinances, regulations and standards (LORS); the regional and site-specific setting; the modified project direct and cumulative impacts; proposed mitigation measures; conclusions and recommendations; and modified and/or new conditions of certification for both construction and operation (if applicable).

Part B (Cultural Resources) of the FSA is anticipated to be published the week of September 16th.

Part C (Air Quality) of the FSA will be published 30 days after staff receives the Preliminary Determination of Compliance (PDOC) from the South Coast Air Quality Management District (SCAQMD). Currently, staff has not received this permit.

AGENCY AUTHORITIES, RESPONSIBILITIES, AND COORDINATION

The Energy Commission has the exclusive authority to certify the construction, , operation and modification of thermal electric power plants 50 megawatts (MW) or larger within California. The Energy Commission certification is in lieu of any permit required by state, regional, or local agencies and by federal agencies to the extent permitted by federal law (Pub. Resources Code, § 25500 et. seq.). The Energy Commission must evaluate the impacts caused by the proposed changes to the approved project and will determine if the PSEGS would remain in compliance with applicable laws, ordinances, regulations, and standards (LORS) (Title 20, Calif. Code of Regulations, section 1769). However, the Energy Commission typically seeks comments from and works closely with other regulatory agencies that administer LORS that are applicable to the proposed project. The following paragraphs describe the agency coordination that has occurred throughout this amendment process.

Staff had multiple meetings with Native American Tribes, and staff coordinated with a number of other agencies including but not limited to U.S. National Park Service, U.S. Department of Defense, Caltrans, California Department of Public Health, California Department of Resources Recycling and Recovery (CalRecycle), California Division of Occupational Safety and Health (Cal-OHSA), California Office of Environmental Health Hazard Assessment (OEHHA), Colorado River Basin Regional Water Quality Control, South Coast Air Quality Management District, Riverside County, Riverside County Fire Department, Riverside County Sheriff’s Department, Riverside County Airport Land Use Commission, and the San Bernardino and Riverside Counties Building and Construction Trades Council. Additional information regarding tribal consultation and agency coordination is provided in the technical sections of this FSA.

U.S. BUREAU OF LAND MANAGEMENT (BLM)

The PSEGS is proposed to be located entirely on land managed by the Bureau of Land Management (BLM) and will require a Right of Way grant from BLM in addition to the certification from the Energy Commission. During the original PSPP proceeding in 2009 and 2010, Energy Commission staff and BLM staff worked closely together on the review and analysis of the project. The Energy Commission and BLM staff issued a joint Draft Environmental Impact Statement/Staff Assessment (DEIS/SA) for the Palen Solar Project on March 18, 2010. The DEIS/SA contained the Energy Commission staff's and BLM's environmental, public health and engineering evaluation of the proposed Palen Solar Project. On May 13, 2011, the BLM Published a Notice Of Availability (NOA) of the Final EIS for the Palen Solar Project in the Federal Register.

During the original licensing case, both the Energy Commission and BLM determined that they would develop and publish separate final documents. The Energy Commission released a Presiding Member's Proposed Decision on November 12, 2010 and approved the Application for Certification on December 15, 2010. BLM never made a final decision on the project and neither a Record of Decision (ROD) nor a Right of Way (ROW) grant was issued.

The BLM issued the PSEGS Plan Amendment/Draft Supplemental Environmental Impact Statement on July 27, 2013. If the project is approved by the BLM, the BLM will issue a ROD and ROW grant for the PSEGS.

Although the Energy Commission and BLM are not publishing a joint document, the Energy Commission and the BLM continue to share staff expertise, information and documentation to promote intergovernmental coordination at the local, state, and federal levels.

U.S. FISH AND WILDLIFE SERVICE (USFWS)

The U.S. Fish and Wildlife Service (USFWS) has jurisdiction to protect threatened and endangered species under the Endangered Species Act (ESA) [16 U.S.C. § 1531 et seq.] and the Migratory Bird Treaty Act [16 U.S.C. §§ 703-712]. Formal consultation with the USFWS under Section 7 of the ESA is required for any federal action that may adversely affect a federally-listed species. This consultation will be initiated through a request by the lead federal Agency – BLM – to initiate formal consultation and the submittal of a Biological Assessment (BA) which determines that the proposed project is likely to adversely affect a listed species. The BLM has received a biological opinion (BO) for the original PSPP project; however, the USFWS has requested that the BLM re-initiate consultation to address changes to the project design and footprint. The BLM has submitted a revised BA addressing these changes and has included the Yuma clapper rail, a federally listed bird that may be adversely affected by the project. Following review of the BA, the USFWS is expected to issue a Revised BO for the modified project, which will specify reasonable and prudent measures which must be implemented for the desert tortoise and Yuma clapper rail. The BLM will not issue a ROD until the final BO is issued; and therefore, the project owner may begin work on the site only after the BO is issued. Permit issuance may occur after the final Energy Commission Decision is released, however, all terms and conditions of the BO are to be incorporated by the project owner, pursuant to Condition of Certification BIO-7.

THE CALIFORNIA DEPARTMENT OF FISH AND WILDLIFE (CDFW)

The California Department of Fish and Wildlife (CDFW) has the authority to protect water resources of the State through regulation of modifications to streambeds. (Fish and Game Code, Section 1602). The Energy Commission, BLM, and the project owner have provided information to CDFW to assist in their determination of the impacts to streambeds, and their identification of permit and mitigation requirements. The project owner previously filed a Streambed Alteration Agreement with CDFW for the original PSPP project. The project owner has agreed to undertake surveys of the gas pipeline and transmission line alignments, and provide the CDFW an updated Application for Streambed Alteration Agreement for the modified project. The requirements of the Streambed Alteration Agreement will be included as a recommended Condition of Certification/Mitigation Measure.

CDFW also has the authority to regulate potential impacts to species that are protected under the California Endangered Species Act (CESA) [Fish and Game Code Sections 2050-2116]. The Energy Commission certification is in-lieu of streambed alteration agreement and incidental take permits for state-listed species usually granted by CDFW, and its Decision will incorporate the recommendations of the CDFW.

ENERGY COMMISSION'S PUBLIC ADVISER'S OFFICE

The Public Adviser advises the public on how to participate in the Energy Commission process, but does not represent members of the public. A representative of the Public Adviser's Office attended and presented information at the February 20, 2013 Informational Hearing and Site Visit. A representative also attended the workshops held on April 17, 2013, May 1, 2013, July 17, 2013, July 22, 2013, July 25, 2013 and July 26, 2013, and the Tribal Consultation Meeting held on March 22, 2013.

COMMENTS

Written comments received during the amendment process are addressed in the FSA in the technical sections they apply to. Below is a table summarizing the comments that were received during the PSA comment period.

PROJECT DESCRIPTION

Testimony of Christine Stora

PROJECT LOCATION

The project site is located approximately ¼ mile north of Interstate 10, approximately ten miles east of Desert Center and approximately halfway between the cities of Indio and Blythe, in Riverside County, California (See **Project Description Figure 1**). The Palen Solar Electric Generating System (PSEGS) would be in the same location as the Palen Solar Power Project (PSPP), but is reduced in size to approximately 3,794 acres, entirely on public land managed by the Bureau of Land Management (BLM) (Right-of-Way No. CACA-048810).

APPROVED PROJECT DESCRIPTION AND PROPOSED MODIFICATIONS

PALEN SOLAR POWER PROJECT APPROVED BY THE ENERGY COMMISSION ON DECEMBER 15, 2010

The 2010 Final Decision for the PSPP approved a solar thermal generating facility that would consist of two separate units of a 250-MW solar parabolic trough technology, with a total nominal capacity of 500 MW. With this technology, arrays of parabolic mirrors focus the sunlight on a receiver tube to create and collect heat energy. The receiver tube is located at the focal point of the trough's parabola. A heat transfer fluid (HTF) is heated to 750°F as it circulates through the receiver tubes. The HTF is then piped through a series of heat exchangers to generate high pressure steam. The steam is then fed to a traditional steam turbine generator where electricity is produced. Individual components of the PSPP included:

- Graded Solar Field & Power Block #1 (east);
- Graded Solar Field & Power Block #2 (west);
- Access road from Corn Springs Road;
- Warehouse/maintenance building, assembly hall, and laydown area;
- Telecommunications lines;
- Liquified petroleum gas (LPG) tank;
- Concrete batch plant;
- Fuel depot;
- On-site transmission facilities, including central internal switchyard;
- Single-circuit, 230-kV transmission line interconnecting to Southern California Edison's (SCE) Red Bluff Substation;
- Groundwater wells used for water supply;
- Four evaporation ponds for wastewater;

- Septic systems for sanitary wastewater; and
- Land treatment plots for remediating spills of Therminol HTF.

During the Energy Commission’s licensing process, technical staff concluded that the PSPP as originally proposed would result in unmitigable significant adverse impacts to biological resources associated with sand transport interference. Two other site configuration alternatives were submitted by the original applicant in an effort to accommodate staff’s and other biological agencies’ concerns. The alternative configurations (Reconfigured Alternatives 2 and 3) moved the project facilities westerly in order to prevent the project footprint from interfering with the area with the greatest sand transport potential. Reconfigured Alternative 2 incorporated into the project boundary 240 acres of private land near the southeast corner of the site, over which the PSPP owner did not have control. Reconfigured Alternative 3 did not incorporate private land. Because of the lack of ownership of the private land used in Reconfigured Alternative 2, the Energy Commission approved use of either Reconfigured Alternative 2 or Reconfigured Alternative 3. (See **Project Description Figures 2 and 3**)

PROPOSED MODIFICATIONS

The PSEGS proposal includes replacing the parabolic trough solar collection system and associated HTF with solar tower technology. The solar tower technology would create steam to run an electricity generator by using a field of 85,000 elevated mirrors known as heliostats—each approximately 12 feet tall, mounted on pylons and guided by a sun-tracking system to focus the sun’s rays on a solar receiver steam generator (SRSG) on top of a 750-foot solar tower located near the center of each solar field. Access to the site would be the same as the PPSP with an access road from Corn Springs Road. The project would continue to interconnect to the regional transmission grid at SCE’s Red Bluff Substation, which is currently under construction. The PSEGS would be comprised of two adjacent solar fields and associated facilities with a total combined nominal output of approximately 500 MW. PSH proposes to develop the PSEGS in two operational units, each consisting of one solar field, one tower, and a power block capable of producing approximately 250 MW of electricity. (See Project Description Figures 4, 5, 6, and 7).

Two natural gas-fired auxiliary boilers are proposed for each power block, for a total of four at the project. A startup boiler would be used during the morning startup cycle to assist the power generation equipment to reach operating temperature more quickly and for augmenting the solar operation when solar energy diminishes or during transient cloudy conditions. Each solar field also includes a night preservation boiler to provide steam to the gland systems of the steam turbine and boiler feedwater pump turbine to prevent air ingress overnight and during other shutdown periods when steam is not available from the SRSG. This boiler would also provide pegging steam to the generator during these shutdowns.

The two units would share common facilities, including an on-site switchyard, a single-circuit, 230-kV generation tie-line, and a common area containing an administration building, warehouse, evaporation ponds, maintenance complex, and a meter/valve station for incoming natural gas service to the site. Other on-site facilities would include access and maintenance roads (either dirt, gravel, or paved), perimeter fencing, tortoise fencing, and other ancillary security facilities.

The PSEGS footprint is smaller by 572 acres than the original footprint of the PSPP. While the PSPP included the use of a private parcel (of approximately 40 acres) located in the northeast portion of the site, the PSEGS would not include any development within this private parcel. The PSPP also had Energy Commission approval to develop the private parcels (approximately 240 acres) located in the southeastern portion of the site, if the project owner acquired the parcels. The PSEGS owner would not develop these private parcels.

The primary modifications to the PSPP are as follows:

- Two 250-MW power-generating units, each consisting of a dedicated field of approximately 85,000 heliostats, a 750-foot solar tower and receiver, and a power block;
- An approximately 15-acre common facilities area located in the southwestern corner of the site, with an administrative/warehouse building and two 2-acre evaporation ponds (reduced from four 2-acre evaporation ponds for the PSPP);
- An approximately 203-acre temporary construction laydown area located in the southwestern portion of the site immediately north of the common facilities area;
- Re-routing of the generation tie-line near the western end of the route and around the newly constructed Red Bluff Substation. The purpose of this re-routing is to align the PSEGS generation tie-line route immediately adjacent to the NextEra Desert Sunlight generation tie-line to minimize crossings over Interstate 10 and to ensure easy entry into the Red Bluff Substation nearest the PSEGS breaker position;
- Removal of the secondary emergency access road and the addition of two secondary access gates for emergency vehicles to enter the site;
- Re-routing of the redundant telecommunication line along the generation tie-line route;
- Natural gas delivery from a new extension of the existing Southern California Gas (SoCal Gas) distribution system to the project boundary;
- Reduction of the project footprint from 4,366 acres to 3,794 acres;
- Reduction of the amount of grading by 4.3 million cubic yards because the heliostat technology does not require an entirely flat surface;
- Reduction of the amount of water used by 99 acre-feet per year (AFY); and
- An increase in NOx emissions from the use of the auxiliary boilers.

COMMON FACILITIES AREA

A 15-acre common facilities area would be established on the southwestern corner of the site to accommodate an administration, warehouse, and maintenance complex; and an asphalt-paved visitor and employee parking area. The common facilities area also includes two 2-acre evaporation ponds. The administration complex would be served by power from the local 12.47-kV distribution system and by water from wells located in the common facilities area. The common facilities area would also be used for a temporary construction laydown area.

ACCESS ROADS AND DRIVE ZONES

Primary access to the site during both construction and operation would be a new 1,350-foot-long, 24-foot-wide, paved road entering from Corn Springs Road. The access road would be constructed from a point just north of the I-10 Corn Springs Road entrance/exit ramps east to the project site entrance, as described in the Final Decision. This road would include a 12-foot-wide, gravel-surfaced shoulder for truck staging, to preclude traffic interferences.

The PSEGS would contain internal roadway and utility corridors for each power-generating unit (comprised of the heliostat field, solar tower, and power block). Each unit would be accessible from a 20-foot-wide, paved or hardscaped access road running from the entrance of the PSEGS site to the power blocks, and then around the power block.

In addition to the paved or hardscaped access road to the power block of each unit, 12-foot-wide, unpaved roads would radiate out from each power block to provide access through the heliostat fields to a 12-foot-wide, unpaved perimeter road, running 5 feet inside of and parallel to the boundary fence. PSEGS personnel would use this road to monitor and maintain perimeter security and tortoise exclusion fencing. This road would be grubbed, bladed, and smoothed to facilitate safe use, with minimal grading where necessary to cross washes. Within each heliostat field, 10-foot-wide, dirt roads would be located concentrically around the power block to provide access to the heliostat mirrors for maintenance and cleaning. These concentric roads would be approximately 152 feet apart and would be grubbed to remove vegetation and smoothed.

LIGHTING

The lighting system would provide personnel with illumination for operation under normal conditions, for egress under emergency conditions, and emergency lighting to perform manual operations during an outage of the normal power source. The system also would provide 120-volt AC convenience outlets for portable lamps and tools. Exterior light fixtures would utilize technologies to reduce light pollution.

TEMPORARY CONSTRUCTION LAYDOWN AREA

The 203-acre temporary construction laydown area on the west side of the site would be used for equipment laydown, construction parking, construction trailers, a tire cleaning station, heliostat assembly, a temporary concrete batch plant, and other construction support facilities. The surface areas within the temporary construction area that are used frequently would be stabilized with a layer of crushed stone in areas subject to heavy daily traffic.

PROCESS DESCRIPTION

In each plant, one Rankine-cycle steam turbine would receive steam from the SRSG to generate electricity. The solar field and power generation equipment would start each morning after sunrise and would shut down (unless augmented by the auxiliary boiler) when insolation drops below the level required to keep the turbine on-line. Each plant would have two natural gas-fired auxiliary boilers that could also be used to extend daily power generation. However, on an annual basis, the natural gas used as a supplement to power generation would be limited to below 2 percent of the annual energy output of the PSEGS.

Each plant would use an air-cooled condenser (ACC) for the main steam cycle. A wet surface air cooler (WSAC) would be used for auxiliary equipment cooling. Raw water would be drawn daily from on-site wells located in each power block and in the common area adjacent to the administration building. Groundwater would be treated in on-site treatment systems and would be used for mirror washing, WSAC makeup, and process water makeup.

Each of the power blocks would be connected via underground electrical cables to the on-site switchyard in the northern area of the site. Each power block would also have a gas metering set. Permanent parking areas would be provided at each power block for operations and maintenance personnel.

POWER CYCLE

Solar energy is reflected by the heliostats onto the SRSG where the energy heats water into superheated steam. The steam is then routed to the steam turbine generator (STG) where the energy in the steam is converted to electrical energy.

Following expansion through the steam turbine, exhaust steam is directed to the air-cooled condenser. The ACC blows ambient air across a heat transfer surface area to cool and condense the steam. The condensed steam is collected in a condensate tank and returned to the SRSG via a series of feedwater heaters and pumps.

SOLAR FIELD

Each of the heliostat assemblies is composed of two mirrors, each approximately 12 feet high by 8.5 feet wide, with a total reflecting surface of 204.7 square feet. Each heliostat assembly is mounted on a single pylon along with a computer-programmed aiming-control system that directs the motion of the heliostat to track the movement of the sun. Pylon height may vary due to specific site conditions, but they are generally

6.23 feet tall. Communication between the heliostats and the operations center would be done via surface-mounted anchored cable or a wireless remote system.

GENERATING UNITS

The following in a condensate tank and provided to the feedwater circuit through a condensate pump. The ACC normally operates at a pressure of 3.25 inches of mercury absolute (approximately 1.6 psia).

NATURAL GAS BOILERS

Each unit would include two natural gas-fired boilers to assist with daily startup of the power generation equipment and to preserve energy in the steam cycle overnight. Each unit would contain the following boiler equipment:

- One 249-MMBtu/hr[1] packaged natural gas-fired auxiliary boiler for startup and cycle augmentation, capable of producing 185,000 pounds per hour (lb/hr) at 770°F and 650 psia;
- One 10-MMBtu/hr natural gas-fired, “night preservation” boiler to maintain system temperatures overnight, capable of producing 10,000 lb/hr at 500°F and 175 psia.

MAJOR ELECTRICAL EQUIPMENT AND SYSTEMS

The bulk of the electric power produced by the facility would be transmitted to the grid. Approximately 22 MW of electric power would be used on-site to power auxiliaries such as the ACC, pumps and fans, control systems, and general facility loads, including lighting, heating, and air conditioning. Some power would also be converted from alternating current (AC) to direct current (DC) and stored in batteries, which would be used as backup power for the plant control systems and essential uses. Emergency power would be provided by two diesel generator sets (one in each power block), each with 2,500-kW output capacity and one diesel generator set in the common area (with a 250-kW output capacity).

MIRROR WASHING

The majority of mirror washing activities are planned to be performed at night, with a small minority of the washing activities to be performed in the daytime during plant operation. Mirror washing will be performed by a mobile mirror washing machine. The mirror washing machine will travel along the ring roads and, in a stationary position, use a remote boom to access all heliostats within a 100-foot radius of its location.

When mirrors are washing during the daytime, the heliostats will be constrained in one of two ways:

1) Directional Orientation – Heliostats will be limited in terms of direction so that all heliostats remain facing, generally, toward the tower (and not toward the boundary of the project).

[1] = Million Metric British thermal units per hour

2) Elevation - Depending on its range and relative direction from the washing machine, each heliostat will be limited to a vertical position (like in sleep orientation) or a horizontal (wind stow) position.

NATURAL GAS SUPPLY

The PSPP did not include a natural gas supply pipeline, but rather was approved to use LPG for its auxiliary fuel. The PSEGS would use natural gas to fire its auxiliary and nighttime preservation boilers. The natural gas supply for PSEGS would be provided by SoCal Gas via a new pipeline that would extend southward from the site and interconnect with an existing SoCal Gas transmission pipeline located just south of I-10. The new gas pipeline, approximately 8 inches in diameter and 2,956 feet long, would be constructed within a previously-surveyed corridor as shown on applicant’s Figure 2.1-6, dated and docketed on March 15, 2013. SoCal Gas would construct, own, and operate the new gas pipeline as part of its extensive gas supply system.

WATER SUPPLY AND USE

Primary water uses consist of replacing boiler blowdown, providing supplemental cooling for plant auxiliary systems, and water for washing the heliostats to ensure they function at full performance. The Final Decision allowed the PSPP to use up to 1,917 AFY of water, from up to 10 groundwater wells, during construction (for a total of 5,750 acre-feet during the 39-month-long construction period) and 300 AFY during operation. The PSEGS would utilize the same number of groundwater wells, but would only use up to 400 acre-feet during construction (for a total of 1,130 acre-feet during the construction period) and up to 201 AFY during operation. The well water would be used for process make-up, mirror washing, and domestic uses.

Each unit would have a raw water tank with a capacity of 800,000 gallons. A portion of the raw water (200,000 gallons) is for plant use, while the majority would be reserved for fire water. The common area would also contain a combined service water/firewater tank with a capacity of 480,000 gallons. The water treatment plant would operate continuously in order to minimize water treatment system size and capital cost.

WATER REQUIREMENTS

A breakdown of the estimated average daily quantity of water required for PSEGS operation is presented in **Project Description Table 1**. The daily water requirements shown are estimated quantities based on PSEGS operating at full load.

Project Description Table 1
Average Daily Water Requirements (Both Units)

Use	Average Daily Use*		Annual Average Use
	gpm	gpd	AFY
Process Uses	63	90,873	102
Mirror Washing	44	63,408	71
Potable Water	2.1	2,995	3.4
Dust Suppression	15	21,802	24.4
Total	124	179,078	201

*Average Daily Use is based on annual operating hours of 3,500 hours/year
gpd = gallons per day
gpm = gallons per minute
AFY = acre-feet per year

PLANT COOLING SYSTEMS

The cycle heat rejection system for the main steam cycle would consist of an ACC system. The heat rejection system would receive exhaust steam from the low-pressure section of the steam turbine and feedwater heaters and condense it back to water for reuse. The condenser would remove heat from the condensing steam up to a maximum of 1,140 MMBtu/hr, depending on ambient temperature and plant load.

A WSAC would cool the generator, steam turbine generator lubrication oil, boiler feed pump lubricating oil, SRSG circulating water pumps, and other equipment requiring cooling. The WSAC would use reverse osmosis (RO) brine mixed with filtered well water for cooling. A 40 percent propylene glycol/60 percent demineralized water mixture would be used in the closed cooling water loop to provide freeze protection.

WASTE MANAGEMENT

Waste management is the process whereby all wastes produced at the project site are properly collected, treated (if necessary), and disposed of. Project wastes would consist primarily of non-hazardous solid and liquid wastes, with lesser amounts of hazardous wastes and universal wastes. The non-hazardous solid wastes would be construction and office wastes, as well as solid wastes from the water treatment system. The non-hazardous solid wastes would be trucked to a nearby Class II or III landfill. Non-hazardous liquid wastes would consist primarily of domestic sewage and wastewater streams such as RO system reject water, boiler blowdown, and auxiliary cooling tower blowdown. A septic tank and leach field system would be installed to manage domestic sewage. All other waste streams would be either recycled or sent to the evaporation ponds.

FIRE PROTECTION

The fire protection system would be designed in accordance with applicable regulations, standards and codes to protect personnel and limit property loss and plant downtime in the event of a fire. The primary source of fire protection water would be the service/firewater storage tank located at each power block and the firewater storage tank in the common area. An electric jockey pump and electric motor-driven main fire pump would be provided for the common area and for each power block to maintain the water pressure in the fire main at the level required to serve all fire-fighting systems. In addition, a back-up, 204-hp, diesel engine-driven fire pump would be provided for the common area and each power block to pressurize the fire loop if the power supply to the electric motor-driven main fire pump fails. A fire pump controller would be provided for each fire pump.

The fire pumps would discharge to a dedicated underground firewater loop piping system. Normally, the jockey pumps would maintain pressure in the firewater loop. Both the fire hydrants and the fixed-suppression systems would be supplied from the firewater loop. Fixed fire suppression systems would be installed at determined fire-risk areas, such as the transformers and turbine lube oil equipment. Sprinkler systems would also be installed in the administration complex buildings and fire pump enclosure as required by National Fire Protection Association (NFPA) and local code requirements. Handheld fire extinguishers of the appropriate size and rating would be located in accordance with NFPA 850 throughout the power block and common area. Generator step-up transformers and other oil-filled transformers would be contained and provided with a deluge system. On-site personnel would be trained in the use of fire protection equipment and would be the first responders to an incident.

The PSEGS is located such that it would fall under the jurisdiction of the Indio Office of the Riverside County Fire Department. Based on the requirements of Riverside County Ordinance No. 787.1, the piping system supplying the fire hydrants must be sized to convey a potential firewater flowrate of 5,000 gpm. Minimum firewater storage volume in each power block would be 600,000 gallons. Firewater would be supplied from a combined service water/firewater storage tank located at each power block. One electric primary and one diesel-fueled backup firewater pump, each with a capacity of 5,000 gpm, would deliver water to the fire protection piping network. Fire protection for the solar fields is not required since no combustible materials would be present in the solar field areas.

The common area fire protection system would be sized to comply with LORS and would consist of one electric primary pump and one diesel-fueled backup firewater pump. Firewater would be supplied from the combined service water/firewater storage tank with a storage volume of 480,000 gallons.

SUMMARY OF CONSTRUCTION ACTIVITIES AND METHODS OF THE PSEGS

The PSEGS would have an average construction workforce of 998 and a peak workforce of approximately 2,311. Construction is expected to take a little over two years. The PSEGS would require much less grading than the PSPP because the heliostat technology does not require an entirely flat surface.

The site fence will be installed concurrently with the desert tortoise's survey process. Project construction would commence with the building of site roads and the installation of temporary construction facilities, including office trailers, parking areas, material laydown areas, a concrete batch plant, and a heliostat assembly facility. The construction of each generating unit would begin with grading and construction of earthen berms around the power block areas to divert storm water, followed by the excavation and placement of foundations and other underground facilities. Superstructures and equipment would then be placed on the foundations. Major items include the 750-foot-tall solar power tower and SRSG, the STG pedestal and STG, and the ACC. Once the mechanical equipment is in place, construction would continue with the installation of the piping, electrical equipment, and cables necessary to connect and power the equipment. Upon completion of construction, the checkout, testing, startup, and commissioning of the various plant systems would begin, resulting in a fully operational generating unit.

After required grading in the heliostat fields, the heliostats would be installed in two steps. Initially, the support pylons would be installed using vibratory technology to insert the pylons into the ground (pre-augering prior to the installation of the pylon may be required). Depths would not be expected to be greater than 12 feet. The heliostat assembly (mirrors, support structure, and aiming system) would be mounted on the pylon. Pylons would be delivered to their locations by an all-terrain vehicle. Installation of the heliostat assemblies would be accomplished with a rough terrain crane.

The majority of the project site would maintain the original grades and natural drainage features; therefore, no additional storm drainage control is proposed. The stormwater management design for the I-10 freeway includes three drainage culverts to allow rain to flow from south to north underneath the freeway. To minimize wind and water erosion, open spaces would be preserved and left undisturbed, maintaining existing vegetation to the extent possible with respect to site topography and access requirements. If needed, stone filters and check dams would be strategically placed throughout the project site to provide areas for sediment deposition and to promote the sheet flow of stormwater prior to leaving the project site boundary. During construction, trenches would be excavated for the installation of electrical transmission system conductors and the on-site natural gas system. A typical trench would be 2–3 feet wide at the base and 3–6 feet deep. A few trenches may have widths and/or depths up to 12 feet.

SUMMARY OF PSEGS OPERATIONS

The proposed PSEGS would employ up to 100 full-time employees: 30 at Unit 1 (including mirror washing machine operators), 30 at Unit 2 (including mirror washing machine operators), and 40 at the administration complex. The facility would operate seven days a week. Heliostat washing will cover the entire solar field weekly.

A detailed operation and maintenance program has not yet been developed. The facility would be operated in one of the following modes:

- The facility would be operated at its maximum continuous output for as many hours per year as solar input allows, or as limited by contractual terms and conditions; or
- A full shutdown would occur if forced by equipment malfunction, transmission or gas line disconnect, or scheduled maintenance.

NON-OPERATION AND CLOSURE

Non-operation is time-limited and can encompass part or all of a facility. Non-operation can be a planned event, usually for minor equipment maintenance or repair, or unplanned, usually the result of unanticipated events or emergencies.

Closure is a facility shutdown with no intent to restart operation. It may also be the cumulative result of unsuccessful efforts to re-start over an increasingly lengthy period of non-operation, condemned by inadequate means and/or lack of a viable plan. Facility closures can occur due to a variety of factors, including, but not limited to, irreparable damage and/or functional or economic obsolescence. Please see the **GENERAL CONDITIONS** section of this FSA for specific non-operational and closure requirements.

FINAL STAFF ASSESSMENT – Part C

BIOLOGICAL RESOURCES

Testimony of Ann Crisp, Carol Watson, and Chris Huntley

SUMMARY OF CONCLUSIONS

OVERVIEW OF IMPACTS TO BIOLOGICAL RESOURCES:

The Palen Solar Electric Generating System (PSEGS project or modified project) would have significant impacts to biological resources, impacting all of the Sonoran creosote bush scrub, sand dunes, desert washes and other native plant and wildlife communities within the approximately 3,794-acre site as well as along the natural gas line corridor (3.56 acres) and proposed and approved generation tie-line corridor (100.86 acres). The PSEGS project as proposed would leave the majority of the vegetation within heliostat fields intact, while adding roads and other improvements only where necessary for project development and operation. The PSEGS would eliminate the engineered channels of the approved Palen Solar Power Project (PSPP or approved project) and most of the natural drainage features will be maintained and any grading required will be designed to promote sheet flow where possible. However, staff is assuming a total loss of the function and value of the vegetation and habitats within the project site because perimeter fencing will exclude most terrestrial animals, and ongoing disturbance, noise, and other anthropogenic activities at the site may continue to degrade habitat functions within the project footprint. Wildlife and plants that are tolerant to disturbance may continue to occupy the site, however, staff does not consider leaving the vegetation on site a benefit to these species due to the ongoing risk of injury or mortality from construction equipment or operational work including mowing, maintenance, and washing of the heliostats.

<u>Desert Tortoise Impacts</u>:

The PSEGS project site is located in an area that was surveyed for desert tortoise for the Commission approved PSPP project. Supplemental surveys for desert tortoise were conducted in 2013 for areas not previously covered by the PSPP project including the proposed natural gas line alignment.Most of the PSEGS site provides low to moderate quality habitat for desert tortoise. The PSEGS project would result in 3,897 acres of direct and 51.4 acres of indirect impacts to desert tortoise habitat. This would functionally remove access to approximately 3,948 acres of desert tortoise habitat, including 228 acres within the Chuckwalla Critical Habitat Unit.

Desert tortoise sign (i.e., burrows, pallets, and shell remains) were detected on the PSEGS project site; however no living animals were observed. Surveys conducted in 2010 identified seven tortoises (adult and juvenile) in the project area including four along the generation tie line and three tortoises south of I-10. These tortoises were detected in buffer areas that would not be subject to direct project disturbance. Based on estimates provided by the USFWS 2011 Biological Opinion (BO) for the PSPP (approved project), the site is expected to support from two to 12 adult/subadult tortoises, three to six juvenile tortoises, and approximately 35 eggs. Because these values are based on regional densities and animals detected in buffer areas, the projected number of desert tortoise that may occur on the site is expected to be lower than the estimates provided in this Final Staff Assessment (FSA).

Construction and operation of the PSEGS project will result in direct and indirect impacts to desert tortoise (federally and state listed as threatened). Implementation of the project would result in the permanent loss of desert tortoise habitat.

Construction and operation of the PSEGS project will constrain wildlife movement to some degree and fragment and degrade adjacent native plant and wildlife communities. The PSEGS project may promote the spread of invasive non-native plants and desert tortoise predators such as ravens.

Conditions of Certification **BIO-9** through **BIO-11** would require the protection of desert tortoise and other biological resources that occur in and near the project area and would minimize potential take of desert tortoise during project construction and operation. To offset the direct and indirect loss of 3,948 acres of desert tortoise habitat, Condition of Certification **BIO-12** which recommends habitat compensation at a 1:1 ratio for areas outside of critical habitat and a 5:1 ratio for disturbance to habitat in the Chuckwalla Critical Habitat Unit. These ratios are consistent with the Commission adopted mitigation requirements identified for the PSPP. The PSEGS project would require 4,860 acres of compensatory mitigation for desert tortoise. The project owner provided comments on the Preliminary Staff Assessment (PSA) which included revisions to Condition of Certification **BIO-12.** These revisions recommended an alternative mitigation strategy for desert tortoise compensation based on the retirement of grazing allotments. During a workshop conducted on July 24, 2013 the project owner provided further information on the proposed ratios and how this may benefit desert tortoise. On July 31, 2013 the project owner filed additional revisions to Condition **BIO-12** based on workshop discussions and recommended that up to 50 percent of the mitigation land requirement could be achieved through the retirement of grazing allotments. The project owner proposed mitigation ratios of 3:1 for areas outside of critical habitat and 15:1 ratios for habitat in the Chuckwalla Critical Habitat Unit. Staff considered the request for this change and acknowledges retirement of grazing allotments can benefit desert tortoise. However, after coordination with REAT group team members, staff does not recommend adopting the revised language for this FSA. The approach has merit, however staff is not convinced that the changes to the condition are warranted at this time. The current mitigation approach was considered and adopted by the Commission. The proposed changes are considerable; depart from the adopted mitigation strategy; have not been subject to public review; and the REAT agencies are not in full agreement on the efficacy of this approach or in full agreement if this change will ensure full mitigation.

Condition of Certification **BIO-13** requires implementation of a Raven Management and Monitoring Plan to address project-related increases in ravens, a desert tortoise predator, as well as define the requirements for the project owner to contribute funds to the USFWS regional raven management program.

In June, 2011, USFWS issued a BO for the licensed PSPP project (USFWS 2011b); however, the USFWS requested the BLM re-initiate consultation to address changes to the project design and footprint. The BLM has submitted a revised Biological Assessment (BA) addressing these changes and has included the Yuma clapper rail, a federally listed bird that may be adversely affected by the project. Following review of the BA, the USFWS is expected to issue a Revised BO for the modified project, which will specify reasonable and prudent measures which must be implemented for desert tortoise and Yuma clapper rail. The BLM will not issue a Record of Decision prior to receiving the approved BO.

Ephemeral Streams:

A total of 374.7 acres of state jurisdictional waters, a slight increase from PSPP's impacts to 312 acres were delineated on the project site. In June, 2013 the project owner provided an update of jurisdictional waters that occur on the modified linear facilities. In August 2013 the project owner provided a CDFW Lake or Streambed Alteration Agreement Amendment Notification package for staff's review in coorridnation with CDFW (Palen 2013aaa). Approximately 13.88 acres of state waters are present on the natural gas pipeline alignment. Thirty-two acres of ephemeral streams located downstream of the project will be indirectly impacted but to a limited degree because the project is not expected to substantially alter the hydrology to downstream drainages. The project owner will minimize obstructions of the natural surface drainage patterns where possible, but staff concluded the biological functions and values of the streams will be lost due to perimeter exclusion fencing, partial grading, road construction and maintenance, vegetation maintenance, herbicide spraying (if used), and human disturbance. Staff considers the direct, indirect, and cumulative impacts to ephemeral streams to be significant because they would result in a loss of the beneficial functions and values that these state waters provide to vegetation and wildlife.

Condition of Certification **BIO-21** would minimize and offset direct and indirect impacts to state waters to less-than-significant levels and would assure compliance with California Department of Fish and Wildlife (CDFW) codes that regulate impacts to these waters. **BIO-21** specifies acquisition of state waters within the Chuckwalla Valley basin, in the Palen watershed or adjacent watersheds, at a 1:1 ratio for unvegetated ephemeral dry wash and at a 3:1 ratio for desert dry wash woodland.

Impacts to Groundwater-Dependent Ecosystems:

The modified project would use less groundwater during both construction and operation than the PSPP project. Construction groundwater use is stated to be 1,130 acre-feet per year (AFY), a reduction from the original permitted project groundwater consumption of 1,917 AFY. Operational groundwater use is stated as 201 AFY, a reduction of nearly 100 AFY.

Two conditions, **BIO-23** and **BIO-24** were required for the original project. Condition of Certification **BIO-23** requires monitoring of groundwater levels and of groundwater-dependent vegetation within the area affected by groundwater pumping, and Condition of Certification **BIO-24** requires implementation of remedial action and compensatory mitigation if the monitoring reveals adverse effects. No new or additional impacts were identified in conjunction with the modified project, and therefore no new conditions, or edits to the existing conditions other than updates to dates and map references **BIO-23** or **BIO-24** are necessary. With implementation of these mitigation measures the PSEGS project impacts to groundwater-dependent plant communities would be reduced to less-than-significant levels.

Special-Status Plants:

Impacts to special-status plant species are similar to impacts identified for the PSPP project. No federal- or state-listed plant species were detected within the PSPP Project Disturbance Area, but three other species of special-status plants were detected within the disturbance area during the spring 2010 surveys for the PSPP: Harwood's milk-vetch, California ditaxis, and ribbed cryptantha. These species are located in the PSEGS Project Disturbance Area and would be similarly impacted by the PSEGS project. Fall 2010 botanical surveys were conducted in the PSPP project area; however no additional special-status plant species were detected. No additional special-status plants were detected during spring 2013 surveys for new areas of impact for the PSEGS project including the proposed generation tie-line and natural gas line corridor (Palen 2013jj).

Condition of Certification **BIO-19** describes measures for avoiding and minimizing effects to avoided occurrences of Harwood's milk-vetch, California ditaxis and other special-status plants occurring within 100 feet of the project boundary, and guidelines for minimizing direct effects along project linears. **BIO-19** also contains guidelines for conducting fall botanical surveys, triggers for mitigation, and detailed specifications and performance standards to ensure that any additional special-status plants that would have been missed during the previous spring surveys would be mitigated to a less-than-significant level. Fall 2010 surveys were completed for the PSPP: however, fall 2013 botanical surveys would be required for the new areas of impact for the PSEGS project including the proposed generation tie-line and natural gas line corridor.

Avian Impacts

Desert dry wash woodland, Sonoran creosote bush scrub and other habitat within the project area provides foraging, cover, and/or breeding habitat for a number of resident and migratory birds, including a number of special-status bird species potentially occurring at the site. Construction and operation of the proposed project or its alternatives could result in death or injury of these birds.

The solar tower technology creates a new impact, solar flux. Flux is concentrated over the heliostat field, as the mirrors reflect sunlight back to the solar receiver located near the top of each collector tower. Solar flux increases in intensity as reflected beams of light converge on one another. Under normal operating conditions, intensity of flux is highest at the towers. Exposure to elevated flux may cause injury or death. From an aerial perspective, heliostats may reflect the sky, creating a water-like mirage effect. It is possible for birds to be attracted to the project site by this effect, and collide with mirrors. Mirror collision was also identified as a project impact of the PSPP project. The evaporation ponds and adjacent date-palm and jojoba agricultural operations may attract insects, bats, and birds, increasing their risk from collision or exposure to elevated levels of solar flux. The following discussions group at-risk bird species in terms of state and federallaws. Because nesting birds are afforded legal protections as well, a separate discussion is provided for this group of birds. Please note that birds that nest on the site may also be discussed under the categories of Fully Protected Species, or Other Special Status Species.

Nesting Birds & Habitat Loss

The large-scale conversion of the site from relatively intact native habitat to an operating solar field has the potential to impact nesting birds. Conditions of Certification **BIO-1** through **BIO-8** requires a project biologist, and prescribe a variety of minimization measures and best management practices to protect nesting birds, control fugitive dust, reduce the potential for wildfires, require worker training to minimize disturbances, require biological monitoring and reporting of project disturbances, and compensate for habitat loss through the acquisition and management of offsite lands. Staff has recommended several modifications to **BIO-1** to **BIO-8**. These modifications include: 1) revised timing of submittals; 2) additional duties for the Designated Biologist; 3) additional requirements for the BRMIMP and WEAP; and 4) additional impact avoidance and minimization measures such as requiring the use of best vegetation management practices which will limit activities that may disrupt nesting and breeding of sensitive birds. Condition of Certification **BIO-14**, Weed Management, requires preparation and implementation of a Weed Management Plan to prevent the loss or ongoing degradation of habitat values, and includes measures to protect wildlife from weed management activities. Condition of Certification **BIO-15** requires surveys and avoidance measures to prevent destruction of active bird nests during construction and operations. Staff's proposed conditions of certification **BIO-16a and BIO-16b** (which would replace condition **BIO-16** in the PSPP Decision) provide for ongoing project monitoring, powerline retrofits, and implementation of a suite of habitat restoration and enhancement measures that would benefit nesting birds. Taken together, staff concludes that these conditions of certification would avoid or minimize potential take of nesting birds during project construction and would reduce impacts to their habitat to a level less than significant according to CEQA.

Fully Protected Avian Species (Bald and Golden Eagles, Yuma Clapper Rail)

Several fully protected species have a potential to be impacted by the project. Bald and Golden eagles are protected by the federal Bald and Golden Eagle Protection Act (BGEPA) and Migratory Bird Treaty Act (MBTA) and are fully protected under the California Fish and Game Code. Both bald and golden eagles are also BLM sensitive species. The list of species which may be present at the project site could include other fully protected species such American peregrine falcon, and Yuma clapper rail, among others. This list is not meant to be comprehensive, however, this discussion is generally applicable to any fully protected species.

There is no suitable bald or golden eagle nesting habitat on the proposed project site. The entire project site is suitable golden eagle foraging habitat year-around, and bald eagles may fly over the area or (rarely) forage on the site during winter or migration seasons. Conditions of Certification **BIO-1** through **BIO-8** would serve to mitigate many of the project's impacts to native vegetation and wildlife habitat, including eagle foraging habitat. Staff believes that all compensation land meeting the selection criteria as desert tortoise habitat (**BIO-12**) and desert dry wash habitat (**BIO-21**) also would serve as suitable eagle foraging habitat. Staff concludes that the project's impacts to eagles and their foraging habitat would be less than significant with implementation of these required conditions of certification.

Mortality or other take, such as sub-lethal injury caused by burning or blinding through exposure to elevated flux, would be significant under CEQA. Staff's recommended Conditions of Certification **BIO-1** through **BIO-8** would minimize adverse impacts to eagles and Conditions of Certification **BIO-16a and BIO-16b** provide for ongoing project monitoring and implementation of a suite of habitat restoration and enhancement measures that would benefit bald and golden eagles, including powerline retrofits, to mitigate and avoid potential electrocutions both on and offsite. Staff concludes that the take of a bald or golden eagle, should it occur, would be significant according to CEQA.

While the probability is uncertain, given that the site and surrounding areas are suitable bald and golden eagle foraging habitat, staff believes that operation of the PSEGS project could result in the take of bald or golden eagles, due either to collision with project facilities or to injury or mortality caused by flying through concentrated solar energy over the heliostat field. No mechanism is currently available to allow staff to quantify potential mortality for bald or golden eagles, or any other avian species. Because they are fully protected species, any take of bald or golden eagles is prohibited by law. The burden is on the project owner to avoid any such take.

Other Special Status Avian Species

Special status avian species includes federally and state listed threatened, endangered, or candidate species, or other species such as those considered to be sensitive by the BLM. The list of species of special status species which may be present at the project site includes more species than can be listed here, but would include Yuma clapper rail, gilded flicker, elf owl, osprey, ferruginous hawk, burrowing owl (discussed further below), Cooper's hawk, sharp-shinned hawk, northern harrier, prairie falcon, peregrine falcon, Swainson's hawk, Harris hawk, and short-eared owl. This list is not meant to be comprehensive, however, this discussion is generally applicable to any special status species.

These specially protected birds may be found in the region seasonally, especially during winter, or as year-around residents, and have the potential to be adversely affected by the project during operation. Operational impacts may include collision with heliostats or other project facilities and injury or mortality from exposure to solar flux, such as burning or blinding. Staff cannot quantify the potential risk of these effects; however, this impact is unavoidable, and staff believes these impacts would be significant under CEQA and may violate the California Endangered Species Act (CESA) and/or the Federal Endangered Species Act (ESA) depending on the species taken. Such take is also impermissible under the MBTA, which is applicable to native American birds.

Conditions of Certification **BIO-1** through **BIO-8** and **BIO-12** (Desert Tortoise Compensatory Mitigation), including staff's recommended modifications, would minimize project impacts to special status birds. In addition, staff's recommended Conditions of Certification **BIO-16a and BIO-16b** provide for ongoing project monitoring, powerline retrofits, and implementation of a suite of habitat restoration and enhancement measures that would benefit special status birds. Staff is unable to quantify the risk to each species of threatened or endangered bird that may be impacted by the site. However, the risk is predictable and unavoidable. Take of a special status bird, in the absence of appropriate permits (a federal Section 7 permit or a state 2081 permit) may be considered significant under CEQA. Effects to special status birds may be unmitigable.

Impacts to Burrowing Owl

Burrowing owls have been detected on the PSEGS site as recently as 2013. Construction and operation of the PSEGS would result in disturbance or habitat loss for this species. Approximately 18 observations of individual owls were made during spring avian surveys of the project site. Burrowing owls were detected on the modified linear facilities however active burrows were not observed. Potential direct impacts to burrowing owls would be mitigated by implementation of Condition of Certification **BIO-18**

Staff has proposed minor modifications to address the more recent recommendations included in the CDFW Staff Report of Burrowing Owl issued in 2012 after the PSPP was approved and also incorporated modifications requested by the project owner related to selection criteria for mitigation lands (Palen 2013a) This condition involves passive relocation of burrowing owls, as well as acquisition of 78 acres of off-site compensatory mitigation lands suitable for two pairs of burrowing owls for development of the PSEGS project site. This offset may be nested within Condition of Certification **BIO-12**, Desert Tortoise Compensatory Mitigation; given that selection criteria are met. Additional, off-site compensatory mitigation land may be required pending completion of pre-construction surveys if additional owls are identified on the project site. Indirect impacts to burrowing owl include collisions with project features, glare, also collision, electrocution, glare, and exposure to elevated levels of solar flux. Conditions of Certification **BIO-16a and BIO-16b** provide for ongoing project monitoring and implementation of a suite of habitat restoration and enhancement measures that would benefit burrowing owls, and implement adaptive management strategies based on results of project monitoring. However potential indirect impacts may remain significant after mitigation.

Special Status Bats

Documented roosting areas for several special-status bats, including caves and mines, are known to occur in mountains surrounding the project site. Bats have also been found roosting under bridges along Interstate 10. Bats may roost in large palm trees in adjacent commercial agriculture operations. Important foraging habitat is found over agricultural lands and desert wash woodland on-site and on lands to the east. No special-status bats are expected to roost on-site, but several species could forage or fly over the site en route between roosting areas in the Mule Mountains and agricultural lands located to the east. Conditions of Certification **BIO-1** through **BIO-8**, including staff's recommended modifications, would minimize or compensate for habitat loss, including offset for dry desert washes at a 3:1 ratio. Staff concludes that these measures would effectively mitigate habitat impacts for special-status bats. Bats may also experience flux and collision impacts as described above under **Avian Impacts.** Conditions of Certification **BIO-16a and BIO-16b** provide for ongoing project monitoring and implementation of a suite of habitat restoration and enhancement measures that would benefit bats, and recommends adaptive management strategies based on results of project monitoring. Staff has requested the project owner install acoustic bat detection systems (Anabat™ or Sonobat™) on the project site to collect further data on bat species that may be present (CEC 2013i). Data collected during this effort would be used to inform the Bird and Bat Conservation Strategy. Take of special status bats on the project site would be considered significant under CEQA, as it would violate CESA and/or FESA, depending on the species taken.

Impacts to Burrowing Mammals

Desert dry wash woodland, Sonoran creosote bush scrub and other habitat in the project area provides foraging, cover, and/or breeding habitat for American badgers and desert kit fox. Construction and operation of the project could result in death or injury of these species.

American badgers and desert kit fox occur throughout the project area, and construction activities could crush or entomb kit fox and American badger. Passive relocation would also potentially increase the risk of Canine Distemper Virus (CDV) transmission in desert kit fox if CDV is present in local area. Staff's proposed revised Condition of Certification **BIO-17,** requires development of an American Badger and Desert Kit Fox Mitigation and Monitoring Plan that includes, but is not limited to, procedures and impact avoidance measures for conducting pre-construction baseline surveys and avoidance measures to protect badgers and kit fox during construction and operation, as well as the option for the project owner to participate in the CDFW-led Proposed Desert Kit Fox Health Monitoring and Mitigation Program and would avoid or minimize this potential impact.

Impacts to Sand Dunes/Mojave Fringe-toed Lizards

The 2010 Final Decision approved two reconfigured alternatives (Reconfigured Alternative 2 and Reconfigured Alternative 3) that shifted the original proposed PSPP project partially out of the sand transport corridor, thus reducing interference with the sand transport corridor and reducing impacts to sand dune dependent species such as Mojave fringe-toed lizards and several special-status plants. The PSEGS project is located within the footprint of the approved PSPP footprint (Reconfigured Alternative 2 and Reconfigured Alternative 3) and would directly impact 267 acres of Zone II sand transport corridor, and 893 acres of Zone III sand transport corridor, for a total of 1,160 acres of direct impacts to sand transport zones II and III, based on the use of the Philip Williams and Associates (PWA) model. The PSEGS project would result in approximately 421 acres of indirect impacts to Zone II and Zone III (25-100% sand transport reduction). This impact would occur outside the project footprint on BLM lands downwind of the project (CEC 2013l). Indirect impacts would occur in areas that experience reduced sand transport in areas that lie outside the project footprint and are affected by varying degrees of sand flux reduction. This is an increase in impacts as compared to the PSPP project, and mainly attributable to an increase in sand shadow effects. The number of heliostat pylons and other project features also factor into the increase in impacts. Specifically, and acknowledging constraints in the accuracy of modeled results, this is an increase of 480 acres of direct effects to sand transport zones compared to Reconfigured Alternative 2. In comparison with Reconfigured Alternative #3, the project would increase direct impacts by 370 acres, and would increase indirect impacts by 316 acres. Implementation of Condition of Certification **BIO-20** would mitigate onsite direct impacts, as well as offsite indirect impacts.

The PSEGS project would directly affect 1,480 acres of Mojave fringe-toed lizard habitat. This includes direct impacts to 1,160 acres of habitat in sand transport zones II and III and 320 acres of other habitat identified as potential Mojave fringe-toed lizard habitat as part of the PSPP that includes stabilized and partially stabilized sand dunes, some wash habitat, and other areas within Sonoran creosote scrub bush habitat with appropriate soils as identified during the original PSPP project proceedings (Solar Millennium 2010m). The PSEGS project would have significant but mitigable impacts to Mojave fringe-toed lizards within the project footprint, and would indirectly affect Mojave fringe-toed lizard offsite and downwind of the project, due to projected deflation of the dunes, plant successional shifts, and other predictable events which would all degrade Mojave fringe-toed lizard habitat. Offsite indirect impacts to Mojave fringe-toed lizards would be cumulatively significant but mitigable. This is an increase in indirect impacts, compared to the approved PSPP (Reconfigured Alternatives 2 and 3).

The PSEGS project proposes leaving some vegetation onsite, while adding roads and other improvements only where necessary for project development and operation. In addition, the PSEGS will have asphaltic roads within the project site fence that were not present for the PSPP project. Additional asphaltic pavement onsite may lead to increased road kill of Mojave fringe-toed lizard and other reptiles or amphibians that may use the asphalt roads as thermoregulation sites. Implementation of vegetation management activities could also result death or injury of Mojave fringe-toed lizard. In addition, Mojave fringe toed lizard may be injured or killed by vehicles on unpaved roads as they are difficult to detect as they hide under loose sand.

Condition of Certification **BIO-20** requires acquisition, protection and enhancement of core populations of Mojave fringe-toed lizard habitat elsewhere in the Chuckwalla or Palen valleys. This compensatory mitigation would offset the impacts of the PSEGS project to less-than-significant levels. In addition, staff has modified **BIO-6** and **BIO-8** to address the potential for vehicle strikes of Mojave fringe-toed lizard when lizards are using asphaltic and unpaved roads within the PSEGS site to thermoregulate.

Temporarily Disturbed Areas

Avoidance and minimization measures for the restoration of temporarily disturbed areas previously described in the deleted **BIO-27** were incorporated into **BIO-8** (Impact Avoidance and Minimization Measures) and weed management measures previously described in **BIO-27** were incorporated into **BIO-14** (Weed Management Plan). Restoration and revegetation of the solar facility and other permanently disturbed areas upon closure is addressed separately in **BIO-22**.

Cumulative Effects

Construction and operation of the PSEGS, as proposed, would have cumulatively considerable impacts to many biological resources within the Chuckwalla Valley and the Northern and Eastern Colorado Desert Coordinated Management Plan (NECO) area. These include: desert washes; Mojave fringe-toed lizard; desert tortoise; movement and connectivity; special status birds such as bald and golden eagle, Swainson’s hawk, Leconte’s thrasher and burrowing owl; American badger and desert kit fox; the Chuckwalla Valley dune system, desert wash woodland, groundwater-dependent ecosystems and other natural communities, and special-status plants.

With the exception of avian species the projects contribution to significant cumulative effects to biological resources including desert washes and dune habitats would be minimized to a level less than cumulatively considerable with implementation of Conditions of Certification **BIO-1** through **BIO-29**.

Conditions of certification address impacts that might be individually minor but cumulatively considerable. These conditions include measures to minimize the spread of invasive non-native plants, habitat fragmentation, an increase in raven predation, increased roadkills, bird collisions and damaging exposure to elevated solar flux, increased disturbance from noise and lighting, fugitive dust, chemical drift, unauthorized off-road vehicle use of temporary access roads, altered surface drainage patterns, and accidental impacts during construction and operation.

Additional Information Staff Received from the Project Owner in Order to Complete the FSA

Staff received several submittals after publication of the PSA that included Palen Solar Holdings, LLC's Bat Habitat Assessment, dated July 22, 2013 (Palen 2013hh), Palen Solar Holdings, LLC's Spring 2013 Avian Survey Results, dated July 23, 2013 (Palen 2013ii), Supplemental Spring 2013 Biological Surveys (Palen 2013jj), Palen Solar Holdings, LLC's Final Sand Transport Study, dated July 23, 2013 (Palen 2013kk), Palen Solar Holdings, LLC's Response to CEC Staff Data Request Set 4 (73-89) (Palen 2013ss), PSH's Response to Staff's 8/2/13 Email Request - Additional Data Sheets and CNDDB Report Forms for Spring 2013 Supplemental Biological Resource Surveys, dated August 13, 2013 (2013zz), and the requested CDFW Lake or Streambed Alteration Agreement Amendment Notification package (Palen 2013aaa) and has incorporated information as appropriate.

INTRODUCTION

This section of the Final Staff Assessment (FSA) provides the California Energy Commission (Energy Commission) staff analysis of potential impacts to biological resources from the construction and operation of the Palen Solar Electric Generating System (PSEGS project, or modified project). This analysis describes the biological resources at the PSEGS project site (including ancillary facilities) and addresses potential impacts to special-status species, sensitive natural communities, and other significant biological resources. This section discusses the need for mitigation, evaluates the adequacy of mitigation proposed by the project owner, and specifies additional mitigation measures designed to reduce impacts. It also describes compliance with applicable laws, ordinances, regulations, and standards (LORS) and recommends staff's proposed conditions of certification. Changes from the Palen Solar Power Project (PSPP) (approved Reconfigured Alternative 2 and Alternative 3) to the PSEGS project have been evaluated to determine if the PSEGS would remain in compliance with LORS. Refer to **Biological Resources Figure 1**. Information contained in this document includes a detailed description of the existing biotic environment for all areas of the PSPP which are also part of the proposed PSEGS and new areas that are part of the PSEGS. The Revised Staff Assessment for the approved project provides the basis for this document and this FSA provides an analysis of potential new or revised impacts from the PSEGS project to biological resources and, where necessary, specifies new or modified mitigation measures (conditions of certification) to reduce potential impacts to less than significant levels.

The analysis for the Revised Staff Assessment for the approved PSPP project was based, in part, upon information from the following sources: the Application for Certification (AFC) (Solar Millennium 2009a), Supplement to the AFC (Solar Millennium 2009b), and additional information from the prior project owner (Solar Millennium) (Galati & Blek 2010i; Galati & Blek 2010j; AECOM 2010f; Solar Millennium 2010k; Solar Millennium 2010l); responses to staff data requests (AECOM 2010a, Palen 2010; Kenney 2010; Solar Millennium 2010m; AECOM 2010u); staff workshops held on December 9 and 18, 2009, January 7,10,14, and 25, 2010, and April 28 and 29, 2010; site visits by staff on October 7, 2009, November 3, 2009, April 8, 2010, and January 25, 2010; communications with representatives from the California Department of Fish and Wildlife (CDFW), the Bureau of Land Management (BLM), and the U.S. Fish and Wildlife Service (USFWS); and information contained within the Northern and Eastern Colorado Desert Coordinated Management Plan (NECO) (BLM CCD 2002). Additional analysis for the PSEGS is based, in part on information provided in the Palen Solar Holdings LLC's Petition for Amendment (Palen 2012a), two supplements to the Petition to Amend (Palen 2013a and Palen 2013c), responses to data requests, independent research and reconnaissance level surveys conducted by staff on April 9, 10, and 30, 2013. Information was also obtained through ongoing coordination with representatives of the USFWS, CDFW, and BLM. Workshops addressing biological resources for the project were conducted in April, May, and July of 2013.

CHANGES FROM PSPP REVISED STAFF ASSESSMENT

Information included in this FSA is based in part on the previously published PSPP Revised Staff Assessment (RSA) (CEC 2010c). The staff assessment has been revised where new data is available to reflect changes in the project design or footprint, or where new analysis is required to disclose impacts from the PSEGS project.

Changes from the PSPP RSA to this PSEGS FSA are summarized below:

New Project Features and Modifications: These changes are described below and staff has provided an analysis of new project features that could affect biological resources in this FSA:

Phasing of Construction: The project owner has proposed a phased plan for construction where Phase 1 will include construction of the generation tie-line, access road, common facilities area, common facilities, temporary construction laydown area, both power blocks including laydown area, and a portion of solar field 2. Phase 2 will include construction of the remainder of the facility (Palen 2013a). The gen-tie will be constructed during Phase 1; the natural gas line will be constructed during Phase 2 (Palen 2013jj). Mitigation measures would be similarly phased, with clearance surveys and translocation of desert tortoise and deposits of security for compensatory mitigation completed before each phase of construction as described in Condition of Certification **BIO-29.**

Red Bluff Substation: When the RSA for the PSPP was published the location of the substation had not yet been determined. Since then the site for the Southern California Edison's (SCE) Red Bluff Substation has been determined and the substation is currently under construction. The Red Bluff Substation is expected to be completed and operational in December 2013. Staff has removed the discussion of the impacts of substation construction that were included in the Project-Related Future Actions subsection of the Revised Staff Assessment (RSA) for the PSPP.

Spring 2013 Survey Results: The project owner has undertaken surveys of the natural gas line corridor and the previously-unsurveyed segment of the generation tie-line route (CEC 2013b and CEC 2013l). Surveys were conducted during the spring and summer of 2013, from March to July and staff has provided an analysis of impacts based upon the final impact calculations and relevant information from the project owner.

New and Revised Conditions of Certification: Staff has made revisions to several conditions of certification based on new information and analysis, as well as requests by the project owner (Supplement No.1 to Support PSH's Petition for Amendment, Palen 2013a). See **Biological Resources Table 11** for a summary of changes to conditions of certification.

New Terms and Definitions for General Conditions Compliance responsibilities carried out on recent large solar projects including Ivanpah, and Genesis have highlighted the need to revise and/or modify several general conditions. The modifications are minor in nature; however, the General Conditions contain several modified and/or refined definitions, terms, protocols, and new conditions of certification that are critical to effective compliance enforcement. A detailed description of the changes is provided in the **General Conditions** section of this Final Staff Assessment. The bulleted list below summarizes the revisions/modifications contained in the Compliance Plan:

- Definitions for specific terms utilized during compliance monitoring, including "Start of Construction", "Start of Commercial Operation", "Non-Operation and Closure", "Site Assessment and Pre-Construction Activities", and "Site Mobilization and Construction", among others;
- A new sub-section and expanded discussion of "Roles and Responsibilities", and new sections for "Pre-Construction and Pre-Operation Compliance Meeting", and "Energy Commission Record";
- New conditions of certification addressing "Non-Operation" and "Facility Closure Plans".

These new terms have been incorporated in this FSA and the Biological Resources conditions of certification.

METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

The analysis of PSEGS project effects must comply with California Environmental Quality Act (CEQA). However, given the land jurisdiction of the U.S. Bureau of Land Management (BLM) the project will also be analyzed according to National Environmental Policy Act (NEPA) requirements through a separate process with the BLM. The BLM is the federal lead agency and has prepared a Supplemental Draft Environmental Impact Statement (EIS), which analyzed the PSEGS project. The BLM will issue a Final EIS following a 30 day public comment period followed by a Record of Decision (ROD) which is the final step for BLM in the EIS process. Although separate state and federal documents will be prepared and each agency will make a decision on the PSEGS project independently, Energy Commission and BLM staff have been sharing information. CEQA requires a list of criteria that are used to determine the significance of identified impacts. A significant impact is defined by CEQA as “a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project” (Cal. Code Regs., tit. 14, § 15382).

Thresholds for determining CEQA significance in this section are based on Appendix G of the CEQA Guidelines (Cal. Code Regs., tit. 14, § 15000 et seq) and performance standards or thresholds identified by the Energy Commission staff. The determination of whether a project has a significant effect on biological resources is based on the best scientific and factual data that staff could review for the project. In this analysis the following impacts to biological resources are considered significant if the project would result in:

- a substantial adverse effect to plant species considered by the California Native Plant Society (CNPS), CDFW, or USFWS to be rare, threatened, or endangered in California or with strict habitat requirements and narrow distributions; a substantial impact to a sensitive natural community (i.e., a community that is especially diverse; regionally uncommon; or of special concern to local, state, and federal agencies);
- a substantial adverse effect to wildlife species that are federally-listed or state-listed or proposed to be listed; a substantial adverse effect to wildlife species of special concern to CDFW, candidates for state listing, or animals fully protected in California;
- substantial adverse effects on habitats that serve as breeding, foraging, nesting, or migrating grounds and are limited in availability or that serve as core habitats for regional plant and wildlife populations;
- substantially interferes with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- a substantial adverse effect on important riparian habitats or wetlands and any other “Waters of the U.S.” or state jurisdictional waters; and
- conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

The project owner would need to comply with the following LORS during project construction and operation, as listed in **Biological Resources Table 1.** There are no new LORS since publication of the RSA that would affect the PSEGS project however the Desert Tortoise (Mojave Population) Recovery Plan (USFWS 2011a) was issued and replaces the Desert Tortoise (Mojave Population) Recovery Plan (USFWS 1994a) and Draft Revised Recovery Plan (USFWS 2008a). The update plan included revised recovery unit designations and builds upon the foundations of the 1994 plan to aid in the recovery of the desert tortoise. Notwithstanding changes to the 1994 plan; the revised recovery plan did not anticipate the extent to which the landscape of desert ecosystems in the Pacific Southwest might become modified as a result of the nation's renewable energy priorities (USFWS 2011a). The USFWS considers the revised recovery plan to be a living document and the recommendations identified in the plan have been considered in the evaluation of impacts to desert tortoise in this FSA.

Biological Resources Table 1
Laws, Ordinances, Regulations, and Standards (LORS)

Applicable LORS	Description
Federal	
Federal Endangered Species Act (Title 16, United States Code, section 1531 et seq., and Title 50, Code of Federal Regulations, part 17.1 et seq.)	Designates and protects federally threatened and endangered plants and animals and their critical habitats.
Clean Water Act (Title 33, United States Code, sections 1251 through 1376, and Code of Federal Regulations, part 30, section 330.5(a)(26))	Requires the permitting and monitoring of all discharges to surface water bodies. Section 404 requires a permit from the U.S. Army Corps of Engineers (USACE) for a discharge of dredged or fill materials into waters of the U.S., including wetlands. Section 401 requires a permit from a regional water quality control board (RWQCB) for the discharge of pollutants. By federal law, every applicant for a federal permit or license for an activity that may result in a discharge into a California water body, including wetlands, must request state certification that the proposed activity will not violate state and federal water quality standards.
Eagle Act (Title 50, Code of Federal Regulations, section 22.26)	Would authorize limited take of bald eagles (*Haliaeetus leucocephalus*) and golden eagles (*Aquila chrysaetos*) under the Eagle Act, where the taking is associated with, but not the purpose of activity, and cannot practicably be avoided.
Eagle Act (Title 50, Code of Federal Regulations, section 22.27)	Would provide for the intentional take of eagle nests where necessary to alleviate a safety hazard to people or eagles; necessary to ensure public health and safety; the nest prevents the use of a human-engineered structure; or the activity, or mitigation for the activity, will provide a net benefit to eagles. Only inactive nests would be allowed to be taken except in the case of safety emergencies.
Bald and Golden Eagle Protection Act (Title 16, United States Code section 668)	This law provides for the protection of the bald eagle and the golden eagle by prohibiting, except under certain specified conditions, the take, possession, and commerce of such birds. The 1972 amendments increased penalties for violating provisions of the Act or regulations issued pursuant thereto and strengthened other enforcement measures. Rewards are provided for information leading to arrest and conviction for violation of the Act.

Applicable LORS	Description
California Desert Conservation Area (CDCA) Plan	The California Desert Conservation Area (CDCA) Plan was established by Congress at the time of the passage of the Federal Land and Policy Management Act (FLPMA). The FLPMA outlines how the BLM will manage public lands. Congress specifically provided guidance for the management of the CDCA and directed the development of the 1980 CDCA Plan.
Northern and Eastern Colorado Desert Coordinated Management Plan (NECO)	A regional amendment to the CDCA Plan approved in 2002, NECO protects and conserves natural resources while simultaneously balancing human uses in the northern and eastern portion of the Colorado Desert.
Migratory Bird Treaty Act (Title 16, United States Code, sections 703 through 711)	Makes it unlawful to take or possess any migratory nongame bird (or any part of such migratory nongame bird) as designated in the Migratory Bird Treaty Act.
Executive Order 11312	Prevent and control invasive species.
Wild Free-Roaming Horse and Burro Act (Public Law 92-195)	Wild horses and burros are protected from capture, branding, harassment, and death, and managed with the intent to achieve and preserve the natural ecological balance on public lands.
Desert Tortoise (Mojave Population) Recovery Plan (USFWS 2011)	Describes a strategy for recovery and delisting of the desert tortoise.
State	
California Endangered Species Act of 1984 (Fish and Game Code, sections 2050 through 2098)	Protects California’s rare, threatened, and endangered species.
Protected furbearing mammals (California Code of Regulations, Title 14, section 460)	Fisher, marten, river otter, desert kit fox, and red fox may not be taken at any time.
California Code of Regulations (Title 14, sections 670.2 and 670.5)	Lists the plants and animals of California that are declared rare, threatened, or endangered.
Fully Protected Species (Fish and Game Code, sections 3511, 4700, 5050, and 5515)	Designates certain species as fully protected and prohibits the take of such species or their habitat unless for scientific purposes (see also California Code of Regulations Title 14, section 670.7).
Nest or Eggs (Fish and Game Code section 3503)	Protects California’s birds by making it unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by code or regulation.
Birds of Prey (Fish and Game Code section 3503.5	Unlawful to take, possess, or destroy any birds in the orders Falconiformes and Strigiformes or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by code or regulation.
Migratory Birds (Fish and Game Code section 3513)	Protects California’s migratory birds by making it unlawful to take or possess any migratory nongame bird as designated in the Migratory Bird Treaty Act or any part of such migratory nongame birds except as otherwise provided by code or regulation.

Applicable LORS	Description
Nongame mammals (Fish and Game Code section 4150)	Makes it unlawful to take or possess any non-game mammal or parts thereof except as provided in the Fish and Game Code or in accordance with regulations adopted by the commission.
Significant Natural Areas (Fish and Game Code section 1930 and following)	Designates certain areas such as refuges, natural sloughs, riparian areas, and vernal pools as significant wildlife habitat.
California Environmental Quality Act (CEQA), CEQA Guidelines section 15380	CEQA defines rare species more broadly than the definitions for species listed under the state and federal endangered species acts. Under section 15830, species not protected through state or federal listing but nonetheless demonstrable as “endangered” or “rare” under CEQA should also receive consideration in environmental analyses. Included in this category are many plants considered rare by the California Native Plant Society (CNPS) and some animals on the CDFW’s Special Animals List.
Streambed Alteration Agreement (Fish and Game Code sections 1600 and following)	Regulates activities that may divert, obstruct, or change the natural flow or the bed, channel, or bank of any river, stream, or lake in California designated by CDFW in which there is at any time an existing fish or wildlife resource or from which these resources derive benefit. Impacts to vegetation and wildlife resulting from disturbances to waterways are also reviewed and regulated during the permitting process.
California Native Plant Protection Act of 1977 (Fish and Game Code section 1900 and following)	Designates state rare, threatened, and endangered plants.
California Desert Native Plants Act of 1981 (Food and Agricultural Code section 80001 and following and California Fish and Game Code sections 1925-1926)	Protects non-listed California desert native plants from unlawful harvesting on both public and private lands in Imperial, Inyo, Kern, Los Angeles, Mono, Riverside, San Bernardino, and San Diego Counties. Unless issued a valid permit, wood receipt, tag, and seal by the commissioner or sheriff, harvesting, transporting, selling, or possessing specific desert plants is prohibited.
Porter-Cologne Water Quality Control Act	Regulates discharges of waste and fill material to waters of the state, including “isolated” waters and wetlands.

Desert Renewable Energy Conservation Plan – Interim Planning

In addition to the federal, state, and local LORS summarized above, federal and state agencies are currently collaborating to establish joint policies and plans to expedite development of California’s utility scale renewable energy projects. On October 12, 2009, the State of California and the U.S. Department of Interior entered into a Memorandum of Understanding (MOU) on renewable energy, building on existing efforts by California and its federal partners to facilitate renewable energy development in the state. The MOU stems from California and Department of Interior energy policy directives, and California’s legislative mandate to reduce greenhouse gases to 1990 levels by 2020, and meet the goal of 33 percent of California’s electricity production from renewable energy sources by 2020.

The California-Department of Interior MOU expands on several MOUs issued in 2008 to establish the activities of the California Renewable Energy Action Team (REAT). The REAT was established with California Executive Order S-14-08 (issued November 18, 2008), to "*establish a more cohesive and integrated statewide strategy, including greater coordination and streamlining of the siting, permitting, and procurement processes for renewable generation*…"

The Energy Commission and CDFW are the primary state collaborators of the REAT agencies, operating under a November 18, 2008 MOU between the two agencies to create a "one-stop process" for permitting renewable energy projects under their joint permitting authority. The REAT agencies also include the BLM and the USFWS under a separate MOU signed in November 2008, which outlines the state and federal cooperation of the group. In October 2011, two MOUs were issued that outlined the participation and engagement of the REAT agencies and the Desert Renewable Energy Conservation Plan (DRECP) for participating agencies, one MOU was between CDFW, Energy Commission, BLM, USFWS and the California State Land Commission and one was between CDFW, Energy Commission, BLM, USFWS and the US Department of Defense.

The October 12, 2009 MOU between California and the Department of Interior reiterates several tasks of the REAT agencies provided for in S-14-08 and the Energy Commission–Fish and Game MOU (2009). The MOU between California and the Department of Interior MOU was amended and reissued on January 13, 2012. The primary change to the MOU included the inclusion of additional participating agencies including the California Public Utilities Commission (CPUC), the California State Lands Commission (CSLC), and the California Independent System Operator (CAISO). The updated MOU was based on SBX2 (2011). Modifications to the objectives of this MOU included an extension of the timeline to complete the draft DRECP from June 2012 to the second quarter 2013 but which is now targeted for the third quarter of 2013.

The REAT agencies' primary mission is to streamline and expedite the permitting processes for renewable energy projects in the Mojave and Colorado Desert ecoregions within the State of California, while conserving endangered species and natural communities at the ecosystem scale. To accomplish this goal the REAT agencies are developing a Desert Renewable Energy Conservation Plan (DRECP), a science-based process for reviewing, approving, and permitting renewable energy applications in California. Once the DRECP is complete, which was anticipated in late 2012 and now is anticipated in 2013, the plan will be a state Natural Communities Conservation Plan (NCCP) and a federal Habitat Conservation Plan (HCP) that will provide tools to expedite coordination of federal and state endangered species act permitting. Last year the Legislature gave the CDFW the authorization to allow take of the fully-protected golden eagle as a covered species in a NCCP. When the DRECP is completed, and if the DRECP includes the PSEGS site as expected, the take of golden eagles would be covered. The DRECP would also offer a unified framework for state and federal agencies to oversee mitigation actions, including land acquisitions, for listed species. Since 2010 when the approved project was licensed, major DRECP milestones reached include the release of the Description and Comparative Evaluation of Draft DRECP Alternatives for public review and comment in December 2012. The Draft DRECP is anticipated to be released for formal public review in October 2013.

The REAT agencies recognize that some renewable energy projects are scheduled to be approved prior to completion of the DRECP. Section 8.9 of the October 2009 Draft Planning Agreement for the DRECP <www.energy.ca.gov/2009publications/...2009.../REAT-1000-2009-034.PDF> provides explicit guidance for such interim projects, and directs the REAT agencies to ensure that permitting for these projects:

- be consistent with the preliminary conservation objectives for the DRECP;
- not compromise successful completion and implementation of the DRECP;
- facilitate Endangered Species Act, California Endangered Species Act, National Environmental Policy Act, and California Environmental Quality Act compliance; and
- not be unduly delayed during preparation of the DRECP.

REAT Account and SBX8 34

The REAT agencies signed a Memorandum of Agreement (MOA) with the National Fish and Wildlife Foundation (NFWF) in May 2010 to establish a REAT Account that may be used by project developers to deposit funding for specified mitigation for approved renewable energy projects in the Mojave and Colorado Desert region of southern California (the MOA is available at <www.energy.ca.gov/33by2020>). For each project using the REAT Account, an individual subaccount would be established for project specific tracking, compliance and accounting purposes. The subaccount would include a list of the specific mitigation actions, the cost, a timeframe for carrying out the actions, and identify which of the REAT agencies would be responsible for requiring and coordinating the mitigation actions. NFWF would manage the subaccount on behalf of the REAT agencies, and at their direction would disburse mitigation funding to satisfy mitigation requirements for impacts to biological resources. NFWF is a charitable non-profit corporation established in 1984 by the federal government to accept and administer funds to further the conservation and management of fish, wildlife, plants and other natural resources <hwww.nfwf.org>.

Senate Bill 1094, enacted in 2012, established criteria for selection of the entity that will hold endowments to fund the long-term management of mitigation lands for projects such as this one. The bill, codified at Gov. Codes § 65965-65968, limits the circumstances under which NFWF may hold project related endowments. SB 1094 prohibits state and local agencies from requiring that endowment funds be transferred to a preferred endowment holder, and CEC does not require that endowments be held or managed by NFWF.

Subject to SB 1094 and other applicable state and federal laws, project developers may elect to use the REAT Account, but use of that account will not change any of the requirements a project proponent must fulfill in order to comply with applicable State and Federal environmental laws governing the permitting of the projects. Renewable energy developers are not required to use the REAT Account to fulfill their obligations for securing compensation lands and are free to undertake mitigation on their own, except for the required contribution in **BIO-13** to the regional raven control program.

The SBX8 34 legislation that was signed into law by the Governor created a $10 million loan that provides for advanced mitigation habitat purchases. This advanced mitigation can be used by a qualifying solar renewable energy project to receive credit for implemented mitigation after a project proponent pays into the Renewable Energy Development Fee Trust Fund that was created by the SBX8 34 legislation (SBX8 34 Trust Fund). Funds in the NFWF-administered REAT Account and the SBX8 34 Trust Fund are similar in that renewable energy project proponents pay into accounts set up to receive project-specific mitigation funds, and a third party entity implements the mitigation actions. Condition of Certification **BIO-28** provides an opportunity for the project owner to fulfill their mitigation obligations by depositing funds into the SBX8 34 Trust Fund.

The REAT agencies have developed a total cost accounting method for calculating acquisition or conservation easement costs for mitigation lands, including costs associated with the purchase transaction, appraisal, escrow, and title insurance including mineral, oil, and gas rights (REAT 2010). The estimate also addresses costs of initial enhancement (e.g., signs, fencing, and boundary/property line surveys; or restoration actions such as removal of exotic species, roads), management for ongoing activities such as public access and enforcement; and monitoring the implementation, effectiveness, and compliance of conservation measures with the goals and objectives. For those projects using the REAT Account for implementing mitigation actions, the budget includes administration of contracts and reporting. These cost estimates are also used for purposes of establishing an appropriate security amount in conditions of certification.

PROPOSED MODIFIED PROJECT

Palen Solar Holdings, LLC (PSH) (referred to as the project owner in this document) propose to construct, own, and operate the Palen Solar Electric Generating System (PSEGS project or modified project). The approved Palen Solar Power Project (PSPP) was a concentrated solar thermal parabolic trough electric power generating facility with two adjacent, independent, and identical solar plants of 250-megawatt (MW) nominal capacity each, for a total nominal capacity of 500 MW. For the PSEGS, two adjacent solar fields producing 250 MW each are proposed for a combined nominal output of approximately 500 MW using BrightSource's solar tower technology. The PSEGS project site is located approximately ½- mile north of Interstate 10 (I-10), approximately 10 miles east of the small community of Desert Center, and less than 2 miles from the southern edge of Palen Dry Lake in an unincorporated area of eastern Riverside County, California.

The PSEGS site occurs at elevations ranging from 130 feet above mean sea level (MSL) along the eastern edge to 200 feet above MSL near the southwestern portion of the study area. The study area for the PSPP was approximately 13,715 acres, encompassing the 4,024-acre Project Disturbance Area (including the transmission Disturbance Area) for the PSPP. The study area for the PSPP included all areas that would have been required to be surveyed for the PSEGS per the Energy Commission's Siting Regulations (proposed project site plus 1 mile buffer and project linear features plus a 1,000 foot buffer) except for the slight re-routing of the generation tie-line near the western end of the route and around the Red Bluff Substation, currently under construction, which encompasses 18.9 acres (120-foot Proposed Corridor). The Natural Gas Line corridor has been relocated since the submittal of the Petition to Amend from a previously unsurveyed area and would instead be located within the study area for the PSPP (Palen 2013d). Refer to **Biological Resources Figure 2**. The PSEGS Project Site Disturbance Area (solar facility and common area) is smaller by 572 acres than the footprint of the PSPP Project Site Disturbance Area. The total Project Disturbance Area for PSEGS is approximately 3,898acres. The total Project Disturbance Area for the PSEGS includes the Transmission Line Disturbance Area (81.9 acres for the 120-foot Permitted Corridor and 18.9 acres for the 120-foot Proposed Corridor), the Natural Gasline Disturbance Area (3.5 acres), and the Project Site Disturbance Area (3,794 acres). New biological resource surveys of the PSEGS site were not required for areas of the project that were included in the license for the PSPP as the project owner holds a license to construct a power plant within the PSEGS footprint. Only new areas of the PSEGS project required additional biological resource surveys.

The project owner has applied for a revised right-of-way (ROW) grant for approximately 5,200 acres of open lands owned by the federal government and managed by the U.S. Bureau of Land Management (BLM) (BLM 2013a). The portion within the ROW that would support all project facilities and would be disturbed by the project is 3,896 acres, referred to as the Project Disturbance Area (BLM 2013).

A detailed description of the project is provided in the **PROJECT DESCRIPTION**. The following discusses key PSEGS project design elements as they relate to the potential effects on biological resources.

Proposed Modified Project Features

In the Petition to Amend the PSEGS project features were identified and changes from the PSPP were described. This section will describe the modified project features for the PSEGS and all project description changes from the PSPP. A discussion of the potential for impacts to biological resources and applicable biological conditions of certification that would reduce the adverse environmental effects to less-than-significant levels are discussed in this FSA under the “Assessment of Impacts” and “Discussion of Mitigation” subsections of this document. The project changes to the PSEGS discussed in this section include the following:

- Two 250-MW power-generating units, each consisting of a dedicated field of approximately 85,000 heliostats, a 750-foot solar tower and receiver, and a power block;
- An approximately 15-acre common facilities area located in the southwestern corner of the site, with an administrative/warehouse building and two 2-acre evaporation ponds (reduced from four 2-acre evaporation ponds for the PSPP);
- An approximately 203-acre temporary construction laydown area located in the southwestern portion of the site immediately north of the common facilities area.

- Re-routing of the generation tie-line near the western end of the route and around the newly constructed Red Bluff Substation, currently under construction; the purpose of this re-routing is to align the PSEGS generation tie-line route immediately adjacent to the NextEra Desert Sunlight generation tie-line to minimize crossings over Interstate 10 and to ensure easy entry into the Red Bluff Substation nearest the PSEGS breaker position;
- Natural gas delivery from a new extension of the existing Southern California Gas (SoCal Gas) distribution system to the project boundary;
- No need for relocation of the existing Southern California Edison 161-kv power line, and

Solar Power Tower Technology

For the PSEGS, two adjacent solar fields producing 250 MW each are proposed for a combined nominal output of approximately 500 MW using BrightSource's solar tower technology. The two adjacent solar fields would each consist of a power block and approximately 85,000 heliostats for heating a receiver on top of a 750 foot tall solar power tower. During construction, portions of the PSEGS site would be graded, including portions along the ephemeral washes. Grading is not intended to level the site, but rather to prepare the site for installation of the heliostats and ease future maintenance activities. As such, the drainages would remain, to the extent feasible, and natural drainage waters are expected to continue to flow in and through these ephemeral washes. Any grading required would be designed to maintain existing drainage pathways, where possible (Palen 2013e). Approximately 27 percent of the site will be completely developed and the rest of the site will be left largely intact. Disturbance-tolerant wildlife and birds will continue to inhabit and utilize the site throughout construction and operation, and ongoing vegetation management and operational activities such as mowing, vegetation removal, and mirror washing could continue to degrade remnant native habitat. Grading and mowing during construction, and continued vegetation control during operations, could affect ephemeral drainages both on and offsite, over the life of the project.

Modification of the Project's Generation-tie Line

The PSPP provided an analysis of two proposed 230-kV transmission line connection routes to two alternate Southern California Edison (SCE) Red Bluff substation sites. The 230/500-kV Red Bluff substation sites would be constructed, owned, operated, and maintained by SCE (Galati & Blek 2010i). SCE considered the construction of two substations sites (eastern and western) and two separate transmission lines (eastern and western) would have been required for each of the two sites. The Red Bluff substation and both alternate sites were described in further detail in the 'Reasonably Foreseeable Project' subsection of the PSPP Revised Staff Assessment (RSA) however since the Red Bluff substation is currently under construction this section has not been included in the PSEGS analysis. The final location of the SCE Red Bluff substation, which is currently under construction, would require the project owner to construct the eastern generation tie line (gen-tie) alignment. The discussion of the western gen-tie alignment has also not been included in this FSA.

Addition of Natural Gas Line

The PSPP did not include a natural gas supply pipeline, but rather was approved to use liquid petroleum gas for its auxiliary fuel. The PSEGS would use natural gas to fire its auxiliary and nighttime preservation boilers. The natural gas supply for PSEGS would be provided by SoCal Gas via a new pipeline that would extend southward from the site and interconnect with an existing SoCal Gas transmission pipeline located just south of I-10. The new gas pipeline, approximately eight inches in diameter and 2,956 feet long, would disturb an approximately 50 foot wide corridor that would be approximately 3,000 feet long and encompasses 3.3 acres. The proposed natural gas line distribution disturbance area encompasses approximately 0.23 acres.

Relocation of the Blythe Eagle Mountain 161kv Line

The existing 161-kV Eagle Mountain-Blythe power line which runs in a northwesterly direction across the southwest portion of the PSEGS site, would no longer require relocation for the PSEGS project as it would have for the PSPP project.

Emergency Access Gates

Due to site constraints increasing the difficulty of providing a secondary access road, **Worker Safety and Fire Protection** staff is instead requiring at least two emergency access gates, one each on the north fence line and south fence line. In the event of an emergency, if the main access road was blocked, all-terrain fire engines would be able to access the site through these gates. **Worker Safety and Fire Protection** staff is requiring that PSEGS “buy into” the Riverside County Fire Department’s all-terrain fire engines purchased by the Genesis Solar Energy Project by paying the Genesis project owners the PSEGS’ fair share of the cost of the purchase and maintenance of the fire engines. See the **Worker Safety and Fire Protection** section of this FSA for more details.

SETTING AND EXISTING CONDITIONS

REGIONAL SETTING

The PSEGS project would be located within the Northern and Eastern Colorado Desert Coordinated Management Plan (NECO) area; a region that includes most of the California portion of the Sonoran Desert ecosystem. Specifically, it is located at the southwestern side of Palen Dry Lake, between the Chuckwalla and Palen mountains in eastern Riverside County (DTPC 2006). The project site would be located within the central portion of Chuckwalla Valley, an area east of Palm Springs in the remote Colorado Desert, a subsection of the Sonoran Desert. The range of the Chuckwalla Valley is from 400 feet above mean sea level (MSL) at Ford Dry Lake to approximately 1,800 feet above MSL along some of the bajadas that occur west of Desert Center, California with the surrounding mountains rising to over 3,000 above MSL (Solar Millennium 2009a). Hydrologically, the study area occurs in the Colorado River Basin within the Chuckwalla Valley Drainage Basin. This is an internally drained basin and all surface water flows to Palen Dry Lake in the western portion of Chuckwalla Valley and Ford Dry Lake in the eastern section of Chuckwalla Valley.

The Sonoran Desert region of southeastern California has a uniquely ‘tropical’ warm desert climate influenced by the addition of monsoonal summer rains; a contrast to the dry summer Mediterranean climate that characterizes much of California. The unique position of the region contributes to the presence of a number of rare and endemic plants and vegetation communities specially adapted to this bi-modal rainfall pattern, and not found elsewhere in California. These include microphyll woodlands, palm oases, and a number of summer annuals that only germinate after a significant warm summer rain.

The Chuckwalla Valley is a region of active aeolian (wind-blown) sand migration and deposition but at a magnitude substantially less that it had experienced during dune aggradational events since the late Pleistocene. Nevertheless, aeolian processes play a major role in the creation and establishment of sand dune habitat in the Chuckwalla Valley and those within the project area. These habitats are essential to the existence of the Mojave fringe-toed lizard among many other dune habitat specialists. In general, major local sand migration corridors utilized in the past are currently utilized but the corridors have decreased in width since the late Pleistocene within the project area indicating that the aerial extent of aeolian activity in recent times is less than it once was during regional dune aggradational events (Solar Millennium 2010b, Geomorphic Aeolian and Ancient Lake Shoreline Report).

The dominant sand migration direction within the corridors is toward the east and south. Regional aeolian system studies indicate that the prevailing wind responsible for aeolian sand transport was from the northwest toward the southeast and locally controlled by topography (mountain ranges). Three aeolian sand migration corridors have been identified within the Chuckwalla Valley region including the following: The Dale Lake-Palen Dry Lake-Ford Dry Lake sand migration corridor; the Palen Valley-Palen Dry Lake sand migration corridor; and the Palen Pass-Palen-McCoy Valley sand migration corridor (Solar Millennium 2010b).

The PSEGS project and portions of the generation tie-in are located within designated wildlife habitat management areas (WHMA) or Desert Wildlife Habitat Management Area (DWMA). These include the Palen-Ford WHMA and DWMA Connectivity WHMA, and the Chuckwalla DWMA. Management emphasis for the Palen-Ford WHMA is on the management of the dunes and playas within the Palen-Ford dune system. Management emphasis for the DWMA Connectivity WHMA is on the geographic connectivity for desert tortoise for the conservation areas east of Desert Center (i.e., connectivity between the Chuckwalla DWMA and the wilderness area north of I-10). The Palen-McCoy Wilderness is approximately three miles to the northeast of the project and the Palen Dry Lake Area of Critical Environmental Concern (ACEC) borders the project site to the east.

Vegetation and Wildlife

Natural Communities

Seven natural communities occur within the study area for the PSEGS, a 13,715-acre area that encompassed the 4,024-acre Project Disturbance Area (including the Transmission Disturbance Area) for the PSPP, and a surrounding buffer area. These communities include: Sonoran creosote bush scrub, desert dry wash woodland (also known as “microphyll woodland”), unvegetated ephemeral streams, stabilized and partially stabilized desert dunes, active desert dunes, alkali desert sink scrub, and dry lake bed (Palen Dry Lake). Two other cover types occur in the study area: agriculture and developed. Refer to **Biological Resources Figure 3**. The Project Disturbance Area (including Transmission Line and Natural Gas Line Disturbance Area) for the modified project will include approximately 3,899 acres of disturbance to cover types. The Project Disturbance Area for the solar plant site only has been reduced by 572 acres from 4,366 acres to 3,794 acres. The Project Disturbance Area includes Sonoran creosote bush scrub, desert dry wash woodland, stabilized and partially stabilized sand dunes, and unvegetated ephemeral streams as well as minimal amounts of developed (Palen 2013f and 2013pp). Staff has provided an analysis of impacts of the PSEGS on natural communities based in part on information provided as part of the analysis for the approved PSPP project. Staff requested additional information for all new areas of the project including the natural gas line corridor and the unsurveyed segment of the generation tie-line. The project owner submitted preliminary information regarding vegetation community mapping and vegetation was re-mapped during Spring 2013 surveys to verify changes since the original mapping (Palen 2013f). Staff reviewed the final results of vegetation community mapping submitted by the project owner after the publication of the Preliminary Staff Assessment (PSA) and made minor updates to the PSEGS Project Disturbance Area acres included in **Biological Resources Table 2** (Palen 2013jj).

Three large desert washes of varying hydrologic capacity transverse the project site from the Chuckwalla Mountains, south of I-10, trending northeast under I-10 via bridges. Large collector ditches south of I-10 divert flows from the smaller streams into these three primary features. The upper portions of these three washes support more deeply incised channels with woody, riparian vegetation while dry, flashy washes located in the center of the project site support less vegetated, ephemeral washes. Areas of stabilized and partially stabilized desert dunes occur in the northeastern portion of the Project Disturbance Area in association with an active dune system with portions of desert sink scrub and lake bed farther north and east in the study area. Agriculture and disturbed areas occur in minimal amounts in the Project Disturbance Area and also occur within the 1-mile survey buffer area in the northwestern portion of the study area.

Five of the seven natural communities—desert dry wash woodland, active desert dunes, desert sink scrub, dry lake bed (playa) and stabilized and partially stabilized desert dunes—are considered rare natural communities by CDFW (CDFG 2010) and are also NECO-designated sensitive communities. Desert washes, including unvegetated ephemeral streams, are not a NECO or CNDDB community-type but are considered state jurisdictional waters (AECOM 2010a). These communities are discussed in more detail below. Vegetation communities in the study area were classified by Holland (Holland 1986) and then cross-referenced with *A Manual of California Vegetation* (Sawyer and Keeler-Wolf 1995), where appropriate. **Biological Resources Table 2** summarizes the acreage of natural communities that occurs within the study area (AECOM 2010a).

Biological Resources Table 2
Natural Communities and Cover Types

Natural Communities and Cover Type within the Biological Resources Study Area	PSEGS Project Disturbance Area[1]	PSPP Biological Resources Study Area[2]
Riparian		
Desert dry wash woodland	206	846
Unvegetated ephemeral dry wash	168	225
Subtotal Riparian	*374*	*1,071*
Upland		
Active desert dunes	0	684
Desert sink scrub	0	9
Dry lake bed	0	270
Sonoran creosote bush scrub	3335	10,845
Stabilized and partially stabilized desert dunes	186	910
Subtotal Upland	*3,522*	*12,718*
Other Cover Types		
Agricultural Land	0	833
Developed	2	149
Subtotal Other Cover Types	*2*	*982*
Total Acres	**3,899**	**14,771**

Source: Palen 2013pp(final acreages are rounded up)
1 – The Project Disturbance Area encompasses the disturbance resulting from the proposed construction of the PSEGS project including solar fields, transmission facilities, office and maintenance buildings, lay down area, bioremediation area, drainage channels, leach fields, and other components. It includes the impact acreage of the permitted gen-tie line for the Red Bluff Substation. These acreages include final data for the 18.9 acre proposed gen-tie line route included in the Final Comments on the Preliminary Staff Assessment (Palen 2013pp)
2 – The BRSA encompasses the Project Disturbance Area (area inside and outside the facility fence that will be disturbed by the project), the solar facility footprint area inside the facility fence including solar fields and other support structures and facilities, the transmission line route and buffer areas (1 mile for solar footprint, 1,000 feet for the transmission line) for the PSPP project. All features for the PSEGS except the proposed generation tie-line route are included in the PSPP Project Disturbance Area.

Sonoran Creosote Bush Scrub

Sonoran creosote bush scrub habitat characterizes the majority of the study area and intergrades with desert dry wash woodland along desert washes. This natural community is not designated as a sensitive community by BLM. CNDDB recognizes many rare associations of creosote bush scrub but none of these were found in the Project Disturbance Area. Areas of desert pavement occur in areas with a lower density of vegetation and cobbles ranging in size from one to three inches (Solar Millennium 2009a). Sonoran creosote bush scrub occurs on well-drained, secondary soils of slopes, fans, and valleys and is the basic creosote scrub habitat of the Colorado Desert (Holland 1986). Within the study area, this community is characterized by sandy soils with a shallow clay pan. Past disturbance of the study area by military training and agricultural practices has resulted in a high percentage of non-native invasive plant species, also referred to as noxious weeds, especially in the southern portion of the study area and consisting primarily of Sahara mustard (*Brassica tournefortii*), Mediterranean grass (*Schismus* sp.), and Russian thistle (*Salsola tragus*). Noxious weeds are discussed in the following section. The diversion of all the smaller washes by collector ditches south of I-10 may also contribute to the overall sparse cover and low diversity of the creosote bush scrub in the vicinity of the project.

Agriculture

There is no Holland or Sawyer and Keeler-Wolf natural community designation for this land cover type. CDFW characterizes farmed areas as cropland or more general categories of agriculture and urban/agriculture. Active and fallow agricultural fields occur within the buffer of the study area but not within the Project Disturbance Area. The majority of the lands mapped as agriculture within the study area are palm tree plantations. In fallow agricultural areas, ruderal vegetation is recolonizing previously farmed areas including exotic plant species interspersed with some native vegetation (Solar Millennium 2009a). Fallow and active agriculture fields provide habitat value to local and migratory wildlife in the form of food, cover, and shelter habitat, especially if fields are actively irrigated (Mayer and Laudenslayer 1988). Adjacent to the project site lies approximately 850 acres of palm and jojoba production, an extensive irrigation network, as well as two small man-made pools.

Developed

Developed areas consist of roadways (I-10 and Corn Springs Road) and cleared or highly disturbed land in the southern portion of the study area. A small structure, possibly a residential home, is located adjacent to the northwest corner of the Project Disturbance Area.

Dry Lake Bed

"Dry Lake Bed" corresponds with the CNDDB natural community "Playa" and incorporates the unvegetated lake bed sediments at the southern tip of Palen Dry Lake. This dry lake bed has a soft surface when wet and displays desiccation cracks once the surface dries. Dry lake beds are prone to periodic flooding with a high coefficient for swelling and contracting once dried. Palen Dry Lake is characterized as a "wet playa" since it supports significant groundwater discharge at the ground surface by evaporation (Solar Millennium 2009a). Palen Dry Lake bed is a closed, depressional basin with no natural or artificial outlet.

Noxious Weeds

Noxious weeds are species of non-native plants included on the weed lists of the California Department of Food and Agriculture (CDFA) (CDFA 2007), the California Invasive Plant Council (Cal-IPC), or those weeds of special concern identified by the Bureau of Land Management (BLM). They are of particular concern in wild lands because of their potential to degrade habitat and disrupt the ecological functions of an area (Cal-IPC 2006). Specifically, noxious weeds can alter habitat structure, increase fire frequency and intensity, decrease forage (including for special-status species, such as desert tortoise), exclude native plants, and decrease water availability for both plants and wildlife. Soil disturbance and gathering and channeling water create conditions favorable to the introduction of new noxious weeds or the spread of existing populations. Construction equipment, fill, aeolian processes and use of purchased mulch can act as vectors introducing noxious weeds into an area.

During the original project proceeding, preliminary weed data was gathered. Non-native species were recorded as a part of project surveys in 2009, and the project linear features were surveyed for the modified project in spring 2013, and a summary report has been provided (Palen 2013s). Additionally, the project owner docketed an updated weed management plan on May 28, 2013 (Palen 2013u), and performed surveys for weeds along the project linears.

Four[1] noxious weed species were observed within the study area: Sahara mustard, Russian thistle, salt cedar, and Mediterranean grass. Each of these species is identified on a list of the region's worst weeds compiled by the Low Desert Weed Management Area (NRCS 2005). Noxious weeds found in the study area are discussed further below.

Sahara mustard (*Brassica tournefortii*) was found in disturbed areas throughout Sonoran creosote bush scrub habitat (Solar Millennium 2009a, Appendix F). This species is of high concern; it is a BLM weed of special concern and Cal-IPC has declared this plant highly invasive (Cal-IPC 2006) and recommends that it should be eradicated whenever encountered. This species is associated with impacts to habitat for native wildlife as well as for native plants. It promotes the spread of fire by increasing fuel load and competes with native plants for moisture and nutrients. In addition, it increases cover and works to stabilize sand, thereby affecting wildlife species dependent on open sandy habitat (Brossard et al. 2000; Barrows and Allen 2007).

Russian thistle or tumbleweed (*Salsola* sp.) was found in several habitat types in the Project Disturbance Area, including dune, desert scrub, desert dry wash woodland, and Sonoran creosote bush scrub woodland (Solar Millennium 2009a, Appendix F). Although all invasive plants share the trait of being adapted to disturbed habitat, Russian thistle particularly tends to be restricted to roadway shoulders and other sites where the soil has been recently disturbed. However, once an area is disturbed this species competes readily and can affect native plant ecosystems and increase fire hazard (Orloff et al. 2008; Lovich 1999). Dune habitat is particularly vulnerable to non-native species, which can stabilize sand or block sand movement, and Russian thistle is considered an invasive species of primary concern in this habitat (CDFG 2007). There is a high potential that Russian thistle could become established in the construction area and this species should be eradicated if observed. Cal-IPC has determined that this plant has a limited invasiveness rating in California (Cal-IPC 2006) and the CDFA has given it a "C" rating.

Tamarisk or **salt cedar** (*Tamarix ramosissima*) is a riparian plant and is therefore restricted to habitats where there is perennial saturation such as springs and seeps, or runoff from poorly maintained water pipelines or well pumps. It was observed interspersed throughout desert dry wash woodland within the study area. Cal-IPC has declared this plant highly invasive (Cal-IPC 2006) and it is a CDFA "B" rated species.

---

[1] *Fescue* sp. was also recorded, however *Festuca arundinacea*, the Cal-IPC "moderate" listed invasive species, is not expected in this area.

Salt cedar is associated with many ecological impacts including impacts to channel geomorphology, groundwater availability, plant species diversity, and fire frequency (Lovich 1999). Salt cedar can also affect sand dunes by blocking sand movement, a vital part of the natural function of these habitats (CDFG 2007).

Mediterranean grass (*Schismus arabicus, S. barbatus*) is prevalent throughout Sonoran creosote bush scrub within the study area. Mediterranean grass is an annual that reproduces by seed, and is widespread in arid and semi-arid California landscapes. This species competes effectively with native plants for nutrients and water and can provide cover that prevents native annuals from sprouting (VanDevender et al. 1997; Brossard et al. 2000) and contributes to dune stabilization (CDFG 2007). Fire, historically, was rare in the Colorado Desert. The presence of Mediterranean grass and other annual non-native grasses has provided a continuous and increased fuel load, influencing the extent, frequency, and intensity of fire in these ecosystems (Brooks and Pyke 2001; Brooks et al. 2004). BLM and other agencies recognize that because of the widespread distribution of Mediterranean grass, this species is not considered feasible to eradicate.

Sensitive Natural Communities and Waters of the State

Sensitive natural communities support unique or biologically important plant or wildlife species, or perform important ecological functions (e.g., bank stabilization or water filtration). These communities are usually locally and regionally scarce and therefore vulnerable to elimination. Sensitive natural communities in the desert region includes many wash-dependent communities, dune and playa habitats, and groundwater-dependent plant communities, such as mesquite groves, waters of the state, wetland and riparian habitats, and others that are of particular concern to BLM, CDFW, and other local, state, and federal agencies. The most current version of the Department's *List of California Terrestrial Natural Communities* indicates which natural communities are of special status given the current state of the California classification (CDFG 2010).

The following sensitive natural communities occur in or immediately adjacent to the project, and thus may be directly or indirectly affected:

- Desert dry wash woodland (waters of the state)
- Unvegetated ephemeral wash (waters of the state)
- Desert sink scrub (off-site)
- Active dunes (off-site)
- Playa/lake bed (off-site)
- Stabilized and partially stabilized dunes
- Mesquite Bosque (small stands)

Waters of the State

A total of 374.6 acres of state jurisdictional waters were documented on the PSEGS project disturbance area (Palen 2013y). Waters regulated by the U.S. Army Corps of Engineers (USACE) and U.S. Environmental Protection Agency (USEPA) do not occur on the project site. Correspondence from the USACE South Coast Branch determined that waters regulated by the USACE are not present on the project site (letter from

USACE). The project is located in a closed basin with no identifiable outlet and there is no direct hydrologic connection to any navigable waters.

This information was based on the November 25, 2009 formal jurisdictional delineation report submitted as part of the Lake and Streambed Alteration Agreement Notification application to CDFW for the approved PSPP (Galati & Blek 2009a) and a supplemental delineation conducted to address the new and altered linear facilities, including the natural gas pipeline and transmission line for the PSEGS (Palen 2013y). In August 2013 the project owner provided a CDFW Lake or Streambed Alteration Agreement Amendment Notification package (Palen 2013aaa). The delineations addressed waters (and/or wetlands) regulated under the federal Clean Water Act and/or streams and associated habitat regulated under the California Fish and Game Code. Refer to **Biological Resources Figure 4**. A total of 32 acres of jurisdictional state waters were documented downstream of the Project Disturbance Area to account for project design features of the PSPP that reduced or eliminated flow to these features post construction. The solar field for the PSEGS project would occur within the Disturbance Area of the approved PSPP project and would rely on the November 25, 2009 delineation. This report delineated all aquatic features, including desert washes which lack a continuous component of desert wash woodland but provide other wildlife habitat function and values. The delineation also included waters and wash-dependent vegetation downstream of the project footprint that would have been indirectly affected by the diversion of waters at the upstream side of the project into a perimeter stormwater conveyance channel. However, the PSEGS project requires less area and the project Disturbance Area would be reduced from 4,366 acres to 3,898 acres. In addition, the PSEGS project would not require the construction of manufactured channels within the solar field to control storm flows. The PSEGS project includes two linear facilities that were not analyzed for the approved PSPP project. This includes a natural gas pipeline and a relocation of the proposed generation tie-in to the Red Bluff substation, which is currently under construction.

Hydrology

The affected waters occur within the Chuckwalla-Palen hydrologic unit, or “watershed” of the Colorado River Hydrologic Basin Planning Area (Solar Millennium 2009a). The rainfall pattern is bimodal with a rainy season in summer and winter (December through March and July through September [commonly the wetter of the two]). Average annual rainfall for the project area is approximately 3.7 inches (NOAA 2009).

In arid fluvial systems, it is flash flood events (particularly the larger summer thunderstorms), combined with highly erosive soils of alluvial fans that most contribute to the conversion from single thread channels to a compound or anastomosing (braided) morphology. Because the ephemeral washes occurring within the disturbance area are subject to very wide fluctuations in discharges over a short period of time their channels can frequently change configuration to accommodate large variations in surface flow during storm events. As a result, arid fluvial systems usually exhibit long periods of little morphologic change interspersed with short-term dramatic changes in channel configuration. Therefore, arid stream geometry is more likely to be influenced strongly by a large event of low recurrence frequency (Lichvar et al. 2006).

Surface hydrology in the project area is influenced largely by stormwater runoff from the northeastern flank of the Chuckwalla Mountains, approximately 4 miles south, and south of I-10 (Galati & Blek 2010a). The main hydrologic feature in the watershed, and in the project area, is Corn Springs Wash, which is supported largely by precipitation but also in part by Corn Springs. The stream drains approximately 31 square miles of the Chuckwalla Mountains at higher elevations (Solar Millennium 2009a). Corn Springs Wash and all other desert washes in the watershed are ephemeral (flowing only in response to storm events). At the foot of the Chuckwalla Mountains, as Corn Springs Wash and other features empty onto the alluvial fan of more erosive, less consolidated soils, the stream system changes from single thread channel to compound, anastomosing channels with highly variable flow pathways. Compound channels are considered the most common channel types in arid regions and are characterized by low-flow meandering channels inset into a wider braided channel network (Lichvar et al. 2006). These channels are highly susceptible to widening and avulsions (i.e., rapid changes in channel position and/or channel relocation) during moderate to high discharges, reestablishing a low-flow channel during subsequent low flows (Lichvar and McColley 2008). This channel avulsion creates diverse physical features and habitats, supports a complex ecosystem, and sustains healthy stream function despite frequent and rapid changes in channel position (USACE 2007). With any compound/ anastomosing ephemeral stream system in arid regions, the riparian corridor may consist of streambanks lined with adapted riparian vegetation, unvegetated areas such as recently created swales and terraces (interfluves), or a mosaic of these types (Bendix and Hupp 2000).

Historic Hydrologic Alterations

When I-10 was constructed across the alluvial fan outlet of Corn Springs Wash over 40 years ago, it deprived the downstream reaches of all surface flows, interrupted natural channel formation and meandering nature of the alluvial fan flow path(s) that historically drained unimpeded from the Chuckwalla Mountains toward Palen Dry Lake, a playa lake (depressional desert sink) (Galati & Blek 2009a). A series of wing dikes were constructed just upstream (south) of the freeway, diverting the flows of numerous smaller channels into the three largest branches of Corn Springs Wash, which I-10 crosses with three short bridges. These dikes and bridges along I-10 concentrate the flows of dozens of small washes into three discrete discharge points. The westerly bridge near Corn Springs Road Interchange conveys flows from the main branch of Corn Springs Wash to the northwest corner of the site. The two other bridges convey flows to the center and east side of the project site respectively. The flat topography at the outlet of the culverts creates an initially incised watercourse that rapidly diminishes and eventually spreads out into numerous small, newly formed channels that abate fairly quickly. In general, alluvial fan channels become increasingly less defined as they flow down the fan (Vyverberg 2010), confinement is lost and the channels dissipate.

The elevated freeway permanently deprived flows of many of the channels that once crossed the project; many dead and declining ironwood trees are still evident and there is a marked decrease in the cover, vigor, diversity, and overall habitat function and value in the impaired reaches on the project. This observation is also supported by comparisons of current and historical aerial photography of the project site (before and after the diversions) (Galati & Blek 2010a).

Habitat Function and Value of State Waters

Desert dry washes play an integral role in the ecology of the watershed. The importance of ephemeral streams to wildlife in the desert is undisputed and well-documented in the literature, the sum of which represents decades of observations and surveys (Levick et al. 2008; Baxter 1988; Kirkpatrick et al. 2007; Kubick & Remsen 1977; Tomoff 1977; Daniels & Boyd 1979, and others). Ephemeral washes (both vegetated and unvegetated) provide unique habitat that is distinct from the surrounding uplands providing more continuous vegetation cover and microtopographic diversity than the surrounding uplands. Ephemeral and intermittent streams in the arid west provide important habitat for wildlife and are responsible for much of the biotic diversity (Levick et al. 2008). They have higher moisture content, and the topographic relief provides shade and cooler temperatures within the channel. In cases where the habitat is distinct in species composition, structure, or density, wash communities provide habitat values not available in the adjacent uplands. They provide movement corridors and seasonal access to water or moisture.

Both the wash-dependent and upland vegetation along desert washes drive food webs, provide seeds for regeneration, habitat for wildlife, access to water, and create cooler, more hospitable microclimatic conditions essential for a number of plant and animal species. Baxter (1988) noted that washes, because of their higher diversity plant communities, are probably important foraging locations for desert tortoise; in smaller washes, there is greater cover and diversity of spring annuals, providing important food sources. Researchers have noted the high diversity of herpetofauna in desert washes and many snakes and lizards preferentially use xeroriparian habitat because of its denser cover (*ibid.*). Kirkpatrick et al. (2007) noted that even dry, ephemeral washes have greater avian abundance and species richness than adjacent uplands. In a study of 66 plots on BLM lands in California, dry washes supported 1.5 times more breeding species and twice as many wintering species as the more common desert scrub (Kubick & Remsen 1977; Tomoff 1977; Daniels & Boyd 1979, and others).

The vegetation—whether dominated by woodland trees or shrubs and perennial herbs—contributes channel roughness that reduces the velocity of floodwaters, and provides organic matter for soil development and nutrient cycling. Functional services of these communities include moderating soil and air temperatures, stabilizing channel banks and interfluves, seed banking and trapping of silt and fine sediment favorable to the establishment of diverse floral and faunal species, and dissipating stream energy which aids in flood control (USEPA 2008).

During seasonal dry periods, plant species diversity levels along ephemeral stream channels are typically low. Following seasonal wet periods, however, diversity levels along some ephemeral stream channels can equal that along perennial stream channels (Lichvar and McColley 2008) with ephemeral desert annuals.

Because ephemeral and intermittent stream channels have a higher moisture content and more abundant vegetation than the surrounding areas, they are very important to wildlife. Frequently, these streams may retain the only available water in the area, with permanent pools interposed wherever hydrogeological conditions allow (USEPA 2008). The short duration and episodic flood pulses of surface and overbank flow is important as it allows some species to complete important life-history developmental stages. The habitat provided by desert streams contracts and expands dramatically in size due to the extreme variations in flow, which can range from high-discharge floods to periods when surface flow is absent. This spatial variation in habitat or ecosystem size is a fundamental, defining feature of these streams (Smith et al. 1995; USEPA 2008).

Within the survey area there was ample evidence of the presence of wildlife use of the ephemeral washes (e.g., tracks and scat) as a movement corridor (Solar Millennium 2010a). In addition to Sonoran creosote bush scrub, the desert dry wash woodland and unvegetated ephemeral dry wash communities within the survey area are considered suitable burrowing owl foraging and nesting habitat. Desert tortoises are often present in higher densities associated with drainages, swales, mountainous areas, and alluvial fans. Annual and perennial plant production is higher in these areas and is longer lasting. Ephemeral streams also contain rich assemblages of both invertebrates and macro-invertebrates (USEPA 2008).

Desert Dry Wash Woodland

Desert dry wash woodland is a sensitive natural community recognized by the CNDDB, BLM, and is also designated as state waters by CDFW (CDFG 2003, BLM CDD 2002). This community is described by Holland as an open to densely covered, drought-deciduous, microphyll (small-leaved) riparian scrub woodland. These habitats are often supported by braided wash channels that change patterns and flow directions following every surface flow event (Holland 1986).This natural community occupies the major washes that traverse the Project Disturbance Area and is dominated by an open tree layer of ironwood (*Olneya tesota*), blue palo verde (*Parkinsonia florida*), honey mesquite (*Prosopis glandulosa*), and smoke tree (*Psorothamnus spinosus*) with an understory of big galleta grass (*Pleuraphis rigida*), desert starvine (*Brandegea bigelovii*) and intermixed with creosote scrub (*Larrea tridentata*) and Russian thistle (*Salsola tragus*) (Solar Millennium 2009a, AECOM 2010a). Desert dry wash woodland is most developed in the primary wash near I-10 where channel development is most pronounced and water supply more abundant. As the washes become shallower and eventually abate into the landscape further northward from I-10 within the Project Disturbance Area, desert dry wash woodland is eventually replaced by washes of mixed creosote and big bush galleta grass, and other upland and wash-dependent species. Outside of the major washes, desert dry wash woodland appears to be declining overall within the Project Disturbance Area as hydrological diversions upstream (collector ditches and the construction and placement of I-10) in the early 1960s interrupted natural flow paths that have reduced water flows either through obstruction and/or redistribution from the Corn Springs Wash (AECOM 2010a). This community type is present along portions of the proposed natural gas pipeline and in discrete areas of the generation tie-in north of the Red Bluff sub-station.

Desert dry wash woodland habitat was surveyed for wildlife use during December 2009 and various signs of coyote (*Canis latrans*), fox (either kit fox or gray fox), burro deer (*Odocoileus hemionus eremicus*), and bobcat (*Lynx rufus*) were observed. This habitat provides value to various species of wildlife in the form as food, cover, dispersal, and refuge habitat (AECOM 2010a). Surveys of the natural gas pipeline conducted in 2013 detected or observed sign for a variety of wildlife including burro deer, desert kit fox, and burrowing owl (Palen 2013jj). Desert dry wash woodland also provides habitat for species such as desert tortoise, American badger, and loggerhead shrike and many other common and special-status species.

Other Ephemeral Desert Washes

In the project area, there are numerous smaller streams, which lack a continuous cover of desert dry wash woodland and consist largely of small compound channels. These are also recognized as regulated state waters. These smaller streams are subject to frequent channel avulsion and highly variable flow pathways contained within broad floodplains. Vegetative cover consists largely of mixed upland and wash-dependent shrubs and herbs and very widely scattered, small-statured, individual ironwood trees. These ephemeral streams provide movement corridors for small and large mammals and provide a seasonal water source not available in the surrounding dry uplands. Even smaller washes have been shown to support a higher density of spring and summer annuals than the surrounding uplands and thus provide important habitat value. Wildlife use of the site as a movement corridor is described in detail in the prior project owner's Data Responses (Solar Millennium 2010a and Palen 2013jj). Special-status species likely to benefit from ephemeral desert washes include desert tortoise.

Desert Sink Scrub

Desert sink scrub is considered sensitive by the CNDDB (CDFG 2003) and BLM (BLM CDD 2002). Desert sink scrub occurs below 4,000 feet in elevation and often exhibits poorly drained soils, a high water table with salt crust at the surface, and widely spaced shrubs (Holland 1986). This community occupies the salt clay pan and sandy areas around Palen Dry Lake in the northeastern portion of the study area. Dominant and indicator plants of this community include four-wing saltbush (*Atriplex canescens*), allscale saltbush (*Atriplex polycarpa*), bush seepweed (*Suaeda moquinii*), Arizona honeysweet (*Tidestromia oblongifolia*), western sea purslane (*Sesuvium ventricosum*), and Russian thistle. Desert sink scrub was not mapped within the Project Disturbance Area (AECOM 2010a).

Stabilized and Partially Stabilized Desert Dunes

Stabilized and partially stabilized desert dunes are considered sensitive by the CNDDB (CDFG 2010) and the BLM (BLM CDD 2002). These dune systems are described as accumulations in the desert which are stabilized or partially stabilized by evergreen and/or deciduous shrubs and scattered, low grasses. These dunes typically occur lower than active dune systems and retain water just below the sand surface which allows deep-rooted, perennial vegetation to survive during longer drought periods (Holland 1986).

Desert sand dunes are unique insular habitats that support sand obligate plants, mammals, reptiles and insects, including some that are restricted to sand dunes. Desert sand dunes are very limited in their distribution in California, comprising less than 7 percent of California's desert, and are threatened by disturbance such as intensive recreational use and other development (Luckenbach and Bury 1983). The disjunct distribution and limited nature of sand dunes in California's deserts mean that they often function as habitat islands, with the resident biota showing distinctive adaptations to their sand dune environments. Sand dunes in the American west support a number of endemic species which are unique, sensitive to disturbance, and at high risk of extinction (Van Dam and Van Dam 2008).

In the project area stabilized and partially stabilized desert dunes occupy the margins of Palen Dry Lake and extends into the PSEGS Project Disturbance Area. Dominant plants within the study area of this community include mesquite, dye bush (*Psorothamnus emoryi*), and desert milk-vetch (*Astragalus aridus*). The dunes within the study area are an important habitat type for the Mojave fringe-toed lizard, Harwood's milk-vetch, Harwood's phlox (a BLM Sensitive plant species), western burrowing owl, American badger, desert kit fox, as well as a variety of common plant and wildlife species (AECOM 2010a). A potentially new taxon of four-wing saltbush (*Atriplex canescens ssp.)* has been documented on the dunes just outside the Project Disturbance Area (Andre pers. comm., LaDoux pers. comm.) and other special-status plants and plant communities have been documented on the southern portion of Palen Dry Lake, including jack-ass clover (*Wislizenia refracta* ssp.) and mesquite bosque (Silverman pers. comm). The vegetation mapping provided in the Response to Staff Data Requests Set 1 (Palen 2013f) depicts the stabilized and partially stabilized desert dunes as a few discrete patches within the northern and eastern portion of the PSEGS Project Disturbance Area, totaling 187 acres.

Active Desert Dunes

Active desert dunes are considered sensitive by the CNDDB (CDFG 2010) and the BLM (BLM CDD 2002). This community is characterized by mostly unvegetated drifted sand dunes and sand fields of five feet or less in height. Dominant and indicator plants within the study area for this community include desert twinbugs (*Dicoria canescens*), creosote bush, birdcage evening primrose (*Oenothera deltoides*), and Russian thistle. The active desert dunes are in the northeastern portion of the study area and northeast of Palen Dry Lake. Despite the presence of Russian thistle, the active desert dunes within the study area provide habitat values to many species of plants and wildlife since there was little sign of human activity on the low-lying dunes (AECOM 2010a).

Active desert dunes only occur in the buffer area, northeast of the PSEGS project boundaries within the most active part of the wind transport corridor; no active desert dunes occur within the Project Disturbance Area.

Groundwater-Dependent Vegetation Communities

Information presented herein was generated during the original proceedings for the PSPP project; no further surveys or data collection was determined to be necessary as part of analysis of the modified project. Groundwater-dependent ecosystems (GDEs) are an important component of biological diversity in the California desert region. Because they are rare or limited in distribution, they often support rare or special-status plants and animals. All GDEs depend upon groundwater for all or part of their survival. Characteristic GDEs of the California desert region include playas or dry lakes, seeps and springs, mesquite woodlands (mesquite "bosques"), microphyll woodland or desert dry wash woodland, palm oases, alkali sink scrubs, alkali meadows, alkali desert scrub, and spring mounds. Groundwater may also be a vital component of the base flows of rivers and streams, and wetlands (Howard & Merrifield 2010).

In the desert region, phreatophytes, or deep-rooted plant species that obtain water from a permanent ground supply or from the water table, are largely restricted to areas of high groundwater availability, such as larger desert washes, the fringe zone around ephemeral or dry lakes (Sawyer et al. 2009), dune areas, and alluvial riverine systems (Smith et al 1998). They are also found around seeps and springs, such as fan palm oases (*Washingtonia*). Several leguminous trees form extensive riparian woodlands, such as mesquite (*Prosopis*), ironwood (*Olneya*), and palo verde (*Cercidium*), and there are a number of halophytic shrubs that are indicative of shallow saline groundwater, including seep-weed (*Suaeda*), greasewood (*Sarcobatus*), iodine bush (*Allenrolfea*), and some saltbush species (*Atriplex canescens, A. spinifera*) (ibid). Other desert shrubs such as sagebrush (*Artemisia*) and rabbitbrush (*Chrysothamnus*) facultatively exploit groundwater (ibid). Cheesebush (*Hymenochlea*), a common desert wash shrub, is also included on some lists of desert phreatophytes.

The distinction between phreatophytes depending on groundwater or exploiting surface water or soil moisture is complicated in areas where groundwater levels are not shallow. However, groundwater elevation contour mapping by Steinemann (1989) suggests that groundwater levels around Palen Lake are within the known rooting depths for most of the phreatophytes documented within the zone potentially affected by the project wells, including:

- mesquite woodlands (Solar Millennium 2009a, Appendix F; Sawyer 2009; Evens & Hartman 2007; Silverman pers. comm);
- alkali sink scrubs (Solar Millennium 2009a), dune communities along the margins of the playa (Solar Millennium 2009a, Silverman pers. comm.);
- and ironwood-palo verde woodlands (Evens & Hartman 2007, BLM CDD 2002).

Documented examples around Palen Dry Lake were also confirmed during staff site visits or through aerial photo interpretation. Groundwater levels drop to over 100 feet at Ford Dry Lake and are even deeper in other portions of the valley (Worley-Parsons 2009). Desert phreatophytes are legendary for their deep-rooting (Barbour et al. 2007). Mesquite, for example, typically root to depths of 40 feet but have been documented to root as deep as 150 feet (Steinberg 2001) to over 250 feet in one example at a mine shaft (Sosebee and Wan 1989).

The potentially groundwater-dependent plant communities found or documented to occur within the area that would be affected by groundwater pumping (Solar Millennium 2010l) are described below, including their importance to wildlife and special-status species known to occur in these areas. All of these natural communities are recognized as rare or sensitive by either CDFW (CDFG 2010) or BLM (or both).

Mesquite Bosque and Microphyll Woodlands

Shrubby “bosques” (groves) of honey mesquite occur around the open, unvegetated playa along the northwest and southwest margins of Palen Dry Lake (Evans and Hartman 2007) on small coppice dunes (vegetated sand mounds) (Solar Millennium 2009a, Appendix F).

Mesquite bosques are a rare and sensitive community recognized by BLM and the CNDDB (CDFG 2003). They occur in areas with access to permanent and stable groundwater. When available, mesquite will exploit sources of deep water by growing a taproot. Mesquite can also persist on sites that have little or no ground water by growing lengthy shallow lateral roots. In some parts of their range they are considered “facultative phreatophytes” that function as phreatophytes if unlimited water is available, but are capable of surviving on sites with limited soil water. In California, however, they are very rare outside of washes or areas with available groundwater (Steinberg 2001). They also occur as a decumbent or running bush found on coppice dunes. These adaptations allow honey mesquite to retain most leaves in all but the most severe droughts (Ansley et al. 2004).

The fruit of honey mesquite is valuable forage for wildlife; it is quite predictable, even in drought years, annually providing an abundant and nutritious food source for numerous wildlife species upon ripening in summer (Steinberg 2001). The fruit's pericarp is high in sugars and the seeds contain large amounts of protein. Where they occur, honey mesquite seeds form an important part of the diet of mice, kangaroo rats, ground squirrels, quail, black-tailed jackrabbit, mule deer, and many other wildlife. Mesquite flowers are eaten by numerous bird species. Quail and many other birds eat mesquite buds and flowers in the spring and seeds during the fall and winter. Western honey mesquite communities often attract large numbers of birds that feed on the mistletoe fruit.

Other known phreatophytic woodlands in the project area include the native trees associated with desert wash dry woodland in the Sonoran Desert region: ironwood, palo verde, smoke tree, and cat’s claw (*Acacia greggii =syn. Senegalia greggii*); the invasive exotic salt cedar (also known as “tamarisk”). These microphyllous trees occur largely along desert washes but they can also be observed singly or in small stands outside of the stream channels on the valley floor or across the upper bajadas on very small channels. The best examples are found on the largest desert washes. The importance of these desert riparian ecosystems to wildlife is described above under “Desert Dry Wash Woodland”.

Bush Seepweed and Other Alkali Sink Scrubs

Other known phreatophytes observed in the project vicinity (Evens & Hartman 2007) include succulent chenopod scrubs dominated by bush seepweed, which forms pure stands or co-occur with four-wing saltbush (*Atriplex canescens*) over large areas around the margins of Palen Dry Lake. Bush seepweed is a characteristic component of alkali sinks, a low-growing, grayish, succulent phreatophyte (Barbour et al. 2007) occupying fine-textured, often poorly drained, saline-alkaline soils on or around the playa margins. It is a ‘facultative’ wetland plant meaning that it can occur in wetlands or non-wetlands, and it is recognized as a phreatophyte, rooting at depths of several meters to access groundwater (Patten et al. 2007).

In the project area, bush seepweed-dominant chenopod scrubs occur in the northern portion of the project area and around Palen Dry Lake, predominantly in sand drifts over playa. This has also been confirmed in detailed surveys, mapping, and classification conducted by CNPS for the BLM NECO plan (Evens & Hartman 2007). Other sink scrubs documented in the project vicinity around Palen Dry Lake include facultative wetland scrubs of iodine bush (*Allenrolfea californica*) and communities dominated by the special-status plant jackass clover (*Wislizenii refracta* ssp. *refracta*) (Evens & Hartman 2007). These communities often occur on the margins of dry lake beds in the Colorado, Sonoran, Mojave, and Great Basin deserts typically below 4,000 feet in elevation (Holland 1986). Chenopod scrub provides habitat value to many species of common and special-status plants, mammals, and reptiles as dispersal, foraging, and cover habitats especially in association with other upland and desert wash communities. Special-status species documented in the scrubs at the northeast portion of the project area include Mojave fringe-toed lizard. Other observed wildlife or known associates include zebra-tailed lizard and kangaroo rat. Alkaline sink scrubs in the vicinity are also associated with the rare Abram's spurge, which is documented from less than five viable occurrences statewide, including an occurrence at Ford Dry Lake in similar habitats.

Sand Dune Transport System

This subsection provides a brief explanation of wind transport of sand relative to the creation, preservation, and destruction of sand dunes in the project area. **BIOLOGICAL RESOURCES APPENDIX A**, provides a more detailed explanation, as does the Geomorphic Evaluation for Reconfigured Alternatives 2 and 3 (Kenney 2010), the Preliminary Sand Transport Summary included in Response to CEC Data Request Set 2 (Palen 2013r), the Final Sand Transport Study (Palen 2013kk) and Supplement No. 1 (Palen 2013bbb) and staff's Geomorphic Assessment of Sand Transport for the Modified Project (Palen Solar Electric Generating System) (CEC 2013v).

The PSEGS (proposed modified project) footprint covers several different land units that vary along a southwest to northeast gradient in the degree of aeolian sand transport they experience. The least sandy land unit is within the PSEGS's western solar field which is almost entirely a stable, coarse gravel alluvial fan surface (referred to as Zone IV in Solar Millennium 2010b). Refer to **Biological Resources Figure 5a.** The sand dunes in the southern and western sector of the PSEGS site are a mixture of degraded vegetated dunes with thin coarse sand, and patches of alluvial gravel lag and desert varnish. This surface has been formed primarily by deposition of sand and gravel from alluvial fans (fluvial action) over hundreds of thousands of years, overlain with patches of vegetated sand dunes that formed from wind action during periods of greater sand availability. The sand dunes on the mid fan have subsequently degraded due to wind erosion and deflation (sand is being removed by the wind but not replaced). Deflation of the relict dunes is leaving behind the more resistant alluvial deposits as a protective lag of gravel. In many places the lag has formed desert varnish (a black coloration on the exposed surface of gravel particles). The presence of desert varnish suggests that parts of this surface have been stable and exposed in its current condition for many hundreds to thousands of years. There is little available sand for either transport to dunes down wind, and the sand that is present is coarse (1–2 millimeter (mm)) with abundant fine gravel (2 mm and larger). The vegetation cover is largely sparse creosote bushes and degraded dunes, with ironwood trees in the larger washes.

Northeast is a more active wind-blown sand area with relatively shallow sand deposits (Zone III) on the lower alluvial fan. This is an area of shallow vegetated sand dunes with a transition from creosote bushes to grasses. The dunes are in relative equilibrium – losses of sand due to wind erosion are matched by deposition of sand from upwind. Refer to **Biological Resources Figure 5a.**

At the northeastern portion of the PSEGS project site within the lower alluvial fan is an area of deeper and more active vegetated sand dunes (Zone II). Refer to **Biological Resources Figure 5a.** This area is characterized by hummocky vegetated dunes with greater topographic expression than the zone to the west, implying that they are more actively supplied by sand. This zone lies within the Palen Dry Lake–Chuckwalla sand transport corridor, a regionally significant geomorphic feature that provides sand build and supports sand dune habitat. This sand corridor stretches down the Chuckwalla Valley to Blythe and the Colorado River.

The most active area of sand transport is Zone I, northeast of the PSEGS project boundary. Two sand transport corridors come together just to the east of the PSEGS project: the Palen Valley corridor which runs from north to south along the eastern edge of the project and the Palen Dry Lake–Chuckwalla Valley corridor which runs northwest to southeast through the northeastern half of the project.

Special-Status Species

Special-status species are plant and wildlife species that have been afforded special recognition by federal, state, or local resource agencies or organizations. Listed and special-status species are of relatively limited distribution and typically require unique habitat conditions. Special-status species are defined as meeting one or more of the following criteria:

1. Listed as threatened or endangered or candidates for future listing as threatened or endangered under CESA or FESA;

2. Protected under other regulations (e.g. Migratory Bird Treaty Act);

3. Listed as fully protected or species of special concern by CDFW;

4. A plant species considered by the CNPS to be “rare, threatened, or endangered in California” (California Rare Plant Ranks (CRPR) List 1A, 1B, 2A and 2B) as well as CRPR List 3 and 4[2] plant species;

5. A plant listed as rare under the California Native Plant Protection Act[3];

---

[2] List 3 plants may be analyzed under CEQA §15380 if sufficient information is available to assess potential impacts to such plants. Factors such as regional rarity vs. statewide rarity should be considered in determining whether cumulative impacts to a RPR 4 plant are significant even if individual project impacts are not. RPR 3 and 4 may be considered regionally significant if, e.g., the occurrence is located at the periphery of the species' range, or exhibits unusual morphology, or occurs in an unusual habitat/substrate. For these reasons, RPR List 3 and 4 plants should be included in the field surveys. RPR 3 and 4 plants are also included in the California Natural Diversity Database’s (CNDDB) Special Plants, Bryophytes, and Lichens List. [Refer to the current online published list available at: http://www.dfg.ca.gov/biogeodata.] Data on RPR 3 and 4 plants should be submitted to CNDDB. Such data aids in determining or revising priority ranking (CDFG 2009).

6. Considered a locally significant species, that is, a species that is not rare from a statewide perspective but is rare or uncommon in a local context such as within a county or region or is so designated in local or regional plans, policies, or ordinances; or

7. Any other species receiving consideration during environmental review under CEQA.

The BLM designates Sensitive species as those requiring special management considerations to promote their conservation and reduce the likelihood and need for future listing under ESA. BLM Sensitive species include all Federal Candidate and Federally Delisted species which were so designated within the last 5 years, and CNPS List 1B species that occur on BLM lands. For the purposes of this analysis, Energy Commission staff considers all BLM Sensitive species as special-status species.

Biological Resources Table 3 lists all special-status species evaluated during the analysis that are known to occur or could potentially occur in the project area and vicinity. Special-status species detected or considered possible or likely to occur based on known occurrences in the vicinity and suitable habitat present within the project area are discussed in more detail below. Special-status species observed during the field surveys conducted in 2009 and 2010 as well as staff site visits in 2013 are indicated by **bold-face type** (Solar Millennium 2009a, AECOM 2010a, Palen 2013m). Staff received the final results of biological resource surveys conducted in spring 2013 including a list of all species observed on the modified linear facilities during surveys and no updates to the table were required (Palen 2013jj).

Biological Resources Table 3
Special-Status Species Known to or With Potential to Occur in the Palen Solar Electric Generating System Biological Resources Study Area

[3] As defined by the California Native Plant Protection Act, a plant is rare when, although not presently threatened with extinction, the species, subspecies, or variety is found in such small numbers throughout its range that it may be endangered if its environment worsens (Fish and Game Code §1901) (CDFG 2009).

Sources: CNDDB 2013

**These species were observed by staff at the Palen Solar Energy Generating System Project site during site visits performed April 9 and 10, 2013.

±These species were observed by staff immediately adjacent to the Palen site within ponds located in the agricultural areas.

Status Codes:

Federal FE = Federally listed endangered: species in danger of extinction throughout a significant portion of its range
FT = Federally listed, threatened: species likely to become endangered within the foreseeable future
BCC: Fish and Wildlife Service: Birds of Conservation Concern: identifies migratory and non-migratory bird species (beyond those already designated as federally threatened or endangered) that represent highest conservation priorities <www.fws.gov/migratorybirds/reports/BCC2002.pdf>

State CSC = California Species of Special Concern: species of concern to CDFW because of declining population levels, limited ranges, and/or continuing threats have made them vulnerable to extinction.
CFP = California Fully Protected
SE = State listed as endangered
ST = State listed as threatened
SR = State listed as rare
WL = State watch list

California Rare Plant Rank
List 1A = Plants Presumed Extirpated in California and Either Rare or Extinct Elsewhere
List 1B = Rare, threatened, or endangered in California and elsewhere
List 2A = Plants Presumed Extirpated in California, But More Common Elsewhere

List 2B = Rare, threatened, or endangered in California but more common elsewhere
List 3 = Plants which need more information
List 4 = Limited distribution – a watch list
0.1-Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
0.2-Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)
0.3-Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known)

Bureau of Land Management
BLM Sensitive = Species requiring special management consideration to promote their conservation and reduce the likelihood and need for future listing under the ESA. BLM Sensitive species also include all Federal Candidate species and Federal Delisted species which were so designated within the last 5 years and CNPS List 1B plant species that occur on BLM lands. http://www.blm.gov/style/medialib/blm/wo/Information_Resources_Management/policy/blm_manual.Par.43545.File.dat/6840.pdf.

Global Rank/State Rank

Global rank (G-rank) and State rank (S-rank) is a reflection of the overall condition of an element throughout its global (or State) range. Subspecies are denoted by a T-Rank; multiple rankings indicate a range of values. State rank (S-rank) is assigned much the same way as the global rank, except state ranks in California often also contain a threat designation attached to the S-rank. An H-rank indicates that all sites are historical
G1 or S1 = Critically imperiled; Less than 6 viable element occurrences (EOs) OR less than 1,000 individuals
G2 or S2 = Imperiled; 6-20 EOs OR 1,000-3,000 individuals
G3 or S3 = Rare, uncommon or threatened, but not immediately imperiled; 21-100 EOs OR 3,000-10,000 individuals
G4 or S4 = Not rare and apparently secure, but with cause for long-term concern; this rank is clearly lower than G3 but factors exist to cause some concern; i.e., there is some threat, or somewhat narrow habitat.
G5 or S5= Demonstrably widespread, abundant, and secure.

Threat Rank
.1 = very threatened
.2 = threatened
.3 = no current threats known

Special-Status Plant Species

As shown in **Biological Resources Table 3,** several special-status plant species have the potential to occur within the study area. Four of these were observed within the study area: Harwood's milk-vetch, Harwood's eriastrum, California ditaxis, and ribbed cryptantha. Utah vining milkweed was observed outside the study area to the east and was documented in Solar Millennium's (prior project owner) July 2010 spring survey report (Solar Millennium 2010m). A potential new taxon of saltbush was reported and documented in the dunes just north of the project boundary (Andre, pers. comm.), and was mapped in the prior project owner's preliminary spring 2010 survey report (AECOM 2010d). It has no official status or recognition at this time; however, the BLM State Botanist has indicated that potential new taxa may be treated as BLM Sensitive species (Lund, pers. comm.), and thus it is included here as a special-status species. Of the six species observed during the surveys, only the Harwood's milk-vetch, California ditaxis, and ribbed cryptantha occur within the Project Disturbance Area. Refer to **Biological Resources Figure 6**.

Several additional species were included in staff's analysis for the PSPP because they are documented or reported to occur within Chuckwalla Valley in similar habitats, or along washes in the surrounding foothills; however, they were not observed in the study area during the spring 2009 or 2010 surveys (AECOM 2010d, Solar Millennium 2009a, Solar Millennium 2010k, Solar Millennium 2010l): Jack-ass clover, Palmer's jackass clover, mesquite nest straw, dwarf germander, Abram's spurge, glandular ditaxis, desert unicorn plant, winged cryptantha, and Las Animas colubrina. Another rare species, morning-glory heliotrope, has been observed in the Chuckwalla Valley and Palo Verde mesa, but this new range extension from the Arizona flora has no status yet in California (Silverman, pers. comm.).

For the PSPP, staff considered that, at a minimum, the following late-blooming special-status plants had some potential to occur based on suitable habitat and known occurrences within the Sonoran Desert region of California: Abram's spurge, flat-seeded spurge, lobed ground cherry, and glandular ditaxis. Surveys for late-season special-status plants were completed in fall 2010. Fall 2010 botanical surveys were conducted in the PSPP project area, which included all areas within one mile of the approved project site, on October 11, 2010 through October 15, 2010. Summer/fall annual plant species were detected in bloom and/or fruit within and in the vicinity of the project, confirming that late season surveys were being conducted at the appropriate time, but no special-status plant species were detected in the PSPP project area during the October 2010 surveys. Surveys would also be required to locate these late-blooming special-status plants identified as potentially occurring and any other late-blooming special-status plants. Surveys have not been completed for late-season special-status plants along the along the modified generation tie-line route and new gas pipeline corridor. The botanical survey report for the fall 2013 surveys is expected in November 2013.

The special-status plants found in the study area during the 2009-2010 spring surveys for the PSPP and the 2013 spring surveys for PSEGS are described below, followed by a discussion of the late-season special-status plants that may be detected during the fall 2013 surveys for PSEGS, or that are considered to have some potential for occurrence in the study area based on the presence of suitable habitat and known occurrences in the region. Staff requested additional information for all new areas of the PSEGS including the natural gas line corridor and the unsurveyed segment of the generation tie-line corridor. The project owner submitted final survey reports regarding rare plant surveys conducted in March 2013 for the PSEGS that included a complete floristic inventory for the spring 2013 surveys and no additional special-status plants were found (Palen 2013jj).

In order to better define and categorize rarity in California's flora, the CNPS Rare Plant Program and Rare Plant Program Committee developed the new California Rare Plant Ranks (CRPR) 2A and CRPR 2B in 2010 (CNPS 2010). These new categories, in addition to the initial categories, are described as follows:

- List 1A are plants presumed extirpated in California and either rare or extinct elsewhere
- List 1B are rare, threatened, or endangered in California and elsewhere
- List 2A are plants presumed extirpated in California, but more common elsewhere
- List 2B are rare, threatened, or endangered in California but more common elsewhere
- List 3 are plants which need more information
- List 4 are limited distribution or a watch list
- 0.1-Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
- 0.2-Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)
    - 0.3-Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current

Harwood's Milk-vetch

Harwood's milk-vetch is a California Rare Plant Rank (RPR) 2B.2 species, meaning that it is moderately threatened in California, but more common elsewhere. It is also a covered species under the NECO Plan. It is an annual herb that mainly occurs in Sonoran desert scrub habitat throughout the Colorado Desert (BLM CDD 2002). This subspecies is found in desert dunes and sandy or gravelly areas throughout the Mojave and Sonoran deserts covering portions of Imperial, Riverside, and San Diego counties (CNPS 2009). Historic and recent collections include Ogilby Road in Imperial County and three locales west of Blythe, the Pinto Basin, and Chuckwalla Basin in Riverside County. Harwood's milk-vetch has also been reported from Baja California, Sonora Mexico, and portions of Yuma County, Arizona (Reiser 1994). There are several CNDDB records for this species within the project vicinity (CNDDB 2010).

For the PSPP, staff reviewed the occurrence data in the Consortium of California Herbaria and detected 3 new occurrences that were not in the CNDDB. All of these are historical occurrences. Of the total 46 occurrences in California (CNDDB plus new additional occurrences), 9 of these are protected under Park Service or State Park ownership. A total of 11 records are historical records. Sixteen of these occurrences have documented threats including development, OHV, agriculture, transmission lines, road maintenance, and trash dumping.

A total of 146 Harwood's milk-vetch plants were documented in the study area during the 2009 and 2010 surveys for the PSPP (Solar Millennium 2010k). Only four of these occurrences occur within the Project Disturbance Area for the PSEGS totaling 6 plants (5 in solar field and 1 in generation tie-line corridor). Many new occurrences were documented in Chuckwalla Valley and the Palo Verde mesa during the 2010 surveys for the Blythe Solar Power Project (Solar Millennium 2010k) and the Genesis Solar Energy Project (Solar Millennium 2010k) study areas. This species was not observed during March 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline route.

Ribbed Cryptantha

Ribbed cryptantha is a RPR 4.3 species, meaning that it has limited distribution in California, but it is not very threatened in California. It typically occurs in loose friable soils in the eastern Mojave and Sonoran deserts in Imperial, Riverside, San Diego, and San Bernardino counties and into Arizona and south to Baja California, Mexico (CNPS 2009). It commonly occurs in stabilized and partially stabilized desert dunes and sandy areas of Sonoran and Mojavean desert creosote bush scrub. There are 116 records of this species from several locations throughout Riverside, Imperial, San Diego, and Imperial counties in the Consortium of California Herbaria database; the nearest collection is from the Palen Valley approximately three miles east of the Desert Center Airport (CCH 2010).

CDFW protocols for botanical surveys specify: *"Factors such as regional rarity vs. statewide rarity should be considered in determining whether cumulative impacts to a List 4 plant are significant even if individual project impacts are not. CNPS List 3 and 4 may be considered regionally significant if, e.g., the occurrence is located at the periphery of the species' range, or exhibits unusual morphology, or occurs in an unusual habitat/substrate. For these reasons, CNPS List 3 and 4 plants should be included in the field surveys."* (CDFG 2009). The protocols also recommend that cumulative impacts should be considered in the assessment of impacts to RPR 4 plants.

A large local population of this RPR watch list (RPR 4.3) species was found during the 2010 surveys for the PSPP for this and other projects in the vicinity (Solar Millennium 2010k, TTEC 2010m, AECOM 2010v). None of the surveyors have reported that the occurrences exhibit a local or regional significance. Plant estimates of this species were made using sub-sampling methods and an estimate of 8,903 plants per acre was used. Approximately 285 acres and 1,309 acres of occupied ribbed cryptantha acreage were estimated within the PSPP Project Disturbance Area and buffer area, respectively (Solar Millennium 2010m, Table 3). In Data Request Set 4 staff requested that the project owner provide an impacts analysis similar to the impact analysis provided for the PSPP for this species and all other special-status plant species that includes an estimate of the acres of impact or number of individuals in the PSEGS Project Disturbance Area. Plant estimates for this species occupied approximately 15.9 acres in the solar field area totaling approximately 141,558 plants (Palen 2013ss). This species was not observed during March 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline route.

Harwood's Eriastrum

Harwood's eriastrum, also known as Harwood's phlox, or Harwood's woollystar, is a BLM Sensitive spring annual currently known from only 14 documented locations worldwide. It is RPR 1B.2 species, which indicates it is rare, threatened, or endangered throughout its range. It is a California endemic with a global range restricted to San Diego, Riverside, and San Bernardino counties, typically in dunes associated with the margins around dry lakes such as Dale, Cadiz, and Soda lakes. Recently, surveys conducted in spring of 2010 for the Blythe Solar Power Project located this plant primarily in the sandy areas south of I-10, where 2,134 plants were located and mapped (AECOM 2010v). All of these plants were identified in the general vicinity of the Southern California Edison Colorado River Substation. Staff considers all stabilized and partially stabilized dunes to be suitable habitats for this species in the study area.

For the PSPP, staff reviewed the occurrence data in the Consortium of California Herbaria and detected 2 new occurrences that were not in the CNDDB. Both of these are historical records from 1939 and 1958. Of the total of 14 occurrences in California (12 CNDDB plus two additional historic records), three of these are protected under Park Service or State Park ownership. A total of three records are historical records. Four of these occurrences have documented threats, including OHV use and non-native plant impacts.

This species was not observed during 2009 field surveys for the PSPP; however, a total of 23 Harwood's eriastrum plants were observed in the partially stabilized dunes in the northeast corner of the study area during spring 2010 field surveys for the PSPP (Palen 2013ss). No Harwood's eriastrum were found within the Project Disturbance Area for the PSPP and this species does not occur in the PSEGS Project Disturbance Area. This species was not observed during March 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline route.

Utah Vining Milkweed

This twining perennial occurs in sandy or gravelly soils in Mojavean and Sonoran desert scrub habitats or washes from approximately 500 feet to 4,300 feet in elevation (CNPS 2009). The distribution of this species covers San Diego, Imperial, Riverside, and San Bernardino counties and portions of Arizona, Nevada, and Utah.

Until recently discovered growing on the Palo Verde Mesa (AECOM 2010v), it was believed that the project was outside of the range of Utah vining milkweed. As a RPR List 4.2, it is not tracked in CNDDB but there are 58 records of this species from the Consortium of California Herbaria database primarily from San Bernardino and San Diego counties; there is one record from the Big Maria Mountains from wash and stabilized dune habitat at approximately 1,200 feet elevation (CCH 2010). This species was not found during 2009 field surveys; however, this plant was observed incidentally at a single location outside of the study area, east of Palen Lake. No Utah vining milkweed plants were observed within the Project Disturbance Area or buffer area during 2009 or 2010 field surveys for the PSPP (Solar Millennium 2010m, Figure 7). This species was not observed during March 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline route.

California Ditaxis

California ditaxis is a RPR 3.2 species (a review list), meaning that its taxonomic status is questionable and more information is needed. It may be a glabrous variety of the common *Ditaxis neomexicana* but appears to be a rare variety of the common species. Its occurrences in California are fairly endangered (CNPS 2009). This species occupies Sonoran desert scrub habitat, and prefers sandy washes and alluvial fans of the foothills and lower desert slopes, from 100 to 3,000 feet above mean sea level. Reports of this species are known from San Bernardino, Riverside, Imperial, and San Diego counties, and Sonora, Mexico (CNPS 2009). There are 17 records from the CNDDB (2010) primarily from Riverside County.

For the PSPP, staff reviewed the occurrence data in the Consortium of California Herbaria and detected four new occurrences that were not in the CNDDB. Three of these are historical records from between 1921 and 1952; however, one more recent occurrence was found at Anza-Borrego Desert State Park near Starfish Cove Canyon. Of the total 21 occurrences in California (CNDDB plus new additional occurrences), two of these are protected under Park Service ownership. A total of four records are historical records. Five of these occurrences have documented threats, including, OHV use, road grading, and construction of a new power line.

A total of 22 plants were documented in the study area during the 2010 surveys for the PSPP; half of these (11) occur within the PSPP Project Disturbance Area along the gen-tie line (Solar Millennium 2010m, Table 3). These 11 plants are also in the PSEGS Project Disturbance Area along the generation tie line corridor. This species was not observed during March 2013 surveys for the PSEGS along the proposed modified generation tie-line or the natural gasline route.

Atriplex sp. nov

A potentially new taxon of saltbush (*Atriplex*) was discovered on the saline playa margins of Palen Dry Lake last year by a botanist with the U.C. Reserve System (Andre and La Doux, pers. comm.). It resembles the common four-wing saltbush (*Atriplex canescens*), a common plant of dunes which has very linear leaves, but the new taxon has obovate leaves that distinguish it from all *Atriplex canescens* and its subspecies (Andre, pers. comm.). Solar Millennium's botanical consultant tentatively treated it as a variety of the common four-wing saltbush. Although plasticity in fruit and vegetative characters hinders description and identification, many of the subspecies of four-wing saltbush have been demonstrated to differ in ploidy level and chemical constituents and thus their biological validities are confirmed, including *Atriplex canescsens* ssp. *linearis* (Sanderson & Stutz 1994).

The undescribed *Atriplex* was first collected in 2005 at the "dry lake" just northeast of the Interstate 15 and Highway 95 junction approx 35 miles east and northeast of Las Vegas, Nevada. The first voucher/observation of it in California was at Palen Lake 2009. There is also potential for it to occur along the I-8 corridor in Imperial County. Although it is distinct from the common *Atriplex canescens* in its obovate leaves, it would be easy to overlook the new taxon where they co-occur, even by experienced botanists. The new taxon is more confined to subsaline or saline playa margins, though not necessarily so. Andre (pers. comm.) indicated that it may also have been observed in the Ford Dry

Lake area (unconfirmed) and it has been observed in other saline (but non-playa) habitats on remnants of the lower Colorado River flood plain.

Several plants of four wing saltbush were found within in the buffer area, northeast of the PSPP project site during spring 2010 field surveys for the PSPP (Solar Millennium 2010m, Figure 7). This species has been observed in other saline (but non-playa) habitats on remnants of the lower Colorado River flood plain (Andre, Silverman, pers. comm.). This species was not observed during March 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline corridor.

Desert Unicorn Plant

Desert unicorn plant is a RPR 4.3 plant species, meaning it has limited distribution, but is not very threatened in California. This is a covered species under the NECO Plan. This is a low-growing, perennial species that occurs in sandy washes within Sonoran desert scrub habitats in San Bernardino, Imperial, Riverside, and San Diego counties of California. There are 13 records known from the NECO planning area in Milipitas Wash, Chuckwalla Valley, and Chemehuevi Valley (BLM CDD 2002). The blooming period for this species is from May to August (CNPS 2009). It is a late-season bloomer but it has large and distinctive seed pods that can be detected during routine spring surveys. It has a fleshy root system that can remain dormant in dry years. As a RPR 4.3, it is not tracked in CNDDB but there are 36 records in the Consortium of California Herbaria, several of which are from the Chuckwalla Mountains and Desert Center area, including the project area (CCH 2010). This species was not observed during spring 2009 or 2010 field surveys performed for the PSPP; however this plant has been identified in the project region for other solar projects (AECOM 2009d, 2009a and b). This species was not observed during March 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline. Although surveys were not conducted during the blooming period it can be detected during routine spring survey so no additional surveys are required to confirm if this species is present.

Abram's Spurge

Abram's spurge is a late-season, ephemeral annual that responds to summer monsoonal rains but dries quickly and cannot be detected during routine spring surveys. It is a RPR 2B.2 species meaning it is moderately threatened in California but more common elsewhere (CNPS 2009). Habitat consists of sandy flats in creosote bush scrub habitat from approximately 600 to 2,700 feet above mean sea level. This summer annual occurs in halophytic (saline-alkaline) scrub flats, playas, and along inlets and floodplains of playas and always seems to prefer the lower floodplain ecotone but can also extend higher up in the floodplain drainages (Silverman, pers. comm.). Based on fourteen Consortium of California Herbaria database records for this species, habitats in Riverside, San Diego, and Imperial counties consist of sandy soil habitats often along dry lake margins, whereas documented occurrences in San Bernardino County occur on coarser, possibly sandy loams. Abram's spurge occurs from San Bernardino County to Imperial and eastern San Diego counties to Arizona, Nevada, Mexico, and Baja California (GSEP 2009a, b). The CNDDB (CNDDB 2010) lists 15 occurrences of this plant within the Riverside, Imperial, San Bernardino, and San Diego counties in California, east through Nevada to Arizona, and as far south as Baja California, Mexico. Of the total of 15 occurrences in California, seven of these are protected under Park

Service, CDFW, or State Park ownership. A total of four records are historical records and one of these occurrences has documented threats which include grazing. A recent 2000 CNDDB record is from a location near the project site; approximately 0.5 mile east of Ford Dry Lake on Gasline Road just south of I-10, and reported as a "substantial population" (CNDDB 2010).

During workshops the project owner discussed that a request for a Rare Plant Status Review has been submitted to California Native Plant Society (CNPS) for Abram's spurge currently a RPR Rank 2 Plant, as their biologist reports it is so abundant along the I-10 corridor that it warrants a review. In order for a Rank 2 species to be downgraded to a lower rank by CNPS it must have more than 50 occurrences that must be ranked "excellent" or "good" by the CNDDB, currently only 33 of its 86 occurrences are ranked "excellent" or "good" (Sims, per comm., 2013). Moreover, 40 are ranked "fair" or "poor" and 1 is confirmed extirpated (Sims, per comm., 2013). These ranks are based on the site quality and viability of the occurrence, and are one of the only things CNDDB have to go off in attempts to understand the long-term viability of the plants at each occurrence (Sims, per comm., 2013). In addition to threats to known populations from solar development along I-10, there are other threats noted for this species, including development, agriculture, weeds, grazing, and more.

The blooming period is identified by CNPS as September through November (CNPS 2009). Since the project site occurs in the Chuckwalla Valley of the Sonoran Desert, an area known for bi-modal rain patterns and late summer/fall rains, this species typically only blooms during summer or fall months following monsoonal rains (>+/- 0.10 inch) (Silverman pers. comm.). On average, August receives the most rainfall, although rainfall is also received during winter months of December, January, and February. Regional botanical experts have concluded that this, and other summer annuals, may be missed if surveys are only conducted within the mid-March through mid-April window, and that a full inventory at multiple temporal windows are necessary in order to capture all appropriate growing conditions (typically following 12 to 18 mm rain events) (CEC 2009a).

This species was not identified during fall 2010 botanical surveys for the PSPP. This species was not observed during March 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline but surveys were not conducted during a time of year adequate for detecting this species; late season surveys will occur in fall 2013 and the survey report is expected in November 2013, as per Condition of Certification **BIO-19**.

Flat-seeded Spurge

Flat-seeded spurge is a RPR 1B.2 species meaning it is rare, threatened, or endangered in California and elsewhere; fairly endangered in California. It is a BLM Sensitive species. This species occurs in desert dunes and Sonoran desert scrub habitat types, in sandy places or shifting dunes, at elevations from approximately 200 to 300 feet. Some experts speculate that the species may be a "waif" in California, or a species that is not naturalizing, and note that it is more common in Arizona and Mexico (CNDDB 2010) but overall little is known or can be concluded (LaDoux pers. comm.). This ephemeral summer annual blooms February through September (CNPS 2009). There are four CNDDB records of this species for the entire state of California, only one of which is from Riverside County; the closest occurrences are approximately 50 miles away.

For the PSPP, staff reviewed the occurrence data in the Consortium of California Herbaria and detected 1 new occurrence that were not in the CNDDB. This occurrence is a historical record from 1933. Of the total five occurrences in California (CNDDB plus new additional occurrences), one of these are protected under State Park ownership. A total of three records are historical records and none of these occurrences have documented threats.

This species was not observed during spring 2009 or 2010 botanical surveys for the PSPP. Although there are no documented nearby occurrences, the project occurs within its range, suitable habitat is present, and as an ephemeral summer annual it may be under-surveyed and its potential to occur cannot be dismissed (LaDoux pers. comm.). This species was not observed during March 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline route. This is a RPR 1B.2 species meaning that is it rare, threatened, or endangered in California, but more common elsewhere, fairly endangered in California. It is a CNDDB state rank S1. This plant species grows from sea level to approximately 1,400 feet above mean sea level in Mojavean and Sonoran desert scrub habitat, in the sandy soils of dry washes and rocky hillsides. Glandular ditaxis (an annual or short-lived perennial) blooms from October through March (CNPS 2009); while it can be detected during spring surveys; it is easier to detect in fall following the start of the rainy season (Silverman pers. comm.).

For the PSPP, staff reviewed the occurrence data in the Consortium of California Herbaria and detected 3 new occurrences that were not in the CNDDB. All of these are historical records from 1932. Of the total 21 occurrences (CNDDB plus new additional occurrences), one of these is protected on under CDFW land ownership. A total of six records are historical occurrences. One of these has documented threats, including land development, and is likely extirpated. This species was not observed during spring 2009 or 2010 botanical surveys performed for the PSPP or during March 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline route.

Lobed Ground Cherry

Lobed ground cherry is a late season perennial that blooms September to January. It is a RPR 2B.3 species, meaning that is rare, threatened, or endangered in California, but more common elsewhere and not very threatened in California. This species occurs in Mojavean desert scrub on decomposed granite soils, playas, and alkaline dry lake beds. This species occurs from approximately 1,500 feet to 2,400 feet above mean sea level. There are six records from the Consortium of California Herbaria database, all from San Bernardino County (CCH 2010).

For the PSPP, staff reviewed the occurrence data in the Consortium of California Herbaria and detected two new occurrences that were not in the CNDDB. Both of these are more recent occurrences, including one from Joshua Tree National Monument and one in the eastern Mojave Desert. Of the total six occurrences in California (CNDDB plus new additional occurrences), none of these are protected under Park Service or other agency land ownership. None of these are historical records and none of these occurrences have documented threats. This species was not observed during fall 2010 botanical surveys performed for the PSPP. This species was not observed during March 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline but surveys were not conducted during a time of year adequate for detecting this species; late season surveys will occur in fall 2013 and the survey report is expected in November 2013.

Dwarf Germander

Dwarf germander is a RPR 2B.2 meaning that is it rare, threatened, or endangered in California, but more common elsewhere, fairly endangered in California. It is a CNDDB state rank 2. This species occurs in desert dune, playa margins, and Sonoran desert scrub habitats from approximately 100 feet to 1,200 feet. This species typically blooms from March to May but may also bloom from September through November. This species typically occurs in sandy soils and wash habitats and is known from fewer than 10 occurrences in California (CNPS 2009).

For the PSPP, staff reviewed the occurrence data in the Consortium of California Herbaria and detected 2 new occurrences that were not in the CNDDB. Both of these are historic records from 1905 and 1949. Of the total seven occurrences in California (CNDDB plus new additional occurrences), one occurs in a BLM Desert Wildlife Management Area. A total of three records are historical records and none of these occurrences have documented threats. This species was not observed during spring 2009 or 2010 botanical surveys performed for the PSPP. This species was not observed during March 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline route.

Palmer's Jackass Clover

Palmer's jackass clover is a new addition since 2010 to the CNPS inventory and is a RPR 2B.2 (CDFW 2013X).It is a perennial herb that occupies sandy washes, and Sonoran desert scrub habitat from sea level to 650 feet. There are no CNDDB records for this species (CNDDB 2010). Staff reviewed the occurrence data in the Consortium of California Herbaria and detected seven occurrences that were not in the CNDDB. Four of these are historical records from between 1937 and 1952; however, two more recent occurrences were found in the Chocolate-Chuckwalla Mountains region, one southeast of Palen Dry Lake and one near the Palen Sand Dunes. No information on land ownership or documents of threats is available from the Consortium of California Herbaria. This species was not observed during spring 2009 or 2010 botanical surveys performed for the PSPP. This species was not observed during March 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline route

Jackass Clover

This is a RPR 2B.2 species and considered rare, threatened, or endangered in California, but more common elsewhere, fairly endangered in California. Jackass-clover inhabits desert dunes Mojavean desert scrub, playas, or Sonoran desert scrub. This species is commonly associated with sandy washes, roadsides, or alkaline flats, of elevations from 425 to 2,630 feet.

For the PSPP, staff reviewed the occurrence data in the Consortium of California Herbaria and detected 2 new occurrences that were not in the CNDDB. One of these occurrences is a historical record from 1937; however one more recent occurrence was found at the Junction I-5 and Stockdale Highway west of Bakersfield. Of the total 9 occurrences in California (CNDDB plus new additional occurrences), three of these are protected under Park Service ownership. A total of three records are historical records. One of these occurrences has documented threats, including development. Jackass clover was also documented at several locations from the northern to southern end of Palen Lake in dune habitats during a detailed vegetation mapping and classification project conducted by CNPS Vegetation Program for BLM (Evens & Hartman 2007). This species was not observed during spring 2009 or 2010 botanical surveys performed for the PSPP. This species was not observed during March 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline route.

Winged Cryptantha

This RPR 4.3 species is a spring-blooming annual that occurs in Mojavean and Sonoran desert scrub habitats from 300 feet to approximately 5,000 feet above mean sea level. This species blooms from March through April (CNPS 2009). Winged cryptantha is found in Mojavean and Sonoran deserts within California, Arizona, and Nevada. There are 79 records of this species in the Consortium of California Herbaria database from Riverside, Imperial, San Bernardino, and San Diego counties (CCH 2010). This species has low to moderate potential to occur at the project site. There are no CNDDB records for this species for the entire state of California (CNDDB 2010). This species was not observed during spring 2009 or 2010 botanical surveys performed for the PSPP but was observed near the proposed Colorado Substation at the southeastern end of Chuckwalla Valley, south of I-10 (Solar Millennium 2010l). This species was not observed during March 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline route.

Las Animas Colubrina

Las Animas colubrina is a RPR 2B.3 species indicating it is not very threatened in California and more common elsewhere (CNPS 2009). This is a covered species under the NECO Plan. It is an evergreen to semi-evergreen shrub that occurs in Mojavean and Sonoran desert scrub (creosote bush series) and occurs at elevations from approximately 30 to 3,000 feet. It primarily occurs in dry canyons or headwater reaches of desert washes with gravelly, sandy soils. The distribution of this species includes San Diego, Imperial, and Riverside counties; portions of Arizona; Baja California; and Sonora, Mexico. This species has been reported from isolated desert locales in Joshua Tree National Monument, the Eagle Mountains, and Chuckwalla Mountains (Reiser 1994). There are approximately 27 occurrences primarily from the Chocolate Mountains area (BLM CCD 2002). This species typically blooms from April through June.

For the PSPP, staff reviewed the occurrence data in the Consortium of California Herbaria and detected 12 new occurrences that were not in the CNDDB. Of these eight are historical records from between 1930 and 1966; however four of these are more recent occurrences found in the Sonoran (Colorado) Desert, including several occurrences in the mountains and foothills surrounding Chuckwalla Valley (CCH 2010). Of the total 36 records in California (CNDDB plus new additional occurrences), six of these are protected under Park Service, State Park, or BLM DWMA land ownership. A total of 11 records are historical records. None of these occurrences have documented threats. This species was not identified during spring 2009 or 2010 botanical surveys performed for the PSPP; however this plant has been identified in the project region during surveys performed for other solar projects (AECOM 2009d, GSEP 2009a and b). This species was not observed during March 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline route.

Special-status Wildlife Species

Biological Resources Table 4, below, was generated for analysis of the PSPP project, and provides a summary of special-status plants and animals also considered in this assessment. Some of these species were originally considered to have a lower potential for occurrence at the Project site than the species discussed above because the general or micro-habitats known to support them were not found at the site, and/or there are no known occurrences in the Project vicinity.

In consideration of potential effects from the PSEGS project, conclusions regarding the potential for several of the wildlife species to occur at the site have changed, particularly with respect to avifauna. These changes are due to several factors. Each species' habitat needs and behavioral traits were considered and evaluated with respect to the modified project's footprint, profile, and operating characteristics. In several instances, the modified project has introduced a previously unidentified risk to the species which requires further analysis, and for other species such as Swainson's hawk, ongoing surveys have detected additional species at the site or general vicinity. The species list has been updated to indicate that species that have the potential to occur are marked in ~~strikeout~~ in **Table 4**, and are included in **Biological Resources Table 3**.

Bats

The project owner's biologists conducted a habitat suitability survey for bat species and recorded any potential roosting locations or potential sign (guano piles, staining on trees, etc.). To determine how bats may be using the PSPP site and surrounding area the prior project owner's (Solar Millennium) biologist conducted a one-day survey to look for bat sign (i.e., roosting locations, guano piles, staining on trees, etc.) in December 2009. Species specific habitat requirements were considered when conducting bat habitat reconnaissance surveys. In order to assess potential bat use of the PSPP and surrounding area, biologists searched portions of large washes both within, and adjacent to the PSPP within the project buffer. This involved walking slowing up and down some of the main washes searching trees, rock crevices, and other potential locations for bats, bat sign and potential roosting locations. During surveys performed in summer of 2013, freeway underpasses were also searched for bats or bat sign (Palen 2013aaa). As stated in this report, "Three freeway underpasses within one mile of the modified gen-tie were inspected for bats, accumulations of insect carcasses, and bat guano (Figure 3); the underpasses in the vicinity of the gas line had been previously surveyed for PSPP (AECOM 2010c) and were not resurveyed. Only two of the three underpasses had marginal habitat, where washes had been directed under the freeway. However, the slick concrete walls and pillars provided only marginal to negligible roosting opportunities. The third underpass was a completely boxed-in cement culvert. Not surprisingly, no bat sign was seen in any of these underpasses. A fourth underpass, approximately 0.7 miles west of the modified gen-tie was not surveyed."

Desert dry wash (microphyll) woodland areas have been documented as important habitat to several bat species (Brown 2010). Primary suitable roosting habitat for bats within the proposed project site and larger project area includes washes with large trees within the southern portions of the project site in the central wash, and around the transmission line (that connects the Facility Footprint to the substation south of I-10) and substation, and within tall palms located in the adjacent agricultural areas. Large washes with riparian vegetation meander through the southern portion of the buffer around the transmission line and substation south of I-10. Some large trees are located within the southern portion of the central wash in the project site. Large trees with exfoliating bark, tree cavities, rock crevices, bridges, and other locations may provide suitable roosting habitat for a variety of bat species within the project site and buffer area. Any large trees with cavities or rock crevices with potential for bats were observed for any potential bat sign. Staff's Data Requests #45 and #46 requested the project owner install at least three acoustic bat sensing devices on the project site from May 1, 2013, through October 1, 2013 (CEC 2013i). Staff has yet to receive this information; however, it will be incorporated into the BBCS. The project owner has supplied a bat habitat assessment performed over four days in May, 2013 (Palen 2013hh), and using this methodology, detected three species of bats on the project site: pallid bat, canyon bat, and Mexican freetail bat. The report further states that while not detected, the California leaf-nosed bat, Townsend's big-eared bat, hoary bat, Western yellow bat, Western mastiff bat, and Pocketed free-tailed bat may also occur onsite.

California leaf-nosed bat

This bat may occur in the general vicinity of the project site, and there is a potential for this species to forage within the modified project site. Desert dry wash woodland vegetation attracts foraging bats due to increased insect concentration. This is especially true for California leaf-nosed bats that feed on large arthropods which they glean off of foliage. This bat feeds off a variety of insects, such as moths, butterflies, dragonflies, and beetles (Adams, 2003). This species roosts in caves, mines, abandoned buildings, etc. (Brown 2005, Piaggio 2005). Roosts for California leaf-nosed bats have been identified in existing mines in the Eagle and Coxcomb Mountains. During the warmer months, California leaf-nosed bats night roost in ironwood trees between foraging bouts. This species has not been detected onsite.

Pallid bat

The closest known historical location of pallid and western mastiff bats based on the CNDDB search is approximately 4.3 miles southwest of the project site near Corn Springs. Only the pallid bat was identified by the project owner's biologists as potentially roosting within the project site and buffer. The pallid bat may roost in rocky outcrops, cliffs, mines, caves, trees, exfoliating bark, tree cavities, bridges, and man-made structures (Rambaldini 2005). The pallid bat is historically known to occur in the Chuckwalla Mountains, as reported in a Biological Resources Technical Report (AECOM 2009a). Roosts for pallid bats have been identified in existing mines in the Eagle and Coxcomb Mountains. This bat feeds by gleaning insects and even scorpions off the ground, or off of vegetation, and is known for "walking" on the ground using both legs and wing bones. Pallid bats may migrate into or out of the site during various times of the year, although they generally do not migrate long distances between summer and winter sites (Rambaldini 2005). This species has been detected onsite during habitat assessments (Palen 2013hh).

Western mastiff bat

The western mastiff bat lacks suitable roosting habitat (large rock formations with cliffs and exfoliating rock) within the project and buffer, but may occur in the general vicinity and there is a potential for this species to forage within the modified project site and buffer (Siders 2005). The western mastiff bat is historically known to occur in the Chuckwalla Mountains Biological Resources Technical Report (AECOM 2009a). It is also known from CNDDB records near Corn Springs. These bats feed primarily by echolocation, and their diet consists primarily of moths (Lepidoptera), but also includes crickets and katydids. Unlike most North American bats, they do not undergo either migration or prolonged hibernation, but are periodically active all winter. This species has not been detected onsite.

Cave myotis

The cave myotis has a limited potential to roost within the project area due to the presence of two bridges along Corn Springs Road. The cave myotis is known to occasionally roost in crevices in bridges (Peckham 2005). These species were not detected during the CNDDB search of the project area, but are known from locations in similar habitat around Blythe, California. Therefore this bat species has the potential to forage within the project area. This species will roost in caves, mines, or buildings. Foraging is accomplished by echolocation; small moths make up the largest portion of the diet although small beetles, weevils, and antlions are also eaten. Colonies hibernate from mid October until April.

During surveys performed in 2009, a bat was detected roosting between large wood structural components underneath a bridge on Corn Springs Road, near the substation south of I-10, but identification was not possible. Based on features observed, the individual was likely a Myotis species. Since the individual could not be identified to species, it was not possible to confirm if it was a species of special concern.

Western yellow bat

This species - relative to most of our locally occurring bats - is still poorly understood and its occurrence and ecology only recently described. The species was discovered in southern California in 1945 (Pierson and Rainey, 1998) and its continuing expansion is typically linked to the distribution of exotic palms (Williams, O’Farrell, and Riddle, 2006). However, the distribution of the species may also be associated with that of yucca plants (Higginbotham, Dixon, and Ammerman, 2000). The first known occurrence of the western yellow bat in the United States was from Palm Springs, California, in November 1945 (Constantine 1946). They were not found again in the U.S. until 1960 when two yellow bats were found roosting in dead palm fronds while trees were being trimmed at the University of Arizona in Tucson (Cockrum 1961). Locally, the species is known from the Palm Springs area as well as the Lower Colorado River including the vicinity of Blythe.

There are oases in the Desert Center area near Lake Tamarisk that have the potential to support western yellow bat. These may or may not be sufficiently close to support use of the project area by this species. Approximately 850 acres of agricultural development (jojoba and palm farms) occur immediately adjacent to the project. Associated with these farms are two private pools, approximately 2 acres or less in size. The relatively short plantation palms are not expected to support use by this species; however larger palms may provide habitat and the area could support foraging by the species if the trees support appropriate insect fauna. Irrigation at the plantation is expected to provide an important water source to many species and may attract and support a host of insects. Foraging is typically associated with water features and may occur across a variety of habitat, from desert scrub to riparian areas. Foraging has been observed over swimming pools, lawns, and orchards. It is unknown if some individuals or populations migrate and it is likely this species does not hibernate. This species has not been detected onsite.

Desert Tortoise

The desert tortoise was state-listed in California as threatened on August 3, 1989. The Mojave population was federally listed as threatened on April 2 1990. Critical habitat for this species was designated on February 8, 1994. The desert tortoise is a large slow growing herbivorous reptile that is well adapted to a variable and often harsh desert environment (USFWS 2011b). In the United States the desert tortoise's range includes portions of the Mojave and Sonoran desert regions of southern California, southern Nevada, southwestern Utah, and western Arizona. In Mexico, the species is found throughout most of Sonora and into portions of Sinaloa. Based on genetic differences there are two recognized populations of desert tortoise in the United States; these are the Mojave and Sonoran populations (USFWS 2011b). Recently, genetic data suggest these groups are unique species. Although the species often look similar, the differentiation between the Mojave and Sonoran assemblages of the desert tortoise are supported via multiple forms of evidence, including morphology, ecology, and genetics (Weinstein and Berry 1987; Lamb et al. 1989; Lamb and Lydehard 1994; Berry et al. 2002; Van Devender 2002a; 2002b; Murphy et al. 2007). The Mojave population includes those animals living north and west of the Colorado River in the Mojave Desert of California, Nevada, Arizona, southwestern Utah, and in the Colorado Desert in California (a division of the Sonoran Desert). Desert tortoises are adapted to living in a highly variable and often harsh desert environment. They spend much of their lives in burrows, even during their seasons of activity, which generally coincides with the greatest annual forage availability. In late winter or early spring, they emerge from over-wintering burrows and typically remain active through fall. Activity does decrease in summer, but tortoises often emerge after summer rain storms to drink (Henen et al. 1998). Desert tortoises in the project region are active during the late summer months often in response to seasonal rainfall. Because up to 30 percent of the annual precipitation falls in response to summer monsoons; the region supports two distinct annual floras on which tortoises can feed (USFWS 2011a).

During activity periods, desert tortoises eat a wide variety of herbaceous vegetation, particularly grasses and the flowers of annual plants (Berry 1974; Luckenbach 1982; Esque 1994). During periods of inactivity, they reduce their metabolism and water loss and consume very little food. Adult desert tortoises lose water at such a slow rate that they can survive for more than a year without access to free water of any kind and can apparently tolerate large imbalances in their water and energy budgets (Nagy and Medica 1986; Peterson 1996a, b; Henen et al. 1998).

The size of desert tortoise home ranges varies with respect to location and year (Berry 1986a) and also serves as an indicator of resource availability and opportunity for reproduction and social interactions (O'Connor *et al.* 1994). Females have long-term home ranges that may be as little or less than half that of the average male, which can range to up to 200 acres (Burge 1977; Berry 1986a; Duda *et al*. 1999; Harless *et al*. 2009). Core areas used within larger home ranges of desert tortoise depend on the number of burrows used within those areas (Harless *et al*. 2009). Thus, an individual home range is best viewed as a network of burrows, connected by somewhat linear corridors, which the desert tortoise visits serially through the year (O'Connor et al 1994). Over its lifetime, each desert tortoise may use more than 1.5 square miles of habitat and may make periodic forays of more than 7 miles at a time (Berry 1986a).

Tortoises are long-lived and grow slowly, requiring 13 to 20 years to reach sexual maturity, and have low reproductive rates during a long period of reproductive potential (Turner et al. 1984a; Bury 1987; Germano 1994). Mating occurs both during spring and fall (Black 1976; Rostal *et al.* 1994), and the number of eggs as well as the number of clutches (set of eggs laid at a single time) that a female desert tortoise can produce in a season is dependent on a variety of factors including environment, habitat, availability of forage and drinking water, and physiological condition (Turner et al. 1986, 1987; Henen 1997; McLuckie and Fridell 2002). Egg-laying occurs primarily from April to July (Rostal et al. 1994; USFWS 1994a); the female typically lays 2-14 eggs (average 5-6) eggs in an earthen chamber excavated near the mouth of a burrow or under a bush (Woodbury and Hardy 1948; USFWS 1994a). The eggs typically hatch 90 to 120 days later, between August and October. The success rate of clutches has proven difficult to measure, but predation, while highly variable (Bjurlin and Bissonette 2004), appears to play an important role in clutch failure (Germano 1994).

The majority of threats to the desert tortoise and its habitat are associated with human land uses. Many of the threats identified in the 1994 and 2011 Recovery Plans, which formed the basis for listing the species as threatened, continue to affect the tortoise today (USFWS 2011b). Some of the threats identified at the time of listing include urbanization, upper respiratory tract disease and possibly other diseases, predation by common ravens and domestic and feral dogs, unauthorized off-road vehicle activity, authorized vehicular activity, illegal collecting, mortality on paved roads, vandalism, drought, livestock grazing, feral burros, non-native plants, changes to natural fire regimes, and environmental contaminants (USFWS 1994a).

Even though a wide range of threats are known to affect desert tortoises and their habitat, very little is known about their demographic impacts on tortoise populations or the relative contributions each threat makes to tortoise mortality (Boarman 2002a). Extensive research shows that all of these threats can directly kill or indirectly affect tortoises; research has also clarified many mechanisms by which these threats act on individuals. While current research results can lead to predictions about how local tortoise abundance should be affected by the presence of threats, quantitative estimates of the magnitude of these threats, or of their relative importance, have not yet been developed. Thus, the Draft Revised Recovery Plan focuses on expanding the knowledge of individual threats and places emphasis on understanding their multiple and combined effects on tortoise populations (USFWS 2008a).

The original *Desert Tortoise (Mojave Population) Recovery Plan* identified six recovery units (Upper Virgin River, Northeastern Mojave, Eastern Mojave, Eastern Colorado, Northern Colorado, and Western Mojave) and recommended the establishment of 14 Desert Wildlife Management Areas (DWMAs) throughout the recovery units (USFWS 1994a). Since 1994, greater insight into patterns of both ecological and genetic variation within the Mojave desert tortoise population has been gained. Based on this information the USFWS 2011 *Desert Tortoise (Mojave Population) Recovery Plan* identifies revised recovery unit boundaries and identified five recovery units for the Mojave population of desert tortoise. These include the Upper Virgin River; Northeastern Mojave; Eastern Mojave; Western Mojave; and Colorado Desert. Although the Recovery Unit designation does not provide special legal protection, the USFWS defines recovery units as special units that are geographically identifiable and are essential to the recovery of the entire listed population; that is recovery units are individually necessary to conserve the genetic, behavioral, morphological, and ecological diversity necessary for long-term sustainability of the entire listed population (USFWS 2011a).

The PSEGS project is located in the Colorado Desert Recovery Unit. This recovery unit combines the 1994 Eastern Colorado and Northern Colorado recovery units, as well as a portion of the Eastern Mojave Recovery Unit in Piute and Fenner valleys (USFWS, 2012). Desert tortoise in this recovery unit are found primarily in “well-developed washes, desert pavements, piedmonts, and rocky slopes characterized by relatively species-rich succulent scrub, creosote bush scrub, and blue palo verde-ironwood-smoke tree communities” (USFWS 1994a). Habitat within this recovery unit has been described as being in excellent condition despite declines in tortoise densities over the past several decades; disturbance was estimated at less than 1.3 percent throughout the recovery unit (USFWS 2005). The highest desert tortoise densities within this recovery unit occur in Chemehuevi and Ward valleys (approximately 60 miles north of the project); on the Chuckwalla Bench within the Chuckwalla DWMA and associated Critical Habitat Unit (CHU); and in Joshua Tree National Park (approximately 40 miles northwest of the project). Desert tortoise densities at the Chuckwalla Bench in 1992 were estimated between 22 and 49 adults per square kilometer (approximately 57–127 adults per square mile) but have shown declining trends (Berry 1997; Tracey et al. 2004).

Density estimates from range-wide sampling over the past decade have resulted in general estimates of desert tortoise density for the entire Eastern Colorado Recovery Unit of approximately 5.9 animals per square kilometer, with estimates of 3.7 per square kilometer on BLM-managed lands (USFWS 2010c). Generally the data suggest the species may still be in decline across most of its range.

Protocol-level surveys of the project site and linear facilities for the PSPP project were conducted between March 17 and May 22, 2009 (study area except substation) and October 24 to 25, 2009 (substation site and buffer). Post certification clearance surveys were conducted on portions of the site in 2010. Survey results conducted in 2009 detected 17 burrows (Class 3–5), 15 tortoise pallets (Class 4 or 5), and 19 tortoise shell remains (Class 5) in the project area (AECOM 2010a). Pallets are shallow excavations or non-covered depressions used by desert tortoise. Surveys conducted in 2010 identified seven tortoises (adult and juvenile) in the project area including four along the generation tie line and three tortoises south of I-10, the latter being outside of the Project Disturbance Area and buffer area. Only one tortoise was detected in the Project Disturbance Area along the gen-tie line for the PSPP project (Solar Millennium 2010k, Table 1 and Figure 1). Living desert tortoises were not detected on the proposed solar field. Refer to **Biological Resources Figure 7**.

To address changes to the project footprint (e.g., the linear facilities) for the PSEGS project protocol surveys for desert tortoise were conducted from 7 to 30 April 2013. Desert tortoises were not detected during these surveys (Palen 2013m). Two desert tortoise burrows showing sign of recent occupation were detected on the generation tie-in south of I-10 and a possible burrow was noted in a survey buffer north of the freeway (Palen 2013m Table 3, Figure 1). Surveys for desert tortoise were not conducted in the Project Disturbance Area (i.e., the solar field) for the PSEGS project in 2013.

Desert tortoises were not detected on the PSPP project site although this species is known to occur in the project region. Desert tortoise sign is present on the project site and along portions of the modified linear facilities. Additional observations of desert tortoise from project buffers are included in the Revised Desert Tortoise Technical Report (Galati & Blek 2010b, Revised Desert Tortoise Technical Report). In addition, for the PSPP project resource agency staff located a possible desert tortoise burrow near the bridge associated with the large wash that flows into the center of the Project Disturbance Area (LaPre, pers. comm.). Based on surveys of the project site and available data for the region the site is expected to support a relatively low number of desert tortoise.

To support the preparation of the Biological Opinion (BO) for the approved PSPP project, the USFWS developed assumptions in an effort to estimate the number of desert tortoises that may occur in the Project Disturbance Area. The estimates of desert tortoise density predicted by the USFWS was based on desert tortoises found in the buffer transects of the generation tie-in (Palen 2013m). Using this information the FWS concluded that two subadult or adult tortoises occupy the project (USFWS 2011b). Regional population estimates were used to further extrapolate the number of animals that may occur and using this data the USFWS concluded that approximately 2-12 adult tortoises may occupy the site. This data was used to estimate the number of juvenile tortoises and eggs that may occur on the project site. Because desert tortoises were not detected in 2013; surveys conducted by the project owner of the modified linear facilities do not provide any information that would alter this analysis.

Habitat in the Project Disturbance Area north of I-10 (including the Chuckwalla CHU) supports lower quality desert tortoise habitat and the only moderate quality habitat within the Project Disturbance Area occurs south of I-10 (Galati & Blek 2010b, Revised Desert Tortoise Technical Report, Solar Millennium 2010m, Table 5). Staff agrees with the project owners assessment that higher value habitat is found south of I-10 corresponding with higher elevation alluvial fan plant communities, less historic disturbance, and connectivity to lands supporting desert tortoise. However, staff has concluded that, aside from developed areas and sand dunes, the entire Project Disturbance Area contains suitable habitat for this species.

Critical Habitat

The PSEGS project area overlaps with a portion of the Chuckwalla Desert Tortoise Critical Habitat Unit (Chuckwalla CHU).

Mojave Fringe-toed Lizard

The Mojave fringe-toed lizard is endemic to southern California and a small area of western Arizona, where it is restricted to aeolian sand habitats in the deserts of Los Angeles, Riverside, and San Bernardino counties in California and La Paz County in Arizona (Hollingsworth and Beaman 1999; Stebbins 1985). Nearly all records for this species are associated with present-day and historical drainages and associated sand dune complexes of the Mojave and Amargosa rivers (Norris, 1958).

The distribution of Mojave fringe-toed lizards is naturally fragmented because of its obligate habitat specificity to loose sand, a patchy habitat type (Murphy et al. 2007). Many local populations of this species are quite small, with small patches of sand supporting small populations of lizards. This fragmented pattern of distribution leaves the species vulnerable to local extirpations from additional habitat disturbance and fragmentation (Murphy et al. 2007). The loose, wind-blown sand habitat, upon which the species is dependent, is a fragile ecosystem requiring protection against both direct and indirect disturbances (Weaver, 1981; Barrows, 1996). Environmental changes that stabilize sand, affect sand sources, or block sand movement corridors will also affect this species (Turner et al. 1984; Jennings and Hayes 1994). Additional threats to this species include habitat loss or damage from urban development, OHV use, and agriculture. Aside from the direct loss of land, development can also increase predators, such as the common raven, to occupied habitat.

Murphy et al. (2006) identified two maternal lineages of this species; the northern lineage is associated with the Amargosa River drainage system, and the southern with the Mojave River drainage system, Bristol Trough, Clark’s Pass (including Palen Lake and Pinto Wash), and the Colorado River sand transport systems.

The Mojave fringe-toed lizard is found in arid, sandy, sparsely vegetated habitats and is associated with creosote scrub throughout much of its range (Norris 1958; Jennings and Hayes 1994). This species is totally restricted to habitats of fine, loose, aeolian sand, typically with sand grain size no coarser than 0.375 mm in diameter (Turner et al. 1984; Jennings and Hayes 1994; Stebbins 1944). It burrows in the sand for both cover from predators and protection from undesirable temperatures (Stebbins 1944), though it will also seek shelter in rodent burrows. They are primarily insectivorous, but also eat plant food including leaves, seeds, and buds (Stebbins 1944).

Mojave fringe-toed lizards normally hibernate from November to February, emerging from hibernation sites from March to April. The breeding season is April to July, and adult Mojave fringe-toed lizards reach sexual maturity two summers after hatching. Females deposit 2-5 eggs in sandy hills or hummocks May through July (Mayhew 1964, Jennings and Hayes 1994). From April to May, while temperatures are relatively cool, this species is active during mid-day; from May to September, they are active in mornings and late afternoon, but seek cover during the hottest parts of the day. Common predators of the Mojave fringe-toed lizard include burrowing owls, leopard lizards, badgers, loggerhead shrikes, roadrunners, various snakes, and coyotes (Jennings and Hayes 1994).

Nearly half of the Project Disturbance Area for the PSPP (1,503 for Reconfigured Alternative 2 and 1,542 acres for Reconfigured Alternative 3) contained suitable Mojave fringe-toed lizard habitat, including in stabilized and partially stabilized sand dunes, some wash habitat, and other areas within Sonoran creosote scrub bush habitat with appropriate soils (Solar Millennium 2009a-AFC Volume II, Appendix F). For the PSEGS, 1,480 acres of the Project Disturbance Area contains suitable Mojave fringe-toed lizard habitat as defined above. Numerous Mojave fringe-toed lizards were found in the northeastern half of the study area during Spring 2009 and 2010 surveys, including 105 within the PSPP Reconfigured Alternative 2 Project Disturbance Area and 91 within the PSPP Reconfigured Alternative 3 Project Disturbance Area (Solar Millennium 2009a-AFC Volume II, Appendix F; Figure 11). An additional 62 Mojave fringe-toed lizards were observed within the buffer area based on preliminary spring 2010 survey results (Solar Millennium 2010k, Table 3). Refer to **Biological Resources Figure 5a and 5b**. A total of 95 Mojave fringe-toed lizard observations from 2009 and 2010 surveys occur within the PSEGS Project Disturbance Area. This species or its sign was not reported to be observed during spring 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline route.

Couch's Spadefoot Toad

This species lives in a variety of plant communities, including desert dry wash woodland, creosote bush scrub, and alkali sink scrub. They require habitat with substrate capable of sustaining temporary pools for breeding, and loose enough to permit burial in subterranean burrows (Jennings and Hayes 1994, BLM CDD 2002). Breeding habitat includes temporary impoundments at the base of dunes as well as road or railroad embankments, temporary pools in washes or channels, pools that form at the downstream end of culverts, and playas (Morey 2005; Morey, pers. comm.; Mayhew 1965). Natural scour sites in washes with breeding toads (included in Dimmitt 1977) had washed down to a hardpan, which enabled ponding (Dimmitt, pers. comm.). The majority of known Couch's spadefoot toad breeding ponds are artificial, though this may be because of the difficulty of locating natural ponds within the limited amount of time ponds may retain water. Couch's spadefoot toads consume termites, beetles, ants, grasshoppers, solpugids, scorpions, and centipedes.

This species is dormant from 8–10 months of the year, emerging from burrows at the onset of warm summer rains. Emergence appears to be triggered by the low frequency sound caused by falling rain, low-frequency sound created by off-highway vehicles, and construction vehicles (Dimmitt, pers. comm.). These sounds may trigger emergence, and result in emergence in poor environmental conditions (Jennings and Hayes 1994).

At the time the PSPP was permitted, the closest known record for this species was a very old record: an individual in a breeding pond in a borrow pit near the east end of Chuckwalla Road, south of I-10 (about 15 miles east of the project site) (Dimmitt 1977). Based on these and other records the project site was considered west of the range for this species (NECO, Jennings and Hayes (1994)), although other information indicated the Palen Mountains and surrounding bajadas could support marginal populations (Dimmitt 1977). Couch's spadefoot toads require substrate capable of sustaining ponding for at least nine days (Morey 2005). Staff reviewed aerials of the project area and were unable to identify any areas of obvious ponding, and determined that there was limited potential for breeding habitat at the project site. Because there was uncertainty regarding adult dispersal (Dimmitt, pers. comm.) and existence of offsite breeding ponds (such as the Palen Lake area) within adult dispersal distance, staff ultimately concluded that spadefoot toads could occur on the PSEGS site.

In August 2012 several spadefoot toads were found on the Genesis Solar Energy Project site, following a storm event. The toads were located both in and adjacent an engineered concrete lined drainage channel with standing water, and captured and released offsite at the Ford Dry Lake. In addition, in May of 2012, a desiccated specimen was found adjacent an access road at the Genesis project site (AECOM 2012). This toad was found on bare ground with evidence of recent ponding, located in a low area between creosote shrubs. The Genesis Solar Energy Project is located approximately 10 miles east of the proposed project site, just north of the I-10. In 2013, the project owner surveyed low areas of potential ponding and washes, and did not find any ponded areas (Palen 2013zz).

Western Burrowing Owl

The western burrowing owl inhabits arid lands throughout much of the western United States and southern interior of western Canada (Haug et al. 1993) and is typically a year-round resident in much of California (Gervais et al. 2008).

Burrowing owls are unique among the North American owls in that they nest and roost in abandoned burrows, especially those created by California ground squirrels, kit fox, desert tortoise, and other wildlife. Burrowing owls have a strong affinity for previously occupied nesting and wintering habitats. They often return to burrows used in previous years, especially if they were successful at reproducing there in previous years (Gervais et al. 2008). The southern California breeding season (defined as from pair bonding to fledging) generally occurs from February to August with peak breeding activity from April through July (Haug et al. 1993).

Burrowing owls are rare in the undisturbed desert areas of the eastern and southeastern portion of California (Small 1994). By the 1940s', burrowing owls had become scarce in many portions of the desert southwest as a result of shooting and elimination of ground squirrel burrows (Grinnell and Miller 1944). Limited data suggest that they are decreasing in some areas, but may be stable or increasing in others (Klute et al. 2003). Surveys in California in 1986-91 found population decreases of 23-52 percent in the number of breeding groups and 12-27 percent in the number of breeding pairs of owls (DeSante et al. 1997). In addition, in a 2003 report by the U.S. Fish and Wildlife Service, breeding burrowing owls were thought to be largely extirpated during the last 10-15 years from multiple areas in California, including Napa, Marin, San Francisco, Santa Cruz, and Ventura counties, coastal San Luis Obispo county and the Coachella Valley (http://burrowingowlconservation.org/PR12-09-2010.html).

In the Colorado Desert, western burrowing owls generally occur at low densities in scattered populations, but they can be found in much higher densities near agricultural lands where rodent and insect prey tend to be more abundant, including along the lower Colorado River (Gervais et al. 2008). Western burrowing owls tend to be opportunistic feeders. Large arthropods, mainly beetles and grasshoppers, comprise a large portion of their diet. Small mammals, especially mice and voles (*Microtus, Peromyscus,* and *Mus* spp.), are also important food items for this species. Other prey animals include reptiles and amphibians, young cottontail rabbits, bats, and birds, such as sparrows and horned larks. Consumption of insects increases during the breeding season (Haug et al. 1993).

Threats to burrowing owls include habitat modification and destruction of ground squirrel burrows. Other threats include pesticide accumulation, burrow destruction from farming practices and canal and road maintenance, roadside shooting, and direct mortality from squirrel poisons (BLM CDD 2002; Gervais et al. 2008).

Phase I through III protocol-level surveys for portions of the Project Disturbance Area (except the substation) were conducted in spring and summer 2009 for the approved PSPP project. A habitat assessment was completed for this site in fall 2009. Part of the northern end of the Project Disturbance Area is densely covered in Sahara mustard; other than this area, the entire Project Disturbance Area is suitable western burrowing owl habitat. Two pairs with juveniles and four active burrows with sign were identified during 2009 protocol surveys (Solar Millennium 2009b, Appendix F, Attachment J). Survey results from 2010 indicate that a total of four burrowing owls with active burrows have been observed within the Project Disturbance Area, to date (Solar Millennium 2010m, Table 6). Refer to **Biological Resources Figure 8**. During golden eagle surveys in the winter of 2013, approximately ten observations of burrowing owl were recorded (Palen 2013m). Burrowing owls were observed 18 times during avian point count surveys conducted between April 8 and May 5, 2013 (Palen 2013ii). Fifteen of these observations were of birds in or immediately adjacent to the agricultural lands that border the site, where a nesting burrow was documented (ibid). The other three observations were scattered across the site (*ibid*.). Based on the type of surveys conducted it is not possible to fully establish the exact number of birds that may be using the site or their breeding status. Some of the observations are likely multiple recordation of the same bird. While the nesting status of these birds was not documented it suggests that the site is used by burrowing owls and breeding birds may be present. It is also possible that some of the birds may be migrants. Phase III surveys conducted in 2013 detected one burrowing owl on the transmission line alignment north of the Red Bluff substation and one burrowing owl north of I-10 on the natural gas pipeline right of way. These birds were observed in buffer areas and active burrows were not detected.

Golden Eagle

Golden eagles are typically year-round residents throughout most of their western United States range. They breed from late January through August with peak activity March through July (Kochert et al. 2002). Migratory patterns are usually fairly local in California where adults are relatively sedentary, but dispersing juveniles sometimes migrate south in the fall. This species is generally considered to be more common in southern California than in the northern part of the state (USFWS 2008).

Habitat for this species typically includes rolling foothills, mountain areas, and deserts. Golden eagles need open terrain for hunting and prefer grasslands, deserts, savanna, and early successional stages of forest and shrub habitats. Golden eagles primarily prey on lagomorphs and rodents but will also take other mammals, birds, reptiles, and some carrion (Kochert et al. 2002). This species prefers to nest in rugged, open habitats with canyons and escarpments, with overhanging ledges and cliffs and large trees used as cover.

The status of golden eagle populations in the United States is not well known, although there are indications that populations may be in decline (USFWS 2009b, Kochert et al. 2002). Accidental death from collision with man-made structures, electrocution, gunshot, and poisoning are the leading causes of mortality for this species, and loss and degradation of habitat from agriculture, development, and wildfire continues to put pressure on golden eagle populations (Kochert et al. 2002; USFWS 2009b).

In spring 2010, golden eagle helicopter surveys were conducted to cover the area within a 10-mile radius from the PPSP boundaries as well as three other proposed solar projects (Solar Millennium 2010u, TTEC 2010a). The surveys covered eleven mountain ranges between and around Blythe and Desert Center (TTEC 2010a) and were conducted following the USFWS's February 2010 Interim Golden Eagle Inventory and Monitoring Protocols (Pagel et al. 2010). The surveys found two active golden eagle nests within one territory, approximately 7 miles southwest of the PSEGS project site in the Chuckwalla Mountains. Additionally, three inactive nests were located approximately six miles southwest of the site in the Chuckwalla Mountains; two of these nests were associated with the territory discussed above, the other is likely associated with a territory located further south of the PSEGS project site (Solar Millennium 2010u).

Surveys for golden eagle were also conducted for the Desert Harvest Solar Project, located roughly ten miles to the west of the PSEGS project. These surveys detected eight golden eagle nests, all located on power poles (Aspen 2012). Most of the nests were located south of the I-10 freeway. Additional survey efforts are ongoing for the PSEGS project. From January to February 2013, fresh carcasses and camera stations were placed on the site and within a ten mile buffer area surrounding the project site. A single subadult eagle made repeat visits to a bait station located northeast of the project site, in the Palen Mountains. Additionally, the project owner conducted ground and helicopter surveys for golden eagle in April, 2013 (Palen 2013x). Helicopter surveys for nests were performed within a 10-mile radius of the project, along the Palen Mountains and the Chuckwalla Mountains: the Coxcomb Mountains were surveyed from the ground. Known locations of nests were surveyed, and three potential nests of golden eagles were noted in the Chuckwalla Mountains. Further helicopter studies are scheduled to occur in early August, 2013 (TN 200106) and staff will incorporate that information into the Bird and Bat Conservation Strategy, along with the below information, as it is generated. No eagles were observed during spring 2013 avian surveys (Palen 2013x). Staff's Data Request 3 (#42) provided the project owner further guidance in collecting data on eagle populations in the area, and requested information pertaining to territory and home range size, migration, movements of "floaters," or juvenile unpaired eagles lacking established territories, and meta-population dynamics of the species (CEC 2013i).

Loggerhead Shrike

Loggerhead shrikes are uncommon residents throughout most of the southern portion of their range, including southern California. In southern California they are generally much more common in interior desert regions than along the coast (Humple 2008). Loggerhead shrikes initiate their breeding season in February and may continue with raising a second brood as late as July; they often re-nest if their first nest fails or to raise a second brood (Yosef 1996).

This species can be found within lowland, open habitat types, including creosote scrub and other desert habitats, sage scrub, non-native grasslands, chaparral, riparian, croplands, and areas characterized by open scattered trees and shrubs. Fences, posts, or other potential perches are typically present. In general, loggerhead shrikes prey upon large insects, small birds, amphibians, reptiles, and small rodents over open ground within areas of short vegetation, usually impaling prey on thorns, wire barbs, or sharp twigs to cache for later feeding (Yosef 1996). Loss of habitat to agriculture, development, and invasive species is a major threat; this species has shown a significant decline in the Sonoran Desert (Humple 2008).

The entire Project Disturbance Area contains suitable habitat for loggerhead shrike. This species, including an adult with fledglings, was observed on the project site during spring 2010 surveys (Solar Millennium 2010k), and also during golden eagle surveys in the winter of 2013 (Palen 2013x and 2013k), and was one of the most-commonly sighted birds during bird use studies in spring 2013 (Palen 2013ii).

Le Conte's Thrasher

In California, Le Conte's thrasher is a resident in the San Joaquin Valley and the Mojave and Colorado deserts. It occurs in desert flats, washes and alluvial fans with sandy and/or alkaline soil and scattered shrubs. It rarely occurs in monotypic creosote scrub habitat, because creosote bush is unable to support a nest, or in massive Sonoran Desert woodlands (Prescott 2005). Preferred nest substrate includes thorny shrubs and small desert trees. Breeding activity occurs from January to early June, with a peak from mid-March to mid-April (BLM CDD 2002). Le Conte's thrashers forage for food by digging and probing in the soil. They eat arthropods, small lizards and snakes, and seeds and fruit; the bulk of their diet consists of beetles, caterpillars, scorpions, and spiders.

This species was observed during project surveys, including avian surveys conducted over a period of four weeks in the spring of 2009, and again in spring 2013 (Palen 2013ii). Because the Sonoran creosote scrub bush in this area is fairly monotypic, suitable habitat for this species in the Project Disturbance Area is confined to of the 148 acres of desert dry wash woodland. The closest CNDDB record for this species is about 3 miles south of the project site (CNDDB 2010).

California horned lark

The California horned lark is found throughout California except the north coast, and is less common in mountainous areas. This species prefers open areas that are barren or with short vegetation including deserts, brushy flats, and agricultural areas. Eggs are laid March to early June, and this species frequently lays a second clutch.

The project site contains suitable habitat for this species, especially in creosote bush scrub. This species was observed frequently in the Project Disturbance Area during surveys conducted for the PSPP project, as well as during golden eagle surveys in the winter of 2013 (Palen 2013k), and spring of 2013 (Palen 2013ii). There are numerous CNDDB (2010) records for this species in western Riverside County.

Prairie Falcon

The prairie falcon inhabits dry environments in the North American west from southern Canada to central Mexico. It is found in open habitat from annual grasslands to alpine meadows at all elevations up to 10,990 feet, but is associated primarily with perennial grasslands, savannahs, rangeland, some agricultural fields, and desert scrub areas. They require cliffs or bluffs for nesting though will sometimes nest in trees, on power line structures, on buildings, or inside caves or stone quarries. Ground squirrels and horned larks are the primary food source, but prairie falcon will also prey on lizards, other small birds, and small rodents.

Prairie falcons were observed several times during project surveys both as flyovers and perched in the Project Disturbance Area. The entire Project Disturbance Area (4,024 acres) contains suitable foraging habitat for this species. The project site does not contain suitable nesting habitat, although adjacent mountains may. There are numerous CNDDB (2010) records in the region for this species, including eight records from Little Maria Mountains to the northeast (1977) and the Chuckwalla Mountains to the southwest (1978). During golden eagle Phase 2 nest surveys performed jointly for neighboring proposed energy projects, a pair of prairie falcons was documented to be nesting on the same cliff on which the golden eagle nest was located in the Palen Mountains (TTEC 2010a). Staff observed this species at the PSEGS project site during site visits performed April 9 and 10, 2013, and the project owner documented the presence of this species during spring 2013 (Palen 2013ii).

Elf owl

The elf owl is listed as endangered under CESA. The project site is near the western margin of its geographic range, though nesting has been documented near Corn Springs (Garret and Dunn 1981). Elf owls are more common and widely distributed outside of California and probably have never been common in California due to limited geographic range and generally marginal habitat. Riparian woodland in the Colorado River Valley, the elf owl's primary habitat in California, has declined and been degraded due to agricultural land use conversion and invasion by tamarisk (Gould 1987). The elf owl is also listed as a Bird of Conservation Concern (BCC) by USFWS. It is migratory, spending winters in Mexico and southward. It arrives in California by March, and its breeding period extends from April to mid-July (Gould 1987).

The elf owl is a secondary cavity nester (it nests in cavities of trees and cacti, generally in disused woodpecker nests). Its nesting habitat is closely correlated with nesting habitat of woodpeckers, including Gila woodpecker (Hardy et al. 1999; Johnsgard 2002). In Arizona, both elf owl and Gila woodpecker are best known for nesting in saguaro cacti. However, both species also nest in numerous trees, particularly riparian woodland trees such as cottonwood and willow. With one exception (below) all elf owl reports in California have been in these riparian trees, generally along the Colorado River. Farther east in their range, both species also nest in mesquite (an upland microphyll species). Gila woodpeckers nest in blue palo verde and elf owls have been documented nesting in blue palo verde near Wiley's Well by Robert McKernan (Director, San Bernardino County Museum; SBCM 2012a). The blue palo verde – ironwood woodland habitat on the site may provide suitable (albeit probably marginal) habitat for nesting elf owls.

Elf owls are primarily active nocturnally. Because of this, diurnal SBC surveys are not sufficient to determine their status on the project site. To address this, the project owner has conducted three rounds of nocturnal, focused Elf Owl call playback surveys in Desert Dry Wash and palm plantation habitats during the months of May and June, 2013, without detecting any Elf Owls (Palen 2013ii). As stated in Spring 2013 Avian Survey Results "The complete methods and results for these surveys will be reported in the Bloom Biological, Inc. (BBI) forthcoming Summer Avian Bird Report (see Section 5.0 "Future Surveys"). Additionally, habitat and nest cavity surveys designed specifically to address the suitability of habitat on site for Elf Owls and Gila Woodpeckers were conducted during early July (see Section 5.0) and will be detailed in BBI's Summer report." Staff will incorporate this information into the project's BBCS plan.

Gila Woodpecker

The Gila woodpecker is listed as endangered under CESA but has no status under the federal ESA. It is identified as a bird species of conservation concern by the USFWS. Its geographic range is generally in southern Arizona and southward into Baja California and western mainland Mexico. It occupies this range year around (i.e., it is not migratory). In California, the Gila woodpecker is known from riparian forests along the Colorado River and from desert wash woodlands in Imperial County. It excavates cavity nests in large riparian trees such as cottonwoods and (in upland habitats) saguaro cacti, and feeds largely on insects, mistletoe berries, and cactus fruits. Its primary habitat is cottonwood-willow riparian woodland, but it also uses thickets of other desert trees (e.g., desert ironwood), as well as upland habitats, especially outside the breeding season. Desert ironwood is generally too dense for nest excavation. Where Gila woodpeckers occur in dry desert wash woodlands, they reportedly excavate cavity nests in large blue palo verde trees rather than ironwood. In suburban habitats, they nest in ornamental trees including athel (*Tamarix aphylla*), eucalyptus, and palms. Availability of suitable nesting trees is apparently a limiting factor in breeding habitat suitability.

The project owner had three experienced biologists search for and record the species and location information for any special status species at all times while on the project site. As stated in the project owner's Spring 2013 Avian Survey Results (Palen 2013ii)," including while walking transects between SBC survey stations and, of course, during periods of surveying at SBC stations. In general, the project site does not possess a large amount of high quality habitat for breeding woodpeckers of any species, as evidenced by the low number of woodpeckers detected during Spring surveys. No other woodpecker species was observed, and no active or inactive woodpecker cavities were discovered on site during the course of Spring surveys, although no systematic searches for such cavities were conducted during this period." The report further states that "habitat and nest cavity surveys designed specifically to address the suitability of habitat on site for Elf Owls and Gila Woodpeckers were conducted during early July (see Section 5.0) and will be detailed in BBI's Summer report." Staff will incorporate this information into the project's BBCS plan.

American Badger

American badgers were once fairly widespread throughout open grassland habitats of California. Badgers are an uncommon permanent resident with a wide distribution across California, except from the North Coast area. American badger is a resident species and is most abundant in the drier open stages of most shrub, forest, and herbaceous habitats with friable soils. Badgers are generally associated with treeless regions, prairies, parklands, and cold desert areas (Zeiner et al. 1990). Badgers inhabit burrows and often predate and forage on other small mammal burrows as evidenced by claw marks along the edges of existing burrows. Most of the CNDDB records from the Palo Verde Valley area of Riverside County are prior to 1960 and the closest is located approximately 12 miles southeast of the project site, northwest of Palo Verde (CNDDB 2010).

American badger sign was found during spring 2009 and spring 2010 field surveys for the PSPP; burrow predation evidence by badgers was found throughout the Project Disturbance Area habitats and study area. Surveyors observed 5 badger dens and over 10 wildlife burrows showing evidence of predation by badgers (Solar Millennium 2009b). During spring 2010 surveys for the PSPP, one American badger den was found in the Project Disturbance Area and two were found in the buffer area (Solar Millennium 2010k, Table 3). In addition, a badger skull was observed within the study area, south of I-10 (Solar Millennium 2009b). The PSEGS project footprint would impact fewer known American badger burrows detected in 2009-2010 however since badgers use multiple burrows within their home range impacts to this species would be similar to the PSPP. This species or its sign was not reported to be observed during spring 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline route. (Palen 2013jj) The entire Project Disturbance Area is considered suitable habitat for badgers.

Desert Kit Fox

Desert kit fox is an uncommon to rare permanent resident of arid regions of the southern portion of California. Kit fox occur in annual grasslands, or grassy open, arid stages of vegetation dominated by scattered herbaceous species. Kit fox occur in association with their prey base which is primarily cottontail rabbits, ground squirrels, kangaroo rats and various species of insects, lizards, or birds (Zeiner et al. 1990). Title 14, California Code of Regulations section 460 stipulates that desert kit fox may not be taken at any time. Protection provided by kit fox dens for use as shelter, escape, cover, and reproduction is vital to the survival of the species. Desert kit fox burrows, complexes and scat were observed throughout the study area within desert wash and upland scrub habitats during spring 2009. Approximately 71 kit fox burrows and burrow complexes were recorded within the study area during 2009 field surveys, most of which occur in the Project Disturbance Area (Solar Millennium 2009a). Kit fox scat was observed within the transmission line disturbance area in fall 2009 and a kit fox burrow was observed in spring 2009 (Solar Millennium 2009b). During spring 2010 field surveys, two kit fox complexes were found in the Project Disturbance Area and four burrow complexes were found in the buffer area (Solar Millennium 2010k). The PSEGS project footprint would impact fewer known desert kit fox burrows detected in 2009-2010 however since kit fox use multiple burrows within their home range impacts to this species would be similar to the PSPP. No kit fox dens were observed during spring 2013 surveys for the PSEGS along the proposed generation tie-line and the natural gasline route however sign (e.g. digs and scat) of this species was reported to be observed during the surveys (Palen 2013jj). The entire Project Disturbance Area is suitable habitat for desert kit fox.

Nelson's Bighorn Sheep

Nelson's bighorn sheep includes bighorns from the Transverse Ranges through most of the desert mountain ranges of California, Nevada, and northern Arizona to Utah. Essential habitat for bighorn sheep includes steep, rocky slopes of desert mountains, termed "escape terrain." Their agility on steep rocky terrain is an adaptation used to escape predators such as coyotes, eagles, and cougars (Wehausen 1992). Surface water is another element of desert bighorn habitat considered essential to population health. Male and female bighorn sheep inhabiting desert ecosystems can survive without consuming surface water (Krausman et al. 1985) and males appear to drink infrequently in many situations; however, there are no known large populations of bighorn sheep in the desert region that lack access to surface water. In the spring, when annual plants are available, bighorn tend to disperse downhill to bajadas and alluvial fans to forage. Desert bighorn have a long lambing season that can begin in December and end in June in the Mojave Desert, and a small percentage of births commonly occur in summer, as well (Wehausen 1992).

Over the past 140 years, bighorn sheep have suffered considerable population declines throughout their range and metapopulations have been fragmented by roads and other barriers with a resulting decline in genetic diversity (Bleich et al. 1996, Epps et al. 2005). Disease, sometimes brought about by contacts with domestic sheep, drought and predation, interacting with other anthropogenic factors may also have contributed to declines in bighorn sheep populations (Wehausen 2005). Loss of surface water sources may also diminish the viability of existing populations (Wehausen 2005).

Two metapopulations of bighorn sheep occur within the NECO planning area, the Southern Mojave and Sonoran. Within these metapopulations, there are smaller, isolated subpopulations of bighorn sheep, known as demes, and there are nine demes occurring in the Sonoran metapopulation (BLM CDD 2002). Bighorn sheep metapopulations have been fragmented by highways, roads, railroads, and aqueducts primarily by the construction of Interstate 10 (I-10) and Interstate 40 which are major barriers to bighorn sheep movements. Transportation corridors of Highways 66, 62, 177, 95, and 78, the AT&SF Railroad (parallel to Old Highway 66) and the Eagle Mountain Railroad (scheduled for reactivation) inhibit bighorn sheep movements between demes. Nevertheless, bighorn sheep are known to cross these and other linear features such as transmission lines and fences.

The PSEGS site is located south of occupied range in Bighorn Sheep Wildlife Habitat Management Areas (WHMAs) in the Palen, Granite, and Coxcomb mountains (BLM CDD 2002). Recent surveys also suggest bighorn sheep may occur in the Little Maria Mountains, farther northeast of the project area (Wehausen 2009). CNDDB records for this species from the project area indicate that bighorn sheep disperse through these mountain ranges typically whenever forage and water conditions permit.

No sign or evidence of Nelson’s bighorn sheep were found during field surveys performed within the study area; however, bighorn sheep have been documented in the Chuckwalla Mountains southwest of the project site and the Palen, Granite, Coxcomb, Eagle mountain ranges among other ranges to the north, west, and east. Six rams were observed in the Coxcomb Mountains during Phase 2 golden eagle surveys performed jointly for various energy projects during 2010 (Tetra Tech 2010a). This species or its sign was not observed during spring 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline route (Palen 2013jj). The project area does not occur in a known movement corridor as identified in the NECO. All vegetation communities within the study area are considered suitable for bighorn sheep.

Burro Deer

Burro deer is a subspecies of mule deer (*Odocoileus hemionus*) found in the Colorado Desert of southern California. This species is found in the Colorado region of the Sonoran Desert near the Colorado River and within desert dry wash woodland communities. Some burro deer are resident along the Colorado River, but a significant portion move into desert areas in response to water and forage. During the hot summers, water is critical, and burro deer concentrate along the Colorado River or the Coachella Canal where water developments have been installed and where microphyll woodland is dense and provides good forage and cover. With late summer thundershowers and cooler temperatures, deer move away from the Colorado River and Coachella Canal and then up the larger washes into mountains or wash complexes in the foothills (BLM CDD 2002).

During spring 2009 and December 2009 field surveys for the PSPP, deer scat and tracks were observed in rocky substrate and deep washes including the western, central, and eastern desert washes that transect the project site. Deer sign was found within the washes and 150-foot-wide box culverts that convey the washes underneath I-10 via (Solar Millennium 2009a, AECOM 2009a). Burro deer use the culvert associated with the western-most project area wash to access a water source at a nearby orchard. Other species sign observed in these washes include coyote, cottontail rabbit (*Sylvilagus audubonii*), bobcat, badger, and kit fox. During spring 2013 field surveys for the PSEGS, deer scat and tracks were observed in arboreal washes east of the modified gen-tie, both adjacent to the I-10 and one set of deer tracks was also observed in the buffer for the natural gas pipeline, south of the I-10 (Palen 2013jj). The entire project site supports suitable habitat for burro deer.

SPECIAL STATUS INSECTS

Desert ecosystems are known to support a broad group of invertebrate life. As in all ecosystems, invertebrates play a crucial role in a number of biological processes. Insects serve as the primary or secondary food source for a variety of bird, reptile, and mammal predators; act as important pollination agents for plant species; they act as efficient components in controlling pest populations; and supporting the naturally occurring maintenance of an area by consuming detritus and contributing to necessary soil nutrients. The project site likely supports a wide variety of common and non-native invertebrates. Some of the orders identified in the project area included Hemiptera (true bugs), Coleoptera (beetles), and Diptera (flies). Various insects were observed on the project site by staff during surveys conducted to verify and document biological resources. A review of the CNDDB by staff resulted in a list of several special status insects known from the area, including the federally endangered Casey's June beetle.

Conservation Challenges California's Action Plan states that within the Mojave Desert Region, 29 invertebrate taxa are included on the CDFW's Special Animals List, including 19 arthropod taxa and 10 mollusk taxa. Of these, 22 are endemic to the Mojave Desert Region, and six other taxa found here are endemic to California but not restricted to this region (CDFG 2007a). Staff believes the adjacent agricultural operation and concomitant water supply likely attracts and supports a variety of insect species. Other species may migrate over the project site and general area at various times of the year, or stopover at the project site and general area during migration. Little data on migration routes is available, and it is unclear which, if any, special status species might be present at or over the project site and general vicinity during migratory movements.

Biological Resources Table 4, below, was generated for analysis of the PSPP project, and provides a summary of special-status plants and animals also considered in this assessment. Some of these species were originally considered to have a lower potential for occurrence at the Project site than the species discussed above because the general or micro-habitats known to support them were not found at the site, and/or there are no known occurrences in the Project vicinity.

In consideration of potential effects from the PSEGS project, conclusions regarding the potential for several of the wildlife species to occur at the site have changed, particularly with respect to avifauna. These changes are due to several factors. Each species' habitat needs and behavioral traits were considered and evaluated with respect to the modified project's footprint, profile, and operating characteristics. In several instances, the modified project has introduced a previously unidentified risk to the species which requires further analysis, and for other species such as Swainson's hawk, ongoing surveys have detected additional species at the site or general vicinity. The species list has been updated to indicate that species that have the potential to occur are marked in ~~strikeout~~ in **Table 4**, and are included in **Biological Resources Table 3**.

Biological Resources Table 4
Special-Status Species with Low to Moderate Potential to Occur at the Project Site

Species	Habitat Requirements and Geographic Range	Potential to Occur or Presence On Site
Plants		
Angel trumpets *Acleisanthes longiflora*	This species occurs in Sonoran desert scrub habitats on carbonate soils from approximately 200 to 300 feet above MSL. There are two records from the Consortium of California Herbaria from the Colorado Desert, Palo Verde area (CCH 2010).	This species has a low potential to occur since the elevation range of the project site is appropriate for this species although the study area does not support carbonate/limestone derived soils in mountainous areas.
Argus blazing star *Mentzelia puberula*	This plant species occurs in desert scrub and desert woodlands with limestone and granitic slopes above 2,000 feet in elevation. Based on 13 Consortium of California Herbaria database records for this species, this species has been collected from Riverside, San Bernardino, and Imperial counties from the Little and Big Maria Mountains in Riverside County.	This species is not expected to occur in the study area due to lack of limestone and granitic slopes which are soil types preferred by this species that are absent from the study area. The project site is located at approximately 130 to 200 feet above MSL which is well below the typical elevation where this species typically occurs.
Arizona spurge *Chamaesyce arizonica*	This species occupies sandy, Sonoran desert scrub habitat areas and has been reported from Imperial, Riverside, and San Diego Counties and portions of Arizona and Baja California (CNPS 2009) from approximately 150 feet to 1,200 feet above MSL. There are seven database records from the Consortium of California Herbaria primarily from San Diego County but also Riverside and Imperial counties often from sandy areas and transition areas between chaparral and desert habitats. The record from Riverside County is near Palm Springs from Andreas Canyon (CCH 2010).	Arizona spurge has a low potential to occur within the study area due to the presence of suitable habitat and appropriate elevation range of the project site.
Bitter hymenoxys *Hymenoxys odorata*	Bitter hymenoxys grows riparian scrub and Sonoran desert scrub habitats from 150 feet to 500 feet above MSL. This plant species blooms from February through November (CNPS 2009). There are five CNDDB records for this species for the entire state of California, two of which occur in Riverside County; the nearest CNDDB occurrence is a historical record approximately 5 miles southeast of the project area from sandy slope, low bottom lands and overflow flats (CNDDB 2010).	This species was not found during spring 2009-2010 or 2013 field surveys. This species has a potential to occur within desert dry wash woodland, unvegetated washes, and Sonoran creosote bush scrub habitats within the project area.

Species	Habitat Requirements and Geographic Range	Potential to Occur or Presence On Site
Bitter snakeweed *Condalia globosa* var. *pubescens*	Also referred to by the common name, spiny abrojo. Bitter snakeweed occurs in Sonoran desert scrub from approximately 400 feet to 3,000 feet above MSL. Bitter snakeweed blooms from March through May (CNPS 2009). Based on 35 records from the Consortium of California Herbaria database, all records are from Imperial County except one from Riverside County, a record from 1,900 feet in elevation from a relatively flat alluvial fan from Chuckwalla Bench (CCH 2010). There are no CNDDB records for this species in California (CNDDB 2010).	This species was not observed during spring 2009-2010 or 2013 field surveys. The project site occurs below the elevation where this species typically occurs.
California ayenia *Ayenia compacta*	This species occurs in Mojavean and Sonoran desert scrub habitats from approximately 500 to 3,300 feet above MSL. This species blooms from March through April. There are 29 records from the Consortium of California Herbaria database from the Anza-Borrego area alone, one from Riverside County from a sandy wash in the Santa Rosa Mountains off Martinez Canyon (CCH 2010). The nearest CNDDB occurrence is a historical record from 1776 approximately 30 miles southwest of the project area in the Chuckwalla Mountains (CNDDB 2010).	This species was not observed during spring 2009-2010 or 2013 field surveys. This species has a potential to occur within Sonoran creosote bush scrub and desert wash habitats within the project area.
California satintail *Imperata brevifolia*	This species occurs in grassy areas found near chaparral, desert scrub, riparian scrubs, coastal scrub, wet springs, meadows, stream sides, and floodplains from sea level to approximately 1,500 feet above MSL. There are 64 records from the Consortium of California Herbaria database from many northern and southern California Counties. Records from Riverside County are from the Palm Springs and San Jacinto Mountains area along irrigation ditches or streams.	California satintail has a low potential to occur within the study area due to the presence of suitable habitat although lack of occurrences from the project area. This species was not observed during spring 2009-2010 or 2013 field surveys.
Chaparral sand verbena *Abronia villosa* var. *aurita*	This species occupies sandy soil areas of chaparral, coastal sage scrub, and sandy desert dune habitats (CNPS 2009) from approximately 240 feet to 4,800 feet above MSL. There are 147 records in the Consortium of California Herbaria database many from Riverside County in the San Jacinto Mountains area.	Chaparral sand verbena has a low potential to occur within the study area due to the presence of suitable habitat although lack of occurrences from the project area. This species was not observed during spring 2009-2010 or 2013 field surveys.

Species	Habitat Requirements and Geographic Range	Potential to Occur or Presence On Site
Coachella Valley milk-vetch *Astragalus lentiginosus* var. *coachellae*	The Coachella Valley Multiple Species Habitat Conservation Plan states that this species occurs on "dunes and sandy flats, along the disturbed margins of sandy washes, and in sandy soils along roadsides and in areas formerly occupied by undisturbed sand dunes. Within the sand dunes and sand fields, this milk-vetch tends to occur in the coarser sands at the margins of dunes, not in the most active blowsand areas. As this species is strongly affiliated with sandy substrates, it may occur in localized pockets where sand has been deposited by wind or by active washes. It may also occur in sandy substrates in creosote bush scrub, not directly associated with sand dune habitat (CVAG 2007). This plant species blooms from February to May, producing pink to deep magenta-colored flowers. This species occurs on aeolian deposits with fewer than 25 occurrences in the Coachella Valley. Coachella Valley milk-vetch depends on natural disturbances from fluvial and aeolian processes for seedling establishment (BLM CDD 2002).	This species was not observed during spring 2009-2010 or 2013 surveys and does not have a potential to occur in the study area. This species is not expected to occur in the project area. The distribution of Coachella Valley milk-vetch is restricted to the Coachella Valley in Riverside County, between Cabazon and Indio. CVAG (2007) identifies six outlying occurrences within a 5-mile area along Rice Road in the Chuckwalla Valley north of Desert Center, California (CVAG 2007); however, USFWS staff has indicated that these occurrences are not of the listed taxon (Engelhard, pers. comm.).
Cove's cassia *Senna covesii*	This species occurs on dry, sandy desert washes and slopes of the Sonoran Desert between 1,600 to 2,000 feet above MSL. This species occurs in sandy washes, roadsides, and alkaline flats in the Mojave and northern Sonoran deserts between 1,600 to 2,000 feet above MSL (CNPS 2009).	Cove's cassia has a low potential to occur within the study area due to the presence of suitable habitat and the project site being located below the typical elevation range where this species is known from. This species was not observed during spring 2009-2010 or 2013 field surveys.
Crucifixion thorn *Castela emoryi*	This species occurs in Sonoran and Mojavean deserts in scrub habitats and playas with dry, gravelly washes, slopes, and plains from approximately 300 to 2,100 feet above MSL. There are 64 records in the Consortium of California Herbaria database from Riverside, San Bernardino, Imperial counties among others and often times prefers grassy or hayfield habitats. There is a record from a hayfield in Chuckwalla Valley.	This species has a low potential to occur within the study area due to the presence of suitable habitat and appropriate elevation range of the project site. This species was not observed during spring 2009-2010 or 2013 field surveys.
Desert portulaca *Portulaca hamiloides*	This species occurs in Joshua tree woodlands and has been reported from Riverside and San Bernardino counties and portions of Arizona and Baja, California from 3,000 feet to 3,600 feet above MSL (CNPS 2009).	This species is not expected to occur within the study area due to lack of typical habitat associations and the project site being located outside of the elevation range. This species was not observed during spring 2009-2010 or 2013 field surveys.

Species	Habitat Requirements and Geographic Range	Potential to Occur or Presence On Site
Desert sand parsley *Ammoselinum giganteum*	This species occupies Sonoran creosote bush scrub habitat and has been reported from Riverside County, California and portions of Arizona (CNPS 2009) at approximately 1,200 feet above MSL (There are two records from the Consortium of California Herbaria database from Riverside County from the Chuckwalla Valley where this species was observed growing in dry basins at 500 feet above MSL (CCH 2010).	Desert sand parsley has a low potential to occur within the study area due to presence of suitable habitat and reported occurrences from the Chuckwalla Valley. This species was not observed during spring 2009-2010 or 2013 field surveys.
Desert spike moss *Selaginella eremophila*	This is a dense, mat forming, non-flowering plant. This species occurs in Sonoran creosote scrub habitats in gravelly or rocky soils from approximately 600 to 2,700 feet above MSL. There are 56 records in the Consortium of California Herbaria database from Riverside and San Diego counties with several records from Anza Borrego State Park, Palm Springs, Palm Canyon, and San Jacinto Mountain Range. One collection from Riverside County is from the vicinity of the Chocolate-Chuckwalla Mountain region near the north side of the Orocopia Mountains from sloped rocky, shady surfaces in gravelly soils (CCH 2010).	This species was not observed during spring 2009-2010 or 2013 field surveys. This species has a low potential to occur within the study area give the presence of suitable desert scrub habitat and historic collections from the project area, although the project site is located below the typical elevation range of this species.
Dwarf germander *Teucrium cubense* ssp. *depressum*	This species occurs in desert dune, playa margins, and Sonoran desert scrub habitats from approximately 100 feet to 1,200 feet above MSL. This species typically blooms from March to May but may also bloom from September through November. This species typically occurs in sandy soils and wash habitats and is known from fewer than 10 occurrences in California (CNPS 2009). There are 15 records from Consortium of California Herbaria database from Riverside and Imperial counties; there are records from the Chuckwalla Valley in the Hayfield area and Palo Verde Valley. There is a CNDDB record from Wiley's Well Road (400 feet elevation) from 1979 (CNDDB 2010). Another CNDDB occurrence is a historical record from 1912 located approximately 7 miles southeast of the project area from the Palo Verde Valley (CNDDB 2010).	This species has a low potential to occur due to the presence of suitable habitat and appropriate elevation range of the site. This species was not observed during spring 2009-2010 or 2013 field surveys.

Species	Habitat Requirements and Geographic Range	Potential to Occur or Presence On Site
Foxtail cactus *Coryphantha alversonii*	This species occurs on rocky, granitic soils in Sonoran and Mojavean desert scrub habitats from 200 feet to 4,600 feet above MSL. Prior to conducting spring 2009 field surveys, a reference population was observed on April 9, 2009 at a gravel pit northwest of Blythe along State Route 95 and several individuals were observed in relatively undisturbed Sonoran creosote bush scrub on granitic rock, a preferred habitat type of this species (CNPS 2009). This species was not found during surveys performed in the Biological Resources Survey Area (BRSA). There are 25 records of this species from the Consortium of California Herbaria database from Riverside, Imperial, and San Bernardino counties. There are records from the Chuckwalla Valley from rocky, granitic slopes (CCH 2010).	Foxtail cactus has a low potential to occur within the study area due to the presence of suitable desert scrub habitat and appropriate elevation of the site although lack of rocky, grantic soils. This species was not observed during spring 2009-2010 or 2013 field surveys.
Mesquite nest straw *Stylocline sonorensis*	This species occupies Sonoran desert scrub habitats around 1,300 feet elevation and has been reported from Riverside County and portions of Arizona and Sonora, Mexico (CNPS 2009). There are two records from the Consortium of California Herbaria database from Riverside County both from the Chuckwalla Mountains, Hayfields region from 1930 (CCH 2010).	This species was not observed during spring 2009-2010 or 2013 field surveys. Mesquite nest straw has a low potential to occur within the study area due to suitable habitat present within the site.
Orocopia sage *Salvia greatae*	This species occurs in the southeastern Sonoran Desert and is associated with the Orocopia and Chocolate Mountains on alluvial slopes between 100 and 800 feet above MSL. There are 49 records from the Consortium of California Herbaria database, several from the Chocolate, Chuckwalla, and Orocopia mountain areas (CCH 2010).	This species was not observed during spring 2009-2010 or 2013 field surveys. This species has a low potential to occur within the study area due to the presence of suitable habitat and appropriate elevation range of the site.
Pink fairyduster *Calliandra eriophylla*	This species occurs in the Sonoran Desert in sandy washes, slopes and mesas from 350 to 5,000 feet above MSL. There are 62 records from the Consortium of California Herbaria database, several from the Chocolate-Chuckwalla Mountains area in Imperial and San Diego counties (CCH 2010).	This species was not observed during spring 2009-2010 or 2013 field surveys. Pink fairy duster has a low potential to occur within the study area due to suitable habitats, appropriate elevation range of the site, and reported records from the project area.

Species	Habitat Requirements and Geographic Range	Potential to Occur or Presence On Site
Pink velvet mallow *Horsfordia alata*	This species occurs in the Sonoran Desert in California, Arizona, and Mexico. It occurs in Sonoran desert scrub habitats from approximately 300 to 1,500 feet above MSL. There are no CNDDB records for this species for the entire state of California; the most recent collections have been from the Chocolate, Chuckwalla, and Cargo Muchacho Mountains approximately 50 miles south of the study area and are believed to be extant.	This species was not observed during spring 2009-2010 or 2013 field surveys.
Sand evening-primrose *Camissonia arenaria*	This species occupies sandy and gravelly areas of Sonoran desert scrub habitat and has been reported from Imperial and Riverside counties and areas of Arizona and Mexico from 200 feet to 2,700 feet above MSL (CNPS 2009). There are 13 records of this species in the Consortium of California Herbaria database several from the Chocolate-Chuckwalla Mountains, Palo Verde Valley, and Ogilby Pass area (CCH 2010).	This species has a low potential to occur within the study area due to the presence of suitable habitat and appropriate elevation of the site. This species was not observed during spring 2009-2010 or 2013 field surveys.
Slender woolly-heads *Nemacaulis denudata* var. *gracilis*	This species occupies desert sand dunes, coastal dunes, and Sonoran desert scrub (CNPS 2009) from 150 to 1,200 feet above MSL. There are 45 records in the Consortium of California Herbaria database from the Palm Springs, Indian Wells area in Riverside County (CCH 2010).	Slender woolly-heads has a low potential to occur within the study area due to suitable habitat and appropriate elevation range of the site. This species was not observed during spring 2009-2010 or 2013 field surveys.
Small-flowered androstephium *Androstephium breviflorum*	This species occurs in desert dune and Mojavean desert scrub habitats from approximately 700 feet to 2,000 feet above MSL (CNPS 2009). This species blooms from March through April and often occurs on desert bajadas. The nearest CNDDB record for this species is from Cadiz Valley from Riverside and San Bernardino Counties approximately one mile north of Highway 62 during 1995 from a sandy, Mojavean Desert shrub-land bajada (CNDDB 2010).	This species has a potential to occur within the site due to suitable sand dune habitat and appropriate elevation range of the site. Species was not observed during 2009-2010 or 2013 field surveys.
Spearleaf *Matelea parvifolia*	This species occurs in Mojavean and Sonoran desert scrub habitats from 1,320 feet to approximately 3,300 feet above MSL. This species blooms from March through May (CNPS 2009). The nearest CNDDB record for this species is from the Chuckwalla Bench area during 1986 from desert dry wash woodland and creosote scrub habitats (CNDDB 2010).	This species has a potential to occur within the project site although was not observed during spring 2009 field surveys. The project site is located below the typical elevation range of this species. This species was not observed during spring 2009-2010 or 2013 field surveys.

Species	Habitat Requirements and Geographic Range	Potential to Occur or Presence On Site
Wiggins' cholla *Cylindropuntia wigginsii*	Wiggins' cholla is not recognized as a species, but is considered a hybrid of silver cholla (*C. echinocarpa*) and pencil cholla (*C. remosissima*). Wiggins' cholla is not found as a separate species in The Jepson Manual nor in A California Flora and Supplement (Munz and Keck 1959, Munz 1968); however, the BLM's Proposed NECO identifies Wiggins' cholla as a special-status species (BLM CDD 2002). CNPS considers this species a sporadic hybrid of the two Cylindropuntia species mentioned above (CNPS 2009).	Since this species is not a recognized subspecies, Wiggins' cholla is not expected to occur in the project area.
Birds		
~~Bendire's thrasher~~ ~~*Toxostoma bendirei*~~	~~Bendire's thrashers are known in California from scattered locations in Kern, Inyo, San Bernardino, and Riverside counties. This species is a summer resident in southeastern California, and arrives at breeding grounds from mid-March through May, and departs by late August. It favors open grassland, shrubland, or woodland with scattered shrubs, primarily in areas that contain large cholla, Joshua tree, Spanish bayonet, Mojave yucca, palo verde, mesquite, catclaw, desert-thorn, or agave. The status of populations of this species is poorly understood, but threats are believed to be loss of habitat due to urbanization, harvesting of yucca and Joshua trees, overgrazing, and off-road vehicle activity. In parts of the range, grazing may increase habitat suitability by increasing scattered junipers within the area.~~	~~The desert dry wash natural community provides potential habitat for this species (148 acres), although this species was not observed during surveys. There are CNDDB (2010) records from near the Desert Center, approximately 8 miles west of the project, from 2004.~~
~~Black-tailed gnatcatcher~~ ~~*Polioptila melanura*~~	~~A year round resident in southwestern United States and central and northern Mexico, in California the black-tailed gnatcatcher is found in the southeast desert wash habitat from Palm Springs and Joshua Tree National Monument south, and along the Colorado River. It is now rare in eastern Mojave Desert north to the Amargosa River, Inyo Co. This species nests primarily in wooded desert wash habitat, but also occurs in creosote scrub habitat during the non-breeding season.~~	~~Based on a review of the natural community descriptions provided by the Applicant, the project site contains little, if any, of the dense scrub habitat preferred by this species. They are known from the area, including from McCoy Spring, Palen Valley, and Chuckwalla Well (Fitton 2008). The closet occurrence based on the CNDDB (2010) is from 1977 and is approximately 16.5 miles east of the project site.~~

Species	Habitat Requirements and Geographic Range	Potential to Occur or Presence On Site
~~Crissal thrasher~~ ~~*Toxostoma crissale*~~	~~Crissal thrashers are non-migratory residents ranging from southern Nevada and southeastern California to western Texas and central Mexico. This species prefers habitats characterized by dense, low scrubby vegetation, which, at lower elevations, includes desert and foothill scrub and riparian brush. Nests of this species typically consist of an open cup of twigs, lined with finer vegetation, and are placed in the middle of a dense shrub.~~	~~Based on a review of the natural community descriptions provided by the Applicant, the project site contains little, if any, of the dense scrub habitat preferred by this species. They are known from the area, including from McCoy Spring, Palen Valley, and Chuckwalla Well (Fitton 2008). The closet occurrence based on the CNDDB (2010) is from 1977 and is approximately 16.5 miles east of the project site.~~
~~Ferruginous hawk~~ ~~*Buteo regalis*~~	~~Ferruginous hawks do not breed in California, but are winter residents and in California are most common in grassland and agricultural areas in the southwest. Ferruginous hawks are found in open terrain from grasslands to deserts, and are usually associated with concentrations of small mammals. Threats to this species include loss of wintering habitat from urbanization and cultivation.~~	~~The project site contains suitable wintering habitat for this species. There are nine CNDDB (2010) records for this species in western Riverside County.~~
~~Gila woodpecker~~ ~~*Melanerpes uropygialis*~~	~~The Gila woodpecker's range is limited to a small area of southwestern United States and northwestern Mexico. In California, this species is found only along the Colorado River and in small numbers in Imperial County. In southeastern California, Gila woodpeckers were formerly associated with desert washes extending up to 1 mile from the Colorado River. Currently, they are found only in riparian areas along the Colorado River.~~	~~In California, this species is currently known only from the Colorado River; therefore this species is not expected in the project site. The project site does not contain suitable nesting habitat for this species. The closest CNDDB (2010) record for this species is a 1986 record east of the project site at the Colorado River.~~
~~Gilded flicker~~ ~~*Colaptes chrysoides*~~	~~In California, the gilded flicker is known from the southeast; habitat includes stands of giant cactus, Joshua tree, and riparian groves of cottonwoods and tree willows in warm desert lowlands and foothills. Until the mid-1990's, this species was considered a subspecies of northern flicker (*C. atratus*). This species nests primarily in cactus, but also will use cottonwoods and willows of riparian woodlands. This species may be nearly extinct in California.~~	~~This species is not expected to regularly use the project site due to lack of suitable habitat. The closest CNDDB (2010) records for this species are along the Colorado River.~~
~~Mountain plover~~ ~~Charadrius montanus~~	~~Mountain plovers do not breed in California, but are winter visitors primarily from September to mid-March. In California they are found in the Central Valley, Antelope Valley, San Jacinto Valley, Imperial Valley, and Palo Verde Valley. Mountain plover habitat includes short-grass prairie or their equivalents, and in southern California deserts are associated primarily with agricultural areas, though use of these areas is suspected to be because of loss of native grassland and playa habitats.~~	~~This species may use the dry lakebed and nearby agricultural areas as winter habitat. The closest CNDDB (2010) record for this species is in Imperial County at the southern end of the Salton Sea.~~

Species	Habitat Requirements and Geographic Range	Potential to Occur or Presence On Site
~~Northern harrier~~ ~~*Circus cyaneus*~~	~~In western North America, the northern harrier breeds from northern Alaska south to Baja California, Mexico. This species does not commonly breed in desert regions of California, where suitable habitat is limited, but winters broadly throughout California in areas with suitable habitat. Northern harriers forage in open habitats including deserts, pasturelands, grasslands, and old fields.~~	~~The project site contains suitable wintering habitat for the northern harrier, and this species was observed during 2009 and 2010 project site surveys (Solar Millennium 2009a). There are CNDDB (2010) nesting records for this species in eastern Riverside County.~~
~~Peregrine falcon~~ ~~*Falco peregrinus*~~	~~The Peregrine falcon's year-round range includes coastal and northwestern California and the Sierra Nevada and other California mountains. Additionally, this species winters inland throughout the Central Valley and in northeastern California. They are rare in the arid southeast, but they occur and are suspected to breed in the lower Colorado River Valley. Peregrine falcons require open habitat for foraging, and prefer breeding sites near water. Nesting habitat includes cliffs, steep banks, dunes, mounds, and some human-made structures.~~	~~This species may forage on the project site and nest in nearby mountains, but was not observed in the project site during project surveys. There are no CNDDB (2010) records for Riverside County.~~
~~Purple martin~~ ~~*Progne subis*~~	~~The historical breeding range of the purple martin includes southern California, though populations have shrunk dramatically. Neither the historical or current breeding range, however, includes the Colorado Desert. Purple martins habitat requirements include adequate nest sites and availability of large aerial insects, and therefore are most abundant near wetlands and other water sources. Threats to this species include loss of large tree and snags and competition from European starlings.~~	~~This species was observed migrating through the project site, but is not expected to extensively use the project site. There are six CNDDB (2010) records for this species from western Riverside County, the most recent of which include nesting records from 1983 and 1993.~~
~~Short-eared owl~~ ~~*Asio flammeus*~~	~~Short-eared owls breed through much of northern North America, and are year-round residents in some areas of California. Historically, this species occurred throughout much of California, west of the southern deserts, in low numbers. Currently, small populations breed in regularly in the Great Basin and in the Sacramento/San Joaquin River Delta area, but sporadically in other parts of its former range. Short-eared owls require open country that supports small mammal populations, and that also provides adequate vegetation to provide cover for nests. This includes salt- and freshwater marshes, irrigated alfalfa or grain fields, and ungrazed grasslands and old pastures.~~	~~The project site contains suitable wintering habitat for the short-eared owl. This species was not observed during surveys for this project, it was observed during surveys for a nearby proposed energy facility site immediately west of the McCoy Mountains. There are no Riverside County CNDDB (2010) records for this species.~~

Species	Habitat Requirements and Geographic Range	Potential to Occur or Presence On Site
~~Swainson's hawk~~ ~~*Buteo swainsoni*~~	~~Swainson's hawks require large areas of open landscape for foraging, including grasslands and agricultural lands that provide low-growing vegetation for hunting and high rodent prey populations. Swainson's hawks typically nest in large native trees such as valley oak, cottonwood, walnut, and willow, and occasionally in nonnative trees, such as eucalyptus within riparian woodlands, roadside trees, trees along field borders, isolated trees, small groves, and on the edges of remnant oak woodlands. While there are historical breeding records of this species from the Colorado Desert, this species is now known from southern California only as a spring and fall migrant. This reduction in breeding range is believed to be from loss of nesting habitat.~~	~~The project site may provide foraging habitat for migrating individuals, and this species was observed in the project site during 2009 and 2010 surveys. There are no CNDDB (2010) records for this species in Riverside County.~~
~~Vaux's swift~~ ~~*Chaetura vauxi*~~	~~This species is not known to breed in Riverside County or elsewhere in southern California. Very few nests have been found so their breeding range has been inferred from sightings of birds flying over potential nesting areas during their nesting season, in June and July. Vaux's swifts prefer to nest in the hollows formed naturally inside of large old conifer trees, especially snags, which are entirely lacking from the project site.~~	~~This species was observed during surveys, but occurrences are expected to be of migrants, only.~~
~~Vermilion flycatcher~~ ~~*Pyrocephalus rubinus*~~	~~Vermilion flycatchers are rare breeders or residents in localized areas of southern California, including along the Colorado River. They are usually found near water in arid scrub, farmlands, parks, golf courses, desert, savanna, cultivated lands, and riparian woodlands; nesting substrate includes cottonwood, willow, and mesquite.~~	~~Within the project vicinity, occurrences of this species are limited to the Colorado River. This species is not expected in the project site. The closest CNDDB (2010) records include a recent (1983) record from the Blythe golf course.~~
~~Yellow warbler~~ ~~*Dendroica petechia*~~	~~Yellow warblers historically bred throughout much of California except for high elevations, the Colorado Desert, and most of the Mojave Desert. Breeding abundance for this species has declined in much of California, as has the breeding range, especially in the Central Valley and parts of Owens Valley. In southeastern California, this species is known only from the lower Colorado River Valley from the middle of San Bernardino County through Riverside and Imperial Counties. Currently, this species no longer breeds in much of the Riverside County segment of the lower Colorado River Valley. This species commonly uses wet, deciduous thickets for breeding, and seeks a variety of wooded, scrubby habitats in winter.~~	~~This species was not observed during surveys, and is not expected to nest in the project site due to lack of suitable habitat. The closest CNDDB (2010) records for this species are two 1986 records east of the project site at the Colorado River.~~

Species	Habitat Requirements and Geographic Range	Potential to Occur or Presence On Site
~~Yellow-breasted chat~~ ~~*Icteria virens*~~	~~The yellow-breasted chat occurs as a summer resident and migrant in California. In the southeastern California, the yellow-breasted chat breeds primarily in scattered locations in Owen's Valley and the Mojave, from the Salton Sea, and from the lower Colorado River Valley. This species occupies shrubby riparian habitat with an open canopy, and will next in non-native species including tamarisk. Threats to this species include loss of riparian habitat, and, it is suspected, pressure from cowbird parasitism.~~	~~In this region, this species is associated with the Colorado River only. The project site does not contain suitable habitat for this species. CNDDB (2010) records in the region are associated with the Salton Sea or the Colorado River. The closest CNDDB records for this species are two 1986 records east of the project site at the Colorado River.~~
Mammals		
Colorado Valley woodrat *Neotoma albigula venusta*	Occurs from southern Nevada, southeastern California, northeastern Baja California, to western Arizona. Colorado Valley woodrats are found in a variety of habitats including low desert, pinyon-juniper woodlands, and desert-transition chaparral. Suitable habitat elements for this species include washes where organic debris gathers, areas of prickly pear cactus and mesquite, rocky areas, and crevices in boulders which are used for cover and nest sites.	This species is not expected to occur due to coarse soils and disturbance of the project site from past agricultural activities. The nearest CNDDB record is from 1934 near Blythe (CNDDB 2010).
Arizona myotis *Myotis occultus*	This species has been found from southeastern California through Arizona, New Mexico, and south into Chihauhau, Mexico. Arizona myotis is most commonly known from conifer forests from 6,000 to 9,000 feet in elevation, although maternity roosts are known from much lower elevations including areas along the Colorado River in California.	This species is not expected to occur due to lack of coniferous forests and low elevation of the study area. The closest CNDDB (2010) record is a historical occurrence from 1945 approximately 10 miles south of the study area near the town of Ripley.
Big-free tailed bat *Nyctinomops macrotis*	This species ranges from most of South America northward to include Mexico, Arizona, New Mexico, southern and western Texas, southern California, southeastern Nevada, southern Utah, and north and western Colorado from generally sea level to 8,000 feet in elevation. This species occurs in desert shrub, woodlands, and coniferous forests. It roosts mostly in the crevices of rocks although big free-tailed bats may roosts in buildings, caves, and tree cavities	This species has the potential to roost and forage within the project area. The nearest occurrences for this species in Riverside County are from the vicinity of Palm Springs and Joshua Tree National Park (CNDDB 2010). A single bat of an unidentified species was observed roosting beneath a bridge near Corn Springs Road near the location of the proposed substation during December 2009 surveys (AECOM 2010a).

Species	Habitat Requirements and Geographic Range	Potential to Occur or Presence On Site
~~California leaf-nosed bat~~ ~~*Macrotus californicus*~~	~~California leaf-nosed bats occur in the deserts of California, southern Nevada, Arizona and south to northwestern Mexico. In California, they are now found primarily in the mountain ranges bordering the Colorado River Basin. In California, the two largest roosts (each sheltering 1,500 bats during winter months) are in mines in extreme southeastern California. This species depends on either caves or mines for roosting habitat. All major maternity, mating, and overwintering sites are in mines or caves (BLM CDD 2002). Radio-telemetry studies of *Macrotus* in the California desert show that the California leaf-nosed bat forages almost exclusively among desert wash vegetation within 6.2 miles of their roost (WBWG 2005-2009).~~	~~All habitats within the Project Disturbance Area are suitable habitats for this species. A single bat of an unidentified species was observed roosting beneath a bridge near Corn Springs Road near the location of the proposed substation during December 2009 surveys (AECOM 2010a). There are several CNDDB records in the vicinity of the study area. The nearest record is from 1993 near the McCoy Mountains area in creosote bush scrub habitat approximately where approximately 300 adults were observed roosting (CNDDB 2010).~~
Cave myotis *Myotis velifer*	The cave myotis occurs from western Texas, to southern Nevada, southeastern California (only along the Colorado River), southward into Mexico, and is also widely distributed in Arizona. This species is found primarily at lower elevations (the Sonoran and Transition life zones) of the arid southwest in areas dominated by creosote bush, palo verde, and cactus. This species is a “cave dweller” and caves are the main roosts although this species may also use mines, buildings, and bridges for roosts.	This species has a potential to occur within the study area, more likely as a foraging species than a roosting bat species. The nearest CNDDB record for this species is from 2002 near the I-15 bridge over the Colorado River in Blythe where individual bats of this species were detected acoustically during April 2002 (CNDDB 2010).
Hoary bat *Lasiurus cinereus*	Hoary bat is the most widespread of North American bats and are highly associated with forested habitats in the west. Hoary bat roosts are usually located at the edge of a clearing although more unusual roosting sites have been reported in caves, beneath rock ledges, woodpecker holes, squirrel nests, and building sides.	This species has a potential to roost and forage within the project area. The closest CNDDB (2010) record is a historical occurrence approximately from the town of Neighbors during 1919. A single bat of an unidentified species was observed roosting beneath a bridge near Corn Springs Road near the location of the proposed substation during December 2009 surveys (AECOM 2010a).

Species	Habitat Requirements and Geographic Range	Potential to Occur or Presence On Site
~~Pallid bat~~ ~~*Antrozous pallidus*~~	~~Pallid bats inhabit low elevation (less than 6,000 feet) rocky, arid deserts and canyonlands, shrub/steppe grasslands, but also occur in higher elevation coniferous forests, greater than 7,000 feet in elevation. This species is most abundant in xeric landscapes including the Great Basin, Sonoran, and Mojave deserts (WBWG 2005-2009). Pallid bats are known from Cuba, Mexico, and throughout the southwestern and western United States. Population trends are not well known, but there are indications of decline. Pallid bats roost alone, in small groups (2 to 20 bats), or gregariously (100s of individuals). Day and night roosts include crevices in rocky outcrops and cliffs, caves, mines, trees with exfoliating bark, and various human structures such as bridges, barns, porches, bat boxes, and human-occupied as well as vacant buildings (WBWG 2005-2009).~~	~~This species has a potential to roost and forage within the project area. A single bat of an unidentified species was observed roosting beneath a bridge near Corn Springs Road near the location of the proposed substation during December 2009 surveys (AECOM 2010a). Anabat/Sonobat surveys, which allows for more precise identification of bat species based on the recording of echolocation frequencies, were not conducted in conjunction with the December 2009 surveys. The nearest CNDDB record is approximately 5 miles southeast of the project site (CNDDB 2010).~~
~~Pocketed free-tailed bat~~ ~~*Nyctinomops femorosaccus*~~	~~This species occurs in western North America, from southern California, central Arizona, southern New Mexico, western Texas, south into Mexico and Baja, California (WBWG 2005-2009). Despite only a limited number of records, pocketed free-tailed bats are known to occur in the desert from March through August, when they are migrating out of the area. In California, they are found primarily in creosote bush and chaparral habitats in proximity to granite boulders, cliffs, or rocky canyons.~~	~~This species has a potential to roost and forage within the project site based on what is understood of its habitat requirements and roosting habits. The nearest CNDDB record for this species is from 2002 near the I-15 bridge over the Colorado River in Blythe. Individual bats of this species were detected acoustically during April 2002 (CNDDB 2010). A single bat of an unidentified species was observed roosting beneath a bridge near Corn Springs Road near the location of the proposed substation during December 2009 surveys (AECOM 2010a).~~
Spotted bat *Euderma maculatum*	This species is known from all the states west of and including Montana, Wyoming, Colorado, New Mexico and Texas. Although broadly distributed, this species is rarely common, but may occur locally from southern British Columbia, northern Arizona, Arizona/ Utah border, and western Texas from below sea level to 8,100 feet above MSL. Spotted bats occur in arid, low desert habitats to high elevation conifer forests and prominent rock features appear to be a necessary feature for roosting.	This species has a potential to roost and forage within the project site based on what is understood of its habitat requirements and roosting habits. The nearest CNDDB record is a historical occurrence from 1907 in the Colorado Desert near Mecca (CNDDB 2010). A single bat of an unidentified species was observed roosting beneath a bridge near Corn Springs Road near the location of the proposed substation during December 2009 surveys (AECOM 2010a).

Species	Habitat Requirements and Geographic Range	Potential to Occur or Presence On Site
~~Townsend's big-eared bat~~ ~~*Corynorhinus townsendii*~~	~~This species has been reported in a wide variety of habitat types ranging from sea level to approximately 9,000 feet above MSL. Habitat associations include coniferous forests, deserts, native prairies, riparian communities, active agricultural areas, and coastal habitat types. Foraging associations include edge habitats along streams, adjacent to and within a variety of wooded habitats.~~	~~This species has a potential to forage within the Study although roosting is unlikely to occur since cave and abandoned buildings do not occur within the study area. A single bat of an unidentified species was observed roosting beneath a bridge near Corn Springs Road near the location of the proposed substation during December 2009 surveys (AECOM 2010a).~~
~~Western mastiff bat~~ ~~*Eumops perotis*~~	~~The subspecies that occurs in North America, *E. p. californicus*, ranges from central Mexico across the southwestern United States including parts of California, southern Nevada, Arizona, southern New Mexico and western Texas. Recent surveys have extended the previously known range to the north in both Arizona with several localities near the Utah border and California. It is found in a variety of habitats, from desert scrub to chaparral to oak woodland and into the ponderosa pine belt and high elevation meadows of mixed conifer forests. Surveys in northern Arizona have documented roosts at approximately 3,600 feet above MSL and foraging bat species at 7,500 feet above MSL (WBWG 2005-2009).~~	~~The project site does not support suitable roosting habitat for western mastiff bat but this species may utilize the study area for foraging. The nearest CNDDB record is approximately five miles southwest of the study area (CDFW 2010). A single bat of an unidentified species was observed roosting beneath a bridge near Corn Springs Road near the location of the proposed substation during December 2009 surveys (AECOM 2010a).~~
~~Yuma myotis~~ ~~*Myotis yumanensis*~~	~~This species ranges across the western third of North America from British Columbia, Canada, to Baja California and southern Mexico. Yuma myotis is usually associated with permanent sources of water, typically rivers and streams, feeding primarily on aquatic emergent insects, but Yuma myotis also use tinajas in the arid west. It occurs in a variety of habitats including riparian, arid scrublands and deserts, and forests. The species roosts in bridges, buildings, cliff crevices, caves, mines, and trees.~~	~~This species has a potential to roost and forage within the project site. The nearest CNDDB record is from 2002 near the Blythe bridge over the Colorado River where individual bats of this species were detected acoustically during April 2002 (CNDDB 2010).~~

Species	Habitat Requirements and Geographic Range	Potential to Occur or Presence On Site
Yuma mountain lion *Puma concolor browni*	In the NECO planning area, mountain lions primarily inhabit the low mountains and extensive wash systems in and around Chuckwalla Bench, Chuckwalla Mountains, Chocolate Mountains, Picacho Mountains, Milpitas Wash, Vinagre Wash, and other washes in that area. Mountain lions typically occur in habitats with extensive, well-developed riparian or shrubby vegetation interspersed with irregular terrain, rocky outcrops, and community edges. Mountain lions are restricted to the southern Colorado Desert from Joshua Tree National Park south and east to the Colorado River. Burro deer, the primary prey item, are known to spend the hot summer and fall in riparian areas along the Colorado River and in dense microphyll woodlands near the Coachella Canal.	Mountain lion likely use the BRSA but no definitive sign for this species was observed during 2009 spring surveys. This species or its sign was not reported to be observed during spring 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline route.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

CONSTRUCTION AND OPERATION – DIRECT IMPACTS, INDIRECT IMPACTS, AND MITIGATION

Direct impacts are those resulting from a project and occurring at the same time and place. Indirect impacts are caused by a project, but can occur later in time or farther removed in distance while still reasonably foreseeable and related to the project. The potential impacts discussed in this analysis are those most likely to be associated with construction and operation of the project.

Impact analyses typically characterize effects to plant communities as temporary or permanent, with a permanent impact referring to areas that are paved or otherwise precluded from restoration to a pre-project state. In the desert ecosystems the definition of permanent impacts needs to reflect the slow recovery rates of its plant communities. Natural recovery rates from disturbance in these systems depend on the nature and severity of the impact. For example, creosote bushes can resprout a full canopy within five years after damage from heavy vehicle traffic (Gibson et al. 2004), but more severe damage involving vegetation removal and soil disturbance can take from 50 to 300 years for partial recovery; complete ecosystem recovery may require over 3,000 years (Lovich and Bainbridge 1999). In this analysis, an impact is considered temporary only if there is evidence to indicate that pre-disturbance levels of biomass, cover, density, community structure, and soil characteristics could be achieved within five years.

Summary of Impacts

Biological Resources Table 5 summarizes the direct, indirect and cumulative impacts to biological resources and includes the proposed conditions of certification that would mitigate these impacts. **Biological Resources Table 6** provides a summary of acreage impacts and recommended mitigation.

Biological Resources Table 5
Summary of Impacts and Mitigation

Biological Resource	Impact/Mitigation
Sonoran Creosote Bush Scrub & Associated Wildlife Habitat	**Direct Impacts:** Permanent loss of 3,335[a] acres; fragmentation of adjacent wildlife habitat and native plant communities. **Indirect Impacts:** Disturbance (noise, lights, dust) to surrounding plant and animal communities; spread of non-native invasive plants; changes in drainage patterns downslope of project; erosion and sedimentation of disturbed soils. **Cumulative Impacts:** Contributes to cumulatively considerable loss of habitat, fragmentation, and indirect effects from past, present, and foreseeable future projects in the California Desert region of the NECO planning area. **Mitigation:** Off-site habitat acquisition and enhancement (**BIO-12**); implement impact avoidance and minimization measures (**BIO-8)** and weed control plan (**BIO-14**). **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation; Cumulative Impacts are Less than Significant with Mitigation.

Biological Resource	Impact/Mitigation
Stabilized and Partially Stabilized Dunes	**Direct Impacts:** Permanent loss of 187 acres of stabilized and partially stabilized dune habitat; potential accidental direct impacts to adjacent preserved habitat during construction and operation. **Indirect Impacts:** Disruption of sand transport corridor resulting in downwind impacts to sand dune habitat; introduction and spread of non-native invasive plants; erosion and sedimentation of disturbed soils; fragmentation and degradation of remaining habitat. **Cumulative Impacts:** Contributes substantially~~100%~~ to cumulative impacts~~loss~~ from future projects within Chuckwalla Valley and NECO planning area. **Mitigation:** Implement **BIO-20,** Sand Dune Community Impact Mitigation. **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation; Cumulative Impacts are Less than Significant with Mitigation.
Waters of the State/ Sensitive Plant Communities	**Direct Impacts:** Permanent loss biological functions and values of 375.3[a] acres of state waters, including: • 206.5 [a] acres desert dry wash woodland • 168.2 [a] acres of unvegetated ephemeral dry wash **Indirect Impacts:** Indirect impacts to approximately 0.55 acres of state waters. Impacts include colonization of invasive weeds and erosion/sedimentation to downstream areas. **Cumulative Impacts:** Contributes to cumulative loss of habitat from future projects within the Chuckwalla Valley and NECO planning area. Indirect effects cumulatively considerable. **Mitigation:** Acquisition and enhancement of 788 acres of ephemeral desert washes, implementation of avoidance and minimization measures to protect state waters (**BIO-21**); implement weed management plan (**BIO-14**). **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation; Cumulative Impacts are Less than Significant with Mitigation.
Groundwater-dependent Plant Communities	**Direct Impacts:** None. The effects of pumping may take several-to-many years to appear, depending on the degree of separation in the confining layers between the shallow aquifer (supporting plants) and deep aquifers (where pumping will occur); see below. **Indirect and Cumulative Impacts:** Potential for significant adverse effects to groundwater-dependent plant ecosystems (GDEs) near Palen Dry Lake, including loss of habitat function and value for wildlife, reduced plant cover which increases wind erosion and affects air quality, increase in weedy species, impacts to special-status species inhabiting the GDEs. Even minor individual impacts to GDEs are considered cumulatively considerable. **Mitigation:** Monitoring groundwater-dependent plant communities near the project site (**BIO-23**) and implementation of remedial action and compensatory mitigation if adverse effects are detected (**BIO-24**). **BIO-7** BRMIMP ensures enforcement of all conditions of certification. **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation Cumulative Impacts are Less than Significant with Mitigation.

Biological Resource	Impact/Mitigation
Desert Tortoise	**Direct Impacts:** Potential take of individuals during operation and construction; permanent loss of 3,948[a] acres (including 228[a] acres of critical habitat) of low to moderate quality desert tortoise habitat and fragmentation of surrounding habitat. **Indirect Impacts:** Increased risk of predation from ravens, coyotes, feral dogs; disturbance from increased noise and lighting; introduction and spread of weeds; increased road kill hazard. **Cumulative Impacts:** Contributes to cumulative loss of low to moderate value desert tortoise habitat from future projects in NECO, based on USGS habitat model (Nussear et al. 2009). Impedes movement in the region. Impacts to higher quality habitat values less than cumulatively considerable. **Mitigation:** Implement avoidance and minimization measures (**BIO-6** through **BIO-11**) and acquire 4,860 acres of desert tortoise habitat (**BIO-12**). **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation; Cumulative Impacts are Less than Significant with Mitigation.
Mojave Fringe-toed Lizard	**Direct Impacts:** Mortality to individuals during construction and permanent loss of 1,480 acres of Mojave fringe-toed lizard habitat; increased road kill hazard from construction traffic; potential accidental direct impacts to adjacent preserved habitat during construction and operation, increased risk of disturbance or mortality from vegetation management activities. **Indirect Impacts:** Disruption of sand transport (25%-100%); introduction and spread of non-native invasive plants; erosion and sedimentation of disturbed soils; fragmentation and degradation of remaining habitat; increased road kill hazard from construction and operations traffic; harm from accidental spraying/drift of herbicides and dust suppression chemicals. **Cumulative Impacts:** Contributes substantially to cumulative loss of Mojave fringe-toed lizard habitat in the Chuckwalla Valley. Project's contribution to fragmentation and indirect impacts cumulatively considerable. **Mitigation:** Implement **BIO-20,** Mojave fringe-toed lizard compensation, and **BIO-8,** impact avoidance and minimization measures; **BIO-14** weed management plan. **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation; Cumulative Impacts are Less than Significant with Mitigation.

Biological Resource	Impact/Mitigation
Western Burrowing Owl	**Direct Impacts:** Permanent loss of breeding and foraging habitat for at least two pairs of resident burrowing owls; potential loss of eggs and young **Indirect Impacts:** Degradation and fragmentation of remaining adjacent habitat from edge effects; disturbance of nesting and foraging activities for nesting pairs near the plant site and linear facilities. Collisions with project features, glare, also collision, electrocution, glare, and exposure to elevated levels of solar flux. Increased road kill hazard from operations traffic and collision with mirrors; increased predation from ravens; disturbance of nesting activities from operations. **Cumulative Impacts:** Contributes to cumulative loss of habitat from future projects in the Chuckwalla Valley and NECO planning area. Indirect impacts also cumulatively considerable. **Mitigation:** Implement burrowing owl impact avoidance and mitigation measures, including a minimum acquisition of 78 acres of burrowing owl habitat (**BIO 18**). If additional breeding owls are detected additional compensatory mitigation will be required. Additionally, implement impact avoidance and minimization measures (**BIO-1** through **BIO-8**); pre-construction nest surveys (**BIO-15**); avian enhancement and conservation plan (**BIO-16a**), and avian and bat protection plans (**BIO-16b**). **Impact Significance:** Direct Impacts are Less than Significant with Mitigation; Indirect Impacts May Remain Significant After Mitigation; Cumulative Impacts May Remain Significant After Mitigation
Golden Eagle/Bald Eagle	**Direct Impacts**: Loss of foraging habitat, potential mortality or disturbance during construction and operation, loss or fragmentation of habitat, displacement, and disruption of movement. **Indirect Impacts**: Collision, glare, electrocution, and death or injury from exposure to concentrated solar flux. Fragmentation of local population; introduction and spread of non-native invasive plants; increased risk of fire; and degradation of off-site springs or seeps. Weed abatement, mirror washing and maintenance. Glare or heat associated with the heliostats may also adversely affect bird's use of the site. **Cumulative Impacts:** The modified project would contribute to cumulative loss of foraging habitat (Sonoran creosote scrub and desert dry wash woodland) within a 140-mile radius of the project, and also would contribute to cumulatively considerable loss of habitat, fragmentation, and direct loss of these species from past, present, and foreseeable future projects within 140-mile radius of the modified project. Fragmentation and indirect impacts also would be cumulatively considerable. Mitigation: Off-site habitat acquisition and enhancement (**BIO-12** and **BIO-21**); pre-construction nest surveys (**BIO-15**); avian enhancement and conservation plan (**BIO-16a**), and avian and bat protection plans (**BIO-16b**). **Impact Significance:** Direct Impacts are Less than Significant with Mitigation; Indirect Impacts May Remain Significant After Mitigation; Cumulative Impacts May Remain Significant After Mitigation.

Biological Resource	Impact/Mitigation
Special-status Avian Species	**Direct Impacts:** Permanent loss of breeding and foraging habitat, Sonoran creosote bush scrub and desert dry wash woodland); potential loss of eggs and young; disturbance of nesting and foraging activities for populations on and near the plant site and linear facilities; degradation and fragmentation of remaining adjacent habitat from edge effects; disturbance from operations. **Indirect Impacts:** Increased road kill hazard from operations traffic; increased predation from ravens; fragmentation of local population; introduction and spread of non-native invasive plants; increased risk of fire; degradation of off-site springs or seeps; weed abatement; mirror washing and maintenance; death or injury from exposure to concentrated solar flux; and glare or heat associated with the heliostats may adversely affect bird's use of the site. **Cumulative Impacts:** Contributes cumulative loss of habitat from future projects within NECO planning area desert dry wash woodland. Project's cumulative contribution to fragmentation, indirect impacts, and direct loss of special status and migratory birds from collisions and exposure to solar flux would be considerable. **Mitigation:** Implement impact avoidance and minimization measures (**BIO-1** through **BIO-8**); pre-construction nest surveys (**BIO-15**); avian protection plan (**BIO-16**) off-site habitat acquisition and enhancement (**BIO-12**). Pre-construction nest surveys (**BIO-15**); avian enhancement and conservation plan (**BIO-16a**), and avian and bat protection plans (**BIO-16b**). **Impact Significance:** Direct Impacts are Less than Significant with Mitigation; Indirect Impacts May Remain Significant After Mitigation; Cumulative Impacts May Remain Significant After Mitigation.
Special Status Bats	**Direct Impacts**: No anticipated direct loss of maternity, day roosts, or hibernacula. Loss of foraging habitat. Bats that forage near the ground, such as the pallid bat, would also be subject to crushing or disturbance by vehicles driving at dusk, dawn, or during the night. Collision with facility structures, exposure to concentrated solar flux **Indirect Impacts**: the loss of foraging habitat due to type conversion, night time lighting that exposes bats to predation, and alteration in prey base. Degradation to groundwater dependent communities in the vicinity of the project site. **Cumulative Impacts**: Contributes to cumulatively considerable loss of habitat, fragmentation, and direct loss of these species from past, present, and foreseeable future projects in the Chuckwalla Valley. Mitigation: **BIO-1** through **BIO-8** requires avoidance and minimization measures during life of project, construction monitoring, worker training, fugitive dust control, fire prevention and weed management. pre-construction nest surveys (**BIO-15**); avian enhancement and conservation plan (**BIO-16a**), and avian and bat protection plans (**BIO-16b**). **BIO-23** requires monitoring to track the impacts of pumping to groundwater levels as they develop during the life of the project, and defines triggers for adaptive management to be implemented if data indicate impending adverse effects. **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation; Cumulative Impacts are Less than Significant with Mitigation.

Biological Resource	Impact/Mitigation
Desert Kit Fox & American Badger	**Direct Impacts:** Permanent loss of 3,899[a] acres of habitat; fragmentation and degradation of remaining habitat, loss of foraging grounds, crushing or entombing of animals during construction; increased risk of road kill hazard from construction traffic. **Indirect Impacts:** Disturbance from increased noise and lighting; introduction and spread of weeds; increased risk of road kill from operations traffic; increased risk of infection from Canine Distemper Virus (CDV) during passive relocation or hazing activities conducted in an area experiencing or adjacent to distemper cases, increased risk of disturbance or mortality from vegetation management activities. **Cumulative Impacts:** Contributes to cumulative loss of habitat from future projects within the NECO planning area. Project's contribution to fragmentation and indirect impacts also cumulatively considerable. **Mitigation:** Implementation of impact avoidance and minimization measures (**BIO-17**); off-site habitat acquisition and enhancement (**BIO-12**). **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation; Cumulative Impacts are Less than Significant with Mitigation.
Special Wildlife Management Areas	**Desert Wildlife Management Areas:** A portion of the proposed generation tie-line would be located in the Chuckwalla DWMA south of I-10. **Areas of Critical Environmental Concern:** None. **Wildlife Habitat Management Areas:** Contributes to the loss of Sonoran creosote scrub and desert dry wash woodland habitat from future projects within Palen-Ford WHMA. Project would not contribute to the loss of sand dune communities within the WHMA. Contributes to the loss to the DWMA Connectivity WHMA. No cumulative contribution to habitat loss in Big Maria Mountains WHMA. **Desert Tortoise Critical Habitat:** Approximately 228 acres of the southwestern corner of the project overlaps the northern boundary of the Chuckwalla Desert Tortoise Critical Habitat Area. **Mitigation:** Mitigate loss of critical habitat with acquisition and preservation of suitable desert tortoise at a 5:1 ratio (**BIO-12**). **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation; Cumulative Impacts are Less than Significant with Mitigation.

Biological Resource	Impact/Mitigation
Special-status Plants	**Direct Impacts:** – • Harwood's milk-vetch: Less-than-significant direct loss of approximately six in Project Disturbance Area; • Harwood's eriastrum: No direct impacts; • California ditaxis: Loss of 11 plants significant; • Ribbed cryptantha: abundant throughout the vicinity; less-than-significant direct effect; • New taxon of saltbush: No direct impacts. • Late-season plants: no direct impacts within approved PSPP project footprint. Potentially significant impacts to fall-blooming plants not detected during spring surveys along new PSEGS features, including modified generation tie-line corridor (Sonoran creosote bush scrub and dry desert wash woodland). **Indirect Impacts:** Minor to potentially significant indirect impacts to all plants in close proximity to site from introduction and spread of non-native invasive plants; increased risk of fire; altered drainage patterns downstream of site; erosion and sedimentation of disturbed soils; accidental chemical and herbicide drift; disruption of photosynthesis and other metabolic processes from dust; fragmentation of population and impaired gene flow and increased vulnerability to local extinctions, and accidental impacts to avoided plants during construction. **Cumulative Impacts:** Project's contribution to spread of weeds, fragmentation, altered hydrology, and risk of fire is cumulatively considerable, however these effects would be reduced through the implementation of staffs proposed conditions of certification. **Mitigation:** Implement impact avoidance and minimization measures (**BIO-8**); Avoidance and minimization measures (**subsection A, BIO-19**); conduct fall surveys (subs**ection B, BIO-19**) and mitigate according to thresholds in **BIO-19**); implement avoidance and compensation mitigation according to performance standards in subs**ection D, BIO-19**; implement weed management plan (**BIO-14**); implement worker training in fire prevention (**BIO-8**). **Impact Significance:** Direct and Indirect Impacts are Less than Significant with Mitigation; Cumulative Impacts are Less than Significant with Mitigation.

2 –MFTL calculation based on identified habitat from the PSPP and final acre calculations are from an email from project owner on 8/13/2013.
3 –State waters calculations are from Table 1 in Applicant's Supplement NO.1 (Palen 2013jj).

Waters of the State: Impacts and Mitigation

Biological Resources Table 6a summarizes the direct and indirect impacts to waters of the state as a result of project construction, and includes recommendations from Energy Commission staff and CDFW for compensatory mitigation ratios.

Construction of the PSEGS project would result in direct and indirect impacts to numerous ephemeral streams and washes that occur within the Project Disturbance Area. Construction and operation would alter the hydrological, biogeochemical, vegetation and wildlife functions of these drainages. This would result from the construction of evaporation ponds, roads, and placement of the power towers, heliostats, and ancillary facilities. Approximately 374.7 acres of jurisdictional waters of the state were delineated by the project owner on the PSEGS project site and linear facilities (Palen 2013y). Waters of the United States do not occur on the project site or linear facilities (Palen 2013a).

For the approved PSPP project all vegetation would be removed and the ephemeral drainages graded within the Project Disturbance Area. To control flooding an engineered channel would have been constructed to contain the 100 year storm event. For the PSEGS project impacts to desert washes would be minimized by allowing water to pass through the site, rather than diverting flows around the site in artificially constructed channels. This analysis recognizes that at least a portion of the hydrologic and geomorphic functions would be maintained. However, staff and the CDFW maintain that wildlife habitat functions and values of the streams would be eliminated or significantly diminished by construction and operation of the facility. A review of Appendix A of the project owner's Hydrology Report (Palen 2013a) identified approximately 27 percent of the site would be developed by dirt roads, heliostats, or other facilities. Activities including road construction and maintenance; the placement of perimeter exclusion fencing; dust and weed control; periodic vegetation removal; and mirror-washing would contribute to the loss of functions within the site. Glint and glare, nighttime lighting, human disturbance, and potential erosion and sedimentation of streams during storm events would also diminish habitat values for plants and wildlife. The functions and values of the ephemeral washes associated with the natural gas pipeline and transmission line could also be adversely affected.

Direct impacts to state jurisdictional waters would include the removal of native vegetation including some areas characterized by microphyll woodland, the discharge of fill, degradation of water quality, and vegetation removal. Indirect impacts could include alterations to the existing topographical and hydrological conditions and the introduction of non-native, invasive plant species. As described previously the diversity and episodic nature of streams and streambed materials creates habitat niches within the floodplain for wildlife. Operational impacts would include routine mowing of vegetation, vehicle access, weed abatement, mirror washing and facility maintenance. Desert washes downstream from the project area, comprising approximately 32 acres of state waters, would be indirectly impacted as a result of changes to upstream hydrology; however these effects would be minimal as flows would be allowed to pass through the site. Nonetheless, a small portion of these waters could be affected through the spread of weeds or disruption of flows.

Staff considers direct and indirect impacts of the project to approximately 374.7 acres of state jurisdictional waters to be significant. The extensive ephemeral drainage network at the project site currently provides many functions and values, including landscape hydrologic connections, stream energy dissipation during high-water flows that reduces erosion and improves water quality, water supply and water-quality filtering functions, surface and subsurface water storage, groundwater recharge, sediment transport, storage, and deposition aiding in floodplain maintenance and development, nutrient cycling, wildlife habitat and movement/migration, and support for vegetation communities that help stabilize stream banks and provide wildlife habitat. The project would eliminate most of these functions and values from mowing, weed abatement, and the operation and maintenance of the facility. Because the site would be fenced; remaining habitat features would not be available to many species of wildlife.

Staff and CDFW agree that acquisition and enhancement of off-site state waters would mitigate project impacts for the PSEGS and would be consistent with the Commission's decision for the PSPP. The Energy Commission adopted a 3:1 mitigation ratio for desert dry wash woodland as required by guidelines in the Northern and Eastern Colorado Desert Coordinated Management Plan (NECO) (BLM-CDD 2002) and a 1:1 mitigation ratio for the loss of ephemeral dry wash habitat.

Table 3 of the project owner's Supplemental Spring 2013 Biological Survey Report (Palen 2013ii) identifies indentifies the expected direct and indirect impacts to state waters that would occur from the implementation of the PSEGS project. Condition of Certification **BIO-21** provides the specifics of impact avoidance and mitigation measures for impacts to ephemeral drainages of the Project Disturbance Area. Implementation of Condition of Certification **BIO-21** would reduce project impacts to state waters to less-than-significant levels.

Impacts to Wildlife Connectivity

The entire valley floor in this region is an important corridor that links the mountain ranges together (Solar Millennium 2010a), and the culverts under I-10 are an important component of the corridor. The operation of the I-10 fragments the valley floor and makes it difficult for wildlife to disperse between mountain ranges. Wildlife likely relies on these culverts to cross the I-10 because high traffic volumes likely cause wildlife to avoid crossing over the I-10, which is raised well above existing grade.

Project impacts to the network of ephemeral drainages and the placement of perimeter fencing at the site would adversely affect wildlife connectivity, and would impede the ability of wildlife to move through washes and under I-10 in the project area. Surveys conducted by Solar Millennium (Solar Millennium 2010a) and field observations by staff indicate that the culverts and associated major washes are used by a variety of wildlife, including deer, coyote, roadrunner, black-tailed jackrabbit, gray fox, Gambel's quail, woodrat, and other small rodents. The project owner's biologists found both recent and old tracks indicating culverts are important crossing points for wildlife as they move between mountain ranges and along the valley floor. Partial fencing on the box culvert under I-10 at the central wash, and complete fencing on the eastern culvert impedes some wildlife from using the culverts. CDFW reports that numerous tracks have been noted around three bridges under I-10, close to the site (M. Rodriquez pers comm.).

Solar Millennium (prior project owner) conducted additional surveys and provided the report *Wildlife Movement and Desert Tortoise Habitat Connectivity* (AECOM 2010f). This report includes the location and photographs of 24 underpasses under I-10 along a 32-mile stretch between Desert Center and Wileys Well Road and further details describing five underpasses closest to the PSEGS project. The majority of these underpasses are suitably open enough to allow wildlife movement, and many provide moderate cover as well. This includes the underpasses closest to the PSEGS project. Staff concluded that with implementation of proposed conditions of certification the PSPP project would not result in significant unmitigated impacts to connectivity for desert tortoise and other wildlife. Impacts to connectivity would be similar for the PSEGS project and no changes to conditions of certification are proposed. Conditions of certification include **BIO-9**, #1, which requires construction of desert tortoise exclusion fencing on both sides of I-10 to direct desert tortoise and other wildlife to safe passage under the freeway bridges. See "Impacts to Desert Tortoise" subsection for a further discussion of fencing along I-10.

Impacts to Sand Transport Corridor and Sand Dune Habitat

The northeastern portion of the project lies within in the Palen Dry Lake–Chuckwalla sand transport corridor as mapped in the Preliminary Geomorphic Aeolian and Ancient Lake Shoreline Report (Geomorphic Report) (Solar Millennium 2010b). The Geomorphic Report (page 22, Solar Millennium 2010b) divides the sand transport corridor into different zones based on the amount of sand transported, noting that Zone 1 (off the project site) transports "a minimum of 80 percent" of the total volume of sand within the corridor, sand migration within Zone 2 is described as "moderately strong", and sand transport in Zone 3 is "relatively low."

For the PSPP, staff concluded that the intrusion of the project within an active sand transport corridor, Zone 2, and to a lesser extent Zone 3, would have significant on-site impacts and would interfere with the creation and maintenance of sand dunes off-site. The Palen Dry Lake–Chuckwalla sand corridor is a major source of sand that supports downwind sand dunes; because most sand transport takes place close the ground (a general rule of thumb is that 90 percent of sand transport occurs within 6 feet of the ground surface) wind fences and solar arrays would effectively block sand transport.

The PSPP would also have had offsite impacts, cutting off the supply of sand within the PSPP Project Disturbance Area that would otherwise have been transported downwind to other dune areas, and would deflate downwind sand dunes, gradually diminishing their depth and extent over time as sand output exceeds sand input. New sand that would have been transported across the project footprint from upwind would potentially be cut off by drainage ditches, wind fences and above ground infrastructure. Staff modeled the indirect impacts to these sand transport zones, including impacts by percent reduction in sand input to areas downwind of the PSPP project. The PSEGS project has been designed to eliminate the PSPP project's 30 foot tall wind fences that contributed to disruption of the sand transport (Palen 2013a). The revised PSEGS project boundary is proposed to be defined by an 18-inch tortoise fence surmounted by a 7- foot chain-link fence, which will have a very different effect on wind flow and sand transport. The project owner assumed 39.7 acres of indirect impacts for the private parcel adjacent to project site that would be surrounded on three sides by project fencing (Palen 2013a). The project owner initially assumed with removal of the 30 foot tall wind fence required for the PSPP that all sand would flow through site unrestricted and the heliostats would behave in a similar fashion to desert plants as it relates to blocking sand transport (April 17, 2013 workshop). Staff subsequently undertook an independent modeling effort to ascertain indirect effects to Zones II and III of the sand transport corridor (CEC 2013v). Staff utilized the "PWA Model" (included as **APPENDIX A**) which was also used for the original project proceeding. The project owner also prepared an assessment of the transport corridor, without the incorporation of a model (Palen 2013kk). While the results of these two reports have fairly similar conclusions regarding direct impacts, the predictions of indirect effects showed more considerable deviation. Both staff's modeled results and the project owner's assessment of the effects of the PSEGS project to be greater than either of the Reconfigured Alternatives 2 or 3. While the wind fence from the PSPP project did indeed block sand transport, the new project footprint and facility features, such as size and number of pylons used to support heliostats, and the presence of the towers and the footings they require, has, in fact, greater effects to the sand transport system than the PSPP project. The PWA model does have limitations, and the report (CEC 2013v) acknowledges uncertainty in offsite impacts. The PWA model also is limited in predicting the extent of degradation would actually be realized off the project site. Refer to **Table 6b** for the acreage of direct and indirect impacts sand transport corridor.

Biological Resources Table 6b
Acreage of Direct and Indirect Impacts to Sand Transport Corridor

	PSEGS Modifed Project (acres)	PSPP Reconfigured Alternative 2 (acres)	PSPP Reconfigured Alternative 3 (acres)
Direct Impacts to Zone II	267	140	150
Direct Impacts to Zone III	893	540	640
Total Direct	**1,160**	**680**	**790**
Indirect Impacts to Zone II (25-50%, 50-75%, 75-100%) (Staff)	119 95 135 [348]	80 39 11 [130]	68 10 1 [79]
Indirect Impacts to Zone III (25-50%, 50-75%, 75-100%) (Staff)	9 10 54 [73]	3 6 5 [14]	6 9 1 [16]
Total Indirect (Staff)	**421**	**144**	**95**
Indirect Impacts to Zone II (0-50%, 50-100%) (Project Owner)	158 111 [269]	n/a	n/a
Indirect Impacts to Zone III (0-50%, 50-100%) (Project Owner)	23 67 [90]	n/a	n/a
Total Indirect (Project Owner)	**359**	**n/a**	**n/a**

The project owner has suggested that only blockages of 50% or more to the sand transport corridor should be mitigated. Staff disagrees with this approach. The project owner has submitted no documentation supporting this approach, while an abundance of literature exists demonstrating the adverse effects of sand corridor blockages to dune-dependant ecosystems and species, including Mojave fringe-toed lizard (Turner et al 1984, Barrows 1996) and special status plants. Blockages in the sand transport system start a cascading chain of events. When sand supply is interrupted, deflation of the area begins to occur, as enough sand is not available to maintain the dune structure, and wind and surface water flow continue to move sand out of the area. As this deflation occurs, a successional shift in the type of cover of plant species inhabiting the dunes will occur, and generally, the dunes will become stabilized over time as plant roots and corresponding biota accumulate. And even if deflation (the loss of sand) is not rapid or significant, the lack of new sand coming to the dunes will result in stabilization. Sand sheets and patch size are highly influential in distribution and movement of Mojave fringe-toed lizard (Barrows and Allen 2007, Barrows 1996), and perturbations should appropriately be mitigated. Furthermore, this matter has already been before the Commission. During the original permitting process for the PSPP, staff used the threshold of 25% percent sand corridor blockage. This approach is fundamental to condition of certification **BIO-20**, which was adopted in the Final Decision for the PSPP project (CEC 2010f). Therefore, staff has continued to use the threshold of 25 percent corridor blockage to be significant, and believe this level of habitat degradation should be mitigated, consistent with the mitigation approach for the PSPP.

The PSPP also had an impact on sand transport by eliminating the network of desert washes throughout the site and replacing them with engineered channels (**BIOLOGICAL RESOURCES APPENDIX A**). Part of the sediment-delivery system that contributes to active sand dunes northeast of the project area consists of fluvial depositional areas fed episodically by ephemeral streams. Finer fluvial sediments (typically sand size and finer) are mobilized in the sand transport corridor, which may be recharged with fine-grained sediment during large flood events. Project construction on the alluvial fans and alteration of stream channels by channelization may have reduced the amount of fluvial sediment reaching the depositional areas upwind of sand dunes. The proposed PSEGS eliminates the large drainage control channels and the majority of the project site would maintain the original grades and natural drainage features (Palen 2012a). However, indirect impacts to sand transport would be greater for the PSEGS than the PSPP primarily due to the heliostat array. The PSEGS heliostat array is predicted to have a very significant effect on sand transport such that sand transport will be reduced by 93% at 1,738 feet into the array (CEC 2013v).

The approved PSPP, Reconfigured Alternatives 2 and 3, shifted the project footprint out of the sand transport corridor, and thus avoided substantial interference with the sand transport corridor and reduced impacts to sand dune dependent species such as Mojave fringe-toed lizards. The PSEGS project footprint is still within the sand transport corridor and the heliostats field intrudes further than wind fence for the PSPP Reconfigured Alternatives 2 and 3 (Refer to **Figure 5b**). Therefore the PSEGS would have greater effects than either of the approved Reconfigured Alternatives 2 or 3. The direct and indirect impacts of the PSEGS on sand dunes and the processes that support them would significantly affect sand dune-dependent species such as Mojave fringe-toed lizards, and could also impact Harwood's woolly-star, Harwood's milk-vetch and sand dune-dependent insect species. The direct, indirect and cumulative impacts of PSEGS to sand dune habitat would still be considered significant but can be mitigated to less-than-significant levels with implementation of staff's proposed Condition of Certification **BIO-20** (Sand Dune Community/Mojave Fringe-Toed Lizard Mitigation).

Impacts to Groundwater-Dependent Vegetation from Groundwater Pumping and Project Groundwater Use

The modified project would use less groundwater during both construction and operation than the originally approved PSPP project. Construction groundwater use is stated to be 1,130 acre-feet per year (AFY), a reduction from the original permitted project groundwater consumption of 1,917 AFY. Operational groundwater use is stated as 201 AFY, a reduction of nearly 100 AFY. No further analysis has been conducted for the modified project, as the original analysis is considered conservative, tailored to mitigate for greater impacts, and therefore is still fully protective of groundwater dependant resources. The following analysis is predominately taken from the PSPP RSA.

Groundwater levels near the project's water supply wells will decline during the project pumping (Galati & Blek 2010i, Soil and Water Figures 2 and 3). During the operation phase only 300 acre feet per year (AFY) would be required for this dry-cooled project. However, to supply the needed quantity of water during construction, and because of the uncertainty in well yield due to the limited number of well tests, the project proposes to install and operate *up to* 10 wells on site, or as needed to yield 5,750 AFY for the 39-month duration of construction.

Groundwater pumping could have significant impacts to biological resources if it lowers the alluvial (shallow) aquifer water table in areas where groundwater-dependent ecosystems occur. Based on a worst-case analysis that assumes no groundwater recharge during the 30-year life of the project, groundwater in the deep fossil aquifers where water would be extracted[5] is predicted to drawdown between approximately 0.1 feet and 5 feet within a 2-mile (approximate) radius centered on each project well (Galati & Blek 2010i, Soil and Water Figures 2 and 3).

The present-day shoreline of Palen Dry Lake ("Palen Lake") is located approximately 2 miles from the nearest project pumping well; the northeastern-most well. The area between this well and Palen Lake supports habitats associated with shallow groundwater, including alkali sink scrubs of iodine bush (a facultative wetland[6] species) and bush seep-weed (facultative), and scattered stands of honey mesquite (Solar Millennium 2009a; Evens & Hartman 2007; Sawyer et al. 2009; Silverman pers. comm.).

The extent to which this drawdown will also occur in the alluvial (shallow) aquifer that supports groundwater-dependent ecosystems is dependent on the extent to which the

---

[5] Water would be pumped from the "Bouse Formation" deep aquifer; see Section C.9 Soil & Water Resources for a detailed discussion of the groundwater analysis.

[6] Facultative Wetland = Usually occurs in wetlands (estimated probability 67%-99%), but occasionally found in non-wetlands; Facultative = Equally likely to occur in wetlands or non-wetlands (estimated probability 34%-66%). The wetland indicator categories should not be equated to degrees of wetness (USFWS 1993).

confining or separating layers of impermeable clays (the "aquitard") have been fractured by faulting (Worley-Parsons 2010). Worley-Parsons (2009) contend that the two aquifers are fully contained and separated by confining layers of low permeability sediments, citing the *Geologic Map of the Blythe Quadrangle* (Stone 2006) and the *Chuckwalla Valley Groundwater Basin Description* (DWR 2004) as evidence that faults are not known to extend upward into the basin fill materials. In Data Response S&W #197 (AECOM 2010a), from the PSPP proceeding the applicant stated: "*The results of the aquifer testing on the PSPP site suggest there is interconnectivity between shallow and deeper aquifer units below the site*..... *Draw downs of up to 10 feet were observed during the constant-rate discharge test, suggesting a component of vertical flow and connectivity to the overlying sediments. While it is not certain whether the former water supply well tested was gravel packed and if the gravel pack extended to the surface, it is probable that there was some measure of vertical influence*."

Staff concurs that the position of the site near the playa, where finer sediments predominate, combined with a history of relatively little faulting, suggest that the confining layers are more likely to be intact and with less vertical movement of groundwater between the shallow and deep aquifers than areas with more faulting and coarser-grained fills. However, the evidence does not preclude the possibility for fracturing and vertical hydraulic conductivity and the potential for drawdown in the shallow aquifer to lower the groundwater below the effective rooting level for some species, particularly the shallower-rooted sink scrubs. Further, the resources at risk are rare and sensitive habitats that support a wide variety of special-status plant and animal species. Staff is particularly concerned about those that occur in close proximity to the proposed pumping wells because: 1) the significance of the drawdown (5 to 10 ft in some areas just off the northeastern boundary 2) because the drawdown will occur quickly (within a few years), and 3) the effects of pumping are greatest near the well.

Because the evidence is not conclusive, staff supports a more conservative approach and recommends long-term monitoring and adaptive management in the event that adverse effects are detected. This adaptive approach is discussed in more detail under "Mitigation", below, and in Condition of Certification **BIO-23** and **BIO-24**.

Groundwater-Dependent Ecosystems and Phreatophytes in the Project Area

The groundwater-dependent ecosystems and other habitats at risk are documented as rare natural communities by the California Department of Fish and Game Vegetation Program (CDFG 2003). Some are also BLM NECO Sensitive communities. Groundwater-dependent ecosystems documented in the area of predicted drawdown (Solar Millennium 2009a; Evens & Hartman 2007; Sawyer et al. 2009; Silverman pers. comm.) include:

- Honey mesquite woodlands (mostly small groves);
- Alkali sink scrubs (dominated or co-dominated by bush seep-weed, iodine bush, fourwing saltbush, spinescale, and allscale);
- Sparsely vegetated playa lake beds;
- Jackass clover unique stands (a special-status plant);
- Stabilized and partially stabilized dunes (mesic dune swales), and

- Microphyll woodlands (ironwood and palo verde desert wash woodlands)

Groundwater-dependent ecosystems are an important component of biological diversity in the California Desert region. Because they are rare or limited in distribution, they often support rare or special-status plants and animals, and the project area is no exception: in the area predicted to incur the greatest drawdown, *i.e.*, surrounding the northeastern well, special-status species documented include Mojave fringe-toed lizard, American badger, desert kit fox, Harwood's woolly-star, Harwood's milk-vetch, jackass clover, ribbed cryptantha, a newly discovered species (or taxon) of saltbush, and a historic occurrence of a species presumed extinct in California: mesquite nest straw (AECOM 2010v, CNDDB 2010, CCH 2010). Ground waters are important to sustain vegetation for wildlife habitat in areas where surface waters are not present (RWQCB 2006). Common mammals observed and/or associated with the habitats in the area where drawdowns are predicted include: black-tailed jackrabbits, round-tailed ground squirrels, white-tailed antelope ground squirrels, kangaroo rats, kit foxes, and coyotes. The most common birds include: horned larks, loggerhead shrikes, lesser nighthawks, ravens, black-throated sparrows, and white-crowned sparrows. Reptiles observed or expected to occur include: zebra tail lizards, desert horned lizards, desert iguanas, Mojave fringe-toed lizards, western whiptail lizards, coachwhips. Other important species observed in this area include these special-status birds: ferruginous hawk, northern harrier, and Swainson's hawk (AECOM 2010d).

Use of Groundwater by Phreatophytes

Within the 2- to 3-mile radius drawdown zone, the GDEs are dominated or defined by "phreatophytes". Phreatophytes have deep roots that extend down to, and extract water from a periodically stable water supply, including the capillary fringe, *i.e.*, the zone just above the water table that is not completely saturated, where water is lifted up by capillary action, or surface tension (Brown et al 2007). Even though the groundwater may never be visible at the ground surface, as it is in a wetland or spring, phreatophytic ecosystems can still be groundwater-dependent (Naumberg et al 2005).

The use of groundwater may not be year-round by phreatophytes. In these instances, other water sources are used during the rainy season but groundwater is used in the dry season (Froend & Loomes 2004). In the project vicinity, for example, phreatophytes may utilize precipitation, stormwater runoff, or temporary ponding on the playas during the rainy season, and use groundwater during the dry season. There is also growing evidence that the dimorphic shallow and deep root systems of some phreatophytes (*e.g.*, honey mesquite) that alternately act as conduits that potentially redistribute water from moist layers to dry layers, a phenomenon termed "hydraulic redistribution" (Hultine et al 2003) that may play an important role during summer drought for surrounding shallow-rooted species and perhaps for the larger ecosystem (Brown et al 2007; Caldwell et al. 1998).

Obligate versus Facultative Phreatophytes

Desert phreatophytes are a complex group of species with varied adaptive mechanisms to tolerate or avoid drought. They should not be considered simply as a group of species that avoid desert water stress by utilizing deep ground water unavailable to other desert species (Nilsen et al 1984). There are two types of phreatophytes:

1) Obligate phreatophytes, which are deep rooted plants that only inhabit areas where they can access groundwater, via the capillary fringe, to satisfy at least some proportion of their environmental water requirement. Access to groundwater is a critically important to their presence in a landscape; and

2) Facultative phreatophytes, which are deep rooted plant species that tap into groundwater, via the capillary fringe, to satisfy at least some portion of their environmental water requirement, but will also inhabit areas where their water requirements can be met by soil moisture reserves alone. That is, the species will be groundwater dependent in some environments, but not in others.

Determination of Groundwater-Dependency

The dependence of these species on groundwater is a function of the hydrogeologic setting of the ecosystem, which governs whether a shallow water table exists that the species can use. Groundwater levels beneath the southeastern portions of Palen Lake, and a small ancillary playa located approximately one mile southeast of Palen Lake, were reported by Steinemann (1989) as being 20 to 30 feet below ground level. With capillary rise, this would be well within the reach of many or most of the phreatophytes known to occur here.

The identification of phreatophytic ecosystems can be challenging because there is no comprehensive list, but the following are general guidelines for deciding if an ecosystem or species is phreatophytic (Brown et al 2007; LeMaite et al 1999; Froend & Loomes 2004):

- It is known or documented to depend on groundwater, expert opinion or local knowledge can be useful in making a determination as some species' dependence varies by setting;
- A species known to have roots extending over a meter in depth;
- The community occurs in areas where the water table is known to be 'near' the surface;
- In arid regions, the herbaceous or shrub vegetation is still green or has a high leaf area late in the season (compared to other dry areas in the same watershed that do not have access to groundwater).

Additionally, stable isotope analysis can be used to identify whether groundwater is supplying the species' or ecosystem water needs (Froend & Loomes 2004).

The key ecosystem attributes of phreatophytic ecosystems include one or more of the following attributes (Brown et al 2007):

- The depth below surface of the water table;
- The chemical quality of the groundwater or soil, as expressed in terms of pH, salinity, or other nutrients (or contaminants).

Response to Water Stress

The response of these ecosystems to change in these attributes is variable (SKM 2006). The phreatophytes known to occur in the project area are mostly facultative phreatophytes (Steinberg 2001; USFWS 1993; and others). Phreatophyte trees and shrubs have a range of strategies for dealing with water stress and some species are better adapted to deal with water stress than others, whether they are obligate or facultative phreatophytes. There is insufficient information available to assess whether facultative phreatophytes have a greater resistance to change in groundwater condition than obligate phreatophytes. However, obligate phreatophytes are less resilient than facultative phreatophytes and will only grow in areas where specific groundwater conditions exist, and require uninterrupted access to the water table; all of these species are groundwater-*dependent*. “Facultative” phreatophytes, however, can use groundwater if it is available but they can also occur in settings where groundwater is not available (Naiman et al 2005).

A plant affected by competition for water displays signs of stress (e.g. Manning and Barbour 1988), and stress can be manifested as anything from diminished physiological processes to plant death. Lowering the local water table from groundwater pumping has been demonstrated to cause habitat conversions and reduce plant cover where pumping causes water levels to drop below the effective plant rooting depths, increasing wind erosion of the soil and affecting air quality, and native habitats converted to invasive exotic communities (Patten et al 2007; Lovich 1999; Manning 2006).

Secondly, declining water tables may *reduce* the amounts of salts and water wicked to the surface by capillary action, potentially altering the chemistry of surface soils (Patten et al. 2007) around the playa (Palen Lake) margins. If the surface salinity decreases, it could render the habitat unsuitable for the halophytes (salt-adapted plants) that make up these ecosystems, which includes several rare or special-status plants, and cause a habitat conversion to non-halophytes (Dodd & Donovan 1999). Reduced surface salinity may be an expected response of regional groundwater withdrawal for urban expansion and other uses in the Great Basin and Mojave Deserts (Patten et al. 2007), and now also in the Sonoran Desert of California for solar thermal development and other groundwater uses.

As Elmore et al. (2006) and Manning (2007) showed, as water table is lowered by pumping, total live plant abundance (plant cover) on a site decreases correspondingly. Shallower rooted herbs are the first affected and least adapted; deep-rooted woody phreatophytes can take many years longer to die, but the effects of stress may be evident in indicators of plant vigor that would not be visible in an aerial photo. Non-native opportunistic “weed” species (e.g., Russian thistle) are better adapted to nutrient-poor soils and wider variety of soil moisture regimes or conditions, and may demonstrate a competitive edge. Lower plant cover can also lead to increased soil erosion, due to wind or water, leading to loss of nutrients, minerals, and structure necessary for seed germination of plants adapted to prior groundwater conditions on the site. The complex below-ground systems of bacteria, algae, and fungi, which provide many valuable ecosystems services (e.g. breakdown of organic matter, nitrogen fixation, carbon storage, and recycling of nutrients) are also disrupted when water tables are lowered. Ultimately, if pumping lowers the water table below the effective rooting depth of the predominant species, a decline in plant cover and change in species abundance due to groundwater withdrawal from groundwater-dependent ecosystems may result in severe consequences, depending on the organism(s) involved or the prevailing ecosystem processes (Manning 2009).

Animals, including mammals, reptiles, birds, and invertebrates, who may require certain plant species or a certain vegetation structure, may no longer find suitable food or living space. Local extirpations are compounded if the displaced animal is an important food source for another animal. If the vegetation is dependent on the groundwater aquifer, but the decline in water table depth is minor and/or temporary (i.e., a minor drawdown and restored to spring baseline levels following construction), the ecosystem effects may be correspondingly minor or temporary, depending on the time required to refill the impacted aquifer.

Impacts to Springs

According to the prior project owner's (Solar Millennium) analysis of the potential impacts of the project pumping to area springs (AECOM 2010a, DR 181-233):

> *"Corn Spring appears to derive its water from precipitation falling onto the Chuckwalla Mountains, and movement of groundwater under pressure along an historic fault that bisects the mountains. Groundwater extraction from the PSPP site will not affect Corn Spring. According to the NWIS database, seeps and surface discharge/outfall (along with streams, lakes, wetlands, and diversions) are categorized as "surface water sites" and four sites are located in the Chuckwalla Valley Groundwater Basin. One of the four locations is the aforementioned Corn Spring Wash, while two other sites are located near the northern edge of the Chuckwalla Mountains approximately eight and 13 miles west of the PSPP site. Water in these three sites appear to originate from infiltration of precipitation that falls on the Chuckwalla Mountains as all three sites are located either within the Chuckwalla Mountains or are less than one mile downslope from the Chuckwalla Mountains. At this great distance and given the source of water to the sites, groundwater extracted from the PSPP site will not affect these three sites. The fourth "surface water site" listed in the NWIS database for the Chuckwalla Valley Groundwater Basin is Coxcomb Wash, located approximately eight miles northwest of the PSPP site. Coxcomb Wash is an ephemeral dry wash that flows southeastward from the Coxcomb Mountains. As a result, groundwater extracted from the PSPP site will not affect the flow of water in Coxcomb Wash. The locations of Corn Spring and other "surface water sites" identified in the NWIS database and through the several other data sources are shown on Figure DR-S&W-193. The sites are listed on Table DR-S&W-193-1."*

McCoy Spring is located at an elevation of 889 feet at the outlet of a bedrock canyon near the toe of the western slope of the McCoy Mountains, approximately 15 miles to the northeast of the project. According to the groundwater investigation conducted by Worley-Parsons (2009):

"Springs may be considered surface extensions of the local groundwater system; however, springs and seeps that occur near the interface between bedrock mountains are often associated with base flow discharge or perched aquifers that are part of a separate groundwater flow system that originates in the surrounding mountains and do not have direct hydraulic connection to the adjacent basin aquifer system. Based on the close proximity of bedrock outcrops to the spring, it likely represents baseflow discharge from the McCoy Mountains. As such, it does not appear to have a direct hydraulic connection to groundwater levels in the Chuckwalla Valley Groundwater Basin, which occurs in the basin fill materials to the west of McCoy Spring. They concluded that a groundwater level drawdown of many feet would be required to cause a change in the baseflow discharge from the McCoy Mountains."

The **SOIL AND WATER RESOURCES** section provides a discussion of potential project impacts to springs. Biological Resources staff agrees with the conclusion that springs would not be affected by project groundwater pumping. This conclusion is based on the distance of the project from these features, as well as the bedrock geology and physiographic setting.

Impacts to Non-Phreatophytes

The proposed groundwater pumping could also potentially cause some loss of habitat function or value for drought-tolerant, upland species that occur in close proximity to a pumping well. Creosote bush are not characteristically dependent on groundwater but could be affected if a significant drawdown were to occur quickly and in an area where this shallow-rooted species is accustomed to the regular availability of soil moisture. The permanent diversion of surface flows north of I-10 after construction of the freeway and diversion dikes has had a marked adverse effect on the vigor of the creosote scrub community, apparent in the stunted, depauperate shrubs, low cover density and low species diversity. These drought-adapted and shallow-rooted species are typically supported by precipitation (or, in the I-10 example, by sheet flow). It is unclear if a drawdown in the groundwater would significantly affect the creosote bush scrub close to the wells but staff remains cautious and recommends sampling the creosote bush scrub habitats in the long-term monitoring program (see "Mitigation for Impacts to Groundwater Dependent Plant Communities", below).

Monitoring for Early Detection of Potential Impacts

In general, the hydrologic threshold for vegetation change is not well understood (Patten et al. 2007) but is expected to occur as tolerance levels, along a gradient from wetland to upland, or beginning with the obligate or least resilient species, depending on the depth, timing and duration of the drawdown, and where tolerances are exceeded for the dominant plant taxa.

Patten, Rouse & Stromberg (2007) suggest that on-site monitoring is critical for detecting impacts, and, in addition to monitoring groundwater responses, emphasize direct monitoring of ecosystem function (Eamus et al 2006; Lake & Bond 2007; Stromberg et al 2006). Long-term vegetation data are capable of providing early warning signs of impending changes in ecosystem processes (Patten et al. 2007). Combined with the data on groundwater and climate, sampling of plant communities can provide sensitive metrics for assessing ecological changes over time. However, to ensure that the information is appropriate for management, it is important that monitoring and analysis be designed to test for magnitudes of changes rather than just existence of change, a phenomenon which can occur under disturbance or non-disturbance conditions.

Mitigation for Impacts to Groundwater Dependent Plant Communities–

Two conditions of certification, **BIO-23** and **BIO-24** were required for the PSPP project. No new or additional impacts were identified in conjunction with the modified project, and therefore no new conditions, or edits to the existing Conditions of Certification **BIO-23** or **BIO-24** (described further below), other than updates to dates and map references, are necessary. Condition of Certification **BIO-23** provides specifications and performance standards for the development of a detailed, peer-reviewed Vegetation Monitoring Plan (Plan). Monitoring would occur for the life of the project. In addition to monitoring indicators of plant vigor, water table monitoring and soil core sampling will also be used to provide additional warning signs of impending changes and ensure that remedial action is taken before effects reach a level of plant mortality or significant impairment of the habitat function and values.

Condition of Certification **BIO-24** requires the project owner to take remedial action if the monitoring described in **BIO-23** detects declining spring and post-monsoon water tables in the alluvial (shallow) aquifer—in any amount greater than the baseline seasonal variability— in combination with a decline in plant vigor of greater than 20 percent when compared to the same plots pre-disturbance. Remedial measures described in **BIO-24** establish a performance standard of restoring the groundwater tables to baseline levels by: 1) relocating the project pumping well to another location where the groundwater-dependent vegetation is no longer within the area of groundwater drawdown, or 2) reducing the project water usage through water conservation methods or new technologies to a level required to restore groundwater levels in the shallow aquifer to pre-impact levels.

One of the possible remedial actions required in Condition of Certification **BIO-24** is installation of a new well in a location that avoids impacts to phreatophytic plants or plant community. Because the location of the new well cannot be within an area that supports phreatophytic species or communities, staff has provided the following criteria for deciding if an ecosystem (or species) is phreatophytic (Brown et al 2007; LeMaite et al 1999; Froend & Loomes 2004):

- It is not known or documented to depend on groundwater, based on scientific literature or expert opinion (local knowledge can be useful in making a determination as some species' dependence varies by setting);
- The species are not known to have roots extending over a meter in depth;
- The community does not occur in an area where the water table is known to be 'near' the surface (relative to the documented rooting depths of the species);
- The herbaceous or shrub vegetation is not still green and/or does not have a high leaf area late in the dry season (compared to other dry areas in the same watershed that do not have access to groundwater).

Special-status Species: Impacts and Mitigation

Desert Tortoise

Direct Impacts

Protocol-level surveys for desert tortoise were conducted for the PSPP project site and linear facilities between March 17 and May 22, 2009 (study area except substation) and October 24 to 25, 2009 (substation site and buffer). Clearance surveys were conducted on portions of the PSPP project site in 2010. Surveys conducted in 2009 detected 17 burrows (Class 3–5), 15 tortoise pallets (Class 4 or 5), and 19 tortoise shell remains (Class 5) in the project area (AECOM 2010a). Surveys conducted in 2010 identified seven tortoises (adult and juvenile) in the project area including four along the generation tie line and three tortoises south of I-10, the latter being outside of the Project Disturbance Area and buffer area. Only one tortoise was detected in the Project Disturbance Area along the gen-tie line for the PSPP project (Solar Millennium 2010k, Table 1 and Figure 1). Desert tortoises were not detected on the PSPP solar field.

Protocol surveys for desert tortoise were conducted for the PSEGS project from April 7 to April 30, 2013. These surveys were limited to areas not previously surveyed for the PSPP project and included portions of the generation tie-in and the new natural gas pipeline alignment. Desert tortoises were not detected during these surveys (Palen 2013m). Two desert tortoise burrows showing sign of recent occupation were detected on the generation tie-in south of I-10 and a possible burrow was noted in a survey buffer north of the freeway (Palen 2013m). Supplemental surveys for desert tortoise were not conducted in the Project Disturbance Area of the solar field for the PSEGS project.

In public workshops, status reports, and in a comment letter on the PSA the Center for Biological Diversity (CBD) raised concerns regarding the age of the desert tortoise surveys for the PSEGS project; contending that the surveys were out of date and not in conformance with guidelines identified by the USFWS (TN# 200055 CBD letter 7-29). Staff considered the age of the surveys and coordinated with agency staff during preparation of the PSA and FSA. The guidelines identified in the Desert Tortoise Recovery Plan are recommendations when working in desert tortoise habitat to facilitate permitting. Please see Response to Public and Agency Comments, below, for additional information regarding the timing and age of the surveys.

Although desert tortoises were not detected on the project site this species is known to occur in the project region. Desert tortoise sign is present on the project site and the species has been periodically detected in adjacent habitat. In addition, for the PSPP project resource agency staff located a possible desert tortoise burrow near the bridge associated with the large wash that flows into the center of the Project Disturbance Area (LaPre, pers. comm.). Potential desert tortoise burrows were noted by staff during reconnaissance level surveys of the project area during April 2010 and April 2013. Additional observations of desert tortoise from project buffers for the PSPP project were included in the Revised Desert Tortoise Technical Report (Galati & Blek 2010b, Revised Desert Tortoise Technical Report). **Biological Resources Figure 7** identifies desert tortoise sign detected by the project owner during surveys of the PSPP and PSEGS project site.

Although desert tortoise were not detected on the solar field and only a small number of desert tortoises were detected in the buffer area it is likely that the project area supports desert tortoise that were not observed by the surveyors. Desert tortoises are frequently unavailable to be sampled by field crews because they make extensive use of underground shelters (Nussear 2004). Similarly, desert tortoises spend much of the year in burrows even during the active season (Woodbury and Hardy 1948; Marlow 1979; Nagy and Medica 1986; Bulova 1994), and only the proportion of the tortoise population that is above ground is usually sampled (Nussear 2004). In a study conducted at Marine Corps Air Ground Combat Center Twentynine Palms, Duda et al (1999) found that during the spring, desert tortoises were located above-ground 45 percent of the time in a productive year, compared with only 20 percent in a drought year. They further noted that surface activity declined from spring levels in the summer of both years, yet the difference between years was still significant. Desert tortoises were located on the surface 26 percent in the productive year and 11 percent in the drought year. Even when desert tortoise are active and above ground during the surveys only a subset of these animals are usually detected. This can lead to a violation of a critical assumption of the line distance sampling technique, namely, that all animals on the line are found (Anderson et al. 2001; Buckland et al. 2001).

In order to account for observer bias, weather conditions, and desert tortoise behavior the USFWS developed a predictive model (USFWS 2010) for estimating the expected range of desert tortoise that may be present based on the limited ability to detect animals during the surveys. The USFWS 2010 survey protocol takes into account the probability that tortoises would be present above ground based on the previous winter's rainfall and the fact that not all tortoises within the survey area are seen by surveyors. The model then provides a mathematical formula that is used to estimate the number of adult and subadult tortoises that are actually present. Statistical techniques can provide further estimates of minimum and maximum numbers of tortoises expected, within a 95 percent confidence interval. In addition, most juvenile tortoises and tortoise eggs are not detected during field surveys. The use of this model requires the detection of live adult or subadult desert tortoise; neither of which was detected on the proposed solar field. The absence of live tortoise data limits the ability of the model to provide statistically defensible estimates of desert tortoise density. Similarly, the fact that living desert tortoises were not detected during surveys does not suggest that desert tortoises are not present on the project site. Review of range wide data, existing site conditions and historic disturbance, and the results of the surveys completed to date suggest the site is expected to support a relatively low number of desert tortoise.

In a comment letter on the PSA the CBD raised concerns regarding the estimates of desert tortoise that may occur on the PSEGS project site. To support the preparation of the Biological Opinion (BO) for the approved PSPP project the USFWS used desert tortoises found in the buffer transects of the generation tie-in and regional estimates to estimate tortoise density for the project (Palen 2013m). Based on this information the USFWS concluded that two to twelve subadult or adult tortoises occupy the project site (USFWS 2011b). In addition to adult and subadult desert tortoises, the proposed project site is expected to support a population of juvenile tortoises that are not considered in the USFWS formula.

Juvenile tortoises are extremely difficult to detect because of their small size and cryptic nature. In many instances juveniles are overlooked during surveys. However, estimates of juvenile tortoise populations can be extrapolated using information based on a four-year study of tortoise population ecology conducted by Turner et al. (1987). This study determined that juveniles accounted for approximately 31.1 to 51.1 percent of the overall tortoise population. Using this range, the USFWS estimated between four and six juvenile desert tortoises may occur on the project site. The project site may also support the eggs of desert tortoise. The number of tortoise eggs that could be present on the project site was estimated by the USFWS based on the assumption of a 1:1 sex ratio and that all females present would lay eggs (clutch) in a given year. Applying the 1:1 sex ratio six out of the 12 desert tortoises could be reproductive females. Given one clutch per reproductive female in a given year multiplied by the average number of eggs found in a clutch (i.e., 5.8; see USFWS 1994b); approximately 35 eggs would be expected to occur in a given year (USFWS 2011b). However, fewer eggs are likely to be onsite at any given time because not all females are expected to be of reproductive age or elected to produce eggs during any given year.

Biological Resources Table 7a
Estimated Number of Desert Tortoise on the Project Site and Linear Facilities

Adult and Sub-adults*		**Juvenile Estimates***		**Eggs***	**Total Adult/Sub-adult and Juvenile**	
Lower	Upper	Lower	Upper		Lower	Upper
2	12	3	6	35	**5**	**18**

*All estimates of desert tortoise abundance are based on values identified in the 2011 Biological Opinion for the Approved PSPP (USFWS 2011b).

As part of its authority granted by the Warren-Alquist Act, the Energy Commission has in-lieu permitting authority for local and state agencies; therefore the State Incidental Take Permit (2081) for desert tortoise would be subsumed in the Commission Final Decision. For the purposes of this analysis staff considers the USFWS 2011 Biological Opinion for the approved PSPP project to provide a reasonable estimate of the expected number of desert tortoise that may occur on the PSEGS site. Because live desert tortoises were not detected during the surveys staff acknowledges that this data is based on the extrapolation of existing information. The actual number of desert tortoises that may occur in the project Disturbance Area is likely much lower. The actual number of desert tortoise encountered on the site, if any, will be quantified during pre-construction clearance surveys and monitoring during construction of the facility.

During construction of the project desert tortoises may be harmed during clearing, grading, and trenching activities or may become entrapped within open trenches and pipes. Construction activities could also result in direct mortality, injury, or harassment of individuals as a result of encounters with vehicles or heavy equipment. Other direct effects could include individual tortoises being crushed or entombed in their burrows, collection or vandalism, disruption of tortoise behavior during construction or operation of facilities, disturbance by noise or vibrations from the heavy equipment, and injury or mortality from encounters with workers’ or visitors' pets. Desert tortoises may be attracted to the construction area by application of water to control dust, placing them at higher risk of injury or mortality. Increased human activity and vehicle travel would occur from the construction and improvement of access roads, which could disturb, injure, or kill individual tortoises. Tortoises may seek shade and thermal cover by taking shelter under parked vehicles and can be killed, injured, or harassed when the vehicle is moved.

Use of paved roads, including I-10, and dirt access roads could result in mortality of desert tortoises by vehicle strikes. The potential for increased traffic-related tortoise mortality is greatest along paved roads where vehicle frequency and speed is greatest. Desert tortoises on dirt roads may be affected depending on vehicle frequency and speed. Data indicate that desert tortoise numbers decline as vehicle use increases (Bury et al. 1977) and that tortoise sign increases with increased distance from roads (Nicholson 1978; Karl 1989; von Seckendorf & Marlow 1997, 2002).

Construction activities that result in accidental fires can directly affect desert tortoise and their habitat. Because of the abundance of weeds in the region wildfires that result from welding, vehicles carelessly parked on vegetation, smoking, or other ignition sources pose a potential direct impact to desert tortoise and can quickly spread to off-site areas. Direct effects of fire on desert tortoise include mortality by incineration, elevating body temperature, poisoning by smoke, and asphyxiation (Whelan 1995). Small individuals such as hatchlings are more at risk from lethal heating than large ones because they have a higher surface to volume ratio that allows heat to penetrate their vital organs relatively quickly (Brooks and Esque 2002).

The prior project owner (Solar Millennium) recommended impact avoidance and minimization measures to reduce these impacts to desert tortoise, including installation of exclusion fencing to keep desert tortoise out of construction areas, translocating the resident desert tortoise from the project site, controlling construction traffic, reducing speed limits to decrease the incidence of road kills, and worker environmental awareness training programs.

Staff incorporated these recommendations into conditions of certification for the PSPP and PSEGS. Conditions of Certification **BIO-1** through **BIO-5,** requires qualified biologists with authority to implement mitigation measures be on site during all construction activities. Condition of Certification **BIO-6** requires the development and implementation of a Worker Environmental Awareness Program to train all workers to minimize impacts to sensitive species and their habitats. Condition of Certification **BIO-7** requires the project owner to prepare and implement a Biological Resources Mitigation Implementation and Monitoring Plan (BRMIMP) that incorporates the mitigation and compliance measures required by local, state, and federal LORS regarding biological resources. Condition of Certification **BIO-8** describes Best Management Practices and other impact avoidance and minimization measures.

Conditions of Certification **BIO-9** through **BIO-11** are specific to desert tortoise. Condition of Certification **BIO-9** requires installation of security and desert tortoise exclusionary fencing around the entire Project Disturbance Area and on portions of I-10 south of the project area. **BIO-10** requires the development and implementation of a desert tortoise relocation/translocation plan to move any desert tortoises found in the Project Disturbance Area to identified relocation or translocation sites. Condition of Certification **BIO-11** requires verification that all desert tortoise impact avoidance, minimization, and compensation measures have been implemented. These conditions are consistent with the Commission's decision for the PSPP.

Implementation of Conditions of Certification **BIO-9** and **BIO-10** have inherent risks and could themselves result in effects such as mortality, injury, or harassment of desert tortoises due to equipment operation, fence installation activities, removal of tortoise burrows, and tortoise relocation/translocation. These impacts are described in more detail below.

Impacts to Critical Habitat

The project area overlaps a portion of the Chuckwalla Desert Tortoise Critical Habitat Unit (Chuckwalla CHU). The Chuckwalla CHU is 1,020,600 acres (USFWS 1994b) and 228 acres would be directly or indirectly impacted by the PSEGS project (Palen 2013m). The functions and values of desert tortoise critical habitat north of I-10 are relatively low; however the presence of desert tortoise in this area has been detected. Habitat south of I-10 is better for desert tortoise and generally increases with proximity to the Chuckwalla Mountains. Both proposed substation sites are south of I-10, and are located in desert tortoise critical habitat. Southern California Edison (SCE) is currently building the Red Bluff substation and has provided mitigation for that project.

The critical habitat area overlapping with the project site contains at least three sizeable washes with major bridges that provide for dispersal and long term gene flow across I-10 which is needed to achieve population connectivity between the Chuckwalla and Chemehuevi critical habitat units. Although I-10 has disrupted the hydrology and associated microphyll woodland components of the lesser washes, the shrub and herbaceous annual vegetative components between the washes remain hydrologically unaffected and support comparable community characteristics with areas south of I-10. Since desert tortoise forage predominantly on annual plants, the hydrologic effects on the tree canopy do not affect foraging habitat characteristics. Therefore, while the habitat in this area may be considered low quality, the area is occupied (based on the presence of sign) and provides a vital role and function of the critical habitat designation for maintaining inter-DWMA population connectivity espoused in the species' recovery plan (USFWS 1994a).

Although the three major culverts under I-10 would remain open to desert tortoise movement, the project would disrupt local movement patterns by forcing tortoises to walk around the project site. Thus, tortoises north of the project site attempting to move in a southward direction would be diverted to the east or west, and the perimeter fencing around the project site would direct tortoises towards I-10 on the traffic surface (AECOM 2010b. Tortoise-proof fencing has not been installed along this segment of I-10, so desert tortoises moving around the project site rather than moving through washes would potentially experience increased rates of vehicular-related mortality. Increased mortality would further reduce local population levels and increase the adverse effects of habitat fragmentation by preventing dispersal between the Chuckwalla Mountains to the southwest and Palen Mountains to the northeast. Staff considers the potential increase in desert tortoise road fatalities to be a significant impact of the project. This impact would be reduced to less-than-significant levels with installation of desert tortoise exclusion fencing along I-10 south of the project site, as described in Condition of Certification **BIO-9** (Desert Tortoise Clearance Surveys and

Fencing). This proposed fencing is consistent with guidance in the NECO, which specifies that: "Interstate Highways 40 and 10 would be fenced by Caltrans along their common boundaries with DWMAs to preclude tortoise mortality and limit other wildlife mortality" (BLM-CDD 2002, page 2-29).

Impacts of Relocation/Translocation

For many projects the regulatory agencies require that desert tortoises be captured and relocated from the development site. This relocation is defined as "translocation" if a desert tortoises is moved more than a certain distance from their current location (i.e., typically greater than 500 meters/1642 feet). Although desert tortoises were not found on the proposed solar field it is likely that a low number of desert tortoises are present. If detected during clearance surveys, desert tortoises will require translocation to off-site locations.

Large scale land acquisition to support military training, residential and commercial development, and the construction of industrial level solar infrastructure projects has necessitated the use of translocation as a tool to minimize direct losses to desert tortoise and other sensitive wildlife. Construction of the proposed project would require the translocation or removal of all desert tortoises, including adults, subadults, and any juveniles that are found on the site during clearance surveys. An important consideration in assessing potential impacts from the translocation effort is establishing the proposed translocation sites. Translocation and control sites should occur on lands that can be managed for the protection of this species. The translocation of animals to privately held lands is not recommended by USFWS and CDFW, given the threat of future development and other inherent risks to desert tortoise associated with private land. The primary and secondary recipient sites identified for the approved PSPP project were located on roughly 11,129 ha (27,500 ac) of BLM lands in the Chuckwalla DWMA along the upper bajadas on the north side of the Chuckwalla and Little Chuckwalla Mountains (USFWS 2011b). Staff expects that additional information on the proposed translocation sites will be developed as part of the revised Desert Tortoise Translocation Plan prepared as part of **BIO-10**.

The distance of the translocation site from the project site also affects the methods used during the implementation of the plan. USFWS may require disease testing and quarantine for any tortoise translocated more than 500 meters (1642 feet). This requirement is intended to limit the potential exposure risk to healthy tortoises adjacent the project site. However, for each desert tortoise translocated to a long distance sites, two other tortoises must be handled, disease tested, and radio tagged. Therefore, a total of three tortoises are handled for each translocation event. Desert tortoises at the recipient site and control site are diseased tested and radio tagged in order to ensure that healthy animals are not being introduced into a diseased population and to track the animals post-release. In addition disease testing and radio tagging allows the agencies to track the mortality of translocated versus host or control populations; provides long term monitoring of the populations; and provides a mechanism for evaluating whether mortality occurs uniformly across the three groups. These requirements may not be enacted in the event that only short distance translocation occurs and if the number of desert tortoises is determined to be low (i.e., usually less than five animals).

The USFWS may limit the maximum number of desert tortoises that may be relocated to a particular area to minimize potential effects to the host population from resource competition. In order to assess this impact, additional information is required, specifically the density of desert tortoises inhabiting proposed translocation sites.

Translocation activities require the implementation of a series of actions. Some of the proposed activities include but are not limited to:

- The identification of the proposed translocation and control sites;
- The evaluation of the habitat quality on the translocation and control sites;
- A determination of existing tortoise density and an assessment of the sites ability to accommodate additional tortoises above baseline conditions;
- Pre-construction fencing and clearance surveys of the project site;
- The construction of holding pens for quarantined translocated tortoises prior to their release into host populations;
- Pre-construction surveys of the proposed translocation sites;
- The placement of tracking units (GPS) on tortoises from the project site, translocation site, and control site;
- Possible disease testing for long distance translocated tortoises, host, and control sites;
- Long term monitoring and reporting of control and translocated and host populations; and
- The implementation of remedial actions should excessive predation or mortality be observed.

Translocation of desert tortoise has inherent risks that must be considered when implementing this activity. Capturing, handling, and relocating desert tortoises could result in harassment, injury, or mortality of desert tortoises. Impacts of translocation may include elevated stress hormone levels, changes in behavior and social structure dynamics, genetic mixing, increased movement (caused by antagonistic behavior with other tortoises, avoidance of predators or anthropogenic influence, homing, or seeking out of preferred habitat), spread of disease, and increased predation. Handling, holding, and transport protocols may also compound with abiotic factors to affect the outcome for translocated individuals (Bertolero et al. 2007; Field et al. 2007; Rittenhouse et al. 2007; Teixeira et al. 2007), particularly during extreme temperatures, or if they void their bladders. Averill-Murray (2001) determined that tortoises that voided their bladders during handling had significantly lower overall survival rates (0.81-0.88) than those that did not void (0.96). Desert tortoises that are improperly handled by biologists without the use of appropriate protective measures may be exposed to pathogens that spread among tortoises in both resident and translocated animals. The introduction of diseased tortoises to a recipient site or holding pen may result in the spread of upper respiratory tract disease (URTD). The USFWS consider URTD to be one of the most serious infectious disease affecting desert tortoises.

Translocation may be a useful tool in the conservation of some species, yet well designed studies are necessary to properly evaluate its efficacy (Field et al 2007). As of 2013 there are a number of ongoing translocation actions that are underway. Most of these translocation events are related to military land expansion and solar energy development although a large scale translocation event is planned to occur on BLM lands near Pahrump Nevada. Definitions of success are variable and determining ultimate success can require lengthy studies (Fischer and Lindenmayer 2000, Seigel and Dodd 2002). For the PSEGS project translocation is considered a mechanism to salvage existing animals and place them in an area where they have the potential to survive post construction.

Success rates of herpetofauna translocations range from 14 percent to 42 percent, suggesting that improved efforts are essential for the future recovery of many reptiles and amphibians (Dodd and Seigel 1991; Germano and Bishop 2009). Existing studies suggest that animals move away from the translocation site and move through the landscape at a higher rate than control animals (Sullivan et al. 2004; Bertolero et al. 2007; Field et al. 2007). More specifically, a review of 91 herpetofauna translocation projects reported the primary causes of translocation failure were homing response by translocated individuals and poor habitat in translocated areas, followed by human collection, predation, food and nutrient limitation, and disease (Germano and Bishop 2009). The risks and uncertainties of translocation to desert tortoises are well recognized in the desert tortoise scientific community. The Desert Tortoise Recovery Office (DTRO) Science Advisory Committee (SAC) has made the following observation regarding desert tortoise translocations (DTRO 2009, p. 2):

> *As such, consensus (if not unanimity) exists among the SAC and other meeting participants that translocation is fraught with long-term uncertainties, notwithstanding recent research showing short-term successes, and should not be considered lightly as a management option. When considered, translocation should be part of a strategic population augmentation program, targeted toward depleted Populations in areas containing "good" habitat. The SAC recognizes that quantitative measures of habitat quality relative to desert tortoise demographics or population status currently do not exist, and a specific measure of "depleted" (e.g., ratio of dead to live tortoises in surveys of the potential translocation area) was not identified. Augmentations may also be useful to increase less depleted populations if the goal is to obtain a better demographic structure for long-term population persistence. Therefore, any translocations should be accompanied by specific monitoring or research to study the effectiveness or success of the translocation relative to changes in land use, management, or environmental condition.*

However, many translocations of desert tortoises have been limited in scope and applicability; shortcomings have included small sample size, loss of tortoises by death, poaching, transmitter failure, limited sampling period, inadequate information on resident tortoises; variation in release techniques or timing of releases, and use of captive or penned tortoises (Walde et al. 2011). In a study conducted over four years at Fort Irwin the USGS observed highly variable mortality rates ranging from 34 percent in 2009 to 1.5 percent in 2011(Drake et al. 2011). Tortoise mortality rate for 2011 continued to decrease from previous years despite an increase in the number of tortoises being monitored (*ibid.*). **Biological Resource Table 7b** provides a summary of the data taken from the 2011 USGS study at Fort Irwin California.

Biological Resource Table 7b
Desert tortoise mortality from 2008-2011 at the Ft. Irwin Study Site.*

Study Year	Number Dead	Number Monitored	Percent Mortality
2008	39	121	32.2
2009	31	90	34.4
2010	11	82	13.4
2011	8	525	1.5

*Drake et al 2011.

This study suggested that the majority of desert tortoise mortality could be attributed indirectly to predation. In times of drought when predators (e.g. coyotes, kit foxes, and bobcats) have fewer mammalian prey items available, they increase take of less preferred prey including desert tortoises (Woodbury and Hardy 1948, Berry 1974). During droughts, coyotes apparently killed most of the tortoises in one study at the Desert Tortoise Natural Area (Peterson 1994) and 21 to 28 percent of the marked wild population in a study near Ridgecrest, California were killed by canids. Longshore et al. (2003) found that periods of drought may directly influence tortoise survivorship leading to regional population declines. Turner et al. (1984) also reported unpublished materials from K.H. Berry indicating that a site in the west Mojave had less than five percent mortality during five previous years (estimated from carcass remains), followed by a year when she observed 27 percent mortality among 48 marked tortoises over 12.5 km^2. Esque et al. (2010) found mortality rates at sites spanning the Mojave Desert ranged from zero to 43.5 percent, where two of the sites had no mortality observed and seven sites had some mortality in at least one of three years reported here.

Mortality data compiled from the ISEGS Monthly Compliance Report - July 2012 identified that of approximately 504 animals tracked (i.e., hatchlings, resident, control, and translocated animals) 32 were deceased and 21 have been identified as missing. The breakdown of mortalities included four hatchlings (born in the holding pens), six control animals, six resident animals, eight animals identified for translocation but held in pens, and seven animals that were subject to short distance translocation efforts. Excluding hatchlings and missing animals, mortality rates (i.e., 28/ 447 animals) for all desert tortoise including resident, control, and translocatees is approximately six percent at this time. However, this is preliminary data and the long term effects of translocation for this population are not yet known.

While data suggests that translocation may be an effective tool for salvaging desert tortoise from large scale land use projects; the implementation of translocation activities must be completed in a thorough and well-coordinated manner. To provide guidance for these actions the USFWS prepared specific draft guidelines for clearance and translocation of desert tortoises from the project sites. This included the *Translocation of Desert Tortoises (Mojave Population) From Project Sites: Plan Development Guidance* (USFWS 2010b). This document provides guidance including the timing of relocation/translocation, disease testing requirements, and other actions intended to minimize impacts to desert tortoise.

Biological Resources Table 7c (Desert Tortoise Density Estimates and Impact Summary) estimates of the numbers of tortoises that may be translocated from the project site; numbers of tortoises that may be handled at the translocation and control sites; and numbers of undetected juveniles and eggs that may occur at the project site. These figures are based on the values provided in the 2011 USFWS BO for the approved PSPP project (USFWS 2011b). Because no living desert tortoises were identified on the proposed solar field the actual number of desert tortoises that require translocation from the Project Disturbance Area is expected to be lower than the values identified in **Biological Resources Table 7c**.

Biological Resources Table 7c
Desert Tortoise Density Estimates and Impact Summary

	Estimated Number of Tortoises Subject to Direct Project Effects*						
Project Feature	**Adult and Sub-adults**		**Juvenile Estimates**		**Eggs**	**Total Adult/Sub-adult and Juvenile**	
	Lower	Upper	Lower	Upper		Lower	Upper
Project Site	2	12	3	6	35	5	18
Translocation Area²	2	12	3	6	N/A	5	18
Control Area³	2	12	3	6	N/A	5	18
Subtotal	6	36	9	18	N/A	15	54

**All estimates of desert tortoise abundance are based on values identified in the 2011 Biological Opinion for the Approved PSPP (USFWS 2011b).

As described in **Biological Resources Table 7c** (Desert Tortoise Density Estimates and Impact Summary) approximately two to 12 adult or subadult desert tortoises, three to six juvenile tortoises, and 35 eggs have the potential to occur on the proposed project site. The actual number of animals that may be subject to translocation is expected to be a subset of this value. It is estimated that only 15 percent of juvenile tortoises (0.15 multiplied by the number of juveniles) on the site would be located during clearance surveys.

There are inherent risks to any action that requires the handling, disease testing, and translocation of desert tortoise. For the proposed project these risks could occur in the translocated, host, and the control population. Although desert tortoises will not be translocated into the control population some mortality may occur from handling or if used, from the placement of GPS tracking devices. For example, mortality at control populations is expected to be approximately five percent based on a review of scientific studies of tortoise mortalities associated with routine handling (Moore pers. comm. 2010).

For this project translocation mortality rates are assumed to range up to 45 percent. This value represents the high end of documented translocation mortality for desert tortoise at this time. Using the five percent mortality rate for the control population (adult and juvenile tortoises multiplied by 0.05) and the 45 percent mortality rate for the translocated and host populations (adults and juveniles multiplied by 0.45) this would result in the potential loss of between five and 20 tortoises from translocation mortality. All of the 35 eggs would be lost. If fewer desert tortoises are discovered or mortality rates are lower there would be a corresponding reduction in desert tortoise deaths from translocation activities.

The prior project owner prepared a draft Desert Tortoise Relocation/Translocation Plan as part of the Incidental Take Permit application (AECOM 2010a, Attachment DR-BIO-47) for the approved PSPP project which includes measures to avoid and minimize adverse impacts to resident and translocated desert tortoise. Condition of Certification **BIO-10** requires development of a Desert Tortoise Translocation Plan in consultation with CDFW, BLM, and USFWS. The Desert Tortoise Translocation Plan will include the identification and prioritization of potentially suitable locations for translocation; desert tortoise handling and transport considerations (including temperature); animal health considerations; a description of translocation scheduling, site preparation, and management; and specification of monitoring and reporting activities for evaluating success of translocation. With implementation of proposed Condition of Certification **BIO-10**, adverse impacts associated with desert tortoise translocation would be minimized.

Mitigation for Desert Tortoise Habitat Loss

The PSEGS project would result in the direct and indirect loss of approximately 3,948 acres of desert tortoise habitat. Construction would also result in the fragmentation and disturbance to adjacent habitat. These impacts are significant and require compensatory mitigation. With the exception of the dune areas desert tortoise habitat is present across most of the PSEGS project site. Habitat conditions vary on the site and generally consist of low to moderate quality habitat. Historic military training, agriculture, the spread of exotic plants, construction of I-10 and the large wing-dykes near the foothills of the Chuckwalla Mountains have contributed to the decline of habitat conditions on the project site. Staff agrees that little of the habitat quality within the Project Disturbance Area could be described as high quality, but all of it is suitable for desert tortoise and all could be potentially occupied.

For the approved PSPP project staff, USFWS, CDFW, and BLM recommended compensatory mitigation ratio of 5:1 for disturbance to critical habitat and at a 1:1 ratio for areas outside of critical habitat. These ratios were adopted for the PSPP and have been recommended for the PSEGS. Staff from BLM, Energy Commission, USFWS, and CDFW agrees that compensatory mitigation at these ratios is appropriate for the PSEGS project because the project would eliminate desert tortoise habitat, fragment adjacent habitat, and adversely affect connectivity for desert tortoise and other wildlife. The compensation ratio for the BLM is determined by its bioregional land use plan rather than the specific effects of the PSEGS project on desert tortoise. The NECO specifies the following desert tortoise compensation requirements applicable for the PSEGS project site (from page D-2, Appendix D, BLM-CCD 2002):

> "*A mitigation fee based on the amount of acreage disturbed shall be required of proponents of new development. Within Desert Wildlife Management Areas (DWMAs) (Category I) the lands delivered or equivalent fee shall be an amount that achieves a ratio of 5 acres of compensation land for every 1 acre disturbed. Outside DWMAs (Category III) the lands delivered or equivalent fee shall be an amount that achieves a ratio of one 1 acre of compensation land for every 1 acre disturbed. Funds may be expended as approved by the Management Oversight Group in 1991. Lands will be acquired or enhanced within the same recovery unit as the disturbance. CDFG may require additional fees for management of lands and for rehabilitation of lands.*"

The project owner suggested revisions to Condition of Certification **BIO-12**. These revisions recommended an alternative mitigation strategy for desert tortoise compensation based on the retirement of grazing allotments. During a workshop conducted on July 24, 2013 the project owner provided further information on the proposed ratios and how this may benefit desert tortoise. On July 31, 2013 the project owner filed additional revisions to Condition **BIO-12** based on workshop discussions and recommended that up to 50 percent of the mitigation land requirement could be achieved through the retirement of grazing allotments. The project owner proposed mitigation ratios of 3:1 for areas outside of critical habitat and 15:1 ratios for habitat in the Chuckwalla Critical Habitat Unit. Staff considered the request for this change and acknowledges retirement of grazing allotments can benefit desert tortoise. However, after coordination with REAT group team members, staff does not recommend adopting the revised language for the FSA. The approach has merit however, staff is not convinced that the changes to the condition are warranted at this time. The current mitigation approach was considered and adopted by the Commission for the PSPP. The proposed changes are considerable; depart from the adopted mitigation strategy; have not been subject to public review; and the REAT agencies are not in full agreement on the efficacy of this approach in this area Integrating State and Federal Desert Tortoise Mitigation

Compensatory mitigation for desert tortoise typically involves balancing the acreage of habitat loss with acquisition of lands that would be permanently protected and enhanced to support healthy populations of desert tortoise. The compensation comes about by removing threats to desert tortoise and by improving the carrying capacity of the acquired property so that more desert tortoises will survive and reproduce on these lands.

While staff from BLM, Energy Commission, USFWS, and CDFW agree that ratios adopted for the PSPP and recommended for the PSEGS for compensatory mitigation are appropriate for project impacts to desert tortoise habitat, some differences remain between the federal and state approach to desert tortoise mitigation that currently preclude a complete integration of desert tortoise mitigation requirements. One difference is the state requirement for permanent protection of acquired mitigation lands. Energy Commission staff and CDFW require that mitigation lands acquired for endangered species be maintained and protected in perpetuity for the benefit of those species. The BLM cannot always make the same commitment to protecting acquired mitigation lands because their multiple use mandate restricts their ability to designate lands solely for conservation purposes and to exclude potentially incompatible development and activities.

For the acquisition of mitigation lands to truly compensate for the habitat loss and to make up for the numbers of desert tortoise that would otherwise have been supported by that habitat, the acquisition must be accompanied by: (1) permanent protection and management of the lands for desert tortoise, and (2) enhancement actions. The permanent protection is essential because it would allow the lands to be managed in a way that excludes multiple threats and incompatible uses (grazing, off-highway vehicle use, roads and trails, utility corridors, military operations, construction, mining, grazing by livestock and burros, invasive species, fire, and environmental contaminants). Without this protection and management desert tortoise populations on the acquired lands would be subject to the same threats that led to its population declines and threatened status. This level of protection would be necessary to meet the mitigation requirements for loss of desert tortoise habitat under CESA. An equally important component of mitigation is the implementation of enhancement actions to improve desert tortoise survival and reproduction. These actions might include habitat restoration, invasive plant control, road closures or road fencing, reducing livestock and burro grazing, reduce the risk of wildfires, and by controlling ravens and other predators. Without permanent protection and enhancement actions on lands acquired for mitigation, the project's impacts would result in a net loss of desert tortoises and their habitat.

The REAT agencies agree that to address the in-perpetuity protection requirement for any lands acquired and subsequently donated to BLM will have either a deed restriction or conservation easement in title that will preclude future development of the land (Fesnock pers. comm., Flint pers. comm.). The REAT agencies also note that protection could be achieved by buying private in-holdings within designated wilderness or wilderness study areas, being that these areas are congressionally designated and as such preclude any development within them, thus meeting the requirement for in-perpetuity protection. The BLM has an established process for accepting lands with deed restrictions or conservation easements and is working on streamlined version of this process. The BLM has also indicated that for any land enhancement actions or recovery actions implemented on existing BLM-owned lands, BLM would develop a Memorandum of Understanding (MOU) with CDFW containing provisions for notification of any proposed projects affecting those lands (BLM 2009a). The BLM agreed that future projects authorized on these mitigation lands that might degrade or diminish the desert tortoise recovery value would be compensated at a higher rate (BLM 2009a).

Calculation of Security for Desert Tortoise Compensatory Mitigation

To satisfy CDFW's full mitigation standard the proposed mitigation must meet criteria described in Title 14, California Code of Regulations, sections 783.4(a) and (b). These criteria include requirements that the proposed mitigation would be capable of successful implementation, and that adequate funding is provided to implement the required mitigation measures and to monitor compliance effectiveness of the measures. These financial assurances are generally provided in the form of an irrevocable letter of credit, a pledged savings account or another form of security prior to initiating ground-disturbing project activities. Staff's proposed conditions of certification typically specify the dollar amount of the security, and include a provision for adjusting that security amount when parcel-specific information is available.

This financial security amount is calculated by multiplying the acreage of the impact area by the total per-acre costs, a figure which represents the sum of the costs required for: (1) land acquisition, (2) initial habitat improvements, and (3) a fund to support long-term management of the acquired lands. The latter cost for the long-term management fund is typically the largest component of the mitigation fee. Interest from the fund provides enough income to cover annual stewardship costs on the acquired lands and includes a buffer to offset inflation.

The REAT agencies have developed a total cost accounting method for calculating acquisition or conservation easement costs for mitigation lands, as shown in **Biological Resources Table 8** below. This method provides an estimate of security costs for mitigation and includes the costs associated with the purchase transactions, appraisal, escrow, and title insurance including mineral, oil, and gas rights. The estimate also addresses costs of initial enhancement (e.g., signs, fencing, and boundary/property line surveys; or restoration actions such as removal of exotic species, roads), management for ongoing activities such as public access and enforcement; and monitoring the implementation, effectiveness, and compliance of conservation measures with the goals and objectives of the mitigation. For those projects using the REAT Mitigation Account for implementing mitigation actions, the budget includes administration of contracts and reporting.

Biological Resources Table 8
REAT Biological Resources Mitigation/Compensation Cost Estimate Calculation Table for PSEGS[1]

	Desert Tortoise Compensation	Mojave Fringe Toed Lizard Habitat	Burrowing Owl	Streambed Compensation
Number of Acres	4,860	2063.5	78	788
Estimated number of parcels to be acquired, at 160 acres per parcel[2]	30	13	1	5
Land cost at $1000/acre[3]	$ 4,860,000	$2,063,700	$78,000	$788,000
Level 1 Environmental Site Assessment at $3000/parcel	$91,925	$38,694	$3,000	$14,775
Appraisal at no less than $5,000/parcel	$ 151,875	$64,491	$5,000	$24,625
Initial site work - clean-up, restoration or enhancement, at $250/acre[4]	$1,215,00	$515,925	$19,500	$197,000
Closing and Escrow Cost at $5000 for 2 transactions[5]	$151,875	$64,490	$5,000	$24,625
Biological survey for determining mitigation value of land (habitat based with species specific augmentation) at $5000/parcel	$151,875	$64,490	$5,000	$24,625
3rd Party Administrative Costs (Land Cost x 10%)[6]	$486,000	$206,370	$7,800	$78,800
Agency cost to accept land donation[7] (Land Cost x 15%) x 1.17 (17% of the 15% for overhead)	$852,930	$362,179	$13,689	$138,294
Subtotal of Acquisition and Initial Site Work	$7,960,680	$3,380,341	$136,989	$1,290,744
Long-term Management and Maintenance (LTMM) fee at $1450/acre [8]	$7,047,000	$2,992,365	$113,100	$1,142,600
Management Fees				

Establish Project Specific Account[9]	$12,000			
Call for and Process Pre-Proposal Modified RFP or RPF [10]	$30,000			
Management fee for Acquisition and Enhancement Actions (Subtotal x 3%)	$235,820	$101,410	$4,109	$38,722
Management Fee for LTMM account (LTMM x 1%)	$70,470.00	$29,924	$1,131	$11,426
Subtotal of Management Fees	$351,290	$131,334	$5,240	$50,148
TOTAL Estimated cost for deposit in project specific sub-account	$ 15,358,970	$6,504,039	$255,330	$2,483,492

1. All costs are calculated based on the REAT Biological Resources Mitigation/Compensation Cost Estimate table (July 23, 2010**)** and are best estimates as of summer 2010. Actual costs will be determined at the time of the transactions and may change the funding needed to implement the required mitigation obligation. Note: regardless of the estimates, the developer is responsible for providing adequate funding to implement the required mitigation.
2. For the purposes of determining costs, a parcel is defined at 160 acres, recognizing that some will be larger and some will be smaller, but that 160 acres provides a good estimate for the number of transactions anticipated (based on input from CDD).
3. Generalized estimate taking into consideration a likely jump in land costs due to demand, and an 18-24 month window to acquire the land after agency decisions are made. If the agencies, developer, or 3rd party has better, credible information on land costs in the specific area where project-specific mitigation lands are likely to be purchased, that data overrides this general estimate. Note: regardless of the estimates, the developer is responsible for providing adequate funding to implement the required mitigation.
4. Based on information from CDFW.
5. Two transactions at $2500 each: landowner to 3rd party; 3rd party to agency. The transactions will likely be separated in time.
6. Includes staff time to work with agencies and landowners; develop management plan; oversee land transaction; organizational reporting and due diligence; review of acquisition documents; assembling acres to acquire….)
7. Includes agency costs to accept the land into the public management system and costs associated with tracking/managing the costs associated with the donation acceptance, including 2 physical inspections; review and approval of the Level 1 ESA assessment; review of all title documents; drafting deed and deed restrictions; issue escrow instructions; mapping the parcels….
8. Estimate for purposes of calculating general costs. The actual long term management costs will be determined using a Property Assessment Report (PAR) tailored to the specific acquisition. Includes land management; enforcement and defense of easement or title [short and long term]; monitoring….
9. Each renewable energy project will be a separate sub-account within the REAT account, regardless of the number of required mitigation actions per project.
10. If determined necessary by the REAT agencies if multiple 3rd parties have expressed interest; for transparency and objective selection of 3rd party to carryout acquisition.

The cost for the long-term maintenance and management is typically the largest component of the mitigation fee. Interest from the long-term maintenance and management fee creates a funding source that provides enough income to cover annual stewardship costs on the acquired lands and includes a buffer to offset inflation. The amount for the long-term maintenance and management fee is established by a Property Analysis Record (PAR), a computerized database methodology developed by the Center for Natural Lands Management (<www.cnlm.org/cms>) which calculates the costs of land management activities for a particular parcel. These activities include development of a desert tortoise management plan tailored for each parcel of mitigation land to assess habitat status, identify desired conditions, and develop plans to achieve conditions that would best support desert tortoise. Once the management plan is developed and approved by the appropriate resource agencies, implementation of enhancement actions such as fencing, road closure, weed control, habitat restoration as well as monitoring can begin. The goal of these activities is to increase the carrying capacity of the acquired lands for desert tortoise and increase their population numbers by enhancing survivorship and reproduction.

Funding for the initial habitat improvements supports those actions needed immediately upon acquisition of the property to secure it and remove hazards. These activities might include fencing or debris clean-up, or other urgent remedial action identified prior to when the parcels were acquired. When the management plan is completed for the acquired parcel activities like these are thereafter funded from the interest produced by the long-term maintenance and management fee described above.

Condition of Certification **BIO-12** specifies acquisition of 4,860 acres to mitigate for impacts to desert tortoise habitat. Based on the calculations summarized in Biological Resources Table 6a, the estimated security with management fees would be $15,358,970. The security amount without management fees would be $15,007,680. The estimated composite mitigation cost for establishing the financial security would be $3,506 per acre (see **Biological Resources Table 8** for a breakdown of expected costs). This security amount may change when an updated appraisal is made and a PAR is prepared for the parcels that have been selected for acquisition. These are estimates based on current costs and the current REAT compensation table; the requirement is defined in terms of acres, not dollars per acre, and actual costs may vary. If the security proves to be inadequate to secure the necessary acreage because of increases in land costs, the project owner would need to make up the difference. Similarly, if the security was an overestimate the project owner would be refunded the excess.

The project owner may elect to purchase and permanently protect compensation lands itself; to fund the acquisition and initial improvement of compensation lands through the Renewable Energy Action Team (REAT) Account; or to fund the acquisition of compensation lands through a third party, as outlined in **BIO-12**. REAT options are described below. Further, **BIO-12** would require that the project owner provide financial assurances to guarantee an adequate level of funding to implement the compensation measures described above. Because there are several suitable options available to the project owner to satisfy the compensation requirement, and because mitigation requirements must satisfy the requirements of both state and federal Endangered Species acts, the calculation of the security amount includes estimates of all transaction and management fees described above. These calculations are presented in **Biological Resources Table 8**.

Indirect and Operational Impacts

Indirect effects to desert tortoises could include soil compaction, fugitive dust, the introduction of non-native and invasive plant species, and increased human presence along access roads. Indirect effects may also include habitat fragmentation, the disruption of existing home ranges, and barriers to dispersal. Increased human presence from new access roads or interest in the facility could lead to increased road kill, illegal collecting and the spread of disease due to abandonment of captive tortoises infected with upper respiratory tract disease. Operational impacts to desert tortoise include both direct and indirect effects including those described above. Typically, these effects are similar in type but smaller in magnitude when compared to construction related effects. These effects may include the risk of mortality from vehicle traffic, crushing of burrows by routine maintenance activities on access roads or if any desert tortoises remain in the facility area post construction, vegetation management activities, and washing of the heliostats. Other operational effects include fires, habitat degradation, and the spread of invasive plant species. Increased road traffic on roads in the region either from facility staff or sightseers increases the risk of road kill to both tortoises and common wildlife. This not only results in the loss of desert tortoise but increases the risk for subsidized predators such as ravens and coyotes.

Ravens and Other Predators

Construction and operation of the project has the potential to increase raven and coyote presence in the project area. Ravens depend on human encroachment to expand into areas where they were previously absent or in low abundance. Common ravens were rarely observed within the Project Disturbance Area during surveys in 2009, although one pair was observed nesting in a desert ironwood tree in the north central portion of the Project Disturbance Area (Solar Millennium 2009a, Volume II, Appendix F). Staff noted ravens at the site during surveys in 2013 and this species is known from the region. Ravens habituate to human activities and are subsidized by the food and water, as well as roosting and nesting resources that are introduced or augmented by human encroachment. Common raven populations in some areas of the Mojave Desert increased 1,500 percent from 1968 to 1988 in response to expanding human use of the desert (Boarman 2002). Since ravens were scarce in this area prior to 1940, the current level of raven predation on juvenile desert tortoises is considered to be an unnatural occurrence (BLM 1990; USFWS 2008a). Multiple coyotes were also observed by staff foraging in the adjacent date farm during surveys of the site in May 2013. In addition to ravens and coyotes, feral dogs have emerged as major predators of the tortoise. Dogs may range several miles into the desert and have been found digging up and killing desert tortoises (USFWS 2011a; Evans 2001). However the site is located in a rural area with only sparse residential development.

Ravens may use the perimeter fence as potential perch sites and new transmission line structures as nest and perch sites increasing the potential for loss of tortoises from raven predation. Several raven subsidies occur in the region including the existing date farm, a small reservoir located adjacent to the project fence line, and other agricultural activities located northwest of the site. Periodic roadkill on I-10 also provides subsidies for opportunistic predators/scavengers such as ravens. Road kills would mount with increased project construction and operations traffic, further exacerbating the raven/predator attractions and increasing desert tortoise predation levels. Bird collisions with facility structures or transmission lines may attract ravens. As the project area is already subject to elevated raven predation pressure the loss of juvenile tortoise in an area supporting limited tortoise densities could have a long-term effect on the tortoise population by reducing the recruitment of juvenile tortoises into the adult life stages (Boarman 2003). The effects of reduced recruitment may not be apparent for years because tortoises do not typically reach sexual maturity until approximately 15 to 20 years of age, and are therefore considered indirect impacts of project operation. Subsidies

Implementation of Condition of Certification **BIO-6** worker environmental awareness training; and**BIO-8** restrictions on pets being brought to the site required of all personnel, and the collection of road kill, would reduce or eliminate the potential for these impacts. The project owner would also implement Condition of Certification **BIO-13** (Raven management Fee) to further reduce impacts to desert tortoise from the projects contribution to raven subsidies in the region.

Regional Approach to Raven Control

The USFWS, in cooperation with CDFW and BLM, has developed a comprehensive regional raven management and monitoring program in the California Desert Conservation Area to address the regional, significant cumulative threat that increased numbers of common ravens pose to desert tortoise recovery efforts (USFWS 2010b). The Regional Raven Management Program will implement recommendations in the USFWS E*nvironmental Assessment to Implement a Desert Tortoise Recovery Plan Task: Reduce Common Raven Predation on the Desert Tortoise* (USFWS 2008). To mitigate the PSEGS's contribution to cumulative and indirect impacts on desert tortoise from raven predation, the project owner would contribute toward implementation of the USFWS Regional Raven Management Program (USFWS 2010a) as described in Condition of Certification **BIO-13**. The project owner's payment would support the regional raven management plan activities focused within the Colorado Desert Recovery Unit, which would be adversely affected by increases in raven subsidies attributable to the PSEGS project. The fees contributed by the project owner would fund implementation of the raven removal actions, education and outreach efforts, and surveying and monitoring activities identified in the Environmental Assessment (USFWS 2008). Implementation of these actions would be an effective means of reducing the project's cumulative contributions to desert tortoise predation from increased raven numbers.

The prior project owner prepared a draft Raven Monitoring and Control Plan (AECOM 2010a DR-BIO-57) in response to staff's request to develop methods and best management practices to avoid and minimize raven attractants and subsidies for the approved PSPP project site. This draft raven plan is integrated into Condition of Certification **BIO-13.** The project owner's final Common Raven Monitoring, Management and Control Plan would involve identifying and preventing conditions that might attract or support ravens (for example, eliminating food sources such as garbage or roadkill, minimizing creation of structures that could provide ravens perches, nests or roosts), monitoring the effectiveness of raven management and control measures, and then implementing additional adaptive management measures to make sure that the project does not result in an increase in raven numbers. Implementation of measures in **BIO-13** would avoid or minimize the contributions of the project to increased desert tortoise predation from ravens to less than significant levels.

Increased Risk from Roads/Traffic

Vehicle traffic would increase as a result of construction and improvement of access roads, increasing the risk of injuring or killing desert tortoise. The potential for increased traffic-related tortoise mortality is greatest along paved roads where vehicle frequency and speed is greatest though tortoises on dirt roads may also be affected depending on vehicle frequency and speed. Census data indicate that desert tortoise numbers decline as vehicle use increases and that tortoise sign increases with increased distance from roads (Nicholson 1978; Hoff and Marlow 2002). Additional unauthorized impacts that may occur from casual use of the access roads in the project area include unauthorized trail creation.

Condition of Certification **BIO-8** contains a variety of minimization measures to minimize the risks of increased traffic fatality and other hazards associated with roads at the project site, These measures include confining vehicular traffic to and from the project site to existing routes of travel, prohibiting cross country vehicle and equipment use outside designated work areas, and imposing a speed limit of 25 miles per hour on paved and stabilized unpaved roads within the construction site and 10 miles per hour on unpaved areas within the construction site .

As discussed above, local movement patterns of desert tortoise would be disrupted by the project, and tortoises north of the project site attempting to move in a southward direction would be diverted to the east or west, and the perimeter fencing around the project site would direct tortoises towards I-10 on the traffic surface (AECOM 2010b). Tortoise-proof fencing has not been installed along this segment of I-10, so desert tortoises moving around the project site would potentially experience increased rates of vehicular-related mortality. Staff considers the potential increase in desert tortoise road fatalities to be a significant impact of the project. To reduce this impact to less-than-significant levels, Condition of Certification **BIO-9** (Desert Tortoise Clearance Surveys and Fencing) requires installation of desert tortoise exclusion fencing along both sides of I-10 south of the project area, and maintenance of the bridge undercrossings of I-10 as safe and accessible passage for desert tortoise.

The placement of fencing in this area would reduce the potential for tortoise mortality on I-10 and would be considered beneficial to the species. Implementation of standard best management practices such as those identified in Condition of Certification **BIO-8** would reduce impacts to desert tortoise during the installation of the fence.

Impacts from Noxious Weeds

Many invasive non-native species are adapted to and promoted by soil disturbance (Lathrop & Archibald 1980). Once introduced, they can out-compete native species because of minimal water requirements, high germination potential and high seed production (Beatley 1994). Weeds can outcompete native annuals where nitrogen deposition (near highways such as I-10) and precipitation rates are higher, leading to higher risk of wildfire (Allen et al. 2010), and can become locally dominant, representing a serious threat to native desert ecosystems (Abella et al. 2008). Sahara mustard (*Brassica tournefortii*) is regarded as one of the most invasive wildland pest plants in the Colorado and Mojave deserts, one of the most common invasive plants in desert tortoise habitat, and capable of dominating entire desert landscapes if no control actions are taken. Sahara mustard spreads explosively during wet years but even during a 12-year drought in Riverside County (1989-1991), the population of Sahara mustard increased by nearly 35 times. Densities equivalent to as high as three million plants per acre have been recorded at Lake Mead National Recreation Area (Graham et al. 2002).

Left uncontrolled, Sahara mustard out-competes and ultimately replaces native wildflowers that provide valuable forage for the desert tortoise. It forms dense thickets that can increase the frequency, intensity, and size of desert fires, increasing the threat to native plant communities, the desert tortoise, and other wildlife (Brooks 2010). In areas where Sahara mustard is particularly dense it may also impede desert tortoise movement (Berry pers. comm.). In the Colorado and Mojave deserts, a single tortoise was necropsied that had died from renal failure, related to renal oxalosis, and the crystals present in the kidneys were identified as oxalates (Jacobson et al. 2009). One additional tortoise was later necropsied that died of oxalosis in the same region (Berry pers. comm. 2010). Although many native plants in the Mojave and Colorado deserts contain oxalates, however, the oxalate-containing weed Sahara mustard is one of the most common invasives in desert tortoise habitat and is a suspected cause of the renal failure (Berry pers. comm.). See “Indirect Impacts to Special-Status Plants” for additional information on the risk invasive weeds pose to desert ecosystems. Condition of Certification **BIO-14** (Weed Management Plan) includes monitoring and control measures that would reduce impacts to desert tortoise from increases in Sahara mustard and other weeds to less than significant levels.

Other Indirect Impacts

Indirect effects to desert tortoise may occur from wildfires. Desert tortoises that escape direct mortality from wildfires may be affected by fire-induced habitat alteration. Alterations to habitat can result in mortality, decreased fecundity, increased predation, starvation, and dehydration; all resulting in reduced viability of this species (USFWS 2011a). Reduction in plant cover also reduces available shelter as perennial plants, especially woody shrubs, provide protection for desert tortoises from mortality due to predators and overheating from the sun (Woodbury and Hardy 1948; Burge 1978; Mushinsky and Gibson 1991). Although single fires may not produce long-term reduction in the cover of perennial plants or biomass of native annual plants (O’Leary and Minnich 1981), recurrent fire can convert native desert scrub to alien annual grasslands (Brown and Minnich 1986; Duck et al. 1997; Esque et al 2003). Indirect effects can also increase the risk of predation by predators attracted to the area by increased human activity, water or food subsidies. Clearing and grading activities would result in the exposure of large numbers of fossorial species such as small rodents and reptiles. Many of these species are killed or injured during these activities and attract ravens and other opportunistic predators. Potential deposition of sediment loads as a result of construction-related sediment mobilization during heavy rain events and flooding downstream would impact existing desert tortoise burrows outside of the Project Disturbance Area.

Connectivity

The PSEGS project is located within designated Wildlife Habitat Management Areas (WHMAs). These include the Palen-Ford WHMA and DWMA Continuity WHMA (USFWS 2011b). Management emphasis for the Palen-Ford WHMA is on the management of the dunes and playas within the Palen-Ford dune system. Management emphasis for the DWMA Continuity WHMA is providing connectivity of tortoises between conservation areas north and south of I–10 (i.e., the Chuckwalla DWMA and Chemehuevi DWMA). The PSEGS project (solar field) is located north of I-10. Adjacent land uses include date farms, a small development and natural lands including the Palen Dunes.

The RSA for the approved project indicated that the project area may be important for desert tortoise movements between higher quality habitats available in the Palen Mountains to the northeast and the Chuckwalla Mountains to the south; the location of the project area connects these higher quality habitats (Galati & Blek 2010b). Similarly, desert tortoise are known to use low-quality intermountain habitat, such as that present across most of the project area, as dispersal routes over time, providing connectivity between high-quality habitat areas in the surrounding mountains (Averill-Murray and Averill-Murray 2005). Currently, three large culverts under I-10, occurring along the existing washes in the project area, provide desert tortoise and other wildlife a safe passage under I-10 in a north-south direction across the project area (Galati & Blek 2010b). The box culverts, range in width from 90 to 150 feet and provide an outlet for Corn Springs Wash and other drainages that flow beneath I-10.

Recent studies indicate that habitat fragmentation and isolation of natural areas ultimately results in the loss of native species within those communities (Soulé et al. 1988). Populations of animals that are isolated from other populations are at higher risk of extirpation both from sources such as drought, disease, or wildlife. In the Colorado Desert large areas have been subject to habitat fragmentation from development (i.e., Desert Center, Blythe, State Prisons), agricultural practices, and off highway vehicle use. On a local scale, large solar infrastructure projects have been permitted and several are currently under construction in the Chuckwalla Valley. All of these features fragment habitat and reduce connectivity for some species of wildlife. The amount and distribution of suitable habitat is an essential element to consider for the management of wildlife. For example, some species require, and are often limited to, unique vegetation or terrain features for breeding or foraging such as desert tortoise.

Construction of the PSEGS project would result in a barrier to desert tortoise in the region. The placement of perimeter fencing will exclude desert tortoise from the site and remove approximately 3,948 acres of habitat for this species. Similarly, the facility will eliminate the large washes and other ephemeral drainages within the Project Disturbance Area and would impair local wildlife movement and reduce habitat connectivity for desert tortoise. Although desert tortoise is not a migratory species, opportunities for local movements within its home range and dispersal are important for maintaining viable populations (Galati and Blek 2010b). Impairment to connectivity through the project vicinity could disrupt desert tortoise population dispersal from the Chuckwalla Mountains to the southwest connecting to the Palen Mountains in the northeast and vice versa (Galati and Blek 2010b); this impact to connectivity was identified as significant and unmitigable in the Staff Assessment/Draft Environmental Impact Statement (SA/DEIS).

After the SA/DEIS was published, the prior project owner conducted a survey of the project-vicinity undercrossings and prepared a report of the findings (*Wildlife Movement and Desert Tortoise Habitat*, AECOM 2010f). The results of this report show that there are numerous project-vicinity undercrossings that provide wildlife movement corridors and provide the opportunity for desert tortoise connectivity. In addition, sand dune habitat and Palen Dry Lake are to the north of the project site; washes associated with the project lead directly into this sand dune and dry lake habitat. While desert tortoises will cross desert pavement and dunes, areas of heavy dune concentration and areas consisting purely of dunes offer little in the way forage and make burrowing difficult, and Palen Dry Lake is also inhospitable to desert tortoise (Galati and Blek 2010j). Staff agrees that these areas are not likely to be a regular part of tortoise home ranges, and with or without the project desert tortoises moving through the area would be forced either to the east or west. Desert tortoise would maintain access through the three large culverts which would remain open after project construction, but their utility as a wildlife movement corridor would be significantly impaired because of the loss of downstream washes that connect to the culverts.

Desert tortoise traveling around the project from the north may attempt to cross I-10 at grade rather than use the underpass, increasing risk of mortality. Fencing on the west side of the project could guide desert tortoise directly onto I-10. In addition to the three underpasses that occur adjacent to the project site, an additional 21 underpasses occur along the existing washes in the 36-mile-long stretch on either side of the proposed project, between Wiley Wells Road and Desert Center (see Figure 8 in AECOM 2010a). The 2011 BO for the approved PSPP project indicated AECOM surveyed these underpasses and determined that all are suitable for tortoise use and provide passage under I–10 in a north–south direction to allow tortoise passage. Therefore, although the proposed project would reduce the amount of available tortoise habitat and result in reduced habitat connectivity; habitat would remain to the west and east of the proposed project to provide connectivity of tortoises in the long term (USFWS 2011b).

To facilitate desert tortoise movement and to connect the undercrossings south of the project with open areas to the west, the prior project owner proposed installation of a large box culvert under the proposed access road leading to the project site from I-10. This, along with desert tortoise fencing along both sides of I-10 to direct desert tortoise to nearby undercrossings, would mitigate impacts to connectivity below a level of significant. Staff incorporated these measures into conditions of certification **BIO-8** and **BIO-9** and recommends the same measures for PSEGS.

Staff considered this loss of connectivity for local wildlife movement and for desert tortoise to be a significant impact of the PSPP and also consider it a significant impact for the PSEGS project. Condition of Certification **BIO-12** requires land acquisitions of parcels that contribute to desert tortoise habitat connectivity and build linkages between desert tortoise populations and designated critical habitat. Implementation of this condition of certification would offset impacts to desert tortoise. These targeted areas are consistent with those described in the California Desert Connectivity Project (Science and Collaboration for Connected Wildlands Desert Linkages Habitat

Connectivity Study <www.scwildlands.org>) (Spencer et al. 2010). With implementation of Conditions of Certification **BIO-8**, **BIO-9**, and **BIO-12**, project impacts to desert tortoise connectivity would be reduced to less-than-significant levels.

Conclusion – Impacts and Mitigation for Desert Tortoise

Conditions of Certification **BIO-9** through **BIO-11** describe measures that would avoid and minimize direct impacts to desert tortoise, and staff concluded that implementation of these measures would reduce potential direct impacts of PSEGS to less-than-significant levels for the PSPP and has proposed the same conditions for the PSEGS. To fully mitigate the loss of 3,948 acres of desert tortoise habitat, and associated fragmentation and loss of connectivity, staff's proposed Condition of Certification **BIO-12** requires acquisition and enhancement of 4,860 acres of desert tortoise habitat within the Colorado Desert Recovery Unit in areas that have potential to contribute to desert tortoise habitat connectivity and build linkages between desert tortoise populations. Staff has determined that sufficient compensatory mitigation lands are available in the Colorado Desert Recovery Unit to fulfill this acquisition requirement.

Mojave Fringe-toed Lizard

The project would directly impact 1,480 acres of Mojave fringe-toed lizard habitat in the northeastern portion of the Project Disturbance Area, an area of active wind-blown sand with relatively shallow sand deposits, as well as areas of deeper and more active vegetated sand dunes. In addition to this direct and immediate loss of habitat, the project would significantly affect downwind Mojave fringe-toed lizard habitat The northeastern portion of the project as originally configured would interrupt the regional wind-borne sand transport corridor that moves sand southeast and east along the Chuckwalla Valley and toward the Colorado River (**BIOLOGICAL RESOURCES APPENDIX A**).

The Mojave fringe-toed lizard relies on vegetated sand dunes and a regular supply of fine wind-blown sand for its habitat. Active sand dunes (i.e., dunes that have an active layer of mobile sand) exist in a state of dynamic equilibrium, continuously losing sand downwind due to erosion and transport and gaining new supplies from upwind. If the upwind sand supply is cut off the dunes deflate, losing sand downwind and shrinking in size and depth. The finest sand (which is most easily transported) is lost first with coarser sand and gravel being left behind to form an armor or lag. This lag does not support Mojave fringe-toed lizard habitat.

The PSPP would have affected sand transport because it included a perimeter sand fence that is 30 feet high designed to stop sand from entering the solar array. Most sand transport occurs close to the ground through the processes of rolling and saltation (bouncing of sand particles) with approximately 90 percent of sand transport occurs within six feet of the ground surface (see **BIOLOGICAL RESOURCES APPENDIX A**). Staff concluded that wind fence would pose an effective barrier to sand transport, and create a "sand shadow" downwind. A sand shadow is defined as an area downwind of a sand barrier where the wind is able to remove sand but there is no supply of new sand upwind. Over time existing sand dunes in a shadow area will be deflated because they will shrink and become coarser as the fine sand is blown away by the wind.

As described earlier in the subsection on impacts to the sand transport corridor, the PSPP would have had an impact on sand transport and Mojave fringe-toed lizard habitat by eliminating the network of desert washes throughout the site and replacing them with engineered channels (**BIOLOGICAL RESOURCES APPENDIX A**). Project construction on the alluvial fans and alteration of stream channels by channelization may have reduced the amount of fluvial sediment reaching the depositional areas upwind of sand dunes and Mojave fringe-toed lizard habitat. Similar effects have been observed in the Coachella Valley, with adverse consequences for Coachella Valley fringe-toed lizard habitat (Griffiths et al. 2002). The direct impacts for the PSEGS project on the sand transport corridor have been reduced to 1,129 acres from the PSPP (1,503 acres for Reconfigured Alternative 3 and 1,542 acres for Reconfigured Alternative 3). The proposed PSEGS eliminates the large drainage control channels and the majority of the project site would maintain the original grades and natural drainage features (Palen 2012a). The PSEGS project has also been designed to eliminate the PSPP project's 30 foot tall wind fences that contributed to disruption of the sand transport (Palen 2013a). The revised PSEGS project boundary is proposed to be defined by a chain-link fence, which will have a very different effect on wind flow and sand transport. Sand may pass through the fence and winds will be affected by the heliostat array (CEC 2013l). The project owner initially assumed 39.7 acres of indirect impacts for the private parcel adjacent to project site that would be surrounded on three sides by project fencing (Palen 2013a).

As discussed under Impacts to Sand Transport Corridor and Sand Dune Habita,t staff utilized the "PWA Model" (included as Appendix C to the RSA (CEC 2010c)), which was also used for the original project proceeding. The project owner also prepared an assessment of the transport corridor, without the incorporation of a model (Palen 2013kk). Both staff's modeled results and the project owner's assessment of the indirect effects of the PSEGS project to be greater than either of the Reconfigured Alternatives 2 or 3.

Other potential indirect and operational impacts of the PSEGS project include: mortality from vehicle strikes; introduction and spread of non-native invasive plants; erosion and sedimentation of disturbed soils; edge effects including fragmentation and degradation of remaining habitat; increased road kill hazard from operations traffic; harm from vegetation management activities including mowing, trimming, and other vegetation removal methods, harm from accidental spraying or drift of dust suppression chemicals; and, an increase in access for avian predators (such as loggerhead shrikes) due to new perching structures. Sahara mustard, in particular, is a noxious weed of high concern in the Colorado Desert. Sahara mustard may affect wildlife by altering the availability of forage plants and characteristics of their habitat structure. Vehicle strikes have been a reported cause of mortality to Mojave fringe toed lizard on project access roads in the region. At least 118 Mojave fringe-toed lizards had been killed by vehicle strikes on the Colorado River Substation access road as of January 2013 (BLM 2013b). In addition, at least two Couch's spadefoot toads have been killed on the Colorado River Substation access road (BLM 2013b).

Staff requested the project owner supply further data relative to onsite vegetation management regimes, and specifically, providing a draft vegetation management plan that describes the mowing plan for the site (CEC 2013h). However, the project owner will not be submitting a vegetation management plan but did provide further detail on the extent of vegetation management within the PSEGS site (Palen 2013cc). It is unclear how mowing may affect fringe-toed lizard that remain within the site or travel through the site to other areas of habitat however staff has added measures to Condition of Certification **BIO-8** to address potential impacts from vegetation management. .

Barrows et al. (2009) found the Coachella Valley fringe-toed lizard to be the only animal species of five vertebrates evaluated to demonstrate a negative response to Sahara mustard abundance. Lizard abundance was monitored in undisturbed, weedy habitat and compared abundance in weeded control sites. The author noted that Coachella Valley fringe-toed lizard abundance on weeded plots showed a decrease (Barrows et al 2009). This negative impact was short-lived and declined no more than a year after the mustard's dominance waned. This indicates that Sahara mustard removal would improve habitat quality for fringe-toed lizards. An indirect effect of Sahara mustard on fringe-toed lizard is that it may increase sand compaction within aeolian sand (active dune) communities (Barrows et al 2009). Over time, sand compaction could lead to a change in habitat from an aeolian sand community to a stabilized sand community.

The distribution of Mojave fringe-toed lizards is naturally fragmented because of its obligate habitat specificity to a patchy habitat type, and many local populations of this species are quite small, with small patches of sand supporting small populations of lizards. This fragmented pattern of distribution leaves the species vulnerable to local extirpations from additional habitat disturbance and fragmentation (Murphy et al. 2007). The Mojave fringe-toed lizard population in the Chuckwalla Valley, along with a very small population in Joshua Tree National Park's Pinto Basin, represents the southernmost distribution of this species (Barrows, pers. comm.). This southern population may represent an important gene pool in light of the likely warming and drying that will occur in this region as a result of climate change; these southernmost lizards that may be already adapted to hotter and drier conditions than those further north could represent a source of genetic variation that could stave off extinction of this species in selected refugia (Barrows, pers. comm.). The cumulative impact of all the PSEGS alternatives would be to increase the already fragmented distribution of the Mojave fringe-toed lizards, and to increase the risk of extirpation of isolated populations within the Chuckwalla Valley.

For the PSPP, staff concluded that impacts to Mojave fringe-toed lizard habitat could be mitigated to less-than-significant levels with implementation of proposed Condition of Certification **BIO-20.** This condition recommends acquisition and protection of core populations of Mojave fringe-toed lizard habitat elsewhere in the Chuckwalla Valley. **BIO-20** requires that impacts to stabilized and partially stabilized sand dunes from the Project or any of its alternatives be mitigated at a 3:1, consistent with recommendations in the NECO plan and with the Commissions' original project Decision (CEC 2010f). For impacts to non-dune habitats occupied by Mojave fringe-toed lizards (sand fields vegetated with sparse creosote bush scrub) the mitigation ratio would be 1:1, with the requirement that acquired mitigation lands be within the Chuckwalla or Palen sand transport corridor. Any indirect “sand shadow” impacts would be mitigated at a 0.5:1 ratio.

The PSEGS project would directly affect 1,480 acres of Mojave fringe-toed lizard habitat, a slight reduction from both the Reconfigured Alternative #2 and #3 (1,503 acres and 1542 acres, respectively).Conversely, indirect impacts to downwind habitat, and Mojave fringe-toed lizards would increase in comparison to the PSPP. Offsite impacts could indirectly affect Mojave fringe-toed lizards downwind of the project, due to projected deflation, stabilization of the dunes, plant successional shifts, and other events that would all degrade Mojave fringe-toed lizard habitat. Offsite indirect impacts to Mojave fringe-toed lizards would be cumulatively significant but mitigable Implementation of **BIO-20** would still mitigate direct impacts to Mojave fringe-toed lizard habitat to less-than-significant levels. In addition, staff recommended measures for the PSPP including maintaining speed limits on site (**BIO-8**), and for the PSEGS staff has incorporated additional measures including posting additional speed limit signs in MFTL habitat, providing additional worker training related to Mojave fringe-toed lizard, and increasing monitoring and reporting of species and vehicle strikes along project access roads into existing conditions of certification (**BIO-6** and **BIO-8**). Impacts to Mojave fringe-toed lizard habitat could be mitigated to less-than-significant levels with implementation of proposed Condition of Certification in **BIO-6** and **BIO-8.**

Couch’s Spadefoot Toad

If Couch’s spadefoot toads are present in the Project Disturbance Area, impacts from construction would include loss of habitat and direct mortality during grading and construction. Construction activities that create pits or depressions during the summer rains could provide breeding habitat, which could either be vulnerable to additional construction impacts or be in substrate that is incapable of sustaining ponded water for the necessary time. During project construction and operation Couch’s spadefoot toads could be crushed on access roads, and it is possible for construction disturbance to cause toads to surface, regardless of whether the season is suitable for emergence. The project owner performed spadefoot toad microhabitat mapping in summer of 2013 (Palen 2013ii) and located no areas of ponding.

Western Burrowing Owl

Burrowing owl and their sign (feathers, whitewash, and/or pellets) was detected on the project site during protocol surveys conducted for the approved PSPP project. No burrowing owls or active owl burrows were documented within the ¾-mile and 1-mile buffer transects performed during spring 2009 surveys for this species (AECOM 2010a, Draft PSEGS Burrowing Owl Relocation/Translocation Plan). Surveys conducted for the natural gas pipeline alignment in 2013 detected one burrowing owl however an active burrow was not detected in the proposed disturbance area. As of 2010 at least five potentially active owl burrows occurred within the Project Disturbance Area. At that time staff determined that at least four owls (two adults and two juvenile/fledglings) were present on the project site. It is possible that the number of breeding owls on the project site has changed since the PSPP was approved. During avian point count and raptor surveys conducted in 2013, the project owner documented 18 burrowing owl observations across the project site (Palen 2013ii). These surveys are not intended to document nesting and these may be resident or transient birds.

Direct impacts to burrowing owl includes the loss of nest sites, eggs, and/or young; permanent loss of breeding and foraging habitat; and disturbance of nesting and foraging activities for burrowing owl pairs within the project site, buffer, or immediately surrounding area. This includes crushing burrows, increased noise levels from heavy equipment, disturbance from human presence, and exposure to fugitive dust. Because burrowing owls are cavity dwellers that are primarily active during crepuscular periods (i.e., dawn and dusk) or at night, birds flushed from burrows during the day would be exposed to elevated predation risk from raptors. Burrowing owls also exhibit site fidelity and owls displaced from a burrow during construction or from passive relocation activities have an increased risk of mortality from predation if they lack access to adequate burrows.

Indirect impacts to burrowing owls during construction and from operation of the facility can include increased road kill hazards, modifications to foraging and breeding activities, and loss of prey items and food sources due to a decreased number of fossorial mammals. Indirect and operational impacts to nesting birds may also include the loss of habitat due to the colonization of invasive plants and the disruption of breeding or foraging activity due to facility maintenance. Weed abatement, mirror washing, and maintenance activities would likely limit the use of some areas as foraging or nesting habitat. Burrowing owls may also be at risk from collision or electrocution with facility structures and from exposure to elevated levels of solar flux (see Impacts to Migratory/Special-status Bird Species).

Implementation of the PSEGS project would destroy occupied burrows or cause owls to abandon burrows. Construction during the breeding season could result in the incidental loss of fertile eggs or nestlings or otherwise lead to nest abandonment. The loss of occupied burrowing owl habitat (habitat known to have been occupied by owls during the nesting season within the past three years) or reductions in the number of this rare species, either directly or indirectly through nest abandonment or reproductive suppression, would constitute a significant impact absent mitigation. Furthermore, burrowing owls and their nests are protected under both federal and State laws and regulations, including the Migratory Bird Treaty Act and California Fish and Game Code Section 3503.5.

There is much debate among state, federal, local, and private entities over the most practicable and successful relocation/translocation methods for burrowing owl. When passive relocation is used solely as an impact avoidance measure, it is generally only effective when burrowing owl nesting territories are directly adjacent to permanently protected lands (i.e. military reservation, airport, wildlife reserve, agricultural reserve with appropriate crop type such as alfalfa) (Bloom 2003). Passive relocation has been criticized as a relocation method because relocated or displaced owls are tenacious about returning to their familiar burrows and are inclined to move back to the impact site if the impact site is still visible to the owl and/or if the impact site is not completely graded (Bloom, pers. comm.). Because project construction would be phased and occur over multiple years passive relocation may result in the repeated harassment of resident owls should they try to re-establish territories within the projects footprint. While construction of replacement burrows in off-site areas and the acquisition of mitigation lands would reduce impacts to the species, it is likely that owls would attempt to occupy areas close to known territories. This could require multiple passive relocation events for the same owls. Each of these events stresses the bird and exposes the owls to predation, lost breeding opportunities, thermal stress, and potential territorial disputes. Burrowing owls are put at increased risk when they are introduced to a new environment. The owls are naturally preyed upon by numerous diurnal and nocturnal avian and mammalian species and evicting owls from their familiar burrow, territory, and home range without a safe opportunity to become familiar with their new habitat increases the potential for predation (Pagel pers. com.). Thus, many burrowing owls likely die during passive relocations used for permanent owl eviction.

For successful active or passive relocation, breaking the owl's site fidelity is of utmost importance (Bloom 2003). The off-site location for the relocated owls should ideally have an existing burrowing owl colony and a large ground squirrel colony. Should neither colony already exist at the translocation site, artificial burrows should be installed if significant grassland or appropriate agricultural crop type is present (Bloom 2003). Active translocation of owls involves trapping owls, temporarily holding them in enclosures with supplemental feeding, and releasing at a suitable off-site location with existing or artificial burrows prior to breeding.

While active translocation might be a better solution than passive relocation for moving owls from large sites like the project site, California Fish and Game Code 3503.3 prohibits the active relocation of burrowing owls unless the effort is designed as a research project. Therefore, staff can only recommend the implementation of passive relocation techniques. Although passive relocation would be conducted to avoid direct mortality of owls within the proposed project area, previously occupied burrow(s) would be destroyed and foraging habitat would be degraded. Due to the loss of habitat compensatory mitigation is required to reduce these impacts to less than significant levels. The location and amount of compensatory habitat required to mitigate impacts to burrowing owl is often based on the number of impacted owls and assumes that currently occupied habitat will be replaced with nearby occupied habitat.

Compensatory mitigation for burrowing owls identified for the approved PSPP project was based on guidelines recommended in the CDFG Staff Report on Burrowing Owl Mitigation (CDFG, 1995) and by the California Burrowing Owl Consortium (CBOC 1993). When published these guidance documents used the best information available and provided strategies for reducing impacts to burrowing owls and recommended mitigation acreages for off-site replacement habitat. For example the California Burrowing Owl Consortium (CBOC 1993) guidelines for off-site replacement habitat included the following recommendations:

1. Replacement of occupied habitat with occupied habitat at 9.75 acres (6.5 acres times 1.5) per pair or single bird;

2. Replacement of occupied habitat with habitat contiguous to currently occupied habitat at 13.0 (6.5 acres times 2) acres per single pair or single bird, or;

3. Replacement of occupied habitat with suitable unoccupied habitat at 19.5 (6.5 acres times 3) acres per pair or single bird.

For the approved PSPP project the USFWS noted that the above guidelines were developed for owls nesting in coastal habitats, and their efficacy in desert environments has not been ascertained (Sorenson, pers. comm.). No documentation is available to statistically evaluate the success of passive relocation in southern California. Passive relocations in western Riverside County have not involved banded birds, so information on rates of success and direct/indirect mortality are not available. Reports elsewhere (Trulio 1995, 1997) do not provide long term analyses associated with passive relocation efforts to determine if passively relocated burrowing owls are present in the area after one or more years. The lack of documented success of passive translocations raises concerns regarding the fate of evicted owls.

In 2012 the CDFW (formerly CDFG) published The Staff Report on Burrowing Owl Mitigation (CDFG 2012). This document indicated that "reversing declining population and range trends for burrowing owls will require implementation of more effective conservation actions, and evaluating the efficacy of the Departments' existing recommended avoidance, minimization and mitigation approaches for burrowing owls". The new guidelines provide revised methods for surveying; reflect new data on the species; and recommend an ecological approach to establishing mitigation for this species. The 2012 guidance departs from the standardized approach to determining off-site habitat compensation because the acreages are often implemented as the "default" mitigation and may not reflect the actual habitat requirements of the species in a given location (CDFG 2012).

Acquisition of the appropriate amount of offsite habitat for burrowing owl should take into consideration the foraging distance and average home range of breeding and non-breeding owls. Diurnal home range for owls can be 150 feet on both sides of a burrow. Nocturnal home range is much larger, 1 square mile per owl pair, and several owls can overlap in that 1 square mile (Bloom, pers. comm.). The mean home range for 11 male burrowing owls in 1998 and 22 males in 1999 was 177 hectares (437 acres) and 189 hectares (467 acres), respectively, at naval air station in Lemoore, California located south of Fresno (Bloom 2003). Male burrowing owls often move greater than 1,000 meters when foraging in the breeding season and home ranges can often times overlap (Bloom 2003).

For the approved PSPP project staff recommended a minimum of 78 acres (19.5 acres each) of suitable, offsite (preferably occupied) burrowing owl habitat be acquired to offset the loss of foraging and nesting habitat for owls that occur in the Project Disturbance Area. This mitigation was based on the 1993 burrowing owl guidelines which the CDFW suggests may not adequately compensate for burrowing owls in arid ecosystems. Staff agrees that the compensatory mitigation approach would likely be different based on the 2012 guidelines and acknowledges that the mitigation acreages alone would not likely be effective in reducing impacts to the species from the loss of over 3,948 acres of foraging habitat. However, for the approved PSPP project and the PSEGS project the compensatory mitigation requirements for land acquisition would be "nested" within desert tortoise mitigation (see **BIO-12**). Under this condition the project owner would acquire approximately 4,860 acres of desert tortoise habitat. Provided the lands meet the requirements for burrowing owls staff considers this approach a viable mitigation option. The land acquisition identified under **BIO-12** would far exceed the recommendations for off-site compensatory burrowing owl mitigation identified in the 2012 guidelines and would theoretically support multiple pairs of owls.

To avoid potential impacts to burrowing owls in the Project Disturbance Area, staff is recommending that proposed conditions of certification (described below) include the completion of pre-construction surveys of the site using established protocols. If present, the project owner would establish a buffer and avoid active nests during the breeding season. If owls are detected using a burrow outside the breeding season the owls may be passively displaced pending the establishment of artificial burrows and the acquisition of adequate mitigation lands.

Condition of Certification **BIO-18** (Burrowing Owl Impact Avoidance, Minimization and Compensation Measures) would require the project owner to prepare and implement a Burrowing Owl Mitigation Plan that would include the following elements: a description of suitable burrowing owl relocation/translocation sites; guidelines for creation or enhancement of at least two natural or artificial burrows per relocated owl if an existing burrowing owl and/or ground squirrel colony does not occur outside the Project Disturbance Area; detailed methods and guidance for passive relocation of burrowing owls; and a description of proposed maintenance monitoring, reporting, and management of the relocated burrowing owls. This condition also requires acquisition and enhancement of a minimum of 78 acres of off-site suitable nesting and foraging burrowing owl habitat to mitigation for displacement of at least four owls. The prior project owner submitted a draft Burrowing Owl Relocation/Translocation Plan (AECOM 2010a, DR-BIO-51) which could serve as the basis for the Burrowing Owl Mitigation Plan. With implementation of Condition of Certification **BIO-18**, and **BIO-12**, direct impacts to burrowing owls would be reduced to less-than-significant levels. Indirect impacts to burrowing owl include collisions with project features, glare, also collision, electrocution, glare, and exposure to elevated levels of solar flux. Conditions of Certification **BIO-16a** and **BIO-16b** provide for ongoing project monitoring and implementation of a suite of habitat restoration and enhancement measures that would benefit burrowing owls, and implement adaptive management strategies based on results of project monitoring. However potential indirect impacts may remain significant after mitigation.

Golden Eagle

Golden eagles can be extremely susceptible to disturbance during the breeding season (Anderson et al. 1990; USFWS 2009b), and adverse effects are possible from various human activities up to (and in some cases exceeding) one mile from a nest site (Whitfield et al. 2008). Surveys documented two active nest approximately seven miles southwest of the PSEGS project site in the Chuckwalla Mountains, three inactive nests approximately 6 miles southwest of the site in the Chuckwalla Mountains, one inactive golden eagle nest just over ten miles southeast of the site in the Chuckwalla Mountains, and two active golden eagle nests just over 10 miles northeast of the site in the Palen Mountains (Solar Millennium 2010u), and preliminary results of spring 2013 helicopter surveys have indicated detection of three active nests in the Chuckwalla Mountains (Palen 2013x). Based on guidance provided by the USFWS (72 FR 31132, June 5, 2007) staff defined disturbance as an activity that would result in injury to an eagle or which would substantially interfere with normal breeding, feeding, or sheltering behavior. For example, a nestling being knocked from the nest by a startled adult would be considered an injury. A nestling fed inadequately because adults were agitated in the vicinity of the nest due to construction-related noise and activity would also be considered substantial interference, as would a situation in which nestlings starve because the adults were excluded from their familiar foraging grounds and could not provide adequate food to their young.

Staff concluded that project construction activities could potentially injure or disturb golden eagles if nests were established sufficiently close to project boundaries to be affected by the sights and sounds of construction. Staff considers these potential impacts unlikely, however, because suitable nesting substrate (i.e., cliff ledges, rocky outcrops, or large trees) does not occur within one mile of the PSEGS project area. The only potential nesting substrate within one mile of project boundaries would be transmission line towers. If such nesting occurs on transmission lines, disturbance to golden eagle nests would be avoided with implementation of Condition of Certification **BIO-16b**. This condition recommends that during construction, golden eagle nest surveys be conducted in accordance with USFWS guidelines to verify the status of golden eagle nesting territories within one mile of the project boundaries. Implementation of **BIO-16b** would reduce potential impacts of project construction on nesting golden eagles to less-than-significant levels.

Staff also assessed the impacts of the project to golden eagle foraging habitat, and concluded that the project would contribute to the cumulative loss of golden eagle foraging habitat within the NECO planning area. The Project would reduce the availability of eagle foraging habitat and could degrade nearby foraging habitat by the introduction and spread of noxious weeds. As discussed in the cumulative impact subsection, the project contributes to cumulative loss of foraging habitat from future projects within the NECO planning area (see **Biological Resources Table 15**). The potential for impacts to golden eagle foraging habitat can be reduced to less-than-significant levels by implementation of Conditions of Certification **BIO-12** (acquisition of desert tortoise compensatory mitigation lands), **BIO-21** (acquisition of state waters compensatory mitigation lands), and **BIO-14** (implementation of weed management plan). As described in **BIO-12**, the acquisition of desert tortoise mitigation lands would be targeted for areas within and near the Chuckwalla Bench and the Chuckwalla DWMA. Because these targeted areas are also within 10 miles of potential nesting sites for golden eagles, acquisition of these desert tortoise mitigation lands would also provide protected golden eagle foraging grounds. Potential golden eagle impacts attributable to concentration of solar flux during operation of the project are discussed below for all avian species, in the subsection titled “Operational Impacts to Flighted Species”.

Special-status Avian Species

Birds are the most conspicuous vertebrate found in the California Deserts (Latting and Rowlands 1995). Records exist for at least 425 species (Garrett and Dunn 1961) from 18 orders and 55 families. These approximately 350 species are characterized as Neotropical migrants who pass through the region during spring and fall migrations. These birds include various raptors including Swainson’s hawks; turkey vultures; and numerous passerines some of which include least Bell’s vireo, southwestern willow flycatchers, many hummingbirds, and various warblers. Shorebirds and other waterfowl are common migrants that have the potential to occur in the project area.

The project site and Chuckwalla Valley provide foraging, cover, and/or breeding habitat for a wide variety of resident and migratory birds. Localized water sources such as Lake Tamarisk are known to attract birds as are irrigated agricultural areas including the palm groves that abut the PSEGS project site. Ponds, including the small cement lined reservoir located at the northwest corner of the site are also expected to attract a variety of birds. Both the project site and adjacent habitat support microphyll woodlands that have been recognized as important habitat for resident and migratory birds.

How a given species is affected by project construction or operation is a function of the species ecology and behavior. Although the project area does not provide breeding habitat for many species (i.e., Swainson's hawks, northern harriers, peregrine falcons, or yellow warblers) these species are known from the region and have been documented overflying the site during migration or in the winter. These species may forage or rest on the project site. Similarly, many species of raptors winter in desert regions and become seasonal long term winter residents. Resident species are also affected by how they use the site. Some species of birds may be semi-permanent dwellers while nesting exhibiting strong site fidelity and territorial behavior; however these species may have much broader ranges during the winter.

Direct impacts to nesting and migratory birds would include the loss of foraging and nesting habitat and disturbance from construction activities. Construction during the breeding season could also result in displacement of breeding birds and abandonment of active nests. Small, well-hidden nests could be subject to loss during construction. Similarly, increased noise levels from heavy equipment, human presence, and exposure to fugitive dust could displace native birds or interfere with breeding. Habitat fragmentation, degradation and shifts in vegetative structure can affect nesting birds. In addition, noise and lighting effects have been demonstrated to adversely affect behavior, reproduction, and increase the risk of predation for some species.

Indirect impacts to nesting birds could include the loss of habitat due to the colonization of invasive plants and a disruption of breeding or foraging activity due to facility maintenance. Weed abatement, mirror washing, and maintenance activities would disrupt use of the area as foraging or nesting habitat.

During project construction, birds may nest on construction equipment, office trailers, and vehicles. Birds may also become trapped in any narrow vertical pipes left uncovered. Birds have been documented to descend into pipes either in search of nest cavities or food and become trapped in the pipes. Once inside the cavity, the birds cannot climb the slick interior or spread their wings to fly (Brean 2011). Vertical pipes have been found to be a significant threat to bird mortality in Nevada, where the wide-spread use of vertical PVC pipes for mining claims markers has led to the widespread mortality of thousands of birds that had become entrapped in them (American Bird Conservancy 2011). To date, the Nevada Department of Wildlife (NDOW) has found over 3,000 fatalities in 10,000 removed pipes (Brean 2011). California Audubon also indicated that open pipes kill birds indiscriminately and that both common birds and protected species have been found among the layers of dead birds in open pipes (http://ca.audubon.org/workinglands-pipes.php). A single pipe on a preserve in Kern County contained the remains of numerous birds (http://kern.audubon.org/Audubon_Kern_River_Preserve_death_pipes.pdf).

Implementation of the PSEGS project would result in the direct loss of habitat that supports breeding and foraging for a variety of resident and migratory birds. This includes the functional loss of approximately 3,948 acres of habitat including Sonoran creosote bush scrub; desert dry wash woodland; dunes; and ephemeral drainages. Although nesting habitat for most migratory birds would not be lost, the removal of foraging habitat, cover and roost sites for these species would be substantial. The project would have more substantial adverse effects to resident breeding birds, some of which include loggerhead shrike, California horned lark, and Le Conte's thrasher. For the PSEGS, the project owner has proposed to mow vegetation and allow some plants to persist within the heliostat field. However, remaining habitat would be degraded and nesting birds would be subject to ongoing maintenance activities. Le Conte's thrasher, loggerhead shrike and other wash-dependent species would in particular be affected by the loss of the cover, foraging and nesting opportunities provided by the structurally diverse and relatively lush desert dry wash woodland. Dry washes contain less than 5 percent of the Sonoran Desert's area, but are estimated to support 90 percent of Sonoran Desert birdlife (CalPIF 2006). The loss of habitat from the proposed project would be significant absent mitigation.

Condition of Certification **BIO-12,** the desert tortoise compensatory mitigation plan, **BIO-16a**, which would annually fund habitat enhancement and restoration, and **BIO-21,** mitigation for impacts to state waters, would offset the cumulative loss of habitat for these species.

Implementation of the PSEGS project would result in direct, indirect and operational effects to nesting birds. During construction it is expected that most birds would disperse to adjacent habitat during initial vegetation clearance. However, if site grading, brush removal, or construction occurs during the nesting season, bird nests may be destroyed, including eggs or nestling birds. Ground nesting species such as night hawks, poorwills, roadrunners, and horned lark, and various shrub nesters may disproportionally affected.

Noise during construction may adversely affect bird nesting success. For most common species, staff concludes that this impact would be less than significant, but staff believes that it could significantly affect breeding habitat suitability for native birds, including special-status species. The loss of active bird nests or young is regulated by the federal Migratory Bird Treaty Act and Fish and Game Code section 3503, which protects active nests or eggs of California birds. Mitigation measures to avoid and minimize impacts to nesting are contained in Conditions of Certification **BIO-8** (Impact Avoidance and Minimization Measures); **BIO-15** (Pre-construction Nest Surveys), which describes guidelines for performing pre-construction surveys; **BIO-16a,** (Avian Enhancement and Conservation Plan)**,** which would implement funding toward habitat restoration and enhancement; and **BIO-16b** (Avian Avian and Bat Protection Plan) which provides a mechanism to monitor for bird collisions and implement adaptive management measures to minimize impacts. Implementation of staff's proposed conditions of certification would avoid direct impacts to nests, eggs, or young of migratory birds, and would minimize the impacts to less than significant levels for construction disturbance to resident and migratory birds. Potential special status and migratory bird impacts attributable to operation of the project are discussed below for all avian species, in the subsection entitled "Operational Impacts to Flighted Species."

Bats

The project would adversely affect bats through the removal of foraging habitat. The entire project site is expected to support bat foraging, in particular desert dry washes, where increased presence of vegetation, especially microphyll woodland, would support a broad variety of insects prey items. Approximately 850 acres of agricultural development (jojoba and palm farms) occur immediately adjacent the project. Associated with these farms are two private pools, approximately two acres or less in size. Agriculture may support foraging by the species if they support appropriate insect fauna, because the plantation is irrigated and it is expected to support a host of unexpected insect species. The presence of an evaporation pond within the project may similarly serve as an attractant for insects, and therefore may attract bats for foraging.

Loss of roosting habitat is another impact of the PSEGS project. Suitable roosting habitat for bats within the modified project and linear features includes washes with large trees within the southern portions of the modified project in the central wash, and around the transmission line and substation. Large washes with riparian vegetation meander through the southern portion of the buffer around the transmission line and substation south of I-10. Some large trees are located within the southern portion of the central wash in the modified project. Large trees with exfoliating bark, tree cavities, rock crevices, bridges, and other locations may provide suitable roosting habitat for a variety of bat species within the modified project and buffer. Bat roosts are known to occur in the project area. Bat roosts are also known to occur in Eagles Nest Mine (Little Maria Mountains) and Paymaster Mine in the project vicinity (LaPre pers. comm.). Additionally, the taller ornamental palm trees within the plantation may be utilized for roosting by bats including Western yellow bats.

The majority of adverse impacts to bat populations in the region result from disturbance of roosting or hibernation sites, especially where large numbers of bats congregate; physical closures of old mine shafts, which eliminates roosting habitat; elimination of riparian or desert wash microphyll vegetation which is often productive foraging habitat; more general habitat loss or land use conversion; and agricultural pesticide use which may poison bats or eliminate their prey-base (Pierson & Rainey 1998; Gannon 2003).

The project owner has suggested that impacts to bats will be limited to loss of forage. However, staff believes that impacts to bats may be caused by collisions with stationary project features such as the tower and heliostats, as well as moving objects such as construction equipment and other moving vehicles, particularly during periods of night time construction. Other onsite practices that increase available water, such as mirror washing, dust control, and leaks/spills when filling water trucks may attract insects, in turn attracting bats to the site. Increased vehicle presence on access roads and the I-10 freeway may also adversely impact bats. Bats are known to collide with stationary objects, such as windows and television towers; and of these collisions, many involved illuminated objects that should have been detected by vision, if not certainly by echolocation (Orbach and Fenton, 2010). Bats do not maneuver solely using echolocation, in fact, some bats have very good eyesight, such as *Macrotus californicus*, a species that feeds by gleaning insects, and therefore would need to clearly see them against foliage in order to eat them. There are several species of bats likely foraging at the site that also feed by gleaning, such as the pallid bat. While bat vision is adapted for long-distance use, and even exceeds echolocation ranges (Suthers

1970), the short-range visual capability of bats is poorly understood (Orbach and Fenton, 2010).

While much documentation of road-kill mortality has focused on terrestrial mammals, birds, reptiles and amphibians, the impact of highways on bat populations has only recently been identified (Kiefer et al. 1995, Wray et al. 2005, Lesinski 2007, López et al. 2007). During studies along a highway conducted in 2009 (Russell et al. 2009) found carcasses of *Myotis lucifugus* and *Myotis sodalis* that were killed by vehicles, and the authors concluded that “most likely does not reflect the true impact of highway traffic on these bat colonies.” During telemetry studies in 2000 (Butchkoski & Hassinger 2002), bats were observed crossing US Route 22 as they emerged from the roosts at dusk, and noted road-killed bats.

A year’s worth of data was collected along a section of road, revealing 61 road-killed bats belonging to seven species (Lesinski et al 2008). The frequency of detection of carcasses varied both seasonally and by the type of habitat surrounding the roadside. Interestingly, species that were struck ranged in typical flight elevations, and the authors’ hypothesis that low-flying species would be killed more frequently was not confirmed.

Conditions of Certification **BIO-1** through **BIO-8** from the PSPP Commission Decision as modified by staff in this FSA would minimize overall project impacts to habitat, require worker training to minimize disturbances, biological monitoring and reporting of project disturbances, and compensate for habitat loss through the acquisition and management of offsite lands, including offset for dry desert wash habitat at a 3:1 ratio. Staff concludes that these measures would effectively mitigate foraging habitat impacts for special-status bats.

As discussed in the cumulative impact subsection, staff considers the project to be a substantial contributor to the cumulative loss habitat for the NECO planning area biological resources, including habitat for these special-status bats. Condition of Certification **BIO-12**, the desert tortoise compensatory mitigation plan and **BIO-21**, mitigation for impacts to state waters, would offset the cumulative loss of habitat for these species. For a discussion of potential bat impacts attributable to operation of the project, as well as a discussion of mitigation, refer to the following subsection titled “Operational Impacts to Flighted Species”.

American Badger and Desert Kit Fox

Construction of the project could kill or injure American badgers by crushing individuals with heavy equipment or could entomb them within a den. Construction activities could also result in disturbance or harassment of individuals . Staff has proposed deleting Condition of Certification **BIO-17** from the PSPP Commission Decision and replacing it with a new Condition of Certification **BIO-17** which would require development of an American Badger and Kit Fox Management Plan that includes, but is not limited to, conducting pre-construction baseline surveys and expanded avoidance measures to protect badgers and kit fox during construction and operation.

The desert kit fox is not a special-status species, but it is protected under Title 14, California Code of Regulations section 460, and potential impacts to individuals of this species must be avoided. Desert kit fox sign was detected on the PSPP project site during surveys conducted in 2009 and 2010, and the site includes suitable foraging and denning habitat for this species. This species has been detected on the site as recently as spring 2013 (CDFW 2013c).

In 2011, an outbreak of canine distemper virus (CDV) was identified in the desert kit fox population within or adjacent to the Genesis Solar Energy Project (GSEP) project site, located approximately 10 miles east of the PSEGS site. This disease had not been reported previously in wild desert kit foxes (Clifford 2011a). Additional CDV deaths were detected at the Colorado River substation approximately 11 miles south of the GSEP site in February 2012 and additional foxes shedding the virus were detected near both sites (Clifford 2013).To date 22 kit fox carcasses submitted from the solar projects have been necropsied and 11 of these deaths (50%) were due to distemper. The last known distemper death was detected in May 2012 near the Colorado River substation (Clifford 2013). It is thought that stress from animals being passively relocated or disturbed may put animals at greater risk of contracting the disease if conducted in an area experiencing or adjacent to a CDV outbreak, as CDV infection decreases immune function (Clifford 2011b). In addition, passive relocation activities in an area experiencing a CDV outbreak may result in increased movement of animals shedding the virus and thereby increase transmission into new areas.

CDFW Wildlife Investigations Laboratory have monitored, via telemetry and remote cameras, the survival of a sample ranging from 9-18 radio collared foxes living in close proximity to each site and their dens at four study sites since late January 2012 in order to better detect cases of CDV (Clifford 2013). Consultants for the Desert Sunlight project, Colorado substation, and GSEP are monitoring survival of the collared foxes near their respective sites while the Palen site is monitored by a CDFW wildlife technician. No distemper caused mortalities have been detected in monitored foxes near the PSEGS or Desert Sunlight sites located in the western portion of the Riverside East Solar Energy Zone (solar zone). However, testing of live foxes in 2012 and 2013 shows that some foxes in this area have been exposed to canine distemper virus as antibodies against the virus have been detected in their serum. Thus it is likely that canine distemper virus is also present in the western portion of the solar zone.

In order to address the concern of increasing the risk of spreading canine distemper virus within the Palen desert kit fox population, CDFW and BLM coordinated with staff to revise **BIO-17** based on measures developed for the GSEP project. In addition CDFW and BLM coordinated with staff to develop a CDFW-led Proposed Desert Kit Fox Health Monitoring and Mitigation Program. The CDFW-led Proposed Desert Kit Fox Health Monitoring and Mitigation Program would be initiated by CDFW potentially by the end of 2013 and project owners could opt to pay a fee to participate in the program. Program goals include the following:

- By minimizing the number of clinical cases (and therefore deaths) to the greatest extent possible and reducing the risk of disease spread through trapping and testing, radio collaring, monitoring, and selective vaccination of animals targeted for relocation.

- By utilizing best practices during relocation events to minimize stress to the greatest extent possible and by systematically evaluating relocation outcomes to determine factors associated with successful vs. unsuccessful outcomes.
- By providing treatment and rehabilitation for foxes found sick or injured due to construction site activities.
- By definitively determining the cause of death whenever possible for foxes that die or are found dead in the project impact area so that projects can address and potentially avoid any causes of death that are construction related.

Construction of the PSEGS project could kill or injure desert kit fox by crushing individuals with heavy equipment, or could entomb them within a den if avoidance measures are not implemented. Construction activities could also result in disturbance or harassment of individuals or introduction of foxes into populations with CDV or increase risk of contracting the disease. Staff's proposed Condition of Certification **BIO-17**, which replaces **BIO-17** from the PSPP Commission Decision in its entirety, requires development of an American Badger and Desert Kit Fox Mitigation and Monitoring Plan. During a workshop held with the project owner and other parties, the content of **BIO-17** was discussed and the project owner provided comments on the condition as part of comment on the PSA. Staff's proposed Condition of Certification **BIO-17** was further revised to include the option for the project owner to participate in the CDFW-led Proposed Desert Kit Fox Health Monitoring and Mitigation Program. The revised Condition of Certification **BIO-17**, which still requires development of an American Badger and Desert Kit Fox Mitigation and Monitoring Plan that includes, but is not limited to, procedures and impact avoidance measures for conducting pre-construction baseline surveys and avoidance measures to protect kit fox during construction and operation, would avoid this potential impact.

The PSEGS would permanently remove approximately 3,899 acres of foraging and denning habitat for American badgers and kit fox and would fragment and reduce the value of foraging and denning habitat adjacent to the project site. This habitat loss and degradation could adversely affect American badger and kit fox populations within the NECO planning area. As discussed in the cumulative impact subsection, staff considers the PSEGS project to be a substantial contributor to the cumulative loss of the NECO planning area biological resources, including American badgers and kit fox. Conditions of Certification **BIO-12**, the desert tortoise compensatory mitigation plan, and **BIO-21**, compensatory mitigation for state waters, would offset the loss of habitat for this species and reduce the impact to less-than-significant.

Nelson's Bighorn Sheep

The PSEGS site is not within any of the bighorn sheep connectivity corridors identified in the NECO; in addition the NECO identifies I-10 as a barrier to bighorn sheep movement (BLM CDD 2002). Staff concluded that the project site is not currently an important movement corridor because of the presence of I-10 and the width of the valley between suitable bighorn sheep habitat. The Society for Conservation of Bighorn Sheep has recommended a 1-mile buffer from the upper edge of any solar development to the base of the mountains to protect spring foraging habitat. The PSEGS site is over one mile from the base of either the Chuckwalla or Palen mountains. Barriers between the

Chuckwalla Mountains and the project site (I-10) and the Palen Mountains and the project site (sand dunes) further restrict the availability and usefulness of the project site for spring foraging habitat.

Also of interest are the potential impacts from project groundwater extraction to seeps, springs, or other water resources that are currently available to bighorn sheep that occupy the Palen Mountains. The prior project owner provided information (AECOM 2010a DR-S&W-193) about the closest water features, and concluded that groundwater extraction for the project would not affect these features. After reviewing the data provided in the Data Responses, staff agreed with the PSPP applicant that the PSPP project was unlikely to affect springs and seeps available for use by bighorn sheep. The PSEGS will not have any additional impacts on springs and seeps not already analyzed for the PSPP.

As discussed in the cumulative impacts section, the PSEGS project would not directly affect habitat within any NECO connectivity corridors or Wildlife Habitat Management Areas (WHMAs), and would not conflict with Desert Bighorn Sheep Conservation goals and objectives outlined in the NECO. In addition, staff has concluded that the project site does not represent significant direct or indirect impacts to bighorn sheep habitat connectivity or foraging.

Construction Noise

Construction activities would result in a temporary, although relatively long-term (34 months) increase in ambient noise level on the project site and in some adjacent habitat. Animals rely on hearing to avoid predators, obtain food, and communicate. Excessive construction noise could interfere with normal communication, potentially interfering with maintenance of contact between mated birds, obscuring warning and distress calls that signify predators and other threats, and affecting feeding behavior and protection of the young. High noise levels may also render an otherwise suitable nesting area unsuitable. Behavioral and physiological responses to noise and vibration have the potential to cause injury, energy loss (from movement away from noise source), a decrease in food intake, habitat avoidance and abandonment, and reproductive losses (Hunsaker 2001; National Park Service 1994).

Noise from operation of PSEGS and nighttime washing and maintenance activities of the heliostats could affect wildlife in adjacent habitats by interfering with breeding or foraging activities and movement patterns, causing animals to avoid areas adjacent to the project. This could disrupt foraging, breeding, sheltering, and other activities. However, lighting and noise from washing would disrupt nocturnal animals in adjacent habitat and those that remain within the project fence line. Staff considers noise effects to be of a concern for wildlife located in and adjacent to the project site.

The bighorn sheep WHMA, approximately 2.5 miles northeast of the PSEGS, is a sensitive noise receptor due to the presence of breeding Nelson’s bighorn sheep. Birds are also expected to nest in creosote scrub and desert dry wash woodland on the project site and on adjacent lands that border the site. Studies have shown that noise levels over 60 A-weighted decibels (dBA) can result in nest abandonment by birds and intense, long-lasting noise can mask bird calls, which can reduce reproductive success (Dooling and Popper 2007; Hunsaker 2001). Many bird species rely on vocalizations during the breeding season to attract a mate and noise from construction or operation could disturb nesting birds and other wildlife. Reijnen et al. (1995) demonstrated that for two species of European warbler (*Phylloscopus* spp.), sound levels between 26 dB(A) and 40 dB(A) reduced breeding density by up to 60 percent compared to areas without disturbance. Noise impact studies on bighorn sheep have not identified numerical noise impact thresholds. Weisenberger et al. (1996) found that bighorn sheep responded to aircraft over-flights (92-112 dBA) with increased heart rates and altered behavior; however, animal response decreased with increased exposure.

The project owner has not provided updated noise estimates to describe construction of the power towers or other facilities. Preliminary data from the project owner suggests noise levels would be similar to those described for the approved PSPP project. Assuming that construction noise is similar; the average construction noise of 85 dBA at 50 feet from the noise center and noise attenuation of 6 dBA per doubling of distance (Solar Millennium 2009a), normal construction noise would attenuate to about 60 dBA approximately 800 feet (0.15 mile) from the noise center. The majority of the construction activities would occur within the power blocks located approximately 3,750 feet (0.71 mile) from the project boundary. Therefore, it is anticipated that average construction noise levels would typically be less than 60 dBA in the bighorn sheep DWMA and surrounding the project site. The infrequent occasions when construction activities would occur near the project boundary and resultant noise levels would be temporarily elevated beyond 60 dBA surrounding the project would not significantly impact sensitive wildlife that occur in habitat adjacent to the PSEGS fence line. Animals that remain within the fence line would be subject to potentially significant noise effects.

Although average construction noise levels would usually attenuate to 60 dBA at the project boundary, unsilenced steam blows and pile driving produce short-term, sporadic, and loud noise that could substantially elevate noise levels in the bighorn sheep DWMA. The loudest proposed construction activity would be steam blows required to prepare a steam turbine for startup during the final phase before operation. This process cleans the piping and tubing which carry steam to the turbines; starting the turbines without cleaning these systems would destroy the turbine. High pressure steam blows require a series of short steam blows, lasting two or three minutes each, which would be performed several times daily over a period of two or three weeks. These steam blows can produce noise as loud as 130 dBA at a distance of 100 feet. This would attenuate to about 88 dBA at a distance of 2.5 miles from the project site, and 77 dBA at 9 miles from the project site. Silenced steam blows, however, are commonly reduced to 89 dBA at 50 feet, which would attenuate to less than 53 dBA at the project boundary. At this time the project owner has not provided information if this process would be the same for the PSEGS project. For the approved PSPP the prior project owner proposed to use a low-pressure technique for steam blows, which would release steam over a continuous period of about 36 hours and would result in noise levels of about 80 dBA at 100 feet and less than 50 dBA beyond the project boundary. Another relatively loud and short-term construction activity is pile driving. If required, noise from this activity could be expected to reach 101 dBA at a distance of 50 feet and attenuate to less than 59 dBA at a distance of 2.5 miles from the project site.

Elevated noise from steam blows and pile driving could adversely affect the breeding, roosting, or foraging activities of sensitive wildlife proximate to the project area. To minimize these potential noise impacts, Condition of Certification **BIO-8**, requires avoidance of loud construction activities (i.e., steam blowing and pile driving) that would result in noise levels over 65 dBA at potential wildlife breeding sites (such as dry desert wash woodland) between February 15 and April 15, the height of the bird breeding season. With implementation of this condition, impacts from project construction activities would be less-than-significant. Employing the low-pressure steam blow technique recommended by staff would further reduce noise levels and the potential for impacts to wildlife. For a complete analysis of construction noise impacts, refer to the **Noise** section of this FSA.

In order to efficiently produce and distribute concrete within the project site, the project owner will utilize a concrete batch plant for the PSEGS . The batch plant would have a similar impact as the concrete batch plant included as part of the project description for the PSPP. The PSPP would have had a concrete batch plant with a production capacity of 150 cubic yards per hour and would be expected to operate 10 hours per day, five days a week. Night operation of the batch plant would be required to overcome the difficulty of performing concrete placement in extremely high ambient temperatures.

The batch plant would be portable and would be moveable to a number of different locations to support current work activities but would occur entirely within the PSPP Project Disturbance Areas (Solar Millennium 2010p). The likely deployment locations for the produced concrete are the two power blocks and the project's main warehouse area. Batch plant noise levels would be approximately 90 decibels at 50 feet. The prior project owner stated that although noise levels would be slightly higher than the construction noise levels at the project site boundary assessed in the Application for Certification, noise levels from the concrete plant would attenuate over a greater distance since the plant would be located within the project boundaries (Galati & Blek 2010i).

The project owner states in the Petition to Amend that construction noise from the PSEGS is expected to be the same as for the PSPP. Therefore, staff assumes noise impacts from the concrete batch plant would be similar to those for the PSPP. Staff still believes that operation of the concrete plant at 90 decibels from the PSEGS project boundary could have negative effects to nesting birds and other wildlife during their breeding seasons. Operation of the batch plant for a ten hour period that spans into night-time hours at intermittent levels of up to 90 decibels could alter breeding, foraging, and other behaviors of wildlife such as small burrowing mammals, bats, nesting birds, especially nocturnal wildlife. With the implementation of site design measures and best management practices outlined in condition of certification **BIO-8** (Impact Avoidance and Minimization Measures), the impacts of additional, loud noise from the concrete batch plant to wildlife would be reduced to less-than-significant levels. If any additional impacts would occur staff will include additional analyses in the Final Staff Assessment

Operational Impacts to Flighted Species

The project would introduce several factors which could result in mortality, morbidity, and reduced reproductive success in birds and in bats, and to insects. Potential impacts of the operating facility to birds, bats, and insects include physical injury resulting from collision with power towers, heliostats, or other project infrastructure features; electrocution; and disorientation (disturbance from lighting, mirror reflection, etc.). Ocular damage, hyperthermia and, depending on period of exposure and level of flux, burning and other heat-caused damage to internal and external body parts, as well as residual damage (morbidity) may occur to bats, birds, or insects that enter the airspace over the heliostat field where elevated solar flux exists.

There are many factors that contribute to the potential risk of operational impacts (i.e., electrocution, collision, glare, or exposure to solar flux) to birds. In addition to weather, risk is a function of the birds ecological, physiological, and behavior characteristics. Some of these factors include when a bird is active (i.e., diurnal or nocturnal); the elevation at which a bird flies flies or migrates; flight and foraging behavior; the size or mass of the bird; bird color; localized residency pattern; and the period a bird is present in the region are other factors that effects risk. Each of these factors is considered below when assessing risk to a given species of bird from the operation of the PSEGS project.

For example, collision risk at night would be expected to increase for nocturnal species including migrants. Nocturnal migrants, which include many species of passerines, would be expected to have a higher collision risk and a lower risk from exposure to elevated levels of solar flux. Conversely, birds that are more active during periods of daylight may have an increased risk of flying into areas containing elevated levels of solar flux. For example many raptors and soaring birds rely on thermals to aid in flight; aerial foragers including swifts and swallows feed on flying insects and these species would be expected to have a higher risk from exposure to elevated levels of solar flux or glare.

However, in any natural system activity patterns may vary and species may be active during both diurnal and nocturnal periods.

Low flying birds or ground foragers including roadrunners are likely have a reduced risk from exposure to solar flux. Each of these effects is discussed in detail below.

Electrocution

Large raptors such as golden eagle, red-tailed hawk, and great-horned owl can be electrocuted by transmission lines when a bird’s wings simultaneously contact two conductors of different phases, or a conductor and a ground. This happens most frequently when a bird attempts to perch or take off from a structure with insufficient clearance between these elements. Electrocution can occur when horizontal separation is less than the wrist-to-wrist (flesh-to-flesh) distance of a bird’s wingspan or where vertical separation is less than a bird’s length from head-to-foot. Electrocution can also occur when birds perched side-by-side span the distance between these elements (APLIC 2006).

In addition, distribution lines that are less than 60 kV but greater than 1 kV pose an electrocution hazard for raptor species attempting to perch on the structure. The majority of bird electrocutions are caused by lines that are energized at voltage levels between 1-kV and 60-kV, and “the likelihood of electrocutions occurring at voltages greater than 60-kV is low” because phase-to-phase and phase-to-ground clearances for lines greater than 60-kV are typically sufficient to prevent bird electrocution (APLIC 2006).

The proposed transmission lines would be 230 kV and would be fitted on top of monopole structures are expected to be 120 feet in height and an average length of 1,100 feet between poles (Solar Millennium 2009a). The transmission line and pole fitting would be constructed in accordance with the guidelines of Institute of Electrical and Electronics Engineers (IEEE) Guide 524 “Guide to the Installation of Overhead Transmission Line Conductors” and would also follow the Suggested Practices for Avian Protection on Power Lines (APLIC 2006). Also, the lines would be insulated from the poles using porcelain insulators engineered for safe and reliable operation at a maximum operating voltage of 242-kV (Solar Millennium 2009a).

To minimize risk of electrocution, the project should impose a “raptor-friendly” construction design for the transmission line with conductor wire spacing greater than the wingspans of large birds to help prevent electrocution as described in Suggested Practices for Avian Protection on Power Lines (APLIC): The State of the Art in 2006 (APLIC 2006). Certification **BIO-8** requires above-ground transmission lines and all electrical components to be designed, installed, and maintained in accordance with APLIC guidelines to reduce the likelihood of large bird electrocutions and collisions. With the Implementation of proposed Condition of Certification **BIO-8**, the project transmission lines would not pose a significant electrocution threat to birds. Additionally, the project owner has proposed to conduct power line retrofits (Palen 2013a), and staff has incorporated this mitigation into Condition of Certification **BIO-16a**.

Collisions, Lighting, and Glare

The modified project would include two power towers, heliostat fields, and ancillary equipment including boilers and control facilities. Onsite facilities range from a height of 750 feet (power towers), to 120 feet for boilers and the air-cooled condenser unit. Each of the heliostats is approximately 12 feet high. The remaining facilities are generally less than 80 feet in height (Palen 2013a). All of these features would pose a potential collision risk for birds. Birds are known to collide with communications towers, transmission lines, and other elevated structures including buildings. Estimates of the number of bird fatalities specifically attributable to interactions with utility structures vary considerably. Nationwide, it is estimated that hundreds of thousands to as many as 175 million birds are lost annually to fatal collisions with transmission and distribution lines (Erickson et al., 2001). Numerous studies have also documented extensive avian collision mortality associated with buildings and similar structures such as smokestacks or monuments (*ibid*). In California, even general estimates are unavailable, although it is plausible that such collisions result in the deaths of hundreds of thousands of birds each year (Hunting, 2002).

Collisions typically result when the structures are invisible (e.g., bare power lines or guy wires at night), deceptive (e.g., glazing and reflective glare), or confusing (e.g., light refraction or reflection from mist) (Jaroslow 1979). Collision rates generally increase in low light conditions, during strong winds, and during panic flushes when birds are startled by a disturbance or are fleeing from danger. The Avian Power Line Interaction Committee (APLIC) has determined that collisions are more probable near wetlands, within valleys that are bisected by power lines, and within narrow passes where power lines run perpendicular to flight paths (APLIC 1996). Passerines (e.g., songbirds) and waterfowl (e.g., ducks) are known to collide with wires (APLIC 2006), particularly during nocturnal migrations or poor weather conditions (Avery et al. 1978).

Diurnal birds, or those active during daylight hours, could also collide with tall structures. Staff has concluded that the risk of such impacts is low. Most diurnal bird collisions with tall structures are associated with guyed towers in poor visibility conditions such as fog or inclement weather (Manville 2001). The PSEGS does not include guyed structures.

The project would have two evaporation ponds (approximately two acres each) that could attract birds to the site. Existing date palm and jojoba farms and other agricultural practices in the area may also be an attractant to birds, subjecting them to greater risk of collisions.

To date, little is known regarding the avian response to glare from solar technology. However, it is likely that glare will affect birds to some degree. In the same way that large mirrored buildings may be confused by birds as open sky; the mirrors will reflect light and take on the color of the image being reflected, and also polarize light, as discussed further below. This may result in birds confusing the heliostats as either open sky or water and increase the collision risk. Staff has reviewed research by McCrary et al. (1986) which quantified bird mortality, including collisions, at a 10 MW pilot SRSG (power tower) pilot facility (Solar One) near Daggett, California. The Solar One facility consisted of a 79-acre heliostat field and a 282-foot solar receiver tower. McCrary et al. documented 70 bird fatalities during the course of a 40-week study, and the total average mortality rate was 1.9 to 2.3 birds per week. Staff is not aware of any other scientific study of bird mortality at any other comparable generator. The authors partially attributed these collisions to high numbers of birds attracted to the adjacent evaporation ponds and agricultural fields. Anecdotal reports of collisions are becoming more common as large-scale photovoltaic (PV) and concentrating solar power facilities are developed in the desert. Similar to heliostat mirrors, photovoltaic panels can reflect light and may be confused by birds as water or sky. Although PV panels absorb solar radiation and are typically less reflective than heliostat panels they may still pose a collision risk to birds or bats. At both the Desert Sunlight Solar Farm project site, and the Genesis Solar Electric Project, birds and bats have been found injured or dead on the site, some of which appeared to be suffering from heat exhaustion. Of these, the majority consisted of waterbirds, species that would be expected as migrants not typically found foraging in desert habitat, and whose presence would not have been expected to occur at the project site (Dr. Joel Pagel, personal communication). A federally endangered species, the Yuma clapper rail, was among the recorded mortalities.

Lighting also plays a substantial role in collision risk because lights can attract nocturnal migrant songbirds, and major bird kill events have been reported at lighted communications towers (Manville 2001), with most kills from towers higher than 300 to 500 feet (Kerlinger 2004). Disruption of birds' migratory path, such as happens during storm events can cause birds to fly at lower heights, and be at risk of collision with the tower or other project facilities. Many of the avian fatalities at communications towers and other tall structures have been associated with steady-burning, red incandescent L-810 lights, which seem to attract birds (Gehring et al. 2009). Longcore et al. (2008) concluded that use of strobe or flashing lights on towers resulted in less bird aggregation, and, by extension, lower bird mortality, than use of steady burning lights. Bright night lighting close to the ground at the project site could also attract bats and disturb wildlife that occurs adjacent to the project site (e.g., nesting birds, foraging mammals, and flying insects). Another study determined that flashing of the normally steady-burning red light (the FAA type L-810 fixture) was considered acceptable, and further determined that on tall communication towers, the steady-burning lights could be extinguished altogether so long as the remaining lights flashed simultaneously between 27 and 33 flashes per minute. Flashing at faster speeds did not appear to offer any value because the light fixtures were not off long enough for to reduce the attractant value to migratory birds (Patterson 2012).

The project's transmission lines may pose a collision risk to bats. Although many studies have quantified bird strikes with transmission lines, analogous information on bats is very limited (Manville 2001). Collisions with distribution, collector or feeder lines will likely occur to some degree, however collision risk is not thought to pose a significant risk to bats in the project area. The most likely collision risk for bats is associated with vehicle or equipment as bats forage near roads or work areas.

Installation of heliostats could also cause an increase in Polarized Light Pollution (PLP) which typically occurs from light reflecting off of dark colored anthropogenic structures, and been demonstrated to be generated from even low-reflectance photovoltaic panels (Horvath et al. 2009). It is unknown to what extant this phenomenon will occur from the heliostats. According to Horvath et al., PLP caused by anthropogenic structures can alter the ability of wildlife to seek out suitable habitat and elude or detect the presence of predators (Horvath et al. 2010). It has also been documented that PLP can affect the ability to detect natural polarized light patterns in the sky which can negatively affect navigation ability and ultimately affect dispersal and reproduction (Horvath et al. 2009). Polarizing surfaces are also known to disrupt insect behavior, causing some insects to react as though the surface is water, and depositing eggs on polarizing surfaces (Horvath et al. 2009). Horvath et al (2009) determined that minimization of polarizing effects was possible by adding white grids onto solar panels, or otherwise minimizing the solar active area. The extent to which heliostats could serve as an attractant is not known.

Wagner et al. (1982) documented insect kills at a much smaller facility, Solar One, in excess of up 800 insects in under a minute, but the methods the authors used to make this estimate is unclear. The presence of insects may serve as an attractant to some species of birds and bats on the project site.

There is uncertainty regarding how many birds may be killed by collisions with project features, but bird mortality is expected. The significance of such mortality, in a CEQA context, is uncertain, and would vary depending on the number and species involved.

To minimize this risk of collision and disturbance to wildlife from lights, Condition of Certification **BIO-8** specifies that the lighting atop the towers be flashing strobe lights rather than steady burning lights, and that lighting be shielded, directed downward, and turned off when not needed. The project owner has proposed use of FAA lighting systems on the project, using only red lights at night with the longest permissible interval between flashes and the shortest flash duration permissible, which would further reduce the potential for nocturnal strikes. Staff has incorporated these measures into proposed Condition of Certification **VIS-3**, which directs the use, placement, and minimization of all lighting. Condition of Certification **BIO-16b**, which requires development of an Avian and Bat Protection Plan, would require the project owner to monitor, record, and report dead or injured birds found within the project footprint, and if feasible, to perform searches outside the project footprint as well. The plan would also require the implementation of remedial actions including the placement of aerial markers, ribbons, or other devices to reduce bird mortality. Monitoring of operational impacts for seasonal factors, and data on species of birds affected, and types of injuries or mortalities, requested by the USFWS, are considered crucial in understanding operational impacts, bird behavior, responses to stresses, and identifying and implementing measures to avoid, minimize, or mitigate impacts. However, residual impacts to avian species may exist after implementation of the staff recommended conditions of certification. Condition **BIO-16b** also requires monitoring of bird mortality due to glare. Staff concludes that the Avian and Bat Protection Plan and mortality monitoring as recommended in Condition of Certification **BIO-16b** would effectively determine rates of bird and bat mortality from collisions with structures. Condition of Certification **BIO-16a** would implement annual funding for avian and bat conservation efforts, effectively improving habitat for birds and bats. It may not be feasible to accurately determine the rate of latent mortality, when mortality occurs at a time and place removed from the project site.

Solar Energy Flux

Operation of the project would concentrate the sun's radiant energy (flux or solar flux) over the heliostat field. Flux levels increase approaching the power towers, and occupy the airspace over the heliostat fields. Any species of bird, bat, or insect that enter this airspace and is exposed to concentrated solar flux are at risk of injury, latent mortality on or off the project site, or mortality within the project footprint. The type and severity of damage experienced is not predictable; however, it is directly linked to the duration of exposure and the intensity of the flux encountered. While safe limits of flux have been established for humans, and the adverse effects of exposure well documented, little information exists to help staff understand what levels of flux may be safe for bats, birds, and insects.

Thresholds for solar flux exposure have been established for humans, and range from 1.42kW/m^2 (24CFR, Section 51.204 Appendix II) to 5kW/m^2 (49CFR Part 193). No published threshold for avian exposure has previously been identified. Exposure to solar flux has the potential to result in direct and indirect effects to birds by damaging their eyes, including the loss of sight; burning or singeing feathers; compromising the molecular structure of feathers (i.e., non-visible damage); and secondary, non-visible physiological changes including elevated body temperatures or thermal stress. In some circumstances exposure to elevated levels of solar energy flux (see **APPENDIX BIO1)** may result in the death of the bird either immediately or within a short period of time following exposure. The potential for injury depends on a variety of factors including the size and type of bird; length of exposure; and the level of solar energy flux. Staff has formulated a thermodynamic model to assist in evaluating impacts from exposure to elevated solar flux (see **APPENDIX BIO1**).

This model establishes a theoretical level of safe exposure for avian species (excluding bats and insects), at no more than a minute of exposure at 5kW/m^2. Solar flux will reach highest concentrations near the tower, likely approaching 500kW/m^2, as based on information filed for two separate BrightSource projects: the Rio Mesa Solar Electric Generating Facility (RMSEGF) and the Hidden Hills Solar Electric Generating System (HHSEGS). Staff assumed that flux fields created by PSEGS, would be essentially the same as the Rio Mesa Solar Electric Generating Facility, which is based on the same proprietary technology.

McCrary et al. (1986) found that 13 of the bird carcasses (19 percent) at the Solar One facility had been burned, reporting that the "heavily singed flight and contour feathers indicated that the birds burned to death," see **APPENDIX BIO2**, Figure 7. The authors interpreted these mortalities as the result of birds flying through that facility's standby points (i.e., areas of concentrated solar energy) though they did not observe the incidents, and that mortalities may have been caused by flying within elevated flux levels surrounding the SRSG during normal operation. Risk of burning was evidently higher for aerial foragers (swifts and swallows) because of their feeding behavior. The McCrary study was based on systematic searches of the 32 hectare (79 acre) Solar One site but not beyond the site boundaries. Thus, if any birds were injured but were able to fly beyond the site's boundaries (about 1,200 ft from the receiver tower), they would not have been found by the field biologists and could have been scavenged before being observed. For this reason, staff believes that actual mortality from burning may have been higher than reported. It is also possible that birds considered collision victims had suffered damage to flight feathers such that birds were unable to fly, or had experienced damage to the eyes and became disoriented, resulting in collision with the heliostats. However, the authors did not perform microscopic examination of feather structure or eyes that would make this determination possible.

Risk to Avian Species

The importance of migration to avian survivorship has been generally recognized for more than two centuries (Bewick 1797) and its significance has received even greater attention in the decades since, especially during the latter years of the 20th century. Carlisle et al (2009) suggest there is increasing recognition that migration is likely the most limiting time of year for migratory birds. It is during migration that the greatest number of bird species and individuals would be expected to pass through the PSEGS project area. Additionally, movement characteristics of migratory birds (for example: flocking, streaming, utilization of stopover locations, and responses to extreme weather) render them vulnerable to a host natural and anthropogenic risks along the way. Mortality rates "may be 15 times higher than those during the breeding and wintering periods when the bird is stationary" (Sillett and Holmes 2002). Thus exposing birds to additional risks during migration may have even greater significance relative to individual and species survivorship (at least at the meta-population or evolutionary significant unit levels). Although several features of the PSEGS facility impose additional threats that were not found with the PSPP (e.g., power towers, large mirror arrays; generation tie-lines), the virtually invisible but very large fields of elevated solar flux may be the greatest of these threats to migrant and resident birds.

There are more than 150 resident and/or spring migrant bird species that may occur at or near the PSEGS project site or Chuckwalla Valley. Some species have a high probability of occurrence in the region (i.e., neotropical song birds) although they occur in the project area for a limited period of time (i.e., during migratory periods); while others are year round residents. The risk to resident and migratory birds is a function of several factors, including: what species pass through the project area; which species have a high probability of occurring there in migration; and which species have the highest probability of experiencing adverse consequences resulting from exposure to elevated levels of solar flux. By investigating resident and spring migrants' natural history traits, including: whether they are daytime or nighttime migrants; known flight characteristics (e.g., whether or not they soar, use thermal air currents, or move in slow and steady or fast flight); their social patterns (e.g., whether a species moves in a flock, an amorphous stream, or as individuals); and whether feeding occurs during stopovers or in flight.

The physical impacts to birds caused by exposure to solar flux will depend on the length of time spent in the solar flux field and at what level intensity the bird flies through (McCrary et al 1986; Santolo unpubl. data). Shorter exposures of limited intensity are less harmful than longer exposures at higher intensities. In **APPENDIX BIO1**, staff combined occurrence potential with each species' natural history to predict which species would have the highest probability of suffering flux-related adverse effects and in what relative numbers.

Based on this information, staff has described the potential risk to various groups of birds. Generally speaking diurnal birds that exhibit flight patterns that place them in the highest potential concentrations of solar flux would be expected to be greater risk. However, some nocturnal migrants are expected to practice daytime migrations (e.g., as opposed to persisting at migratory stopover locations) or occur in the project area during daylight as a result of extreme weather conditions – high winds being one of the most prevalent in southern California deserts.

Species with the greatest potential to suffer adverse effects resulting from exposure to elevated levels of solar flux are expected to include members of two families, swallows (Family: Hirundinidae) and swifts (Family: Apodidae). There is existing documentation for the vulnerability of these families from previous studies at solar power tower energy generating facilities (McCrary et al 1986). These birds are diurnal migrants; they occur in large numbers throughout southern California deserts and have been documented at the Palen site. In addition, the period over which these species' migrations occur is lengthy (i.e. the period between earliest and latest movements spans several months); they move at relatively slow speeds in flight (12 – 20 mph) and at modest heights (between 100 and 1000 feet) above the desert floor typically associated with broad streams. Individuals may feed while moving, especially if a food source (flying insects) is found opportunistically, which may increase the amount of time spent within a limited airspace. Vaux's swift (*Chaetura vauxi*), would have similar risk patterns as swallows; however, the Vaux's swift typically migrates through a more limited time period and often migrates in large aggregates. This latter quality renders the Vaux's swift a species that could potentially suffer catastrophic, single-incident adverse consequences in the event a large migratory pulse encounters a region of elevated solar flux.

Turkey vulture (*Cathartes aura*; Family: Cathartidae), which occurs as a migrant as well as a winter and spring resident in the project area is a highly vulnerable species due to its overall slow flight progress and reliance on thermal currents. This species has been documented on the project site during surveys conducted by the project owner. The vulnerability of this species is due to slow flight speed, static soaring flight pattern (i.e., they rarely wing-flap and are obligate soaring migrants) that often follow circuitous flight paths (Mandela et al 2008). This species commonly occurs within the range of elevations in which solar flux will be generated.

Doves (Family: Columbidae) of two species, the mourning dove (*Zenaida macroura*) and the white-winged dove (*Zenaida asiatica*) would be subject to risk. These two species occur in large numbers throughout southern California deserts and are common migrants in the vicinity of the project area. They migrate during the day; the migration period is lengthy; their migratory flights occur in loosely-associated, broad streams; and individuals may feed opportunistically along the migration route (e.g., they may stop to feed daily). Doves migrate at relatively high speeds - they are capable of sustained speeds of around 55 m/h (88 km/h) - but typically at modest heights (between 100 and 1000 feet) above the desert floor in flights that may be periodically interrupted in order to feed on the ground. Doves' flight patterns are often highly erratic and typically non-linear rendering them vulnerable to solar flux in spite of their rapid flight.

Hummingbirds (Family: Trochilidae), including Anna's hummingbird (*Calypte anna*), Costa's hummingbird (*Calypte costae*), calliope hummingbird (*Selasphorus calliope*), and black-chinned hummingbird (*Archilochus alexandri*) are at extreme risk during migration because they migrate during the day; must feed daily; and must locate suitable nighttime refugia. Their small size puts them at heightened risk relative to all other migrants.

Several hawks (accipiters, harriers, and buteos; Family: Accipitridae) including the Coopers' hawk (*Accipiter cooperi*), sharp-shinned hawk (*Accipiter striatus*), Swainson's hawk (*Buteo swainsoni*), and northern harrier (*Circus cyaneus*) rank relatively high in terms of risk from exposure to elevated levels of solar flux. All of these are diurnal migrants whose documented occurrence in the project area, flight patterns, migration speed, and opportunistic feeding strategies render them vulnerable to regions of generated flux for significant periods when in migration. Two large buteos, the red-tailed hawk (*Buteo jamaicensis*) and the ferruginous hawk *(Buteo regalis*), which are also diurnal migrants would likely be at a lower risk primarily due to their lower expected numbers at the project site.

Several occurring flycatchers (Family: Tyrannidae) including the state endangered northwestern willow flycatcher (*Empidonax traillii brewsteri*), western kingbird (*Tyrannus verticalis*), gray flycatcher (*Empidonax wrightii*), western flycatcher (*Empidonax difficilis*), and ash-throated flycatcher (*Myiarchus cinerascens*) – all of which are primarily nighttime migrants – exhibit extensive daytime movements during which feeding is an important behavior. Although their nocturnal migration habits minimize overall threat of exposure to elevated levels of solar flux, their documented occurrence, flight patterns, speed during diurnal movements, and requisite fly-catching/hawking feeding behaviors render them vulnerable to some degree. The common raven (*Corvus corax*) is ranked similarly in many threat categories with the higher risk species turkey vulture.

Another species that may be at risk is the house finch (*Haemorhous mexicanus*; Family: Fringillidae). Though not an obligatory migrant, this species may occur in small numbers as migrants, and is a regular fall, winter, and spring resident that probably includes a breeding population. Local meta-populations of house finch families may swell into post-breeding agglomerations of between scores and hundreds. Movements of these groups may place relatively large numbers of individuals at risk from exposure to elevated levels of solar flux.

Less predictable species, for which adequate occurrence data are lacking, that may be at risk because of their flight patterns and behaviors include: thrashers (Family: Mimidae), especially the sage thrasher (*Oreoscoptes montanus*); nighthawks (Family: Caprimulgidae), especially the lesser nighthawk (*Chordeiles acutipennis*); Grosbeaks (Family: Cardinalidae), especially the black-headed grosbeak (*Pheucticus melanocephalus*), several species of blackbirds (Family: Icteridae), including the red-winged blackbird (*Agelaius phoeniceus*) and the Brewer's blackbird (*Euphagus cyanocephalus*); and owls (Family: Strigidae) including burrowing owl (*Athene cunicularia*), short-eared owl (*Asio flammeus*), and long-eared owl (*Asio otus*).

Conversely, some birds will likely be at lower risk from exposure. Resident species such as the verdin (*Auriparus flaviceps*), black-tailed gnatcatcher (*Polioptila melanura*), Gambel's quail (*Callipepla gambelii*) along with many ground-feeding, seed-eating, winter resident/nocturnal spring migrant species such as Brewer's sparrow (*Spizella breweri*), horned lark (*Eremophila alpestris*), and black-throated sparrow (*Amphispiza bilineata*), may be less likely to succumb to flux-related impacts due to several factors. Their nocturnal migration, ground-based feeding, consequent low-elevation flight (i.e. relative to projected height above ground or areas of expected elevated levels of solar flux), and loss of foraging habitats within the project area may make them less vulnerable from the operation of the PSEGS.

As described above, staff believes that extended exposure to high-intensity solar flux would likely kill birds. Staff also believes that shorter exposures to high-intensity solar flux would cause tissue or feather damage that could impair flight or vision or cause physiological effects that ultimately cause or contribute to mortality from other causes (e.g., reduce ability to forage, escape from predators, or thermoregulate). Staff believes that longer exposures to lower-intensity solar flux levels are likely to cause feather damage or physiological effects. The following discussion is intended to illustrate the role of feathers in birds, and the types of behavioral or physiological functions that may be impaired or destroyed following exposure to concentrated solar flux in excess of safe thresholds, estimated to be no more than one minute's exposure at $4kW/m^2$.

Damage to Plumage and Flight Feathers

A birds' plumage is well adapted to its environment, and serves a variety of roles, such as: flight, thermoregulation, protection from impact, defense, incubating eggs and young, tactile hunting, seasonal displays such as breeding plumage in male birds, and camouflage from predators (Raptor Research Foundation, 2012). When exposed to elevated levels of solar radiation, plumage may show the first signs of damage. Exposed skin, such as feet and legs, and eyes are also expected to be highly sensitive to elevated solar radiation. Little information is available to help staff assess how skin or eyes are affected by elevated levels of flux, nor is information available to help staff evaluate the potential physiological effects of overheating. Eye exposure is further discussed below in the section entitled "Irradiance". Staff has even less data regarding how bats or insects may respond to exposure to solar flux. All living organisms have general tolerance levels. Staff considers it highly likely that the level of flux, in combination with the size of the flux field, may exceed the level of tolerance for organisms that enter the flux field.

Surface feathers, or contour feathers, cover and streamline the remainder of the body and also contribute to aerodynamics. Insulating feathers are found beneath the contour feathers. Damage to insulating feathers may affect the bird's thermoregulation (body temperature control). A bird's plumage is critical to insulating the bird from the environment, and is influenced by color and structure of the plumage (Wolf and Walsberg 2000).

Bird feathers grow from lines, or tracts, pterylae (Raptor Research Foundation 2012) with bare patches of skin in between, called apteria (Ibid.) There are several types of feathers, including fluffy down insulating feathers (which are used in the manufacture of pillows); semi-plumes, which shape and insulate the bird, bristles, usually around the face and used in feeding; filoplumes, used to feel and sense vibrations, and contour feathers, which add shape to a bird. A diagram of a feather is depicted in **APPENDIX BIO2**, Figure 6. Feathers are comprised of a central shaft, or rachis, and barbs come off the rachis at an approximately 45 degree angle (45°). Between barbs are two sets of barbules, microscopic filaments that connect each barb (Doctors Foster and Smith 2012, Muller and Patone 1998). Barbules have even smaller microstructures, called barbicels, which hooks the barbules together. These barbules act like a zipper, connecting the barbs and making them airtight and able to withstand air resistance during flight (Ibid., see also Muller and Patone 1998). This microstructure of a feather, consisting of barbules and barbicels, comprises the majority of the feather, and is not visible to the naked eye. These components, so critical to flight, are used in establishing a safe avian exposure criteria (see **APPENDIX BIO1**).

Flight feathers may be one of the most important feathers at risk from exposure to high levels of solar energy. The long relatively rigid feathers of the wings and tail (flight feathers) are the bird's aerodynamic flight surfaces. These feathers provide lift and are adapted to the body style of the bird, that is, raptors have long wings and long pointed flight feathers that allow for catching air current and generating great speed, while other birds have wing lengths and flight feather construction that allow for various flight patterns and behaviors. The feathers used for flight include primary, secondary, and tertiary feathers which are located along the arm of the bird, while the large tail feathers are called retrices. Feathers are “instrumental in flying [and] they play a critical role in temperature regulation” (Sibley 2002), and are considered the most valuable asset a bird has (Raptor Research Foundation 2012).

Feathers damaged by concentrated solar flux could only be replaced during a molt, which generally occurs only once per year. Birds have no physiological means to replace damaged feathers other than seasonal molting. Molting generally occurs during or after the breeding season (Raptor Research Foundation 2012), and birds are known to time molting to optimize fitness such as after migration, or in concert with breeding. During a molt, the bird replaces all of the feathers over a period of four to 16 weeks. Typically the molt is staggered, with the bird losing a limited number of feathers at a time,to allow the bird to fly and maintain thermal protection. Depending on the stage of molt, the existing plumage would provide varying degrees of protection from solar energy. A bird in the middle of molt, that may have areas of exposed skin, would be expected to have an increased risk from exposure to elevated levels of solar energy flux and may experience immediate tissue damage to tissue; having no thermal protection from plumage.

Birds replace lost feathers slowly and even minimal damage to flight feathers can significantly affect flight performance. Large birds, such as eagles and vultures may take up to two years to molt (Raptor Research Foundation 2012); although a few species will molt all flight feathers at once (Ibid.). When a feather is actively growing, blood is supplied to the shaft of the feather. When fully grown and formed, the vessels that supply blood to the feather constrict and the feather is considered dead tissue, without feeling, similar to human hair. A feather broken while in the blood feather stage remains damaged until molt (Chubb 2003). Birds exposed to elevated levels of solar energy flux while in the blood feather stage may be subject to increased risk of feather damage. Additionally, it is unknown if a feather heated by flux could conduct heat through the feather shaft and into the follicle or skin of a bird.

Molting requires additional energy to create the feather components and synthesize them (Murphy 1999). A bird that has experienced damage from elevated levels of solar energy flux may have diminished abilities to meet existing energy requirements. Damaged plumage may require the use of additional energy to fly, forage, and perform normal behaviors lowering the survivability of the bird. Hawks and eagles manage the nutritional cost of molting by shedding just two feathers on each wing at a time, and typically having around 24 flight feathers total to be molted (Chubb 2003). Feathers produced during periods of poor nutrition can be faulty, showing ridges and other abnormalities (German Assn. for the Prot. Of Common Swifts 2012), therefore, one or more molts may be necessary to repair the damage, and a bird would be energetically challenged to do so if damaged feathers reduced the birds success at foraging.

Exposure to elevated levels of solar flux would be expected to damage feathers such that insulating and flight capacities are lost, impaired or even destroyed. Birds exposed to damaging levels of solar energy flux either during or after a recent molt may also have an increased the risk of mortality or decreased fitness. In a desert environment, staff expects that a bird exposed to high temperatures and with limited access to water would have low survivability, either succumbing to heat, or extreme cold during cold desert nights, or from being more susceptible to predation. Birds with exposed skin are considered “greatly disadvantaged” (Chubb 2003). As with most species, older and younger individuals would be considered more susceptible to injury or mortality from elevated levels of solar flux. For example, juvenile birds have feathers that are much softer, and are not as adept at maintaining feathers as adults (The Modern Apprentice 2012); and may be more susceptible to injury or mortality than older birds.

Flight Performance

Flight performance is critical to foraging, evading predators, conducting seasonal migration and breeding displays, and performing other life history characteristics. In pet birds, incorrect feeding or caging can cause damage and weakness in feathers such that swifts cannot thermoregulate or fly (German Assn. for the Prot. of Common Swifts 2012). Seemingly minor damage to flight feathers may affect a bird’s flight speed or its ability to maneuver; more significant damage to flight feathers would prevent flight altogether. Length of flight feathers, and asymmetry in flight feathers were noted to reduce take-off speed in birds, when impaired by damage, or during molt (Swaddle et al 1996). In rehabilitating wild birds, the condition of plumage is critical to determining if the bird can be released. If plumage conditions allow the bird to fly, thermoregulate, and waterproof themselves, the survival rate is much greater (Wildlife Rehabber 2012). Additionally, damage to flight feathers may impact a birds’ capability to migrate. Passerines with impaired flight feathers have been demonstrated to avoid long-distance flights (Hedenstrom 2003). Birds prevented from seasonal migrations due to the inability to effectively fly may experience mortality from the lack of food or exposure. Birds damaged by exposure to elevated solar energy flux would likely have limited abilities to complete these actives, and may suffer mortality at a later time or after leaving the site (i.e. off the project site). See **APPENDIX BIO1** for further discussion of flight mechanics.

Flight performance is also important in raising young. Adult birds make numerous trips back and forth from foraging grounds to the nest, carrying food items to young. A bird attempting to feed young with damaged flight feathers would have impaired flight capabilities that reduce the bird’s ability to forage or hunt. Raptors in particular carry large prey to young, and have feathers adapted to these heavy loads. Bald eagles are capable of carrying up to half of their weight (Nye 2005), and damaged flight feathers would be detrimental to successful fledging of chicks.

Flight speeds and patterns will affect the length of time a bird is exposed to solar flux while moving across the project site. Flight speeds are reported to be typically within 20 to 50 miles per hour (mph) (USGS 1998), and vary dramatically on the upper end of the range. **APPENDIX BIO1** provides estimates of the time required to traverse the solar field at various flight speeds, and also provides data for select flight paths and concentrated solar flux dose at the Solar One site. For reference purposes, horned larks and ravens are known to occur on the project site, and fly from 22 to 28 miles per hour, (mph) (USGS 2006), whereas mourning doves, which could also occur onsite, are faster flying, around 35 mph. It is unclear how flight speed may affect the likelihood of exposure to elevated levels of solar flux. Flight patterns would also affect the dose of solar flux a bird receives. Depending on species and behavior, birds exhibit various flight patterns such as continuous flapping, as well as non-continuous flapping such as soaring or gliding, flap-bounding and flap-gliding. Furthermore, flap speed varies depending upon energetics, weather conditions and speed needed, with swallows having a very low flap speed for birds of comparable size (Park et al 2001).

While it is unknown what the behavioral response of a bird will be from exposure to elevated levels of solar energy flux, passage through an area of high energy intensity could result in injury to the birds. Bird behavior will likely act in conjunction with flight speed to influence the probability of the exposure risk. Birds that fly at low elevations below elevated levels of solar energy flux are not expected to experience an exposure risk. However, aerial foraging birds, such as swifts and swallows, have been documented to be more likely to experience exposure to this risk (McCrary 1986).

The type and color of the plumage will also influence the potential risk to the bird. Plumage will absorb various amounts of solar radiation, depending on many factors. Plumage color, position of bird, density and structure of feathers, and flight speed, will all affect a birds' tolerance to this heat (Walshburg 1992). Other factors such as behavioral response to elevated flux levels, age of the bird, ambient temperature and humidity level will also affect how exposure to elevated solar energy levels will impact a bird. Birds will not be able to see the solar energy flux over the heliostat field, and therefore would not be expected to avoid the airspace where solar energy is concentrated. Birds may also become confused or disoriented and depending on behavioral response, such as flying lower, higher, or making evasive maneuvers will affect duration of exposure.

It is unknown what protection plumage will afford the different species of birds that may move into solar fields and experience elevated levels of solar energy flux. At low levels and short durations the birds may suffer little permanent damage and be able to survive post exposure. However, at exposure to high levels of solar energy flux even short durations may be lethal even if the bird is able to fly out of the flux field. For a large powerful bird, such as golden eagle, lethal damage to plumage, skin, or eyes from exposure to high levels of solar energy flux may occur, yet the bird may be able to fly away from the site. Documenting incidences of latent mortality that occur off the project site is likely not feasible nor is it possible to accurately predict what percentage of birds would be subject to this effect.

Irradiance

When the project is operating, the heliostats will reflect the sun's rays onto the SRSG, which occupies the top 130 feet of each solar power tower. During these times, the boilers absorb approximately 95 percent of the light that reaches them. Light that is not absorbed will be visible, reflecting off of the surfaces of the solar boilers.

The perceived brightness of objects is measured in terms of retinal irradiance, which is a measure of the intensity of the light reaching the retina. Retinal irradiance also has the potential to cause adverse impacts. The avian eye is comparatively larger than the human eye (Brooke et al 1999), and raptors have even larger size eyes than non-predatory birds of the same weight (*Ibid*). Birds eyes are typically fixed in the socket and unable to turn (Project Beak 2012), although some species such as raptors have limited ability to turn their eyes (White et al 2007) (O'Rourke et al 2007), and have very wide fields of view (O'Rourke et al 2007). Some birds may be unable to look away or avoid exposure, given their physiological attributes (Dr. Gregg Irvin, personal communication).

This lack of response would be considered similar to a "deer in the headlights". In humans, the sensation of pain is not linked to retinal damage, nor does it seem to be linked in animal species (*Ibid*).

Staff has developed an analysis of glint and glare on human receptors (**TRAFFIC AND TRANSPORTATION, APPENDIX TT2** of this final staff assessment); yet there is no further available data regarding the impacts of irradiance exposure on wildlife. That analysis was developed to answer a specific question, that is, does the project present a significant hazard to motorists passing by on the Interstate 10.The results cannot be directly extrapolated to bird, bat, or insect vision, however, birds in general have much better eyesight, and a wider field of view than humans. It's not known the threshold at which wildlife would experience either temporary damage or irreversible damage, or if this is even possible with the technology in question. While **APPENDIX TT2** ultimately determined that there is not a significant risk of heliostat positioning such that a motorist would be adversely affected, if this event occurred and a mirror was positioned such that a person looked directly at it, then a human's vision could be, at least temporarily, impaired at a distance of more than a mile from that mirror. It would be difficult to determine a birds' or bats' reaction to vision impairment and these animals may still be able to fly off the site, even if experiencing temporary or permanent damage, or impairment.

Staff believes irradiance has the potential to cause injury or lethality to avian species that fly within an un-quantified area of the solar field. It should be noted that the monitoring and mitigation protocol outlined in Conditions of Certification **BIO-16a** and **BIO-16b** would not detect eye damage, as necropsy of a live or freshly killed specimen would be needed to quantify damages. Staff has accounted for the lack of data by incorporating a safety margin (see **APPENDIX BIO1**) for flux exposure on feathers, and therefore will rely on damage to keratin (feathers) as the lowest endpoint of toxicity.

Conclusions and Discussion of Mitigation

Based on staff's understanding of solar energy flux intensity and exposure limits, staff believes that birds flying through energy flux in excess of safe thresholds will likely suffer significant damage to flight feathers, eyes, or skin. In some cases, where they fly through higher flux levels, these birds will fall to the ground with evidence of severe burning as reported by McCreary et al. (1986). Staff believes that many birds may continue flying for a few seconds or minutes, perhaps long enough to escape the hazard, but will be unable to fly effectively, find food, or escape predators and will die a short time after the exposure or persist for longer periods but with reduced reproductive success.

Staff believes that some birds exposed to concentrated solar flux will be at risk of suffering (1) hyperthermia, which may result in disorientation and/or other damaging physiological repercussions and, depending on time and level of exposure (2) feather damage with a consequent flight impediment: or anatomical effects such as tissue damage, temporary or permanent vision impairment. These effects are influenced by both the dose level and exposure time. These effects are considered significant and may be unmitigable, based on the species affected, and the severity of the impact.

Project Owner's Proposed Mitigation

The project owner has proposed three avian conditions of certification: **BIO-A**, **BIO-B**, and **BIO-C**, containing meaningful mitigation for avian and bat impacts. The project owner has suggested that these replace the existing condition **BIO-16**, developed for the PSPP project, as they are appropriate to mitigate impacts associated with the PSEGS. Condition **BIO-A** offers compensatory mitigation at a 1:1 ratio for habitat impacts (approximately 3,794 acres of habitat), with selection criteria that would ensure the acquisition of high quality habitat. This acreage is intended to "nest" within desert tortoise mitigation (e.g. lands acquired would be comparable to habitat impacted by construction of the project), and would not entail additional offsets outside of those required for desert tortoise mitigation, given that all selection criteria are met. These lands would be managed and preserved in perpetuity.

Condition **BIO-B**, Avian Enhancement and Conservation Measures, offers further avian mitigation in a two-pronged approach: the project owner has offered to fund the retro-fit or installation of avian diverters at non-APLIC compliant power poles within the greater vicinity of the project, and has pledged an amount of $300,000 towards this effort, to be held in trust under the National Fish and Wildlife Foundation's Bald and Golden Eagle Protection Act Account. The other part of **BIO-B** would mitigate for losses of migratory birds through funding of conservation actions. The project owner has offered $500,000 towards this effort, and has identified the following 11 conservation areas as having benefit to migratory birds:

1. Restoration of degraded habitat with native vegetation;
2. Restoration of agricultural fields to bird habitat;
3. Movement of agricultural fields to enhance bird populations;
4. Invasive plant species and artificial food or water source management;
5. Control and cleanup of potential avian hazards, such as lead or microtrash;
6. Retrofitting of buildings to minimize collisions;
7. Retrofitting of conductors and above-ground cables to minimize collisions;
8. Animal control programs;
9. Support for avian and bat research and/or management efforts within mitigation lands acquired pursuant to desert tortoise mitigation (**BIO-12**);
10. Funding efforts to address avian diseases or depredation due to the expansion of predators in response to anthropomorphic subsidies that may adversely affects birds; and
11. Contribute to the Migratory Bird Conservation Fund managed by the Migratory Bird Conservation Commission.

Condition **BIO-C**, Avian and Bat Surveys, Monitoring and Adaptive Management, outlines an extensive onsite program designed to monitor operational effects, if any, and to outline a pathway toward managing those impacts on an ongoing basis. These efforts would be memorialized in a Birds and Bat Conservation Strategy, or BBCS. Condition **BIO-C** details various efforts, including monitoring bird and bat use at the site, evaluation of wildlife behavior at the project site in comparison with behavior of birds in an unaltered environment; implement onsite mortality and injury monitoring to gauge operational effects of the project; identify conservation measures to minimize impacts, and develop and implement an adaptive management framework to respond directly to the results of project monitoring. The condition proposes monitoring golden eagle nest locations within 10 miles of the project site.

The project owner has outlined several meaningful approaches to benefit the range of potentially affected species, as well as the larger ecosystem within the NECO planning area. Staff has adapted as many of the tenets of **BIO-A**, **BIO-B**, and **BIO-C** as possible, and has revised Condition of Certification **BIO-16** to reflect these measures. The following is a discussion and explanation of how staff has blended the project owner's **BIO-A**, **BIO-B**, and **BIO-C**, into conditions **BIO-16a** and **BIO-16b**.

Staff's Integrated Mitigation Approach

Staff appreciates the comprehensive nature of the project owners' proposed mitigation, and has integrated the most valuable tenets into two conditions, **BIO-16a** and **BIO-16b**. Staff has not carried forward the project owner's offer of 1:1 habitat offsets for avian and bat species. While acquisitions are valuable, and ensure long-term preservation of habitat, staff believes that the requirements of **BIO-12** are equally conservative, ensuring acquisition of high quality habitat for the desert tortoise, which would also benefit avian species. Additionally, the stated selection requirements would likely "nest" or overlap with the desert tortoise offsets, and therefore would not ultimately result in acquisitions further than already recommended within **BIO-12**. Habitat acquisition is a useful tool. However, when attempting to mitigate potential ongoing losses of such a mobile and diverse group of vertebrates such as migratory birds in particular, and insects and bats to a lesser degree, restoration and enhancement of habitat may prove more useful than placing conservation easements. Restoration of habitat is one of few means of "creating" new habitat, and has the possibility of expanding both abundance and, in some instances, the range, of birds, bats, and insects. Therefore, staff's approach entails focusing on the project owner's mitigation **BIO-B**, enhancement and conservation actions. The essence of this mitigation is now present in **BIO-16a**, with several key modifications proposed by staff.

The project owner offered $500,000 towards funding various habitat enhancement and conservation actions, and staff has also adapted this. However, rather than payment of a lump sum, staff would prefer that the project owner fund an interest-bearing account to achieve this same goal. Monies held in an interest-bearing account would be managed by a non-profit investment entity (e.g., a community foundation such as the Imperial Valley Community Foundation) from which only annually earned interest and fund management fees may be distributed; that is, the investment vehicle will be designed and managed as an interest-bearing account.

Staff has considered a minimum annual benefit of approximately $50,000 is necessary to fund bird mitigation actions, during the operational life of the project. Staff believes in order to yield approximately $50,000 annually, the project owner would need to provide approximately $1,500,000 into an interest-bearing account. The recommended funding amount was determined by considering three primary factors:

a. A reasonable/achievable rate of capitalization (4.0% per annum);

b. Adequacy of the amount of the investment to allow for portfolio diversification; and

c. An annual funding amount of significant benefit to the affected resource

The actual funds needed to support this program may vary. While this approach is more costly than originally proposed by the project owner staff believes the approach is reasonable and may provide indirect benefits to the project owner; primarily that funds would be available to the owner at the end of the project; annual payouts would not incur tax liabilities, the program would provide not only annual revenue for an extended period but does so in a fiscally responsible manner; and the level of funding is expected to provide a significant, demonstrable, and measurable mitigation value that is linked directly, both spatially and temporally, to facility operation.

Alternatively, the project owner may pay $50,000 annually to fund the conservation activities for the life of the project, not to exceed a period of 30 years. If the project owner elects to make annual payments, the annual payments would be adjusted for cost of living increases.

Condition of Certification **BIO-16a** is designed to compensate for death, injury/morbidity, and/or generally reduced reproductive success of individuals or a distinct population segment or segments of bird and bat species resulting from adverse contact with elevated levels of solar flux, mirror-related disorientation, and power tower collisions. The specificity of these conditions links the proposed mitigation directly to project component-specific impacts and furthermore, links the funding of the mitigation measure solely to the period of project duration. The funding for this mitigation measure does not involve the establishment of an endowment that is intended to provide a funding mechanism in perpetuity. This mitigation measure is separate from all other project-related mitigation measures and responds directly to the question posed by the REAT agency biologists; namely, how do we mitigate for flux-related adverse effects to migratory birds and, albeit probabilistically at a more limited threshold, to bats during the operational life of the PSEGS.

Conservation Opportunities

Condition of Certification **BIO-16a** would, among other things, require the development and implementation of conservation opportunities, and envisions formation of a Technical Advisory Committee (TAC) to review data, and select annual mitigation funding recipients. Staff has conferred with various agencies to determine where conservation opportunities may exist. While the final determination of specific conservation actions would be made during development of the Bird and Bat Conservation Strategy, and are not limited to those opportunities presented here, the following are viable examples of conservation actions that may be taken by the project owner.

1. Funding support for the U. S. Bureau of Land Management's strategic plan for migratory bird conservation Emphasis Area 3: Habitat Management Maintenance, Enhancement, and Restoration. Areas to be served by this component of the plan include Important Bird Areas, Areas of Critical Environmental Concern, Watchable Wildlife, Habitat Management Plan Areas, and Habitat Management Areas, all of which have been identified and designated in the BLM's planning process.

2. Funding support for the California Wildlife conservation Board's Riparian Habitat Conservation Program, the mission of which is the development of coordinated conservation efforts aimed at protecting and restoring the state's riparian ecosystems.

3. Funding support for the California Migratory Bird Conservation Partnership, a cooperative venture of Audubon California, PRBO Conservation Science, and The Nature Conservancy that seeks to protect, restore, and enhance lands that support bird populations in California.

4. Funding support for the USFWS Joint Venture, a collaborative, regional partnership of government agencies, non-profit organizations, corporations, tribes, and individuals that conserves habitat for priority bird species, other wildlife, and people. Joint Ventures bring these diverse partners together under the guidance of national and international bird conservation plans to design and implement landscape-scale conservation efforts. Joint Ventures have been widely accepted as the model for collaborative conservation in the 21st century. Joint Venture actions include: biological planning, conservation design, and prioritization; project development and implementation; monitoring, evaluation, and research; communications, education, and outreach; and funding support for projects and activities.

   Within California, several JointVentures exist in the Central Valley, Intermountain, and Sonoran regions. Based on personal conversations with USFWS and the Sonoran JointVenture Coordinator, means of compensation benefitting desert avian species are in place (Robert Mesta, personal communication), and further, the Sonoran JointVenture program also has the capability of designing conservation plans responsive to certain bird species or specific geographic locales.

5. Project owner could fund an existing need (e.g., preservation, restoration, and enhancement) at an acknowledged important migratory stopover. For example, this fund would be adequate to support funding needs at the Ash Meadows National Wildlife Refuge to support their Habitat Management Goal 2: to restore and maintain the ecological integrity of natural communities within the refuge. Their current plan calls for the need to "[o]btain funding for and hire: 1 Integrated Pest Management Coordinator/Botanist, biological technician, or GIS specialist (part-time)".

6. The dedication of $50,000.00 in funds could facilitate a grant of $200,000 or more under the Neotropical Migratory Bird Conservation Act if the program identified is selected for funding*.* In accordance with the act, for every federal dollar, three non-

federal dollars are required in matching contributions. For projects in the United States, the non-federal share must be monetary.

In developing Conditions of Certification **BIO-16a** and **BIO-16b** with respect to species that are fully protected under the California Fish and Game Code (golden eagle, bald eagle, American peregrine falcon, Yuma clapper rail, among others), mitigation is provided for potential ongoing direct loss of individuals from project operation. However, even if project impacts to golden eagle and other fully protected species can be mitigated to less-than-significant under CEQA, take of fully protected species is not permitable under another state law. Take of golden eagles or other fully protected species would violate the Fish and Game Code sections (see **Biological Resources Table 1**) that protect fully protected species. However, the CDFW may allow the take of some fully protected species, including golden eagles, through the context of an adopted Natural Community Conservation Plan (NCCP). Although not yet adopted, the DRECP (an NCCP) is anticipated to provide coverage for some fully protected species, including the golden eagle. If the project falls within a development focus area as determined by the final DRECP, then it is possible that the PSEGS project owners will eventually be able to apply for a take permit of otherwise fully protected species through the DRECP.

Implementation of **BIO-16a** and **BIO-16b** would require the project owner to monitor, record, and report bird deaths and injuries from project construction and operation. Monitoring the project's operational impacts for seasonal factors, the species of birds affected, and the types of injuries or mortalities that occur have also been requested by the USFWS. This type of monitoring is considered crucial in documenting bird behavior, noting responses to stress, quantifying impacts, and subsequently identifying and implementing any available measures to avoid, minimize, or mitigate these impacts. If take occurs, it will be reported to the REAT agencies for further action.

Condition **BIO-16b** requires development of avian, bat, and golden eagle protection plans. These plans require development of project monitoring methodology and implementation of compensatory mitigation according to clear performance standards provided in the condition, should monitoring reveal significant impacts to avian or bat species. This mitigation shall be implemented as needed based on the levels of take revealed by monitoring, and would detail all appropriate minimization and compensatory actions, as determined in consultation with USFWS, CDFW, BLM, and the Energy Commission. These actions would vary from restoration of avian habitat that supports the species impacted by the project, power line retrofits or other means of minimizing take and enhancing habitat, and will allow for flexibility in measures imposed, based on effectiveness monitoring. These plans will also incorporate a means of accounting for individuals that may suffer damage from exposure to elevated levels of solar flux, yet still be capable of flying off the site. These animals would not be detected during onsite carcass searches, yet would be adversely impacted by the project.

While data collection is important, and could potentially inform new mitigation or adaptive management strategies, feasible mitigation to reduce impacts to avian species from exposure to elevated levels of solar energy flux or irradiance to below the level of significance may not exist. This is because mitigation cannot avoid bird mortality, and mitigation may not adequately replace birds in the local population that may be killed by solar flux exposure, particularly fully protected and other special status birds.

Evaporation Ponds

The project has proposed various modifications to the PSEGS project (Palen 2012a), including the reduction from two double-lined 4-acre evaporation ponds to two double-lined 2-acre evaporation ponds. These ponds will receive industrial waste streams that would primarily come from the PSEGS project's auxiliary cooling tower and boiler.

A variety of waterfowl and shorebirds could seasonally use evaporation ponds as resting, foraging, and nesting areas. Evaporation ponds in the Sonoran Desert pose several threats to wildlife. First, creation of a new water source to an area where water is scarce would attract ravens to the PSEGS project, potentially increasing predation rates on juvenile desert tortoise in adjacent habitat. Second, waterfowl, shorebirds, and other resident or migratory birds that drink or forage at the ponds or Couch's spadefoot toads and their eggs could be harmed by selenium or hyper-saline conditions resulting from high total-dissolved-solids concentrations that would exist in the waste contained in the evaporation ponds (EPTC 1999; Lemly 1996; Wingdingstad et al. 1987). Monitoring results from 2007 and 2011-2012 at NextEra Harper Lake Solar Electric Generating System (SEGS) VIII and IX located near Harper Lake in the Mojave Desert revealed that numerous waterfowl, primarily eared grebes, died at the evaporation ponds due to salt toxicosis (Luz 2007). Third, these ponds may attract birds, bats and insects to the project site, exposing them to solar flux and collision risks. Staff, CDFW, and USFWS are concerned about these threats to wildlife posed by the evaporation ponds.

Condition of Certification **BIO-26** requires installation of netting over the evaporation ponds to exclude birds and other wildlife as well as a monitoring program to ensure the effectiveness of exclusion. Implementation of this measure would reduce evaporation pond impacts to birds and other wildlife to less-than-significant levels. The use of netting over ponds has its own drawbacks, primarily that birds may become entangled in netting from time to time, and be unable to escape. Staff believes that even with this risk, netting the evaporation ponds is still a better choice than leaving them uncovered because of the known risk of salt toxicosis to wildlife. Staff researched additional means of making the evaporation ponds unappealing to wildlife; preliminary data shows that the addition of an orange or red colorant has served as a deterrent, as well as placement of large floating rafts in the ponds, but have not found a solution that reasonably appears to be a lower risk than netting.

Special-status Plant Species

Regional Overview

The Sonoran Desert region of southeastern California, a region bounded by the Mojave Desert to the north and by the higher elevations of the Peninsular Ranges to the west, has a uniquely 'tropical' warm desert climate influenced by the addition of monsoonal summer rains; a contrast to the dry summer Mediterranean climate that characterizes much of California. This under-surveyed southeastern corner of California has a bi-modal rainfall pattern, with cooler late fall and winter rains that originate in the North

Pacific Ocean, and tropical summer storms from southern Mexico (Conservation Biology Institute 2009).

The unique position of the region at the junction with the Neotropic ecozone to the south contributes to the presence of a number of rare and endemic plants and vegetation communities specially adapted to this bi-modal rainfall pattern, and not found elsewhere in California. These include microphyll woodlands, palm oases, and a number of summer annuals that only germinate after a significant warm summer rain.

This distinctive bi-modal climate of the Sonoran Desert distinguishes it, floristically, from other deserts, including the Mojave Desert, and from the rest of California, which is characterized by warm dry summers and a single rainy season in winter. In addition to being hotter and drier, the Sonoran Desert region also rarely experiences frost. Although the region supports numerous perennial species, including a wide variety of cacti, more than half of the region's plant species are herbaceous annuals, which reveal themselves only during years of suitable precipitation and temperature conditions (*ibid*).

This region also occupies an important biogeographic location and zone of ecological transition on the Pacific coast of North America, and so its floristic diversity includes many widespread taxa on the edge of their range. This includes all of the California Rare Plant Rank (RPR) 2 plants occurring in the region—species that are more common outside of California but here they represent geographically marginal, peripheral populations on the frontiers of their range. The evolutionary significance—and therefore the conservation value—of peripheral populations are well documented, as is their greater risk of extirpation (Leppig & White 2006).

The results of spring 2009 and 2010; and fall 2010 surveys for the PSPP ; and spring 2013 surveys of the PSEGS project linears indicated that construction of the project including the plant facility, transmission line, access road, telecommunication line, and construction water supply line could directly and/or indirectly impact five special-status plant species:

- Harwood's woolly-star (*Eriastrum harwoodii*, also sometimes referred to as Harwood's phlox or Harwood's eriastrum), a BLM Sensitive species, RPR 1B.2 (rare, threatened, or endangered throughout its range);
- Harwood's milk-vetch (*Astragalus insularis* var. *harwoodii*), a RPR List 2B.2 (rare, threatened, or endangered in California but more common elsewhere);
- Ribbed cryptantha (*Cryptantha costata*), a RPR List 4.3 meaning it is on a watch-list and not tracked in the CNDDB;
- California ditaxis (*Ditaxis serrata* var. *californica*), a RPR List 3.2 species (a review list) with a questionable taxonomic status; however, its occurrences in California are fairly endangered, and
- "Palen Lake saltbush" (*Atriplex* sp. nov. Andre), a potentially new taxon of saltbush detected on the margins of Palen Lake

These five special-status plant species would have the potential to be directly and/or indirectly impacted by construction of the PSEGS including the plant facility, transmission line, access road, telecommunication line, natural gas line, and construction water supply line. However, dune associated species are less likely to be present on the natural gas pipeline alignment.

A discussion of the methods staff used to assess the regional significance of PSPP effects to special-status plants is provided below, followed by a discussion of the impacts to plants detected during the spring 2009 and 2010 surveys and fall 2010 for the PSPP and spring 2013 surveys for the PSEGS. Also, a discussion of the significance of impacts to late-season species, if detected during the fall 2013 botanical surveys is provided below. No additional late-season species were detected in fall 2010. Included in this discussion is a summary of the mitigation measures staff devised to reduce the direct, indirect, and cumulative impacts of the project to special-status plants to a less-than-significant level. Staff requested additional information for all new areas of the project including the natural gas line corridor and the unsurveyed segment of the generation tie-line. The project owner submitted all requested information regarding rare plant surveys conducted in March 2013 and no additional special-status plant species were detected (Palen 2013jj).

Assessment Methodology and Analytical Tools

- Staff's determinations of significance were based on the following considerations:
- Proportion of occurrences affected by the project relative to the total number of documented occurrences in California;
- CNDDB (NatureServe) rank (which encompasses rarity, threats, and population trend);
- Impacts to the local or regional population from all proposed modified projects;
- Impacts to hydrologic or geomorphic processes necessary to sustain the habitat (e.g., diversion or alteration of desert washes, altered sediment transport, interrupted wind transport of dune-maintaining sands);
- Ecological integrity of affected and remaining habitat;
- Cumulative effects and threats to remaining occurrences;
- Ownership and management threats to remaining occurrences;
- Status as a peripheral or disjunct population (or position within the species range);
- Indications of any other population characteristics that may assign it local or regional significance, and
- Indirect effects, such as introduction or spread of invasive plants, operation impacts (dust, chemical drift), fragmentation (and its effects on gene flow)

In addition to state and federal-listed plant species, and BLM sensitive species, staff's definition of special-status plants also included California Rare Plant Rank (RPR) 1B, 2A, 2B, 3 and 4 plants, any potentially new species found, and a few currently unlisted plants that are proposed additions to the CNPS Inventory. RPR List 3 plants (plants of questionable taxonomic status) may be analyzed under CEQA if sufficient information is available to assess potential impacts to such plants (CDFG 2009). RPR List 3 and 4 may be considered regionally significant if, for example, the occurrence is located at the periphery of the species' range, exhibits unusual morphology, or occurs in an unusual habitat/substrate (ibid).

Staff consulted with several recognized experts in the region's rare plant flora during the preparation of the data requests and its analysis of impacts to special-status plants for the PSPP (J. Andre, T. LaDoux, D. Silverman, A. Sanders, pers. comm.). Other sources consulted include the CNDDB (CNDDB 2010), the CNPS online inventory (CNPS 2009) and the BLM Palm Springs occurrence records (unpublished). The Consortium of California Herbaria (CCH 2010) was reviewed to determine if there were additional documented occurrences that were not already included in CNDDB. To improve its analysis, staff entered occurrence data from all sources into a GIS-based web application that allowed staff to view all CNDDB and CCH occurrences overlain on various jurisdictional, biological, landform, utility, USGS topographic maps and aerial imagery. This allowed staff to assess a species' threats and management vulnerabilities relative to probable future renewable energy projects throughout their range. This included an examination of their distance and proximity to projects or features, their peripheral status, potential for fragmentation and other indirect effects from nearby development, potential for mitigation through acquisition or restoration. Because additional rare plant occurrences were not detected on the project site staff reviewed the datasets available for the Approved PSPP project. The datasets that were utilized in staff's analysis for the PSPP project included:

- PLATTS Transmission Data: licensed 3-rd party commercial transmission data);
- CA State County boundaries: http://atlas.ca.gov/download.html?sl=casil
- CNDDB RareFind: http://www.dfg.ca.gov/biogeodata/cnddb/cnddb_info.asp
- BLM Renewables Projects: BLM online solar and wind project data: http://www.blm.gov/ca/gis/
- CA STATSGO Soils: NRCS soil mapping from http://SoilDataMart.nrcs.usda.gov/
- CA Cities boundaries: Part of PLATTS Transmission Data delivery
- CA State Parks boundaries: http://atlas.ca.gov/download.html?sl=casil
- Federal Wilderness boundaries: http://www.blm.gov/ca/gis/
- Federal Lands ownership boundaries: http://www.blm.gov/ca/gis/
- CA GAP Vegetation: http://www.biogeog.ucsb.edu/projects/gap/gap_data_state.html
- Landforms NECO: from BLM Palm Springs Office – no Metadata – based on CA GAP but improved by BLM for NECO area
- Landforms MDEP: Mojave Desert Ecosystem project: http://www.mojavedata.gov/datasets.php?&qclass=geo
- Aerial Imagery – ESRI Data from ArcGIS.com
- USGS Topo – ESRI Data from ArcGIS.com

Impacts to Special-Status Plants Found During Spring and Fall Surveys

This section includes a detailed discussion of the special-status plants detected during the spring 2009 and spring and fall 2010 surveys within the Project Disturbance Area and one-mile buffer for the PSPP and spring 2013 within the Project Disturbance Area and 1,000 foot buffer for all new areas of the PSEGS project including the natural gas line corridor and the unsurveyed segment of the generation tie-line.

The spring 2009 surveys encompassed the entire Project Disturbance Area including the solar facility footprint, transmission line corridor, and survey buffer area. The new areas surveyed during 2010 were areas not previously surveyed during 2009 and included the Reconfigured Alternative footprint, Reconfigured Alternatives 2 and 3, new transmission line route, and associated buffer areas. The PSEGS project occurs within a sub-set of these areas. Staff requested additional information for all new areas of the project including the natural gas line corridor and the unsurveyed segment of the generation tie-line. The project owner has submitted the final spring 2013 survey report for rare plant surveys conducted in March 2013 (Palen 2013jj). No additional special-status species were found.

Harwood's Woolly-star

Harwood's woolly-star, also sometimes referred to as Harwood's phlox or Harwood's eriastrum, is a BLM Sensitive species, and RPR 1B.2 species, which indicates it is rare, threatened, or endangered throughout its range. This spring annual is associated with sandy plains or dunes, but typically semi-stabilized habitat (versus active dunes) (CNPS 2010). Its global distribution and range is restricted to 14 known locations in San Diego, Riverside, and San Bernardino counties, typically in dunes associated with the margins around dry lakes such as Dale, Cadiz, and Soda lakes. Recently, surveys conducted in spring of 2010 for the Blythe Solar Power Project (BSPP) located this plant primarily in the sandy areas south of I-10, where 2,134 plants were located and mapped, the majority of these plants of which occurred at the Colorado River Substation site (AECOM 2010v). Harwood's woolly-star was not previously known to occur in the project vicinity; the nearest known occurrences were at Anza Borrego, to the west, and to the north in the Dale Lake, Cadiz Valley and Ward Valley dune systems in San Bernardino County.

Staff reviewed the occurrence data in the Consortium of California Herbaria and detected two new occurrences that were not in the CNDDB (CCH 2010). Both of these are historical records from 1939 and 1958. Of the total of 14 occurrences in California (12 CNDDB plus two additional historic records), 3 of these are protected under National Park Service or State Park ownership. A total of three records are historical records. Four of these occurrences have documented threats, including OHV and non-native plant impacts.

A total of 13 GPS points totaling 169 plants were found in the dunes to the east of the PSEGS project. No plants were found within the Project Disturbance Area. The closest occurrences appear to be located on the dunes approximately 3,000 feet from the Project Disturbance Area. Based on these results, staff determined that the PSPP project would not result in direct impacts from construction, or indirect impacts from hydrologic changes to downstream areas supporting Harwood's woolly-star. Staff also has determined this for the PSEGS project. However, staff remains concerned about the potential for the spread of Sahara mustard into the dunes north of the project from construction-related disturbance near the dunes, transport of seeds on vehicles during construction and operation and transport via surface runoff). Construction-related soil disturbance and sedimentation from surface runoff render habitat vulnerable to noxious weed invasion, and the potential for the spread of Sahara mustard into the sensitive dune habitats north of the project is very high and the ecological consequences would be considerable. Several large infestations of this highly invasive plant occur along the area roads and the channel intake. The potential for Sahara mustard to spread quickly and aggressively, and the severe ecological consequences, are well documented (Barrows & Allen 2007; Brooks et al 2004; Pavlik 2008, and others). Although the project will have no direct effects, staff believes that project may contribute to the spread of Sahara mustard within Chuckwalla Valla and its dune habitats is cumulatively considerable. The PSPP conditions of certification are also recommended for the PSEGS to reduce the projects potential effects to Harwood's woolly-star. These include condition of certification: **BIO-8** (Impact Avoidance and Minimization Measures) #1, 5, 19-22), **BIO-14** (Weed Management Plan). Implementation of **BIO-8** and **BIO-14** would reduce the project's contribution to the spread of Sahara mustard into Harwood's woolly-star habitat to a less-than-significant level. No new conditions of certification are proposed for the PSEGS.

Harwood's Milk-Vetch

Harwood's milk-vetch is a RPR 2B.2 species; a rank that indicates it is rare, threatened, or endangered in California but more common elsewhere. It is also a covered species under the NECO Plan. It is found in desert dunes and sandy or gravelly areas in portions of Imperial, Riverside, and San Diego counties (CNPS 2009). Herbarium collections occur for this species from Ogilby Road in Imperial County and three locales west of Blythe, the Pinto Basin, and Chuckwalla Basin in Riverside County. Harwood's milk-vetch has also been reported from Baja California, Sonora Mexico, and portions of Yuma County, Arizona (Reiser 1994). There are several CNDDB records for this species within the project vicinity (CNDDB 2010). There is a record in the Consortium of California Herbaria database from Wiley's Well Road between McCoy and Mule Mountains from 400 feet elevation (CCH 2010). The Harwood's milk-vetch populations on the southern deserts are presumed stable given limited disturbance to their desert habitats (Reiser 1994), but the recent push for renewable energy development threatens a large portion of its habitat in Chuckwalla Valley and the broader NECO planning area.

Staff reviewed the occurrence data in the Consortium of California Herbaria and detected three new occurrences that were not in the CNDDB. All of these are historical occurrences. Of the total 21 documented occurrences in CNDDB, 9 of these are protected under National Park Service or State Park ownership. A total of 11 records are historical records. Sixteen of these occurrences have documented threats including development, OHV, agriculture, transmission lines, road maintenance, and trash dumping. The population of Harwood's milk-vetch in the project area would fall within the previously documented CNDDB occurrences in Chuckwalla Valley (CNDDB Occurrence numbers 16, 17 and 18).

It is important to clarify here that CNDDB protocol for mapping occurrences is to lump closely-spaced occurrences (<1/4 mile), that are in similar and unbroken habitat, into one ‘occurrence’. Typically, project surveys map rare plants at a high level of detail to facilitate avoidance or calculation of impacts. Thus, many of the GPS points would be lumped into a smaller number of ‘occurrences’ in CNDDB.

Spring 2010 surveys identified only seven Harwood’s milk-vetch individuals in the Project Disturbance Area for the PSPP (AECOM 2010u) out of a total population of ± 146 plants (Solar Millennium 2010l). However, many of the 140 plants documented in the buffer area for the PSPP (Solar Millennium 2010m) are located in close proximity to the northern boundary of the PSEGS project and in areas downstream of the site. Based on a review of the data it appears that six of the seven plants identified in the PSPP Project Disturbance Area would be directly impacted impacts by the proposed PSEGS project (Palen 2013ss). The 140 plants documented in the buffer area for the PSPP are also located adjacent to the PSEGS northern boundary so impacts would be similar.

For the PSEGS project staff considers the direct loss of six plants to be a minor direct effect, as was determined for the seven plant to be lost for the PSPP, given the large number of plants found off the project site (Solar Millennium 2009a, Solar Millennium 2010b, Solar Millennium 2010m) and in the buffer zone of other projects in the vicinity. Approximately 700 Harwood milk-vetch were documented in the GSEP study area, and 2,748 plants in the BSPP and the Colorado Substation study areas). It is important to note that although the 2010 populations were robust, significantly fewer plants (<100) were found in the disturbance area of three projects during the 2009 surveys—a relatively dry year. Staff expected, as described in the PSPP RSA, that the local Harwood’s milk-vetch population size expands and contracts with the normal wide variations in annual rainfall, similar to many other desert annuals. Thus, the same population in the next dry season could be expected to contract to a number that more closely resembles the population size documented in 2009.

Although the direct impacts of the PSEGS project to Harwood’s milk-vetch would be minor, staff is concerned about the close proximity of the off-site populations to the Project Disturbance Area. Staff believes additional accidental impacts could occur during construction, and that indirect impacts from the spread of Sahara mustard and other weeds into adjacent habitat—an effect readily observable in nearby transmission projects, and along roads—could result in impacts to this species. Staff also believes, plants located downstream of the project could be indirectly affected through the spread of weed seed, altered hydrology or sediment transport. Harwood’s milk-vetch may respond favorably to disturbance (loose, sparsely vegetated soils) but most weeds also quickly colonize disturbed soils.

Condition of Certification **BIO-14**, directs the project owner to finalize and implement a detailed weed management plan, which specifies detailed mapping, monitoring, and reporting requirements. Weed management would minimize the risk of Saharan mustard and other invasives from colonizing the disturbed soils along temporary access roads and transmission corridors; both of which are a common conduit for the spread of invasive pest plants. **BIO-19, Section A** (Special-status Plant Avoidance and Minimization Measures) will protect the off-site occurrence from accidental impacts during construction, and indirect effects during operation and closure activities. **BIO-27** (Revegetation of Temporarily Disturbed Areas) was designed to minimize the risk of Saharan mustard and other invasives from colonizing the disturbed soils along temporary access roads and transmission corridors; both of which are a common conduit for the spread of invasive pest plants. For the PSPP **BIO-27** was deleted and avoidance and minimization measures described in **BIO-27** were incorporated into **BIO-8** (Impact Avoidance and Minimization Measures), and weed management measures described in **BIO-27** were incorporated into **BIO-14** (Weed Management Plan).

No compensatory mitigation is required for Harwood's milk-vetch as only a small number of plants would be directly affected; however, for the PSPP the Commission adopted the recommendation that the compensatory mitigation for dunes and washes (habitat for Harwood's milk-vetch) in **BIO-20** and **BIO-22** must be acquired within the Chuckwalla Valley region. Staff is recommending this requirement for the PSEGS, as well. This additional requirement will minimize the cumulative effects of fragmentation by protecting, in perpetuity, private lands in the range of the species in Chuckwalla Valley from future development.

Ribbed Cryptantha

Ribbed cryptantha is a RPR 4.3 species, meaning that it has limited distribution in California; however it is not very threatened in California. There are 116 records of this species from several locations throughout Riverside, San Diego, and Imperial counties in the Consortium of California Herbaria database; the nearest collection is from the Palen Valley approximately three miles east of the Desert Center Airport (CCH 2010).

Spring 2010 botanical surveys identified several large populations of this species, estimated in the millions, within both the Project Disturbance Area and buffer area for the approved PSPP project. Sampling was used in the field to establish an estimate of 8,903 plants per acre (Solar Millennium 2010m). Approximately 285 acres and 1,309 acres of occupied ribbed cryptantha acreage were estimated within the PSPP Project Disturbance Area and buffer area, respectively (Solar Millennium 2010m, Table 3). It was estimated that an area of approximately 406 acres (estimated 3.6 million plants) located within the Project Disturbance Area would be directly impacted by the PSPP project (AECOM 2010u). Staff expects similar numbers of this species to be impacts from the PSEGS project. The project owner estimated that 15.9 acres of occupied ribbed cryptantha acreage (estimated 141,558 plants) were estimated within the PSEGS Project Disturbance Area (Palen 2013ss)

Many similarly large occurrences of ribbed cryptantha have been found in the disturbance areas for the Genesis and Blythe solar projects (TTEC 2010a, GSEP 2009a, Solar Millennium 2009a, Solar Millennium 2010b, and Solar Millennium 2010 m), totaling over 100,000 plants. Given the large number of ribbed cryptantha plants detected by all the I-10 projects, within and outside of their project areas, staff believes it is reasonable to expect that ribbed cryptantha are likely to occur in similar habitats nearby. Staff concluded that because of the local abundance of ribbed cryptantha and its apparently stable range in California, the direct impacts of the PSPP project to this RPR List 4.3 species are less-than-significant. The impacts from the PSEGS project to potential ribbed cryptantha habitat would be similar and would be considered less-than-significant.

Implementation of **BIO-8, BIO-14**, Section A of **BIO-19** (avoidance and minimization measures), **BIO-20** and **BIO-21**, would further reduce the impacts to this species. **BIO-20** and **BIO-21** help minimize future fragmentation of the habitat and other indirect impacts to the local population by placing large portions of private land within the Chuckwalla Valley under a permanent conservation easement.

California Ditaxis

California ditaxis is a CNDDB State Rank 2 (imperiled) species known from 15 occurrences statewide (CNDDB 2010). It is RPR List 3.2 species, meaning that it is on a review list and its taxonomic status is questionable. The ".2" threat rank means that the 15 documented occurrences in California are fairly threatened (CNPS 2009).

In general, RPR List 3 plants (plants of questionable taxonomic status; more information is needed) may not warrant consideration under CEQA §15380. However, List 3 plants may be analyzed under CEQA §15380 if sufficient information is available to assess potential impacts to such plants (CDFG 2009) According to one regional botanical expert, it appears to be a glabrous variety of the common *Ditaxis neomexicana* but the variety appears to be legitimately rare (Silverman pers. comm.). Staff took the conservative position during the PSPP proceedings and treated it as a special-status species warranting consideration under CEQA until there was documented evidence otherwise.

Staff reviewed the occurrence data in the Consortium of California Herbaria and detected four new occurrences that were not in the CNDDB and three of these are historical records from between 1921 and 1952. Although one more recent occurrence was found at Anza-Borrego Desert State Park near Starfish Cove Canyon. There are no previously documented occurrences in this portion of Chuckwalla Valley (east of Highway 177); all of the occurrences are to the west, from Desert Center to the Mecca Hills (CNDDB 2010; CCH 2010).

One group of 11 California ditaxis plants were observed within the Project Disturbance Area along the generation tie-line alignment for the approved PSPP project, approximately four miles west of the project. The generation tie-line for PSEGS also falls within this population observed during surveys for the PSPP. Another group of 11 plants were found in the survey buffer area (Solar Millennium 2010m, Table 3, and Solar Millennium 2010p, Figure 7).

In addition to the direct impacts to plants within the PSEGS Project Disturbance Area (50 percent of the local population), plants adjacent to the alignment could be indirectly affected by the spread of Sahara mustard, which out-competes with the plants, degrades the habitat, and increases the risk of fire. Roads and transmission corridors are common vectors for the spread of Sahara mustard. Vehicles are also common ignition sources for roadside fires, and the weeds that typically recolonize disturbed soils along roads and transmission corridors tend to increase the flammability. Changes to the vegetation management regime may increase the risk of spread of Sahara mustard. For the PSPP, staff considered the loss of half of the occurrence, combined with the indirect effects of Sahara mustard, to be significant, given that there are no other documented occurrences in the valley west of Desert Center. The Commission adopted the recommended avoidance and minimization measures contained in Section

A of **BIO-19**. Section A, #2-a, which required the project owner to limit the width of the work area, adjust the locations of poles, road and pipeline alignments, establish the occurrences as fenced Environmentally Sensitive Areas, and a variety of additional measures aimed at preventing accidental impacts during construction and indirect impacts during operation. Staff is recommending the same measures for the PSEGS as impacts would be similar. The project owner requested modifications to **BIO-19**, Section C.1 which allowed more flexibility for avoidance of late season Rank 2 plants. Staff incorporated the project owner's requested modifications, as appropriate, but clarified that these measures do not apply to populations of California ditaxis. Staff believes that with implementation of **BIO-8** (Impact Avoidance and Minimization Measures) and **BIO-14** (Weed Management Plan) , the contribution of the PSEGS project to the spread of Sahara mustard will be less-than-significant.

"Palen Lake Atriplex" (Atriplex sp. nov. Andre)

A potentially new taxon of saltbush (*Atriplex*) was discovered on the saline playa margins of Palen Dry Lake in 2009, and has been proposed in a preliminary report (Andre and La Doux, pers. comm.). The unnamed saltbush was first collected in 2005 at the dry lake just northeast of the Interstate 15 and Highway 95 junction, approx 35 miles east and northeast of Las Vegas, Nevada (Andre pers. comm.). The first vouchered observation of it in California was at Palen Lake in 2009. According to Andre (pers. comm.), there is potential for it to occur along the I-8 corridor in Imperial County. It may also have been observed in the Ford Dry Lake area (unconfirmed) and it has been observed in other saline (but non-playa) habitats on remnants of the lower Colorado River flood plain (ibid).

The BLM State Botanist and Plant Conservation Program Lead (Lund pers. comm.) indicated that BLM would treat all new taxa as BLM Sensitive species. Discoveries of new taxa are unusual in California, and are typically assigned to a CNPS list and considered as special-status species by the Forest Service, BLM, and other resource agencies. Staff took a conservative position for the PSPP and assumed that a new taxon proposed by a recognized expert in the flora of the California Desert region warrants consideration under CEQA until documented otherwise.

According to Andre (pers. comm.), although the unnamed saltbush resembles the common four-wing saltbush (*Atriplex canescens*)—a common plant of dunes which has very linear leaves—the new taxon has obovate leaves that distinguish it from all four-wing saltbush and its subspecies. It is also generally more confined to subsaline/saline playa margins than the common four-wing saltbush (ibid).

The preliminary botanical survey report for the PSPP (AECOM 2010d, Figure 2) shows several GPS localities of a saltbush recorded as the common four-wing saltbush, and indicated a total population size of 920 plants within the buffer. However, the report provided no other information, such as the characteristics used to distinguish the plants or whether the author even considered the plants to be distinct from the common four-wing saltbush. Four-wing saltbush is reported to hybridize more often than any other saltbush (Howard 2003). Even non-woody saltbush species may cross with four-wing saltbush and produce fertile offspring (ibid). Although their plasticity in fruit and vegetative characters hinders description and identification, many of the four-wing saltbush subspecies have been demonstrated to differ in ploidy level and chemical constituents and thus their biological validities are confirmed (Sanderson & Stutz 1994). Although the new taxon is distinct from the common species in its obovate leaves, it would be easy to overlook where the common and new taxon co-occur, even by experienced botanists (Andre pers. comm.). Since more information was not available, staff presumed that the plants documented by the prior project owner in a map of special-status plants were the proposed new taxon—not the common species or varieties—and that the occurrences warranted consideration under CEQA.

According to the PSPP project owner's map of special-status plants in the preliminary 2010 botanical report (Solar Millennium 2010m, Figure 7), no plants would be directly affected; however, some of the 920 plants documented in the buffer occur in close proximity to the northeastern boundary of the PSPP project and could be indirectly affected by the project. For the PSEGS there is a considerable buffer between the boundary of the project and the location of the mapped saltbush. Therefore, staff believes that for the PSEGS, the avoidance and minimization measures described in Section A of **BIO-19** would not be necessary; however, staff would prescribe **BIO-19** (Section A) to minimize the PSEGS project's potential for indirect impacts during operation and accidental construction impacts.

The PSEGS also carries a risk of indirect impacts from the proposed groundwater pumping, which is estimated to be reduced from 5,750 acre feet per day for the PSPP to 1,130 acre feet per day during the 34-month construction phase, with a predicted drawdown of 1 to 5 feet in the area just north of the northern project boundary. However, the PSEGS would use less groundwater during both construction and operation than the originally approved PSPP project. Construction groundwater use is stated to be 1,130 acre-feet per year (AFY), a reduction from the original permitted project groundwater consumption of 1,917 AFY. Operational groundwater use is stated as 201 AFY, a reduction of nearly 100 AFY. Alternatives 2 and 3 both reduced the potential for groundwater impacts in the dependent habitats north of the project, where the saltbush is located, by shifting the location of the wells approximately 3,000 feet to the south and away from shallow groundwater area. The PSEGS will use the same number of groundwater wells which will also be in the same location as for the PSPP.

Because the potential new taxon is reported to occur in the saline margins around dry lakes, and because a drawdown in the water table *reduces* salinity (Patten et al. 2007), staff believes there is a potential that the PSEGS project's groundwater pumping could eventually cause a habitat conversion from halophytic obligates (salt-loving plants) to non-halophytes (ibid) in the affected area. Staff expects that this would also render the habitat unsuitable for the new taxon. A detailed discussion of the impacts of groundwater pumping to dependent vegetation is provided above under "Impacts to Groundwater-Dependent Vegetation", and in the **SOIL AND WATER RESOURCES** section.

Condition of Certification **BIO-23** specifies vegetation, soil and groundwater monitoring in the area affected by pumping, for the life of the project. **BIO-24** prescribes remedial measures and compensatory mitigation if the monitoring indicates an impending decline in habitat function and value. **BIO-19**, Section A, would minimize the indirect effects of the project and avoid accidental impacts during construction for plants located in close proximity to the PSEGS project. With implementation of these measures, staff believes that the indirect impacts of the project to the “Palen Lake saltbush” (Andre, sp. *nov*.) would be minimized to a less-than-significant level.

Utah Vining Milkweed

Until recently discovered growing on the Palo Verde Mesa (AECOM 2010v), this RPR List 4 species was not expected to occur in the project area and it was believed that the project was outside of the range of Utah vining milkweed. As a RPR List 4, it is not tracked in CNDDB but there are 58 records of this species from the Consortium of California Herbaria database primarily from San Bernardino and San Diego counties; there is one record from the Big Maria Mountains from wash and stabilized dune habitat at approximately 1,200 feet elevation (CCH 2010). One population of Utah vining milkweed was found east of the project site at least 2.5 miles east of the eastern project boundary and outside of the Project Disturbance Area for the PSEGS and buffer area (Solar Millennium 2010m). Therefore, staff believes no direct or indirect impacts would occur to this species and no mitigation is needed.

Impacts to Summer-Fall Special-Status Plants

Although not detected during late season surveys conducted in fall 2010 for the PSPP there are a number of potentially occurring late-season special-status plants that have the potential to occur in the project region. In addition, late season special-status plant surveys have not been completed along the proposed new generation tie-line corridor but were conducted in the vicinity of the new natural gas line corridor for the PSEGS as part of the PSPP. Late season special-status plant surveys would be required for both new areas of the PSEGS. These species include:

- Abram’s spurge, a CNDDB State Rank 2 and RPR List 2B.2 species;
- Flat-seeded spurge, a BLM Sensitive species, CNDDB State Rank 1 and RPR List 1B.2,
- Lobed ground cherry, a CNDDB State Rank 2 and RPR List 2B.3 species.
- Glandular ditaxis, a CNDDB State Rank 1 and a RPR List 2B.2, and
- California ditaxis, a CNDDB State Rank 2 and RPR List 3.2

Staff identified these late-season special-status plants to have the highest potential for occurrence based on the presence of suitable habitat in the project area and known occurrences in the region. Their rarity, status, and known distribution are discussed below (California ditaxis was observed in the Project Disturbance Area and is analyzed in the previous section). Staff acknowledges that there is potential for unanticipated finds because the area is generally under-surveyed.

It has been estimated that 30 to 40 percent of the species in the California Desert flora reach their reproductive maturity in late summer or fall (Andre pers. comm.). However, there is a long-standing precedent of spring season surveys for special-status plants in California, based on the dry summers and summer-dormant flora of the Mediterranean climate that dominates California. There are exceptions, of course, for late-season blooming species, but the plant survey effort in California typically consists of a major spring survey with narrowly focused summer surveys for any late season species that may occur in the region. Regional botanical experts (J. Andre, T. LaDoux) concluded that significant finds could be missed without late season botanical surveys.

Because the region's flora is so under-surveyed and poorly understood, relative to other parts of the desert or state, and because its flora is so intertwined with its variable and unpredictable climate, it is difficult to predict accurately what special-status plants have potential to occur in this region. This is evidenced by the discovery of a potentially new taxon of saltbush on Palen Dry Lake (Andre pers. comm.), a new undescribed species of lupine on a renewable energy project near Barstow (Lund pers. comm.), and a recent discovery of a new perennial spurge in the Orocopia Mountains by Victor Steinmann (LaDoux pers. comm.). Further, several unanticipated range extensions of special-status plants have been found, such as for Utah vining milkweed, and a slight range extension for Harwood's woolly-star. Additionally, some rare plants have been found in habitats in which they were not previously known to occur. For example, lobed ground cherry was recently discovered growing outside of its characteristic playa margin habitat in upland habitats (Andre pers. comm.).

For the approved PSPP project, the project owner was required to implement Condition of Certification **BIO-19** , Section B; conduct late-season surveys in summer-fall 2010 to ensure that any special-status plants missed during the spring 2009-2010 surveys were detected and mitigated to a less-than-significant level. The project owner conducted late season surveys in 2010 and did not detect any sensitive late-season species. For the PSPP, staff believed that most of the footprint for the project had a low potential for supporting special-status plants because: 1) these areas have been significantly degraded by the near complete diversion of its ephemeral washes into one central wash and two outer washes, and 2) the soils and biotic soil crusts were compacted during the military training exercises during World War II. This assumption was validated by the results of the spring 2009 and 2010 surveys, which detected almost no rare plants in the proposed solar facility and it is assumed to be the same for the PSEGS. An analysis of PSEGS project impacts to the late-season plants with the highest potential for occurrence along the two new proposed linear features, if detected, is provided below. The analysis includes a discussion of mitigation that will be required if these species are detected.

To ensure that impacts to any unanticipated finds, including new species, are analyzed for significance, Section C of **BIO-19** summarizes the avoidance and compensatory mitigation that would be required for impacts, based on the species rarity and status, whether it exhibits any local or regional significance, and the portion of the local population affected. These are the factors upon which rare plant impact analyses are typically based. The CNDDB rank is based on the NatureServe protocol for assessing extinction risk, and encompasses a cumulative assessment of threats from invasive plants, development, ORV, mining, grazing, and many other factors. Section C of **BIO-19** also requires the consideration of indirect and cumulative effects, and specifies downstream/downwind impacts from altered hydrology or geomorphic processes shall be considered as direct impacts. Section C also requires the preparation of a Special-Status Plant Mitigation Plan, subject to review and approval of staff. Implementation of a Special-Status Plant Mitigation Plan based on the strict guidelines for fall surveys and reporting requirements, and performance standards for mitigation specified in **BIO-19** would reduce impacts to species detected during the late season surveys to less-than-significant levels.

Section D also includes a *contingency* measure in the unlikely event that no opportunities are available for off-site mitigation through either acquisition or restoration. The contingency measure provides detailed specifications and performance standards for conducting or funding a distribution and status study and preparing a management plan for future preservation and enhancement of the affected species. Information about the distribution and management of these under-surveyed species would help offset project impacts by providing the tools that BLM, NPS and other land managers need to protect and manage these species. The information can also be used to offset future impacts from other projects by providing critical information on ownership, threats, and management opportunities.

With the options and detailed performance standards for mitigation through either acquisition (preservation) or restoration, combined with mandatory avoidance requirements along the linears and facility perimeter, and the contingency measures, security requirements and verifications specified in **BIO-19**, staff concludes that the mitigation is still feasible for the PSEGS and that it would reduce project impacts to less-than-significant levels.

Abram's Spurge

Abram's spurge is a CNDDB State Rank 2 species, meaning it is 'imperiled' within its range in California due to very restricted range and very few populations (often 20 or fewer). CNDDB lists 15 occurrences for this species; 9 of which have been seen since 1990. Its RPR of 2B.2 (and its NatureServe Global Rank of 4) indicates that it is more common outside of California.

The project owner stated during workshops and as part of comment on the PSA that Abram's spurge, currently a CNDDB Rank 2 Plant, is so abundant along the I-10 corridor that its current ranking is being revisited (Palen 2013ss). A request for a Rare Plant Status review has been submitted to CNPS however it has not been formally initiated yet (Sims pers comm. 2013). Ultimately, this species is a 2B (previously rank 2 without the "B) and will be until or if it ever goes through a CNPS status review process for a rank change and therefore should be fully considered during preparation of environmental documents relating to CEQA (Sims pers comm. 2013).

Abram's spurge is a summer annual that is triggered to germinate by significant summer monsoonal rains; consequently, its year-to-year population size is highly variable. The playa margins and washes could support this species; it is known from similar habitats nearby at Ford Dry Lake (CNDDB Element Occurrence #5). This species is known to occur in halophytic (saline-alkaline) flats, playas, and along inlets and floodplains of playas. It tends to prefer the lower floodplain ecotone but can also extend higher up along the washes that feed the playa (Silverman, pers. comm.). The blooming period is described in the CNPS Inventory (CNPS 2009) as September through November but may be detected earlier if significant (>0.10mm) summer rain event occurred in June. On average, August receives the most rainfall, but the warm monsoonal rains sometimes overlap the start of the fall-winter rains of Pacific Northwest origin.

The CNDDB (CNDDB 2010) lists 15 occurrences of this plant in Riverside, Imperial, San Bernardino, and San Diego counties in California, east through Nevada to Arizona, and as far south as Baja California, Mexico. Of the total of 15 occurrences in California, 7 of these are protected under National Park Service, CDFW, or California State Park ownership. A total of 4 records are historical (pre-1972) that have not been confirmed since collected; 9 records have been observed since 1990. One of these occurrences is described as threatened by grazing. A recent (2000) CNDDB record (#5) is from a location approximately 0.50 mile east of Ford Dry Lake on Gasline Road just south of I-10 and the occurrence was reported as a “substantial population” (CNDDB 2010). The habitat at this site is described as “Silt and fine sand in flat areas with shallow depressions where water collects after rains, adjacent to the bank of the freeway” (CNDDB 2010).

If Abram’s spurge occurs within or near the Project Disturbance Area, staff concludes that direct or impacts would be significant unless only a minor portion of its local population, or habitat, was affected. Even if the occurrence was off-site, it could be indirectly affected if it occurs in close proximity to construction. Staff is also concerned about the contribution of the project to the spread of Sahara mustard and other invasives. Construction-related disturbance, roads, transmission corridors, and the transport of seed via washes are common vectors for Sahara mustard and other weeds.

All but one primary wash through the center of the project, and two washes on the western and eastern edges, were already diverted by the construction of I-10 and the diversion of all sheet flow and washes into the three primary channels. The effects of this diversion are apparent in the many dead or declining ironwood trees, stunted creosote bush, and overall low cover and low diversity over much of the site. Although the site has a history of disturbance from military training exercises during World War II, staff believes that the primary cause of the site’s degraded habitat function and value (outside of the primary washes) is due to the changes in surface drainage patterns from the construction of I-10. Nevertheless, the site, north of I-10, has a large enough watershed to support the development of a few smaller washes (outside of the primary washes) in the northeast portion of the project, washes that could potentially support Abram’s spurge or other summer annuals the prefer similar habitat.

Staff believes that potential direct impacts to Abram’s spurge can be mitigated to a level less-than-significant through implementation of subsection B of **BIO-19**, which mandates late-season botanical surveys, and by subsection C, which prescribes a level of avoidance and off-site mitigation depending on the species status, rarity, and other factors. Section D provides measurable performance standards for off-site mitigation for unavoided impacts. Section A protects any occurrences found in close proximity through a variety of BMPs and other measures. Staff has modified **BIO-19** based on comments on the PSA by the project owner to be consistent with the Commission Decision for the Genesis Solar Power Project (GSEP). Abram’s spurge is late summer/fall blooming that also has the potential to occur at the GSEP site. The modifications allow for complete avoidance along linears unless avoidance would cause disturbance to areas not previously surveyed for biological resources or would create greater environmental impacts in other disciplines (e.g. Cultural Resource Sites) or other restrictions (e.g., FAA or other restrictions for placement of transmission poles). If complete avoidance is not possible for the above listed reasons mitigation at a 2:1 ratio would be required. This modification would only apply to late summer/fall plants and would not apply to California ditaxis.

To address indirect and cumulative impacts to Abram's spurge, **BIO-8** (Impact Avoidance and Minimization Measures) and **BIO-14** (Weed Management Plan) would minimize the contribution of the project to the spread of Sahara mustard and other weeds. The conditions of certification require that acquisition for dunes and washes (**BIO-20** and **BIO-21**) occur within the Chuckwalla Valley region. This would minimize future fragmentation of Abram's spurge habitat (playa margins and washes) by placing private lands under permanent protection and preventing future development and the indirect effects of weeds and fragmentation that accompany development.

Flat-seeded Spurge

Flat-seeded spurge is a RPR 1B.2 species, meaning it is rare, threatened, or endangered throughout its range and it is fairly threatened in California. It is also a BLM Sensitive species and has a NatureServe rank of 1.2. Some experts have speculated that it may be a "waif" in California, or a species that is not naturalizing, and note that it is more common in Arizona and Mexico (CDFG 2010). Very little is known about the species because there are few or no extant occurrences. Its micro-habitat preferences are described in CNDDB (2010) as "sandy places or shifting dunes", and by the Arizona Native Plant Society as "shifting dunes of low to medium height". This suggests that the northeastern corner of the project was the most likely place for it to occur. It was not detected in this part of the PSPP during fall 2010 surveys. However, one botanist suggested that weedy disturbed areas and culverts where water collects should not be overlooked (Silverman pers. comm.). If present, impacts to flat-seeded spurge, a BLM Sensitive species, would be considered significant.

The Jepson Desert Manual (Baldwin et al. 2002) and the Arizona Native Plant Society indicate that it blooms in May. However, the CNPS Inventory (2009) lists the bloom period as February to September. Regional botanical experts consulted by staff indicated that it was also a "summer active" species, and like so many plants in the upper Sonoran/southeast Mojave transition zone, it flowers after it rains, and rains are about equally distributes in this region between spring and summer-fall (Andre pers. comm; Sanders pers. comm.; NOAA 2009).

Flat-seeded spurge has only 4 occurrences listed in the CNDDB (2010); the most recent observation was in 1974. Staff reviewed the occurrence data in the Consortium of California Herbaria and detected 1 new occurrence that was not in the CNDDB. This occurrence is also a historical record (1933). Of the total five occurrences in California (CNDDB plus one additional occurrence from CCH), only 1 of these are protected under State Park ownership. A total of three records are historical records. None of these occurrences documented threats.

The closest known occurrence of flat-seeded spurge is approximately 50 miles away. By virtue of its rarity and the distance to known occurrences, its occurrence in the project area is "unlikely" or "speculative", but it occurs along the western edge of the California desert and in Arizona; hence, it occurs on both sides of the project area (Silverman pers. comm; Sanders pers. comm.). The absence of known occurrences in this area may be because it is easily over-looked (Reiser 1994) or because the area is generally under-surveyed.

If present, potential indirect effects include the spread of Sahara mustard and other invasive pest plants into dune habitat; the ecological impacts of Sahara mustard and the potential for restoration are described in Barrows & Allen (2007); Barrows et al. 2009; Pavlik 2008, and others). Channel diversion and the interruption of aeolian and fluvial sediment transport could also adversely affect its persistence, if detected in the project area.

BLM requests 100 percent on-site avoidance for BLM Sensitive plants but the BLM State Botanist would decide the level of avoidance on a case-by-case basis, if present (Lund pers. comm.). Staff believes with the avoidance required in Section C of **BIO-19**, and the requirement for rescue of an off-site population for any unavoidable impacts, as specified in Sections C and D of **BIO-19**, that the project's direct impacts would be minimized to a less-than-significant level. For the PSPP it was determined that project's contribution to the spread of Sahara mustard, which immediately threatens dunes and other sandy habitats, would be less than cumulatively considerable with the implementation of **BIO-8** (Impact Avoidance and Minimization Measures) and **BIO-14** (Weed Management Plan) Staff's requirement for dune and wash compensation to occur locally (**BIO-20** and **BIO-21)** will minimize future fragmentation of flat-seeded spurge habitat in Chuckwalla (if present) by preventing future development and the indirect effects of weeds and fragmentation that accompany development. Impacts from the PSEGS would be similar and the conditions of certification are recommended to minimize the impacts from the PSEGS to a less-than-significant level.

Lobed Ground Cherry

Lobed ground cherry is a RPR 2.3 species, meaning that is rare, threatened, or endangered in California, but more common elsewhere; the threat rank indicates that it is not very endangered in California. During the proceedings for the PSPP, it had a State Rank of 1.3, indicating that it was known from fewer than 5 viable occurrences in California but the occurrences were somewhat stable. It has since been downgraded to a State Rank of 2 which indicates it is imperiled in California because of rarity due to very restricted range. Its Global rank of 5 indicates that it is relatively stable outside of California. It occurs largely on alkaline dry lake beds but it has also been found in drier, less saline-alkaline environments on decomposed granitic soils in Mojave Desert scrub habitat. Due to its preference for lakebeds, mudflats, and desert sinks, and its apparent preference for alkaline and sub-alkaline habitats, staff believed that the northern and northeastern portions of the project have the highest potential for occurrence but staff does not dismiss the possibility that it could occur anywhere on the project. It was not detected in these areas during fall 2010 surveys however surveys would be required along the two new proposed linear features.

For the PSPP, staff reviewed the occurrence data in the Consortium of California Herbaria and detected two new occurrences that were not in the CNDDB. Both of these are more recent occurrences, including one from Joshua Tree National Monument and one in the eastern Mojave Desert. Staff asserted that the two additional occurrences could (theoretically) reduce the State Rank from 1 (less than 5 viable occurrences) to a rank of 2 ("6 to 20 viable occurrences"), unless the threats to occurrences have increased. None of the 6 occurrences are historical records and none have documented threats (CNDDB 2010). Since 2010 this species has been downgraded to a State Rank 2

For the PSPP, staff considered that impacts to this very rare species in California would be significant, if present. Such an occurrence would also represent a range extension (i.e., occur at the periphery of its range in California). Potential indirect effects, if present, include the spread of Russian thistle and other alkaline-tolerant weeds into its habitat. Russian thistle is already present in the playa margin habitats and in the northeast portion of the project area. Construction-related disturbance and vehicle use along the existing roads are common vectors for the spread of invasive pest plants. Even if found off-site in the playa margins, it could be indirectly affected by alteration of the site hydrology or sedimentation, if located directly below the engineered channel discharge points. For the PSEGS, even with the downgrade to rank 2, staff would still consider impacts as described above to be significant if present.

If present, implementation of the avoidance and compensatory mitigation requirements in Sections C and D of **BIO-19** would reduce the project's impacts to a less-than-significant level. There does not appear to be opportunities for acquisition of occupied habitat at this time but there are private lands adjacent to the Lanfair Valley occurrence at Ox Ranch. Since lobed ground cherry was downgraded to a Rank 2 as a consequence of detecting new occurrences and a low risk of extinction from other threats, then acquisition could include adjacent lakebed or other alkaline and sub-alkaline habitats that are at risk of development. If such lands are acquired within Chuckwalla Valley, as proposed in **BIO-20** (compensatory mitigation for dunes and MFTL habitat) and **BIO-21** (compensatory mitigation for desert washes), then the acquisition would minimize the threat of future fragmentation of remaining habitat surrounding the project.

Implementation of **BIO-8** (Impact Avoidance and Minimization Measures) and **BIO-14** (Weed Management Plan), and the Best management Practices and other measures in Section A of **BIO-19** would minimize the PSEGS project's contribution to the spread of Russian thistle and other weeds to a less-than-significant level.

Indirect Impacts to Special-Status Plants

For the PSPP, staff considered the following indirect impacts to special-status plants, (i.e., impacts outside the Project Disturbance Area or that occur following construction): introduction and spread of invasive plants; alteration of the surface hydrology and basic geomorphic processes that support rare plants and their habitat (e.g., disrupted aeolian and fluvial sand transport processes from obstructions or diversions); population fragmentation and disruption of gene flow; potential impacts to pollinators; increased risk of fire; erosion and sedimentation of disturbed soils which render the habitat vulnerable to invasion by pest plants; disturbance of the structure and ecological functioning of biological soil crusts which affect seed germination, reduces soil nutrition, carbon sequestration, and renders the soil vulnerable to water and wind erosion (Belnap & Eldridge 2001); herbicide and other chemical drift; and disruption of photosynthesis and other metabolic processes from fugitive dust during construction and operation of the project. These impacts would be similar for the PSEGS.

Changes to drainage patterns downslope of the PSPP project area would have had significant impacts to special-status plant species. Therefore, staff included a measure in **BIO-21** (mitigation for impacts to state waters) and **BIO-19**, Section A (avoidance and minimization measures for special-status plants) related to diffuser design to minimize impacts downstream. Because diffusers would no longer be include in the project design this language has been recommended for deletation by the project owner and staff has made the deletion in the conditions of certification Although, the current design of the PSEGS project would allow flows to pass through the project; some disruption will still occur from roads and project facilities. However, because the disruption to surface hydrology to downstream areas would be limited impacts to plants in these areas would be considered less than significant.

Following construction, invasive species could occupy disturbed soils within the Project Disturbance Area, and then spread into adjacent undisturbed habitats—naturally disturbed habitats such as dunes and washes are particularly vulnerable to colonization by weeds. Staff is particularly concerned about the potential spread of Sahara mustard, which is already present along roads and near the freeway. The primary conduit for spread, however, is along roads and transmission corridors. The dramatic increase in vehicle use of the project vicinity roads and construction of transmission corridors and new roads is expected to increase the spread of this highly invasive wildland pest. Sahara mustard has shown a clear negative impact on native flora (Barrows et al. 2009). Sahara mustard can form dense stands and potentially crowd out native annual plants. Sahara mustard plants growing early in the season may dominate available soil moisture which may adversely affect native annuals which start growing a little later in the season (Barrows et al. 2009). Barrows et al. (2009) found that native annuals growing under a canopy of Sahara mustard were often taller and were etiolated, at the expense producing branches, flowers, and fruits. This led to a shift in the dominance of the following year's species composition from native annuals to Sahara mustard.

Staff requested the project owner supply further data relative to onsite vegetation management regimes, and specifically, to provide data regarding the long-term effects of mowing native vegetation (CEC 2013h). Staff has concerns that throughout the life of the project, successional changes to vegetation may occur. As native vegetation is mowed, the regrowth will happen quickly, and after several years, may deplete nutrients in the soil. It is possible that the vigor of native plants may suffer, and invasive species, which are tolerant of poor conditions, may then proliferate.

Mowing is anticipated to substantially decrease the quality of the vegetation as well as the value of the site for wildlife and all remaining vegetation, including wash vegetation, would be mowed to 12-18 inches (Palen 2013cc). Since vegetation will be managed by the project owner to facilitate use of the site and not to maintain vegetation on site staff is assuming a total loss of the function and value of the vegetation and habitats within the project site because ongoing disturbance and other anthropogenic activities at the site may continue to degrade habitat functions within the project footprint. Plants that are tolerant to disturbance may continue to occupy the site, however, staff does not consider leaving the vegetation on site a benefit to these species due to ongoing risk of destruction or disturbance from construction equipment operational work efforts including mowing, maintenance, and washing of the heliostats.

Tamarisk, Russian thistle, Sahara mustard and Mediterranean grasses are already present in the project area and are expected to increase as a result of construction- and operation-related disturbance. The proliferation of many non-native plants has dramatically increased the fuel load and frequency of fire in many desert ecosystems (Lovich & Bainbridge 1999). Unlike other ecosystems in California, fire was not an important part of the Mojave Desert ecosystems and most perennials are poorly adapted to even low-intensity fires, and the animals that coevolved are not likely to respond favorably to fire either. The potential spread or proliferation of non-native annual grasses, combined with the proximity to ignition sources could potentially increase the risk of fire, and the effects to these poor-adapted desert communities would be harmful, particularly to cacti and most native shrubs species. Burned creosote and other native shrubs are typically replaced by short-lived perennials and non-native grasses (Brown & Minnich 1986). The spread of invasive plants is a major threat to biological resources in the Colorado Desert because non-native plants can displace native plants, increase the threat of wildfire, and supplant wildlife foods that are important to herbivorous species.

Wildfires (caused by construction or downed transmission lines) are rare but the increase in daily vehicle use in the area from an anticipated 100 new jobs during operation and up to 840 jobs during construction could significantly increase the risk of ignition. Other temporary and permanent impacts from the project could occur to surrounding vegetation communities from grading activities creating air-born, fugitive dust, sedimentation, and erosion, which disruption of photosynthesis and other metabolic processes. The destruction of plants and soil crusts by windblown sand and dust also exacerbates the erosion of the soil and accelerates the loss of nutrients (Okin et al. 2001).

Indirect impacts to sensitive plants would be significant absent mitigation. Implementation of the following mitigation measures would reduce project impacts to less-than-significant levels: avoidance and minimization measures (**BIO-8**);, compensating for habitat loss by preventing the future development of desert lands through acquisition and permanent protection under conservation easements, and management of lands these lands to sustain enhanced populations of sensitive species and habitats (**BIO-12**, **BIO-19**, **BIO-20**, and **BIO-22**); focusing the acquisitions into important linkages for species dispersal into critical refugia,, restoring degraded portions of acquired lands (**BIO-12** and **BIO-19**); and minimizing the size of the disturbance area along the linears (**BIO-8** and **BIO-19**);

Impacts of Climate Change to Plants

In a recent study “Climate Change and the Future of California's Endemic Flora” (Loarie et al 2009), anticipated climate change is projected to cause greater than 80 percent reductions in range size for up to 66percent of California’s endemic species within a century. These results are comparable to other studies, but projected reductions depend on the magnitude of future emissions and on the ability of species to disperse from their current locations. California's varied terrain could cause species to move in very different directions, breaking up present-day floras. However, these projections also identify regions where species undergoing severe range reductions may persist. Protecting these potential future refugia and facilitating species dispersal will be essential to maintain biodiversity in the face of climate change (*ibid*). These include the cooler, more mesic microclimates of the mountainous areas, which may protect significant components of biodiversity into the next century. Many of these areas are already in some degree of federal wilderness protection. However, the value of these refugia depends critically on the ability to of species to disperse, underscoring the importance of landscape connectivity and potential restoration in the face of increasing urbanization, land use change, and disturbance (*ibid*).

The PSEGS project is expected to contribute to a cumulative reduction in greenhouse gases. However, the benefits gained by the project's reduction in greenhouse gases must also be weighed against the potential loss of carbon sequestration benefits from the desert vegetation. In order to build the facility, the plants, animals and soil of the native desert acreage are damaged and destroyed, which releases CO2. Presently, there is still dispute among scientists as to how to accurately measure the benefits and the loss (Campbell et al. 2009).

Biotic Soil Crusts and Other Carbon Sinks

Numerous studies conducted over the past 40 years have attempted to identify and quantify the major pools of carbon uptake for the various components of desert ecosystems as well as desert ecosystems as a whole (Schlesinger et al. 2009). The estimates of carbon uptake vary immensely between sites and researchers. In addition to vegetation, alkaline soils and biological soil crusts (BSCs), which are composed primarily of photosynthetic cyanobacteria, algae, lichens, and mosses, play a key role in arid and semi-arid ecosystems and are able to fix carbon. Schlesinger et al. (2009) point out, however, that those pools of carbon that biological crusts fix are relatively small. New evidence suggests alkaline desert soils may be responsible for considerable uptake of carbon. Although there is much uncertainty regarding where and how carbon is stored in desert ecosystems but the recent evidence suggests desert soils have the potential to be a carbon sink. Whether a result of biotic crusts, vegetation, alkaline soils, or an increase in average precipitation, the rate of carbon absorption in the soil has scientists considering whether desert ecosystems play a more critical role in the carbon cycle than previously believed (Stone 2008; Campbell et al. 2009). Some scientists, however, dispute these findings and attribute them to an anomaly caused by increased rain for the study period reported (Campbell et al. 2009). A study is currently underway by the University of Oregon "to determine whether the installation and operation of solar thermal plants will impact carbon sequestration capabilities of the Mojave Desert ecosystem and ecosystem services (assessment endpoint) to the extent that more carbon is released or inhibited from being stored than saved while utilizing solar technology." (Campbell et al. 2009).

Until the dispute about the sequestration benefits of alkaline soils and other carbon sinks is resolved, staff assumes that the answer may vary on a case-by-case basis. For example, project sites that are very sparsely vegetated with only a minor component of soil crusts may confer less sequestration capabilities than sites with a rich cover of biological soils crusts and succulent desert scrubs. There is currently no acceptable means to quantify the sequestration occurring on the project site. Staff believes that implementation of the conditions of certification for the PSEGS project would reduce potential adverse effects from the loss of carbon sequestration. These include avoidance and minimization measures (**BIO-8**), compensating for habitat loss by preventing the future development of desert lands through acquisition and permanent protection under conservation easements (**BIO-12, BIO-19, BIO-20** and **BIO-22**), focusing the acquisitions into important linkages for species dispersal into critical refugia,, restoring degraded portions of acquired lands (**BIO-12** and **BIO-19**), minimizing the size of the disturbance area along the linears (**BIO-8** and **BIO-19**), and revegetating after closure (**BIO-23**).

Cacti, Yucca, and Native Trees

The 2009 and 2010 surveys included an inventory of native cacti, succulents and native trees that are not considered rare (e.g., they are not tracked by CNDDB or included on the CNPS special-status plant lists) but the harvesting of these native plants is regulated under the California Native Plant Protection Act (Fish and Game Codes sections 1900-1913) and the California Desert Native Plant Act of 1981 (Food and Agricultural Code section 80001, et . seq. and Fish and Game Code sections 1925-1926), and prevent unlawful harvesting of non-listed native desert plants of the state (see **Biological Resources Table 1**).

During 2009 and at the request of the BLM, the prior project owner conducted sampling plots for cacti, yucca, and native trees in the PSPP study area primarily to search for and map any locations of California barrel cactus, cottontop cactus, or hedgehog cactus for future salvage when construction begins (Solar Millennium 2009a, Appendix F Biological Resources Technical Report). None of these species were observed in the study area during spring 2009; however, a total of four species in the Cactaceae family were observed during 2009 field surveys including teddybear cholla (*Opuntia bigelovii*), silver cholla (*Opuntia echinocarpa*), pencil cholla (*Opuntia ramosissima*), and common fishhook cactus (*Mammilaria tetrancistra*).

Native trees found during 2009 field surveys included smoke tree (*Psorothamnus spinosus*), ironwood (*Olneya tesota*), blue palo verde (*Cercidium floridium* ssp. *floridium*), ocotillo (*Fouquieria splendens* ssp. *splendens*), and honey mesquite (*Prosopsis glandulosa* var. *torreyana*). Additional mapping of cacti species was performed during 2010 and California barrel cacti, cottontop cactus, and hedgehog cactus were found; a single location with five barrel cacti was observed within the buffer study area and south of I-10 and a single location of cottontop cactus was found in the eastern portion of the Project Disturbance Area (Solar Millennium 2010m, Table 3 and Figure 7).

Staff requested additional information regarding native plants regulated under the California Native Plant Protection Act for all new areas of the project including the natural gas line corridor and the unsurveyed segment of the generation tie-line. The project owner submitted final information regarding rare plant surveys conducted in March 2013 which included a tabulation of all individuals of cacti, yucca, and trees protected by the California Desert Native Plant Act (Palen 2013jj). No California barrel cactus, cottontop cactus, or hedgehog cactus were detected during these additional surveys so no additional maps were provided. However, a total of three species in the Cactaceae family were observed during 2013 field surveys including silver cholla, pencil cholla, and common fishhook cactus. These species were found both along the generation tie-line corridor and the natural gas line corridor with the greatest numbers found along the north-south portion north of I-10. Native trees found during 2013 field surveys included ironwood, blue palo verde, and catclaw acacia (*Senegalia greggii*).

Condition of Certification **BIO-27** required preparation and implement a Revegetation Plan which would address the salvaging of topsoil and native desert plants to aid in the revegetation of temporarily disturbed areas following project construction. **BIO-27** was deleted and avoidance and minimization measures described in **BIO-27** were incorporated into **BIO-8** (Impact Avoidance and Minimization Measures), and weed management measures described in **BIO-27**were incorporated into **BIO-14** (Weed Management Plan). Restoration and revegetation of the solar facility and other permanently disturbed areas upon closure is addressed separately in **BIO-22**.

PROJECT CLOSURE

The original project owner (Solar Millennium) submitted a Draft Conceptual Decommissioning Plan – Palen Solar Power Project (Solar Millennium 2010a) in January 2010 in response to staff's data request for a conceptual decommissioning plan that addressed the fate of the engineered channels (CEC 2009a). Staff requested a conceptual plan for filling the re-created channels and restoring drainages on the project site, including a description of a revegetation plan for restoring the function and values of the ephemeral drainages. Staff also requested a cost estimate, adjusted for inflation, for implementing the closure, including the revegetation component of the closure activities for the drainages, and asked for a conceptual plan and funding mechanism for monitoring and maintenance of the ephemeral drainages until existing functions are reestablished. The proposed PSEGS eliminates the large drainage control channels and the majority of the project site would maintain the original grades and natural drainage features (Palen 2012a). A Revised Draft Conceptual Closure (formerly called Decommissioning) Plan and cost estimate for the PSEGS project would still be required to meet BLM regulations.

Regulations promulgated by BLM at Title 43 Code of Federal Regulations, sections 3809.550 et seq. require a detailed reclamation plan and an estimate. Page 5 of BLM's Instructional Memo for Oregon/Washington BLM Policy for Title 43 Code of Federal Regulations, section 3809 Notice and Plan-level Occupations, and Title 43 Code of Federal Regulations, section 3715 (Use and Occupancy and Reclamation Cost Estimates) (BLM 2009b), lists the requirements for a reclamation plan as follows:

"(c)Reclamation Plan. A plan for reclamation to meet the standards in §3809.420 with a description of the equipment, devices, or practices proposed for use including, where applicable, plans for:

(i) drill-hole plugging;

(ii) regarding and reshaping;

(iii) mine reclamation, including information on the feasibility of pit backfilling that details economic, environmental, and safety factors;

(iv) riparian mitigation;

(iv) wildlife habitat rehabilitation;

(v) topsoil handling;

(vi) revegetation;

(vii) isolation and control of acid-forming, toxic, or deleterious materials;

(ix) removal or stabilization of buildings, structures, and support facilities; and

(x) post-closure management."

Page 3 of the same document also explicitly requires an estimate of the costs of reclamation, as follows:

"Reclamation Cost Estimate. An estimate of the cost to fully reclaim disturbances created during the proposed operations as required by §3809.552. The reclamation cost estimate must be developed as if the BLM were to contract with a third party to reclaim the operations according to the reclamation plan."

Condition of Certification **BIO-22** requires the project owner to develop a Closure and Reclamation Plan and cost estimate that meets the requirements of BLM's regulations, prior to the start of project-related ground disturbing activities or alternate date as agreed to by the BLM. With implementation of Condition of Certification **BIO-22**, impacts to biological resources resulting from closure activities would be mitigated to less than significant levels.

CUMULATIVE IMPACT ANALYSIS

ANALYSIS OF CUMULATIVE EFFECTS TO BIOLOGICAL RESOURCES

"Cumulative" impacts refer to a proposed project's incremental effect viewed over time together with other closely related past and present projects and projects in the reasonably foreseeable future whose impacts may compound or increase the incremental effect of the proposed project (Public Resources Code Section 21083; California Code of Regulations, Title 14, Sections 15064[h], 15065[c], 15130, and 15355). The following sections present a definition of the geographic extent within which cumulative impacts are analyzed and an analysis of the project's potential incremental effects when combined with other past, present, and future projects.

SUMMARY OF THE APPROVED PSPP AND PROPOSED PSEGS PROJECT

Cumulative impacts of the approved PSPP project were considered in light of existing and reasonably foreseeable future projects that threaten plant and animal communities within the context or geographic scope of the Northern and Eastern Colorado Desert Coordinated Management Plan (NECO) (BLM-CDD 2002). The approach employed a combination of quantitative and qualitative analyses. A Geographic Information System (GIS)-based quantitative analysis was reviewed for assessing the direct cumulative effects to habitat loss, and a qualitative analysis was employed of the cumulatively considerable indirect effects, based on consultations with REAT agency biologists and regional experts, and a literature review of the threats to species and their habitats.

For the PSEGS project a qualitative assessment of cumulative effects was based on a review of the approved PSPP project's existing data, the conclusions regarding significance, and a review of any new or anticipated projects in the region. The review considered the projects onsite and offsite survey data, databases, literature, and consultation with regional experts. In addition to the combined effects of habitat loss and direct mortality, staff identified a range of indirect effects that combine with similar effects from other past, present, and foreseeable future project that must be factored into the cumulative analysis. This suite of indirect impacts to which the project would contribute includes: increase in ravens, coyotes, and other predators; introduction and spread of invasive weeds; the effects of groundwater pumping on ecosystems; altered surface drainage patterns; habitat fragmentation; increased risk of fire; erosion and sedimentation of streams; potential for the introduction and or spread of wildlife diseases; diminished habitat values from increased noise and lighting; exotic wildlife invasions; dust and air pollution; road kills; human disturbance; and other factors contributing to a significant cumulative effect.

GEOGRAPHIC SCOPE

This cumulative impact analysis makes a broad, regional evaluation of the impacts of existing and reasonably foreseeable future projects that threaten plant and animal communities within a 50 mile radius of the project area to account for differences in the ecology of various plants and wildlife and includes portions of the Northern and Eastern Colorado Desert Coordinated Management Plan (NECO) (BLM-CDD 2002). The NECO planning area is located in the southeastern California Desert Conservation Area (CDCA). It occurs primarily in the Sonoran Desert region but includes a small portion of the southern Mojave Desert region. For some biological resources, a different geographic scope was warranted, such as the use of watershed boundaries to analyze cumulative effects to desert washes and desert dry wash woodland, or the Chuckwalla Valley for locally significant populations and dune systems restricted to that geographic area.

REGIONAL OVERVIEW

This overview of regional impacts is followed by a more detailed discussion of the effects of past, present, and future projects to biological resources of the project vicinity, with an emphasis on resources found within the Chuckwalla Valley of eastern Riverside County. The California desert remained a desolate area for the first few decades of the 20th century. Disturbance was more or less restricted to highways, railroad, and utility corridors, scattered mining operations, and sheep grazing. In the 1940s, several large military reservations were created for military training, testing, and staging areas. The deserts of eastern Riverside County comprise 40 percent of the county's land area but less than one percent of its population. Outside of the small urban-agricultural center of Blythe, near the Colorado River and Arizona border, there are only a few scattered, small residential and agricultural areas between Indio (to the west) and Blythe; most of the lands are under BLM management. The BLM manages land for multiple uses. While maintenance of habitat features and functions is a priority, the BLM must allow uses that stand in direct conflict with many conservation goals. Mining claims, grazing leases, renewable energy and other project development, and recreational uses may all be permittable under certain circumstances.

Populations of many of the desert's sensitive plants and animals were considered relatively stable until recently, as the push for renewable energy development has placed many populations at risk. Renewable energy projects are part of the solution to climate change, one of the biggest environmental challenges of our time; however, renewable energy development has its own ecological consequences and portions of the Sonoran and Mojave deserts of California bear the brunt of these effects. Energy providers have submitted project applications that would collectively cover more than one million acres of the region (BLM 2010). Poorly planned development could contribute to habitat loss and fragmentation and barriers to species movement and gene flow. Although project permitting and regional planning evaluate basic environmental impacts of such projects, often they do not fully consider impacts on connectivity, conduct thorough cumulative effects analyses, or implement regional monitoring of effects or the efficacy of mitigation.

In the areas identified for renewable energy development in eastern Riverside County, some of the many sensitive biological resources at risk include: desert washes and desert dry wash woodland, desert tortoise, Mojave fringe-toed lizard (including an important local population), western burrowing owl, fragile dune ecosystems, dry lakes, groundwater-dependent ecosystems, and a wide variety of special-status wildlife and plants. Approximately 228 acres of the southwestern corner of the project overlaps the northern boundary of the Chuckwalla Desert Tortoise Critical Habitat Area. The project also lies within a Wildlife Habitat Management Area (Palen-Ford Wildlife Habitat Management Area), and is immediately northeast of the Chuckwalla DWMA.

The incremental, direct loss of habitat and individuals is more significant when considered with the significant indirect effects of fragmentation and its effects on gene flow, disrupted wildlife movement and connectivity, the introduction and spread of non-native plant species, and increases in predators such as ravens, which has also contributed to population declines and range contractions for many special-status plant and animal species (Boarman 2002a). Combined with the effects of historical grazing, agriculture, military training, and highway and aqueduct construction, the proposed wind and solar energy projects have the potential to further reduce and degrade native plant and animal populations. In the context of this large scale habitat loss, the project would contribute, at least incrementally, to the cumulative loss and degradation of habitat for desert plants and wildlife, including desert tortoise and Mojave fringe-toed lizards, in the Chuckwalla Valley and NECO planning area.

MAKING CONCLUSIONS ABOUT THE SEVERITY OR SIGNIFICANCE OF THE EFFECT

"No net loss" does not necessarily mean there are no cumulative impacts. The standard for a cumulative impacts analysis is defined by the use of the term "collectively significant" in the CEQA Guidelines section 15355; the analysis must assess the collective or combined effect of development. Cumulative impact assessments cannot conclude that contributions to cumulative impacts are not significant because the contributions represent a small percentage of the overall problem. Doing so could improperly omit facts relevant to an analysis of the collective effect that the project and other related projects would have upon biological resources. The result could be approval of projects based on an analysis that avoided evaluating the severity of impacts which, when taken in isolation appear insignificant, but when viewed together appear significant. For each cumulative effect the following questions were considered in making conclusions about the severity or significance of an effect:

- The health, status or condition of the resource as a result of past, present and reasonably foreseeable impacts;
- The contribution of the proposed modified project to the overall cumulative impact to the resource;
- The project's mitigated effect, when added to the effects of these planned future projects, and;

Impact avoidance and minimization: any project design changes that were made, or additional opportunities that could be taken, to avoid and minimize potential impacts in light of cumulative impact concerns.

PROJECTS CONTRIBUTING TO CUMULATIVE EFFECTS TO BIOLOGICAL RESOURCES

This analysis evaluates the impacts of the project in addition to the current baseline of past effects, present (existing) projects, and reasonably foreseeable or probable future projects in the I-10 corridor within a 50-mile radius of the proposed PSEGS project. For golden eagle, cumulative impact analysis extends to a 140-mile buffer around the project to account for the large area used by this species. **Biological Resources Figure 9** illustrates the numerous proposed renewable projects on BLM, state, and private land in the I-10 corridor between Desert Center and the Colorado River, near Blythe, in eastern Riverside County. **Biological Resources Table 9** lists the existing and foreseeable future projects (proposed) that were included in the quantitative analysis of cumulative effects for the approved PSPP project and the qualitative approach used to support the proposed modified project; these projects are illustrated spatially in **Biological Resources Figure 9.** Refer to **Executive Summary Attachment A – Table 1**, **Executive Summary Attachment A – Table 2**, and **Executive Summary Attachment – Table 3**, for a complete list of projects considered cumulative to the PSPP project, and therefore part of this analysis.

Biological Resources Table 9
Existing and Proposed Future Projects Considered in Cumulative Effects Analysis for the PSEGS Project

Existing Projects (analyzed quantitatively)	ROW Area[1] (acres)	Foreseeable Future Projects[1] [Proposed] (analyzed quantitatively)	ROW Area[1] (acres)
Chuckwalla State Prison	1,044	Palen Solar Electric Generating System (PSEGS)[2]	3,001
Ironwood State Prison	681	Blythe Solar Power Project[2]	7,239
Eagle Mountain Pumping Plant (MDWSC)	378	NextEra Energy – McCoy (solar)	20,560
Kaiser Mine	5,772	Genesis Solar Energy Project[2]	1,768
I-10 Corridor (200-ft freeway buffer from centerline (CL)	6,494	Bull Frog Green Energy – Big Maria Vista (solar)	22,663
State highways (50-ft highway buffer from CL)	2,640	Chuckwalla Solar 1	4,091
DPV2 transmission line and existing access roads (100ft T-line Tower Buffer; 20-ft road width)	2,861	Rice Solar Energy Project	3,859
Landfills (BLM NECO dataset)	n/a	Desert Quartzite (solar)	7,530
Blythe Energy Project I	153	Desert Sunlight (solar)	5,119
BLM Campgrounds – Wiley's Well, Coon Hollow, Cottonwood Spring, and Midland Long-Term Visitor Area	8,042	EnXco 1 (solar)	1,325
BLM Off-Road Vehicle-authorized/designated routes in Meccacopia SRMS. (BLM NECO Human Use LTVAs dataset)	3,031	Chuckwalla Valley Raceway	493
Blythe area urban and agricultural lands (GAP Analysis vegetation dataset)	88,317	Mule Mountain Solar Project	6,618
Desert Center area urban and agricultural lands (2005 NAIP imagery)	8,424	Eagle Mountain Pumped Storage Project	252
Pipeline (NECO pipelines dataset)	4,392		

Projects Considered Qualitatively			
Existing	**Area** (acres)		**Area** (acres)
BLM Grazing – cattle and sheep allotments (Lazy Daisy, Chemehuevi, Rice Valley, and Ford Dry Lake (recently closed)	n/a	Paradise Valley (residential "new town" development)	6,724
BLM Multiple Use – intensive multiple-use classes	n/a	Blythe Airport Solar I Project	639
General Patton military training areas	n/a	Eagle Mountain Landfill	1,,633
Colorado Aqueduct – open portions	n/a	Blythe Energy Project II	153
Chocolate Mountains Aerial Gunnery Range	n/a	DPV2 proposed roads (2-foot width) and towers (100 sq ft/tower)	256
Four approved commercial and 12 residential developments near Blythe	n/a	Genesis Solar Project access road	29

Projects Considered Qualitatively			
Existing	**Area** (acres)		**Area** (acres)
Solar projects at Arizona border	n/a	Blythe Energy Project transmission line towers	148
BLM renewable energy study areas (future, proposed)	n/a	Genesis Solar Project gas line (100-ft width)	85
BLM transmission corridors	n/a	EnXco 2 Mule Mountain	~2,021
		Red Bluff Substation – for Palen Solar Electric Generating System	90
		Colorado Substation – for Blythe Solar Power Project	44
Total Future Projects[1,3] – 02/05/2010			**339,704 acres**
Total Existing Disturbances[1,3]			**134,750 acres**

1 - Not all of the projects depicted here will complete the environmental review, not all projects will be funded and constructed, and many will not use the entire ROW area** 150,272 acres of agricultural and urban development mapped within the NECO boundary according to the NECO Plant Communities dataset (BLM CDD 2002).

2 - Acreage impacts depicted reflect the project footprint only; not the entire ROW. The unused portions of the ROW would be returned to BLM and not included in the final ROW permit

3 - Because some future projects are proposed on disturbed lands; the numbers shown above subtracted for overlap and represent the acreages used in this cumulative effects analysis.

ANALYSIS OF CUMULATIVE EFFECTS TO BIOLOGICAL RESOURCES

Waters of the State/Desert Washes

The geographic scope for the analysis of cumulative impacts to desert washes (including intermittent and ephemeral washes) included the Palen watershed and greater Chuckwalla Valley. The primary hydrologic feature in the Palen watershed is Corn Springs Wash; several branches of the wash pass through or around the site, some of which abate before reaching Palen Dry Lake. This dry lake is the receiving basin for the 1,496 miles of desert washes that drain the watershed (USGS 2010a). Most of the desert washes that pass through the project site are distributary channels of the alluvial fan—or bajada—that drains the northeastern flank of the Chuckwalla Mountains. Staff analyzed the cumulative effects within the context of the watershed because this relatively small watershed would be affected by several proposed solar projects: Palen Solar Electric Generating System; First Solar Desert Sunlight; enXco 2; and Chuckwalla Solar 1 (see **Biological Resources Figure 9**). Existing impacts to desert washes in the Palen watershed include: urban and agricultural lands around Desert Center, segments of the I-10 and Highway 177 corridors, Kaiser Mine, and various transmission corridors (gas and electric).

The watershed area analysis was based on the U.S. Geological Survey (USGS) National Hydrographic Dataset (2010a) within the watershed boundary as defined by the California Interagency Watershed Map of 1999 (California Interagency Watershed Mapping Committee 1999) (**Biological Resources Figure 3**: Desert Washes–Palen Watershed).

The cumulative effects to desert washes within the Palen watershed are cumulatively considerable and the project itself would be a major contributor to those effects. The effects of all projects are compounded by the fact that they also cause impairment of hydrologic, geochemical, geomorphic, and habitat function and values of the remaining reaches downstream of the impact.

Many of the existing washes in the Chuckwalla Valley have been subject to extensive impairment north of I-10. The highway roadbed and a series of collector ditches south of I-10 have permanently diverted stream flows into a few primary features and deprived flows from many miles of smaller washes. Standing dead ironwood trees, stunted, drought-stressed creosote bushes and other shrubs provides sparse cover with very low species diversity occurring north of I-10 in the Palen watershed. The decline in cover, vigor, and habitat function in this area is a testament to the downstream effects that channel diversions can have on both upland and riparian plant communities. Many of the smaller washes on the project site were already diverted and impaired by construction of I-10. Those washes were diverted, historically, into the three primary washes that pass through or around the site. Theoretically, the extra flows may have enhanced the extent of the desert dry wash woodland on these three washes, but the negative impacts apparent in the thousands of acres outside of these washes reflects the importance of these smaller washes to both riparian and upland ecosystems. For the project, impacts downstream from the site would be minimized by allowing existing flows to pass through the project. Allowing flows to pass through the project would minimize adverse effects to desert washes located in these areas. Therefore the project would not contribute to cumulatively considerable impacts to desert washes in downstream areas.

The effects of past, present, and foreseeable future projects combine with the project's effects and contribute to a significant cumulative impacts on desert washes in the local watershed, particularly on the habitat functions and value of the washes. These effects include impacts to water quality and sediment transport from culverts and road crossings, fragmentation of the habitat and the corresponding loss of habitat function and values, including wildlife movement; and the effects of interrupted fluvial sand transport on the Chuckwalla Valley dune system. Impacts to connectivity and wildlife movement from these diversions are discussed in more detail later in this cumulative effects analysis.

Energy Commission staff has concluded that the project's contribution to the direct loss of desert washes in the Palen watershed and surrounding region would be the same as the PSPP and would not be cumulatively considerable with implementation of Condition of Certification **BIO-21**, which requires the acquisition of desert washes within or adjacent to the Palen watershed. Conditions of Certification **BIO-8** (impact avoidance and minimization measures), and **BIO-7** (monitoring and reporting requirements) are designed to minimize accidental impacts during construction and operation.

Special-Status Wildlife

Desert Tortoise

The geographic extent of the analysis of cumulative impacts to desert tortoise is the range of the Mojave Desert portion of the population with special emphasis on the Colorado Desert Recovery Unit, as recognized by the USFWS (USFWS 2011a). Habitat within this recovery unit has been described as being in excellent condition despite declines in tortoise densities over the past several decades; disturbance was estimated at less than 1.3 percent throughout (USFWS 2005).

The PSEGS project is located in the Riverside Solar Energy Zone (BLM 2012). The Riverside Solar Energy Zone (SEZ) is situated between the Chuckwalla and Pinto Mountains and the SEZ may provide important connectivity for desert tortoise movements between the DWMAs (BLM 2012 and CDFG 2002; Stout 2009). According to habitat suitability models, approximately 136,800 acres (554 km2) of potentially suitable habitat could be directly affected by construction and operations of solar energy development on the revised SEZ (BLM 2012 Table 9.4.12.1-1).

The analysis considers the current USGS Desert Tortoise Habitat Model (Nussear et al. 2009) in defining potential habitat for desert tortoise and is a useful tool for evaluating different land-use issues that tortoises face at a landscape scale. **Biological Resources Figure 7** is a spatial representation of the predicted habitat potential index values for desert tortoise, based on the 2009 model. Nussear et al. (2009) identified approximately 5,547,333 acres of habitat for desert tortoise in the NECO planning area. The model is not intended to be used, or viewed, as a substitute for ground-based and site-specific field surveys. Model scores reflect a hypothesized habitat potential given the range of environmental conditions where tortoise occurrence was documented. Nussear et al. (2009, p. 15) specifically states:

> "*As such, there are likely areas of potential habitat for which habitat potential was not predicted to be high, and likewise, areas of low potential for which the model predicted higher potential. Finally, the map of desert tortoise potential habitat that we present does not account either for anthropogenic effects, such as urban development, habitat destruction, or fragmentation, or for natural disturbances, such as fire, which might have rendered potential habitat into habitat with much lower potential in recent years*".

Most of the proposed modified projects in the region appear to impact moderate- to low-quality desert tortoise habitat. Staff considers the PSEGS project contributions to cumulative habitat loss, even for moderate-to low-quality desert tortoise habitat, to be the same as described for the PSPP and would cumulatively considerable, given the species' decline and its present and future threats. The project would also make cumulatively considerable contributions to loss of desert tortoise connectivity between the Chuckwalla and Chemehuevi DWMAs and critical habitat areas. One of the objectives for desert tortoise recovery in the NECO is to "*mitigate effects on desert tortoise populations and habitat outside DWMAs to provide connectivity between DWMAs*." Maintaining connectivity is particularly important given the threats posed by global climate change, according to the USFWS 2008 Draft Revised Recovery Plan.

Probable desert tortoise linkages between the Chuckwalla and Chemehuevi critical habitat areas and DWMAs are shown in **Biological Resources Figure 6.**

The establishment of the Recovery Units was also intended to protect the species and its habitat requirements so that desert tortoises can maintain self-sustaining populations within each recovery unit into the future (USFWS 2011a). The linkages depicted represent areas of the best habitat quality for tortoises between the DWMAs and critical habitat, and therefore represent the most probable linkages and most important areas to protect to maintain connectivity between the Chemehuevi and Chuckwalla DWMAs. This area represents about 3.3 percent of available suitable habitat of the desert tortoise in the region. The BLM concluded that overall impacts on the desert tortoise from construction, operation, and closure of utility-scale solar energy facilities within the revised Riverside East SEZ is considered moderate, because the amount of potentially suitable habitat for this species in the area of direct effects represents between 1 and 10 percent of potentially suitable habitat in the region, and the implementation of programmatic design features alone is unlikely to substantially reduce these impacts (BLM 2012).

With implementation of Condition of Certification **BIO-12** (acquisition of desert tortoise compensation lands), the project's contribution to the cumulative loss of desert tortoise habitat would be reduced to a level less than cumulatively considerable and would be consistent with the Commission's decision for the PSPP. Condition of Certification **BIO-12** specifies that compensation habitat acquisitions occur within the Colorado Desert Recovery Unit in areas that have potential to contribute to desert tortoise habitat connectivity and build linkages between desert tortoise designated critical habitat, known populations of desert tortoise, and/or other preserve land. Many additional measures were devised to minimize indirect effects during operation and accidental impacts during construction, including: **BIO-1** through **BIO-11**, monitoring and reporting requirements (**BIO-7**), and desert tortoise compliance verification (**BIO-11**). Staff considers that the project's contribution to the spread of Sahara mustard in desert tortoise habitat to be the same as the PSPP project and would be individually minor but cumulatively considerable. Implementation of Condition of Certification **BIO-14** (Weed Management Plan) would minimize this effect.

Although project-specific desert tortoise mitigation measures reduce the project's contribution to cumulative effects to a level less than cumulatively considerable, there are still minor residual effects that could contribute to cumulative effects. These include fragmentation, impaired connectivity, and degradation of the function and values of remaining habitat from predators, non-native invasive plants, fire, and disease. These residual cumulative effects can only be addressed through a regional and coordinated planning effort aimed at preserving and enhancing large, intact expanses of wildlife habitat and linkages, including maintaining connections between wildlife management areas and other movement corridors.

Ongoing collaborative efforts by federal and state agencies to develop the Desert Renewable Energy Conservation Plan (DRECP) and the 2012 BLM Solar Energy Development Programmatic EIS offer an appropriate forum for such planning.

Nelson's Bighorn Sheep

The Approved PSPP project analysis of the NECO bighorn sheep WHMAs and connectivity corridors indicated that occupied and unoccupied ranges would be relatively unaffected by past and future projects (from habitat conversion), due largely to their position in wilderness areas and at higher elevations. However, large-scale renewable energy development could significantly impact gene flow between sheep populations through significant cumulative impacts to connectivity corridors, potentially decreasing the viability of the metapopulation of bighorn sheep. The project itself, however, would have no direct contribution to the loss of habitat within the identified connectivity corridors or WHMAs.

Proposed future projects could also cumulatively and significantly affect bighorn sheep through the loss of spring foraging habitat on the upper bajadas adjacent to occupied range. The impact of development within a one-mile buffer from the base of occupied ranges (or potentially restored populations in unoccupied ranges) was assessed for potential impacts to bighorn sheep foraging habitat. No significant direct impacts to bighorn sheep WHMAs, connectivity corridors, or spring foraging habitat would result from the proposed project; therefore, no mitigation measures relating to bighorn sheep are proposed by staff.

The project is located within the Palen-Ford multi-species WHMA (BLM CDD 2002; map 2-21); however, bighorn sheep are not expected to frequently use the I-10 box culvert undercrossing of Corn Springs Wash. Further, NECO identifies I-10 as a barrier to bighorn sheep movement (BLM CDD 2002). Although the project is expected to affect wildlife movement and connectivity with important wildlife areas north and south of I-10, the project is not expected to significantly affect—directly, indirectly, or cumulatively—bighorn sheep movement.

Mojave Fringe-toed Lizard

Reasonably anticipated cumulative effects considered by staff in a qualitative manner include habitat loss; fragmentation and diminished habitat values of remaining lands; and mortality from increased vehicle traffic through lands supporting this species. Other anticipated cumulative effects to Mojave fringe-toed lizard include impacts to sand transport systems and the maintenance of dunes from renewable energy projects (wind fencing and the obstruction of sand-carrying winds and water-deposited sands); premature stabilization of dunes by the spread of noxious weeds, which also fuel wildfires; and increased risk of fire from transmission lines or vehicle use; the effects of past and future grazing and off-road vehicle use; edge effects and fragmentation of the remaining habitat and reduced gene flow; and an increase in predation by ravens and other predators from an increase in perching structures. Obstructions to the wind-sand transport corridor from structures and wind-fencing, and the indirect effects of the obstruction to the maintenance of dunes downwind of the obstruction, are expected to be cumulatively considerable, and would result in an additional—and cumulatively considerable—loss of Mojave fringe-toed lizard habitat.

Within Chuckwalla Valley Mojave fringe-toed lizard habitat would be directly impacted by the construction of the PSEGS, and the project is a major contributor to that effect. These effects are significant when combined with the expected indirect effects to

Mojave fringe-toed lizard habitat, including: interruption of aeolian (wind-deposited) sand transport processes from projects and their wind fencing; diversions of desert washes and interruption of fluvial transport of sand that contribute to the maintenance of habitat; an increase in avian predators from the new perching structures provided by these projects, and the continuing spread of Sahara mustard.

The project's contribution to the loss of habitat, increased noise and lighting, road kills, fragmentation, and the spread of invasive pest plants is cumulatively considerable. However, the project's contribution to these effects would be reduced to a level less than cumulatively considerable through implementation of several conditions of certification designed to address indirect effects as well as habitat loss. Staff has concluded that the loss of Mojave fringe-toed lizard habitat resulting from the PSEGS project to be the similar to the PSPP project and could be mitigated to less than cumulatively considerable levels with implementation of Condition of Certification **BIO-20.** Staff believes that by requiring the project owner to acquire and preserve habitat within the Chuckwalla Valley dune system, at a ratio of 3:1, fragmentation from anticipated future development of private lands can be minimized by protecting, in perpetuity, these lands from future development. The project's contribution to the spread of Sahara mustard, which degrades the quality of Mojave fringe-toed lizard habitat to be the same as the PSPP project and would be individually minor but cumulatively considerable. Staff believes this effect can be reduced to a level less than cumulatively considerable through implementation of **BIO-14** (Weed Management Plan).

Bald and Golden Eagle

The habitat loss from the project is similar to the Commission approved PSPP and would contribute to the cumulatively considerable loss of golden eagle foraging habitats in the Chuckwalla Valley and the NECO planning area, as well as the loss of habitat utilized by bald eagle primarily during migration. The project's contribution to the cumulative impacts is more significant when combined with the reasonably foreseeable indirect effects of habitat fragmentation from the construction of proposed future projects. The USFWS and others (USFWS 2009b; Kochert et al. 2002) estimate there are approximately 30,000 golden eagles in the western U.S., down from an estimated 100,000 in the late 1970s. Survey data from 2003 and 2006–2008 indicate a decline of 26 percent since 2003. Climate change is also expected to impact golden eagle by increasing drought severity, and the CO_2 concentrations are expected to exacerbate the spread of non-native invasive plants, which displace native species and habitats, fuel wild fires, and alter fire regimes. Additionally, the proposed transmission lines for this and other proposed future projects are also expected to increase raptor collisions and electrocutions. The use of power tower technology may further contribute the decline of golden eagles from exposure to elevated levels of solar flux.

Proposed future projects within the NECO planning area and Chuckwalla Valley would cumulatively displace substantial amounts of foraging habitat for golden eagles including creosote bush scrub and desert dry wash woodland. Habitat loss for bald eagles would also occur but the species is expected to occur as a migrant. The project's contribution to the cumulative loss of foraging habitat within the NECO planning area would be minimized to level less than cumulatively considerable through mitigation measures for acquisition of 4,860 acres of Sonoran creosote bush scrub habitat, as specified in staff's proposed Condition of Certification **BIO-12.** Further, 788 acres of desert washes and riparian habitat within or adjacent to the Chuckwalla-Ford Dry Lake watershed would be placed under permanent protection under Condition of Certification **BIO-22**. While acquisition does not address the net loss of foraging habitat in the immediate future, it is expected to prevent future losses of habitat by placing a permanent conservation easement and deed restrictions on private lands that could otherwise be converted for urban or agricultural uses or energy development.

The project's contribution to the spread of invasive non-native plants such as Sahara mustard, which degrades the habitat and fuels fires, would be less than cumulatively considerable after implementation of Condition of Certification **BIO-14** (Weed Management Plan.

The project's associated transmission lines contribute to a cumulatively considerable effect from collisions and electrocutions for golden eagle and other raptors. This impact would be less than cumulatively considerable with implementation of Condition of Certification **BIO-8** (#5) which requires that transmission lines and all electrical components be designed, installed, and maintained in accordance with the Avian Power Line Interaction Committee's (APLIC's) Suggested Practices for Avian Protection on Power Lines (APLIC 2006) and Mitigating Bird Collisions with Power Lines (APLIC 1994). Implementation of Condition of Certification **BIO-16a and BIO-16b** would further minimize the project's contribution to cumulatively considerable impacts from collisions, electrocutions, and habitat loss and degradation through the development of monitoring and an adaptive management program, power line retrofits, and annual funding for the life of the project for avian conservation actions, including habitat enhancement and restoration, to avoid, minimize, and mitigate future project-related avian impacts.

The project's contribution to cumulative effects to golden eagles from the operation of the project may be cumulatively considerable even with the implementation of staffs recommended conditions of certification. This conclusion differs from the PSPP and is based on the risk from exposure to elevated levels of solar flux. While it is uncertain, project operation has the potential to result in injury or mortality (take) to golden eagles, and to a very limited extent to bald eagles from exposure to elevated levels of solar flux and or irradiance during the life of the project. Currently there are no scientific peer reviewed models that allow staff to accurately quantify the expected number of that would be subject to mortality or morbidity during the operation of the project. However, staff considers the risk to be real based on the presence and use of the area by golden eagles and periodically by bald eagles; the physical and behavioral characteristics of the eagles (i.e., large size, soaring flight patterns, elevation of flight), and the presence of elevated levels of solar flux. Staff considers Conditions of Certification **BIO-16a and BIO-16b** to provide meaningful mitigation that would minimize the project's contribution to cumulatively considerable impacts through habitat enhancement and other actions. However, the impacts may remain cumulatively considerable even with the implementation of mitigation.

Special Status Birds

Proposed future projects within the NECO planning area and Chuckwalla Valley would cumulatively displace substantial amounts of foraging and/or nesting habitat for other special status species including the state-threatened Swainson's hawk Yuma clapper rail, gilded flicker, elf owl, osprey, ferruginous hawk, burrowing owl, Cooper's hawk, bald eagle, sharp-shinned hawk, northern harrier, prairie falcon, peregrine falcon, Harris hawk, and short-eared owl (this is not a comprehensive list). The project's contribution to the cumulative loss of habitat is comparable to the cumulative loss of eagle habitat, described above and would be consistent with the Commission's decision for the PSPP. Staff concluded that the loss of habitat from all proposed future projects to be significant, and the project's contribution to that effect is cumulatively considerable. The project will also contribut7e to a cumulatively considerable impact from habitat fragmentation and edge effects, noise and lighting, increased road kills, increased risk of fire from weed invasion and increased ignition sources (vehicles), all of which ultimately degrade the function and values of the remaining habitat. The project's contribution to these indirect effects and loss of habitat would be mitigated to a level less than cumulatively considerable through: avoidance and minimization measures in BIO-8, BIO-14 (Weed Management Plan) and BIO-27 (Revegetation of Temporarily Disturbed Soils) to address the Project's contribution to the spread of Sahara mustard and other weeds; BIO-12 for acquisition of 4,860 acres of desert tortoise habitat, which is expected to contain suitable habitat for many resident and migratory birds; and BIO-21, which requires acquisition and protection of desert washes and adjacent habitat within the local watersheds, which will minimize future fragmentation in the Chuckwalla Valley. The Energy Commission determined that cumulative effects to most resident and migratory birds from construction of the PSPP would be mitigated to less than significant levels; however the risk to these birds from exposure to elevated levels of solar flux for the PSEGS may be cumulatively considerable even with the implementation of Conditions of Certification BIO-16a and BIO-16b. Many species of birds have been observed or are expected to occur in or near the site and have flight characteristics that place them at operational risk during the life of the project.

All of these species may be vulnerable to operational impacts including collision with heliostats or other project facilities and injury or mortality from exposure to solar flux.

Western Burrowing Owl

The project's contribution to the cumulative loss of burrowing owl habitat is comparable to the cumulative loss of badger and kit fox habitat, described above and would be consistent with the Commission's decision for the PSPP. Staff concluded that the loss of habitat from all proposed future projects to be significant, and the project's contribution to that effect is cumulatively considerable. The project will also contribute to a cumulatively considerable impact from habitat fragmentation and edge effects, noise and lighting, increased road kills, increased risk of fire from weed invasion and increased ignition sources (vehicles), and an increase in avian predators, all of which ultimately degrade the function and values of the remaining habitat. Burrowing owls may also be at risk from operation of the facility from collisions or exposure to elevated levels of solar flux.

The project's contribution to these indirect effects and loss of habitat would be mitigated to a level less than cumulatively considerable through: **BIO-18** avoidance and minimization measures specific to burrowing owl; measures for addressing impacts from noise, lighting, and traffic (road kills) through a variety of measures in **BIO-8**, **BIO-14** (Weed Management Plan) and **BIO-27** (Revegetation of Temporarily Disturbed Soils) to address the Project's contribution to the spread of Sahara mustard and other weeds; **BIO-12** for acquisition of 4,860 acres of desert tortoise habitat, which is expected to contain suitable habitat for badger and kit fox; and **BIO-21**, which requires acquisition and protection of desert washes and adjacent habitat within the local watersheds, which will minimize future fragmentation in the Chuckwalla Valley area by protecting lands from future development. The Raven Management Plan **(BIO-13)** is expected to minimize the project's contribution to the increase of avian predators of burrowing owl.

The Energy Commission determined that cumulative effects to burrowing owl from construction of the PSPP would be mitigated to less than significant levels; however the risk to burrowing owl from exposure to elevated levels of solar flux for the PSEGS may be cumulatively considerable even with the implementation of Conditions of Certification **BIO-16a** and **BIO-16b**. Burrowing owls have been routinely observed on the site; are known to occur in the region; and have flight characteristics that place them at operational risk during the life of the project.

Le Conte's Thrasher

The project's contribution to the cumulative loss of habitat for Le Conte's thrasher is comparable to the cumulative loss of badger and kit fox habitat, described above and would be consistent with the Commission's decision for the PSPP. The Le Conte's thrasher is showing steep population declines due to loss of habitat resulting from urbanization and water use combined with prolonged drought. Climate change is expected to exacerbate drought and compound the impacts of surface and groundwater use in the desert region. Further loss, fragmentation, and degradation of habitat could cause local extirpations and imperil Le Conte's thrashers in the Mojave and Sonoran deserts (CalPIF 2006). Current research indicates that many desert birds, including Le Conte's thrasher, are highly susceptible to habitat fragmentation and disturbance (Kershner, pers. comm.). The Le Conte's thrasher is typically found in very low densities and has large territories, and is therefore at risk of local extirpation from habitat loss.

The cumulative effects from foreseeable future projects on habitat loss are substantial. Although the project's contribution to these effects is individually minor, it nevertheless contributes, at least incrementally, to a cumulatively considerable effect. This species may also be at risk from operation of the facility from collisions or exposure to elevated levels of solar flux.

Staff believes that the project's contribution to the cumulative loss of habitat and the indirect effects would be consistent with the Commission's decision for the PSPP and would be minimized through implementation of the following conditions of certification: **BIO-21**, which requires acquisition and enhancement of 788 acres of desert dry wash woodland to be mitigated within the same local watersheds as the site of the impact; **BIO-15**, which requires pre-construction nesting bird surveys; **BIO-16**, which requires monitoring of bird kills and adaptive management; **BIO-23** and **BIO-24**, which would require monitoring for impacts to groundwater-dependent vegetation around Palen Dry

Lake and remedial action if adverse effects are detected, and **BIO-8**, which includes measures for minimizing the effects of noise, lighting, traffic, and other impacts. **BIO-21** will also minimize future fragmentation in the Chuckwalla Valley region by permanently protecting these critical resources from future development and its associated indirect effects.

The Energy Commission determined that cumulative effects to Le Conte's thrasher from construction of the PSPP would be mitigated to less than significant levels; however the risk to Le Conte's thrasher from exposure to elevated levels of solar flux may be cumulatively considerable even with the implementation of Conditions of Certification **BIO-16a** and **BIO-16b**. These birds appear in low densities and have flight characteristics that place them at operational risk during the life of the project.

American Badger and Desert Kit Fox

Reasonably anticipated cumulative effects considered by staff in a qualitative manner include habitat fragmentation and the diminished habitat values of remaining habitat from increased noise, lighting, exotic plant invasions including their ability to fuel wildfires and alter fire regimes, exotic wildlife invasions, dust and air pollution, increase in predators, agriculture, urban development and the consequences of human intrusion into previously undisturbed habitats: hunting, use of rodenticides and other poisons, road kills, trapping, and human disturbance.

American badger and desert kit fox habitat would be displaced by proposed future projects in the Chuckwalla Valley and NECO planning area. Staff considers this effect cumulatively considerable when combined with the anticipated indirect effects to remaining habitat and populations described above. Staff believes that the PSEGS project's contribution to the loss of habitat, increased noise and lighting, road kills, fragmentation, and the spread of invasive pest plants is cumulatively considerable and would be consistent with the Commission's decision for the PSPP. Staff concluded that the project's contribution to these effects would be reduced to a level less than cumulatively considerable through several conditions of certification designed to address indirect effects as well as habitat loss. These include **BIO-17**(Badger- and kit fox-specific avoidance and minimization measures):**BIO-8** (general avoidance and minimization measures) which contains specific measures to minimize noise and lighting impacts and provides mechanisms to monitor and control the spread of canine distemper; **BIO-14** (Weed Management Plan) to address the project's contribution to the spread of invasive plants, which degrade habitat and fuels fires; **BIO-12** for acquisition of 4,860 acres of desert tortoise habitat, which is expected to contain suitable habitat for badger and kit fox; and **BIO-21**, which requires acquisition and protection of desert washes and adjacent habitat within the local watersheds, which will minimize future fragmentation in the Chuckwalla Valley area by protecting lands from future development.

Burro Deer

Burro deer is a subspecies of mule deer found in the Colorado Desert of Southern California, primarily along the Colorado River and in Desert Wash Woodland communities in upland areas. During hot summers, water is critical, and deer concentrate along the Colorado River where water developments have been installed and where microphyll woodland is dense and provides good forage and cover. Impacts are most important within ¼ mile of natural or artificial watering sites.

The project's contribution to the loss of burro deer range is not cumulatively considerable and would be consistent with the Commission's decision for the PSPP. However, the project would contribute to a cumulatively considerable loss of desert dry wash woodland (microphyll woodland) within the Palen watershed.

Staff concluded that with implementation of **BIO-21**, which requires acquisition and enhancement of 788 acres of desert dry wash woodland to be mitigated within the same local watersheds as the site of the impact, the project's contribution would be less than cumulatively considerable and would be consistent with the Commission's decision for the PSPP. **BIO-21** will also minimize future fragmentation in the Chuckwalla Valley region by permanently protecting these critical resources from future development and its associated indirect effects.

Couch's Spadefoot Toad

One researcher (Dimmitt 1977) has indicated the Palen Lake area as being an area of interest for potential marginal populations; however, Dr. Dimmitt indicated (in consultations with staff) that the area containing suitable breeding habitat was observed on the north and east side of the Palen dunes, which intercept washes coming off the Palen Mountains. Recently this species was discovered east of the project site at the Genesis project and near the Colorado River substation; an ongoing SCE project. It is extremely likely that the western boundary of the Couch's spadefoot toad range extends farther west than reported by Dr. Dimmitt. Range extensions for many species have been recorded in recent years; in part due to the extensive survey efforts conducted to support renewable energy projects. Based on information from the project owner (AECOM 2010t) and Dr. Dimmitt (Dimmitt pers. comm.), staff concluded for the approved PSPP that no suitable habitat (temporary pools at the base of dunes, in washes, channels, or playas) occurs in the project area, and therefore the project would not result in cumulatively considerable impacts to this species and would be consistent with the Commission's decision for the PSPP. While it is possible that this species may occur along portions of the natural gas pipeline, the project owner did not detect this species during surveys performed in spring 2013 (Palen 2013ii).

Although not required the implementation of **BIO-12** for desert tortoise would preserve 4,860 acres of desert tortoise habitat, which may contain some habitat for Couch's spadefoot toad which may benefit this species by preserving land.

Wildlife Movement and Connectivity

Connectivity refers to the degree to which organisms can move among habitat patches and populations. Individuals must be able to move between patches to meet their resource needs, and in the long term populations must be connected to allow for dispersion, gene flow, and re-colonization. This discussion includes a qualitative assessment of cumulative effects to connectivity. The PSEGS project lies within the same area as the PSPP project, and therefore, analysis conducted for movement corridors is largely still applicable; staff has updated this analysis after developing a new list of projects considered cumulative to the PSEGS project.

In both the Palen-Ford WHMA and DWMA Continuity WHMA, the project is a major contributor to the cumulative effects of future projects on the loss of Sonoran creosote bush scrub within the WHMAs. Thus, the project could impede wildlife movement in these corridors and obstruct connectivity for wide ranging wildlife such as burro deer, kit fox, coyotes, and badgers, and on a population level could impede gene flow for desert tortoises. However, some connectivity would remain from existing underpasses along I-10. The project owner indicated that connectivity of habitat along 32-miles of I-10, including 24 undercrossings is preserved along this stretch of the freeway (AECOM 2010f). Based on this information staff concluded that with implementation of the measures described below, the project or its alternatives would not result in cumulatively considerable unmitigated impacts to connectivity for desert tortoise and other wildlife. This conclusion is consistent with the Commission's decision for the PSPP.

Conditions of Certification **BIO- 21** requires that compensation for the loss of desert washes, desert dry wash woodland, and their associated upland habitat must occur within Palen and adjacent watersheds; this is expected to minimize impacts in the Ford WHMA and DWMA Continuity WHMA to less than cumulatively considerable levels by ensuring that mitigation occurs locally and that further fragmentation is prevented by permanently protecting these lands from future development. Impacts to connectivity for desert tortoise could be minimized if the desert tortoise compensation lands were targeted for areas that would enhance wildlife connectivity within the same WHMA and corridor. Condition of Certification **BIO-12** requires that the land acquisitions be within the Colorado Desert Recovery Unit, and have potential to contribute to desert tortoise habitat connectivity and build linkages between desert tortoise populations and designated critical habitat.

Although the implementation of these conditions of certification would reduce the project's contribution to cumulative impacts to wildlife movement and connectivity to less than cumulatively considerable levels, there may still be minor residual impacts. These residual effects from all future projects can only be addressed through a regional and coordinated planning effort aimed at preserving and enhancing large, intact expanses of wildlife habitat and linkages, including maintaining connections between wildlife management areas and other movement corridors.

Ongoing collaborative efforts by federal and state agencies to develop the Desert Renewable Energy Conservation Plan (DRECP) and the 2012 BLM Solar Energy Development Programmatic EIS offer an appropriate forum for such planning.

Natural Communities

Significant cumulative effects to plant communities from proposed future projects are expected to occur in many community types, particularly playa, Sonoran creosote bush scrub, and desert dry wash woodland. Similarly, indirect effects to remaining habitat would occur from fragmentation, alteration of the surface drainage patterns which support many common and rare species, to both riparian *and upland* habitats. Other reasonably anticipated indirect effects which the project has a cumulatively considerable effect is an increase in the risk of fire (from increased vehicle use of area roads) and the introduction and spread of noxious weeds. Sahara mustard is of particular concern because it is already infesting many areas on and adjacent to the project and has the potential to spread explosively if not carefully managed. Climate change is expected to exacerbate the effects of drought and noxious weed spread. The project may also have a cumulatively considerable impact on groundwater-dependent ecosystems in the Palen Lake watershed from its proposed construction-related groundwater pumping. The project contributes at least incrementally to the cumulative loss of Sonoran creosote bush scrub and desert dry wash woodland. Sonoran creosote bush scrub is a common and widespread community in the southeastern deserts of California; however, this broad designation does not reflect the importance of large, intact blocks of habitat to wildlife movement, or to foraging and breeding habitat for wildlife, including state and federal listed species. The NECO mapping of plant communities also does not reflect the many uncommon and even rare plant assemblages within creosote scrub that have been documented and are monitored by the CDFW (CDFG 2003).

Condition of Certification **BIO-12** for acquisition of 4,860 acres of desert tortoise habitat (Sonoran creosote bush scrub) in Chuckwalla Valley, and Condition of Certification **BIO-21** for acquisition and protection of 788 acres of desert washes and desert dry wash woodland, would minimize the project's contribution to the cumulative loss of these habitats to a level less than cumulatively considerable. While acquisition does not address the net loss of habitat in the immediate future (a temporal net loss of habitat), it is expected to prevent future losses of habitat by placing a permanent conservation easement and deed restrictions on private lands that could otherwise be converted for urban, agricultural, or energy development.

Condition of Certification **BIO-14** for weed management would offset the project's contribution to the indirect cumulative effects of all projects on the spread of non-native invasive plants and their effects on wildlife and fire risk. Condition of Certification **BIO-23** and **BIO-24** for monitoring of groundwater-dependent vegetation (and remedial action in the event of adverse effects) would reduce the project's contribution to this effect to a level less than cumulatively considerable.

Playas and dry lakebeds appear to be disproportionately affected by the cumulative effects of potential future projects across NECO. Due to their limited extent and potential status as jurisdictional state waters, and their hydrologic importance and seasonal value to wildlife, staff considers this a significant cumulative effect. However, the project does not contribute directly to this effect. The project's potential indirect effects to nearby playa habitats would be minimized to a level less than cumulatively considerable through the implementation of **BIO-23** and **BIO-24.**

Landforms

The cumulative effects of future (proposed) projects to dunes, playas, and plains (including sandy plains, which make up a large portion of Mojave fringe-toed lizard habitat) would be substantial. Dunes and sandy plains provide habitat for several rare plants including Harwood's milk-vetch. The project's contribution to these effects, even when seemingly minor can be significant if they affect an extremely rare or limited resource, and the cumulative impact may be substantial. Staff considers the project's contribution to cumulative effects to sand dunes cumulatively considerable and consistent with the Commission's decision for the PSPP.

Condition of Certification **BIO-20** requires implementation of impact avoidance and minimization measures and acquisition of dune habitat at a 3:1 ratio for the sand dune habitat loss attributable to the project, and a 1:1 ratio for other sandy habitats that support Mojave fringe-toed lizards (e.g., sandy plains, sand-covered fans, and sand-covered playas) and 0.5:1 for indirect impacts to the sand transport corridor. These acquisitions would need to be targeted for dune habitat within the Chuckwalla Valley with potential to contribute to Mojave fringe-toed lizard habitat connectivity. Staff believes that implementation of **BIO-20** would offset the project's contribution to the loss of habitat.

The project's contribution to cumulatively considerable indirect effects from the spread of Sahara mustard and other invasive pest plants into dunes and the adjacent habitats upslope will be minimized to a level less than cumulatively considerable through implementation of Conditions of Certification **BIO-14** (Weed Management Plan), **BIO-27** (revegetation of temporarily disturbed areas using locally native seed). Impacts to the groundwater-dependent ecosystems that occur around the playa and in dunes will be minimized through **BIO-23** and **BIO-24** (monitoring of groundwater-dependent vegetation and remedial action in the event of adverse effects).

Desert Dry Wash Woodland (Microphyll Woodland)

The small overall area typically represented by this community, relative to Sonoran creosote bush scrub, belies its importance to wildlife. Although the project would attempt to maintain existing surface drainage, rather than divert the runoff around the project perimeter, staff considers the perimeter exclusion fencing, and regular vegetation mowing and spraying and road construction and maintenance, and human activity to be a significant impact to the habitat functions and value of the streams. Desert dry wash woodland is a sensitive natural community recognized under many LORS and area plans. Because it has a limited distribution (relative to common and widespread communities such as Sonoran creosote bush scrub) and carries an ecological importance that is disproportionate to its limited extent, staff considers this a cumulatively considerable effect, particularly in light of the project's contribution to cumulative effects to desert washes in the Palen watershed and is consistent with the Commission's decision for the PSPP. The project's contribution to the cumulative loss of desert dry wash woodland would be mitigated to a level less than cumulatively considerable through Condition of Certification **BIO-21,** which specifies acquisition and enhancement of desert wash woodland within or adjacent to the Palen watershed a 3:1 mitigation ratio.

Active Dune Habitat

Dunes provide habitat for a variety of special-status plants and animals; locally these include the Chuckwalla Valley population of Mojave fringe-toed lizard and a variety of special-status plants: Harwood's milk-vetch; Harwood's woolly-star; jackass clover; Palmer's jack-ass clover, and ribbed cryptantha. The effects of these past, present, and foreseeable future projects combined with the project's effects contribute to a significant cumulative effect to dune habitat from: obstruction of wind and fluvial sand transport systems (which are essential for the maintenance of the dunes) by new structures and wind fencing; fragmentation and degradation of remaining habitat by roads; development; off-road vehicles; altered drainage patterns; and the spread of noxious weeds and other invasive plants such as Russian thistle and Sahara mustard. Habitat values for dune-dependent wildlife are also affected by increased predation from avian predators, which benefit from new perching structures**.** Staff concluded that the direct, indirect, and cumulative impacts of the projects to dune habitat function and value were cumulatively considerable and may not be adequately mitigated through habitat acquisition proposed under Condition of Certification **BIO-20** when considering the project's significant indirect impacts to the sand transport corridor. This conclusion is consistent with the Commission's decision for the PSPP. Other mitigation to minimize indirect effects of the project on dunes and dune-dependent wildlife and plants include the raven and weed management plans (**BIO-13** and **BIO-14**).

Groundwater-dependent Vegetation

The cumulative impact analysis in the **SOIL AND WATER RESOURCES** section indicates that groundwater extraction during construction and operation of this and other foreseeable projects would place the Chuckwalla Valley groundwater basin into an overdraft condition. This impact may be exacerbated by other unidentified renewable energy projects in the I-10 corridor, which has been targeted as a potential area for further renewable energy development. However, water resources staff concluded that the project's contribution (300 acre-feet per year) to this cumulative effect is less than cumulatively considerable but recommended a number of monitoring conditions to ensure that the project's impact to area wells was less than cumulatively considerable. This conclusion is consistent with the Commission's decision for the PSPP.

Groundwater pumping could have a significant indirect impact to biological resources if it lowers the water table in areas where deep-rooted phreatophytes occur, such as mesquite bosques and succulent chenopod scrubs or alkali sink scrub. To ensure that the project would not adversely affect groundwater-dependent vegetation near the project well, Condition of Certification **BIO-23** for groundwater-dependent vegetation monitoring within two to three miles of the project well for the life of the project. Condition of Certification **BIO-24** requires a remedial action plan that would be triggered in the event that impending impacts to groundwater-dependent vegetation are detected during the vegetation, soil and shallow groundwater monitoring prescribed in **BIO-23**.

Special Status Plants

Harwood's Milk-Vetch

New occurrences of Harwood's milk-vetch have been found during surveys of proposed solar projects in the I-10 corridor and this species appears to be fairly well distributed in the dune habitats in the Chuckwalla Valley. Of the 46 total occurrences (CNDDB and CCH) known from 2010; 11 are historical occurrences and approximately 10 occurrences appear to be protected in federal wilderness or state park lands. Most of the remaining occurrences are not located on lands under federal or state protection. It is important to note, however, that survey data from projects in the region have not yet been incorporated into CNDDB or other databases. The new occurrences could theoretically downgrade the CNDDB rank of a species, but if many of the new occurrences would also be directly or indirectly affected by the various projects whose surveys resulted in their discovery, this would also be considered in the evaluation of extinction risk. Staff concludes that although the project's direct impacts to Harwood's milk-vetch are minor, they are cumulatively considerable, when combined with the reasonably expected indirect effects of noxious weeds and fragmentation. This conclusion is consistent with the Commission's decision for the PSPP.

Harwood's milk-vetch habitat would be disproportionately affected by renewable development in the region, and the species' range in California is nearly restricted to the NECO planning area. In the Chuckwalla Valley, its habitat is affected by probable future projects and some has already been lost from development. The loss of habitat quantified is exacerbated from the combined indirect effects of spread of noxious weeds, fragmentation and reduced gene flow among isolated populations from existing and future projects.

Although the project's contribution to these effects may be individually small, it contributes, at least incrementally to a cumulatively considerable effect. According to CEQA guidance, in situations where the cumulative impact is substantial, even small incremental impacts may be cumulatively considerable.

Other species restricted to dune and playa habitats, washes and other sandy habitats also have occurrences outside of federal wilderness or state park lands and are threatened by renewable energy development, but the cumulative effects to Harwood's milk-vetch are of particular concern due to the position of many occurrences in the immediate vicinity of probable future projects and the likelihood of significant indirect effects. Other species that would be subject to loss from reasonably anticipated cumulative effects include: lobed ground cherry, Abram's spurge, jack-ass clover, California and glandular ditaxis. Harwood's eriastrum is somewhat more affected than these aforementioned plant species, and dwarf germander and flat-seeded spurge have very few documented occurrences in California. They also have occurrences that are not protected in federal wilderness designation or in national or state park ownership.

Indirect effects to Harwood's milk-vetch and other plants occurring in close proximity to the project, and to which the project has a cumulatively considerable contribution, include: altered drainage patterns, disrupted wind- or fluvial-sand transport processes, fragmentation of the habitat and reduced gene flow between isolated populations, the spread of non-native plants, which fuel fires and degrade habitat. Climate change is expected to exacerbate the effects of drought, and CO_2 concentration has already been demonstrated to promote the spread of invasive plants.

California ditaxis, the only other special-status plant that would be directly affected, is documented with 21 occurrences (17 in CNDDB and four additional occurrences from the Consortium of California Herbaria that were not in the CNDDB). The occurrence found in the project area is not included in the 17 documented. Four of the records are historical records from between 1921 and 1952. Three are documented with threats from ORV; power line construction threatens another occurrence, and road grading is also a concern for one occurrence. Many occurrences of this species are on private land. However there are both threats to remaining occurrences, and opportunities for restoration and protection through acquisition.

The project's contribution to cumulatively considerable impacts to all special-status plants in the project area, including the four late-season species analyzed, will be minimized to a level less than cumulatively considerable through implementation of **BIO-19**, Section A (Avoidance & Minimization Measures for special-status plants) and through the additional avoidance and compensation requirements described in **BIO-19**. The project's contribution to the spread of noxious weeds will be minimized through **BIO-14** (Weed Management Plan). All of the special-status plants, including the four late-season species, are associated with dunes, washes or playa. **BIO-20** (dune compensation) and **BIO-21** (compensation for desert washes) will minimize future development and fragmentation in the Chuckwalla Valley region by requiring that compensation occur locally. These conclusions are consistent with the Commission's decision for the PSPP.

Overview: Cumulative Impacts to Biological Resources of the Chuckwalla Valley

The direct and indirect effects of the project on many biological resources, when combined with past, present, and foreseeable future development of the Chuckwalla Valley, and other portions of the I-10 region are cumulatively considerable. Of particular concern are the cumulative losses of desert washes, dune habitat, obstruction of the active aeolian sand transport corridor, the spread of Sahara mustard, increase in predation by ravens, roadkills, and fragmentation of the remaining habitat for Mojave fringe-toed lizard and several dune- and playa-associated rare plant species. Reasonably anticipated renewable energy development in Chuckwalla Valley could threaten what remains of the habitat and places several populations at risk of local extirpations—most notably, the local Chuckwalla Valley population of the Mojave fringe-toed lizard. Past and present impacts in Chuckwalla Valley that have already contributed to a decline in aeolian dune habitat, loss of habitat for Mojave fringe-toed lizard and dune-dependent rare plant species, or have indirectly degraded habitat include:

- Compaction and habitat degradation from historic military training operations during World War II;
- Past, present, and future off-road vehicle use around Ford Dry Lake;
- Past and recent sheep grazing around Ford Dry Lake;
- Electric and Natural Gas Transmission line construction;
- Road construction associated with the transmission construction;
- Construction and operation of the Wiley Wells Rest Stop;
- Construction of Interstate 10 (I-10) and the network of diversion ditches south of I-10;
- State Highway 177 and a network of both paved and unimproved roads;
- Urban and agricultural conversion around Desert Center (8,424 acres);
- DPV 1 and 2 Transmission Line and Access Road;
- Construction of the Colorado River Substation and Access road;
- Construction of the Genesis Solar Energy Project; and

- Construction of the Colorado Aqueduct.

The collector ditches associated with I-10 limit the depositional area of the Chuckwalla Mountains bajada to the south (upstream) of I-10 and concentrate the flows into three discrete channels, where historically numerous small channels fanned out over large areas contributing to fluvial sediment to the aeolian system. The downstream effects of these diversions are striking, severe, and very apparent throughout the I-10 corridor to the north, and in comparisons of current and historical photos. The perimeter stormwater conveyance channels proposed with nearly every solar project would closely mimic these effects to the fluvial transport systems. Some of the more apparent edge effects of the past and present stressors itemized above include the severe dune infestations of Russian thistle, which have effectively replaced native plant diversity with a monoculture of Russian thistle. More recently, Sahara mustard has invaded the valley and spread explosively since it was introduced some decades ago. Invasive plants increase fire frequency and are correlated with population declines of milk-vetch and fringe-toed lizard in Coachella Valley (Barrows and Allen 2007).

Reasonably foreseeable future actions that would further contribute to the loss of habitat, or to the fragmentation and degradation of dunes and habitat for fringe-toed lizard and dune-dependent rare plant species include:

- Palen Solar Electric Generating System (3,896 acres)
- Chuckwalla Solar 1 (4,091 acres)
- enXco 2 (Solar Energy Project, 1,325 acres)
- First Solar – Desert Sunlight (5,119 acres)

<u>On the dunes south of I-10:</u>

- LightSource Renewables – Mule Mountain II (not available) ;
- Altera - Mule Mountain (6,618 acres).

In Coachella Valley, blocked sand/wind corridors have been shown to lead to sand compaction and premature stabilization of the dunes, increased mean grain size (which reduces habitat suitability for fringe-toed lizards), and aeolian habitat loss (Turner et al. 1984). Stabilization of the dunes is also aggravated by an increase in non-native invasive plants, introduced through soil disturbance and an increase in vectors (vehicles). Invasive plants are correlated with decreases in the rare dune-endemic species of milk-vetch, fringe-toed lizard, and endemic sand treader cricket in Coachella Valley (Barrows and Allen 2007).

Road construction associated with new solar projects and their related transmission corridors further degrade and fragment the habitat, and lead to an increase in vehicle traffic and encroachment in previously undisturbed areas. Unpaved roads into the valley interior and historical grazing have led to a dramatic increase in noxious weed invasion over large areas of dunes and surrounding habitat, and an increase in vehicle-related mortality and habitat destruction. Human encroachment, agriculture, and development around Desert Center are also accompanied by an increase in predators, such as ravens. These indirect cumulative effects on dune-dependent species are particularly acute in isolated, fragmented habitats that lack the buffering effects of connectivity to larger populations. All of these stressor and effects are documented to have led to the decline of dune ecosystems in Coachella Valley and can reasonably be expected to occur in Chuckwalla Valley with future development.

CONCLUSION

Construction and operation of the PSEGS project would have cumulatively considerable effects in nearly every biological resource area analyzed. These include state waters (desert washes), vegetation, sensitive plants and wildlife, migratory birds, unique landforms (dunes), and wildlife movement. However, with the exception to avian species, the projects contribution to cumulatively considerable effects could be reduced to less than significant levels with the implementation of Conditions of Certification **BIO-1** through **BIO-26**. These effects, and the mitigation designed to minimize these effects, are summarized below.

Special Status Birds: The projects contribution to significant cumulative effects to all avian species (resident and migratory birds) is cumulatively considerable when combined with the anticipated indirect effects to remaining habitat and populations. Anticipated indirect effects may remain cumulatively considerable even with the application of proposed mitigation. These effects differ from the Commission's decision for the PSPP which did not propose power tower technology. **Mitigation**: Pre-construction nesting bird surveys **(BIO-15** compensation lands for loss of Sonoran creosote bush scrub **(BIO-12**); avoidance measures **(BIO-8)**, raven management **(BIO-13),** monitoring during project operation and adaptive management (**BIO-16b**), annual funding for habitat enhancement and restoration actions throughout the life of the project and power line retrofits (**BIO-16a)**and evaporation pond netting and monitoring (**BIO-26**).

Bald and Golden Eagle: The project would contribute a small but cumulatively considerable amount to the loss of foraging habitat for this species and is consistent with the Commission's decision for the PSPP. The risk to golden eagles from exposure to solar flux presents an ongoing threat of mortality or morbidity during the lifetime of the project. Anticipated indirect effects may remain cumulatively considerable even with the application of proposed mitigation. These include: collisions & electrocutions, mortality or morbidity from exposure to elevated levels of solar flux; fragmentation of remaining habitat, spread of Sahara mustard and increased risk of fire. **Mitigation:** Compensation lands for loss of Sonoran creosote bush scrub **(BIO-12**); golden eagle inventory & monitoring (**BIO-25**); avoidance measures (**BIO-8**) monitoring for offsite nesting, collisions, and adaptive management (**BIO-16 b**), and **BIO-16a**, funding for power line retrofits and habitat enhancement and restoration actions throughout the life of the project.

Western Burrowing Owl: The project's contribution to significant cumulative effects from habitat loss to burrowing owl are not cumulatively considerable after the implementation of conditions of certification intended to minimize or fully mitigate those impacts. These effects are consistent with the Commission's decision for the PSPP. However, indirect effects to burrowing owl may remain cumulatively considerable even with the application of proposed mitigation. These include: collisions & electrocutions, mortality or morbidity from exposure to elevated levels of solar flux; fragmentation of remaining habitat, spread of Sahara mustard and increased risk of fire. Mitigation: Burrowing owl-specific avoidance & minimization measures **(BIO-18**); general avoidance and minimization measures for noise, lighting, road kills, etc. in **BIO-8**; raven management **(BIO-13); BIO-14** (Weed Management Plan); fire prevention measures in **BIO-6**. Monitoring during project operation and adaptive management (**BIO-16 b**), and **BIO-16a**, funding for habitat enhancement and restoration actions throughout the life of the project.

Waters of the State/Desert Washes: The project's contribution to significant cumulative effects to desert washes is not cumulatively considerable after the implementation of conditions of certification intended to minimize those impacts and is consistent with the Commission's decision for the PSPP. The following impact avoidance, minimization, and mitigation measures would address the project's contribution to many of the significant cumulative impacts described above: **BIO-21**, which requires compensation in local watersheds to minimize future development and fragmentation of washes; and **BIO-14**, which requires a Weed Management Plan.

Desert Tortoise: The project's contribution to significant cumulative effects to desert tortoise are not cumulatively considerable after the implementation of conditions of certification intended to minimize or fully mitigate those impacts and is consistent with the Commission's decision for the PSPP. **Mitigation: BIO-13** (Raven Management Plan); Designated Biologist/Monitor (**BIO-1** through **BIO-5**); Worker Environmental Awareness Program with emphasis on desert tortoise (**BIO-6**); Avoidance & Minimization Measures (**BIO-8**) for construction and operation; desert tortoise clearance surveys and fencing (**BIO-9**); Relocation /Translocation Plan (**BIO-11)**; compensation lands to be acquired within the Colorado Desert Recovery Unit **(BIO-12**); compliance verification **(BIO-11)**; **BIO-14** (Weed Management Plan); and fire prevention measures **(BIO-6).**

Wildlife Movement & Connectivity: The project's contribution to cumulative impacts to connectivity and wildlife movement are minor and not cumulatively considerable after the implementation of conditions of certification intended to minimize those impacts and is consistent with the Commission's decision for the PSPP. **Mitigation: BIO- 21** requires compensation for desert washes, riparian and associated upland habitat must occur in local watersheds. Impacts to desert tortoise connectivity would be minimized with desert tortoise fencing and maintenance of undercrossings under I-10 south of the project area (**BIO-9**) and with acquisition of desert tortoise habitat (**BIO-12**) in identified connectivity corridors. Disturbance from noise and lighting would be minimized by implementing staff's proposed Condition of Certification **BIO-8**.

American Badger & Desert Kit Fox: The project's contribution to American badger and desert kit fox and Nelsons bighorn sheep are cumulatively considerable but mitigated by the implementation of conditions of certification. These effects are consistent with the Commission's decision for the PSPP. **Mitigation:** Badger & kit fox-specific avoidance & minimization measures (**BIO-17**); general avoidance and minimization measures for noise, lighting, road kills, etc. in **BIO-8**; fire prevention measures (**BIO-6).**

Natural Communities: The projects contributions to significant cumulative effects to natural communities are not cumulatively considerable after the implementation of conditions of certification intended to minimize or fully mitigate those impacts. These effects are consistent with the Commission's decision for the PSPP. **Mitigation:** Acquisition of desert washes in local watersheds to minimize future development and fragmentation of washes (**BIO-21**), requires dune compensation in Chuckwalla or Palen wind sand transport corridor **BIO-20**; **BIO-12** compensation for creosote bush scrub prevents future development of same habitat on alluvial fans/bajadas; **BIO-14** (Weed Management Plan); **BIO-27** (Revegetation of Temporarily Disturbed Soils). In addition, potential indirect impacts to groundwater-dependent ecosystems around the playa margins would be avoided/minimized through vegetation, groundwater and soil monitoring to detect impending changes from groundwater drawdown (**BIO-23**); and triggers for remedial action and compensation requirements if impacts detected (**BIO-24**).

Active Dune Habitat: The projects contribution to cumulatively considerable indirect effects to the loss of dunes will be minimized to a level less than cumulatively considerable through implementation of Conditions of Certification. These effects are consistent with the Commission's decision for the PSPP**. Mitigation: BIO-20** which requires compensation in the Chuckwalla or Palen wind sand transport corridor to minimize future development and fragmentation of dunes.

Groundwater-Dependent Vegetation (GDVs): Water Resources staff concluded that project's contribution to groundwater impacts in Chuckwalla basin is less than cumulatively considerable due to size and reservoir of aquifer and is consistent with the Commission's decision for the PSPP. Staff expects that impacts to GDVs, and the wildlife they support, across all groundwater basins in NECO are significant. Project contribution to impacts to GDVs is cumulatively considerable. **Mitigation:** Vegetation, groundwater and soil monitoring to detect impending changes from groundwater drawdown (**BIO-23**); and triggers for remedial action and compensation requirements if impacts detected (**BIO-24**).

Special-Status Plants: The project's contribution to cumulatively considerable impacts to all special-status plants in the project area, including the four late-season species analyzed will be minimized to a level less than cumulatively considerable through implementation of conditions of certification. These effects are consistent with the Commission's decision for the PSPP. **Mitigation:** Avoidance and minimization measures during construction, operation, and closure (**Section A, BIO-19**); **BIO-14** (Weed Management Plan); **BIO-27** (Revegetation of Temporarily Disturbed Soils); and (**Section D, BIO-19**) compensation must occur on occupied lands or adjacent buffer lands to minimize fragmentation and edge effects, and restoration must achieve a rescue of a population threatened by invasive weeds, ORV use, grazing, or hydrologic/geomorphic alterations. Requirement for local compensation for dunes (**BIO-20**) and desert washes (**BIO-21**) minimizes future fragmentation of remaining habitat through preservation and protection of the wind sand transport corridor.

Impacts to Biotic Soil Crusts and Carbon Sequestration Benefits of Native Vegetation and Soils: The PSEGS project is expected to contribute to a cumulative reduction in greenhouse gases and is consistent with the Commission's decision for the PSPP. Staff concluded that the following mitigation measures would reduce the project's contribution to the cumulative loss of sequestration benefits to a level less than significant: Mitigation: Minimizing the area of soil disturbed along the linears through avoidance and minimization measures (BIO-8 and BIO-19); preventing the future loss of habitat by placing permanent conservation easements on private lands that could otherwise be developed under the habitat acquisition requirements (BIO-12, BIO-20, and BIO-21); restoring degraded portions of compensatory mitigation lands, as required in BIO-12, BIO-20, and BIO-21; and revegetating the solar facility after Project closure (BIO-22)**.**

Mojave Fringe-toed Lizard: The project's contribution to significant cumulative effects to Mojave fringe-toes lizard are not cumulatively considerable after the implementation of conditions of certification intended to minimize or mitigate those impacts and is consistent with the Commission's decision for the PSPP. **Mitigation:** Designated Biologist/Monitor (**BIO-1** through **BIO-5**); Worker Environmental Awareness Program (**BIO-6**); Avoidance & Minimization Measures (**BIO-8**) for construction and operation; compensation lands (**BIO-20**); compliance verification **(BIO-11)**; **BIO-14** (Weed Management Plan); and fire prevention measures **(BIO-6).**

Burro Deer: The project's contribution to the loss of burro deer range is not cumulatively considerable and would be consistent with the Commission's decision for the PSPP. **Mitigation**: **BIO- 21** requires compensation for desert washes, riparian and associated upland habitat must occur in local watersheds; preventing the future loss of habitat by placing permanent conservation easements on private lands that could otherwise be developed under the habitat acquisition requirements (**BIO-12** and **BIO-20**).

Couch's Spadefoot Toad: The project's contribution to the loss of Couch's Spadefoot toad or their habitat is not cumulatively considerable and would be consistent with the Commission's decision for the PSPP. **Mitigation:** Although not required the implementation of **BIO-12** for desert tortoise would preserve 4,860 acres of desert tortoise habitat, which may benefit this species by preserving land.

COMPLIANCE WITH LORS

The PSEGS project must comply with state and federal laws, ordinances, regulations, and standards (LORS) that address state and federally listed species, as well as other sensitive species and their habitats.

STATE LORS

Under the Warren-Alquist Act (Pub. Resources Code § 25500) the Energy Commission's certificate for thermal power plants 50 MW and more is "in lieu of" other state, local, and regional permits (*ibid*.). Staff has incorporated into the conditions of certification in this FSA all required terms and conditions that might otherwise be included in state permits to satisfy the following state LORS:

Incidental Take Permit: California Endangered Species Act (Fish and Game Code Sections 2050 et seq.) The California Endangered Species Act (CESA) prohibits the "take" (defined as "to hunt, pursue, catch, capture, or kill") of state-listed species except as otherwise provided in state law. Construction and operation of the PSEGS project could result in the wake of desert tortoise, listed as threatened under CESA. Condition of Certification **BIO-12** specifies compensatory mitigation for desert tortoise habitat loss at a 5:1 ratio for all areas that occur within Critical Habitat and a 1:1 ratio for all other lands. Avoidance and minimization measures described in Conditions of Certification **BIO-6** through **BIO-11** and **BIO-13** would also mitigate for potential impacts to desert tortoise. Implementation of these conditions of certification would ensure compliance with CESA and ensure that impacts to desert tortoise are fully mitigated, with the exception of avian species. Take of any state listed threatened or endangered avian or batspecies by collision, exposure to elevated flux, or loss of foraging habitat, without a take permit would violate CESA and is prohibited.

Streambed Alteration Agreement: California Fish and Game Code Sections 1600 1607. Pursuant to these sections, CDFW typically regulates all changes to the natural flow, bed, or bank, of any river, stream, or lake that supports fish or wildlife resources. Construction and operation of the project would result in direct impacts to at least 374.7 waters of the state. The project may also result in minor indirect impacts to approximately 32 acres of state waters located downstream of the site. Condition of Certification **BIO-21** would minimize and offset direct and indirect impacts to state waters and would assure compliance with CDFW codes that provide protection to these waters.

Protected furbearing mammals (Title 14 California Code of Regulations, Title 14, Section 460). This regulation specifies that fisher, marten, river otter, desert kit fox and red fox may not be taken at any time. Condition of Certification **BIO 17** (American Badger and Kit Fox Avoidance Measures) requires the development of a management plan to safely exclude animals from the project site and ensure compliance with the California Fish and Game Code section 460 that provides protection to these species.

Fully Protected Species (Fish and Game Code, Sections 3511, 4700, 5050, and 5515). Designates certain species as fully protected and prohibits the take of such species or their habitat unless for scientific purposes (see also California Code of Regulations Title 14, section 670.7). Golden eagles are a fully protected species that occurs in the project area. Condition of certification **BIO-15** (Pre-construction Nesting Bird Surveys) will avoid direct take of this species during construction. Staff notes that this condition will not guarantee full protection of golden eagles during project operations. Staff's newly proposed Conditions of Certification **BIO-16a and BIO-16b** would require monitoring of the project site and impacts and implementation of a suite of recovery actions such as habitat enhancement, trash removal, power line retrofits, and other actions as determined to be beneficial across the range of species potentially impacted by construction and operation of the project. Loss of habitat would be off-set through Condition of Certification **BIO-12**, compensation lands for loss of Sonoran creosote bush scrub. Take of golden eagles, even if mitigated as required under CEQA, would violate the Fish and Game Code (Fully Protected Species) and is prohibited.

Nest or Eggs (Fish and Game Code Section 3503, 3503.5, and 3513). These regulations protect California's birds by making it unlawful to take, possess, or needlessly destroy the nest or eggs of any bird and by providing a nexus to the federal migratory bird treaty act. Implementation of Conditions of Certification **BIO-1** through **BIO-8** (Impact Avoidance and Best Management Practices) and **BIO-15** (Pre-construction Nest Surveys) would ensure the project complies with regulations that protect nesting birds and their nests.

FEDERAL LORS

The project is located on federal land under BLM's jurisdiction and is therefore subject to the provisions of BLM's California Desert Conservation Area (CDCA) Plan (BLM 1999). As an amendment to the CDCA Plan, BLM produced the Northern and Eastern Colorado Coordinated Management Plan (NECO) (BLM CDD 2002). This document consists of proposed management actions and alternatives for public lands in the NECO planning area. The project is within the central portion of the NECO planning area.

The BLM has worked with the USFWS and CDFW to develop a variety of land designations as tools to protect sensitive biological resources, including the desert tortoise. The siting of the PSEGS project considered the management direction of these designations, as described below:

Desert Wildlife Management Areas (DWMA) are general areas recommended by the Desert Tortoise Recovery Plan (USFWS 1994a) within which recovery efforts for the desert tortoise would be concentrated. DWMAs had no specific legal boundaries in the 1994 Recovery Plan. The BLM formalized the general DWMAs from the 1994 Recovery Plan through its planning process and administers them as Areas of Critical Environmental Concern (see below). The project site is immediately north of the Chuckwalla DWMA and approximately 1,400 linear feet of the proposed generation tie-line is located within the Chuckwalla DWMA. Construction in a DWMA is restricted to no more than one percent of the surface area. The proposed power plant and overhead transmission line require the BLM's approval of a right-of-way (ROW) grant and two CDCA Plan amendments, one amendment for the solar facility and one to allow the project's electric transmission line to be constructed outside a designated corridor. With the BLM's approval of the ROW grant and plan amendments, the PSEGS and the portion of the transmission line outside of the designated corridor would be consistent with the CDCA Plan. The project owner filed a revised plan of development with the BLM on February 13, 2013. BLM requires increased mitigation ratios to off-set habitat loss when constructing in a DWMA. Conditions of Certification **BIO-9** through **BIO-11** would mitigate the loss of desert tortoise habitat and ensure that the PSEGS is compatible with the Northern and Eastern Colorado Desert Coordinated Management Plan (NECO) area. Impacts to the DWMA will be mitigated at a 5:1 ratio.

Area of Critical Environmental Concern (ACEC) are specific, legally defined, BLM designations where special management is needed to protect and prevent irreparable damage to important historical, cultural, scenic values, fish and wildlife, and natural resources or to protect life and safety from natural hazards. The project is not included within any designated ACEC.

Critical Habitat consists of specific areas defined by the USFWS as areas essential for the conservation of the listed species, which support physical and biological features essential for survival and that may require special management considerations or protection. Critical habitat for the desert tortoise was designated in 1994, largely based on proposed DWMAs in the draft Recovery Plan. The southwestern portion of the project site, natural gas line corridor, and proposed generation tie-line corridor overlaps with 228 acres of the Chuckwalla Desert Tortoise Critical Habitat Unit. Conditions of Certification **BIO-9** through **BIO-11** would mitigate the loss of desert tortoise habitat and ensure that the PSEGS is compatible with the Northern and Eastern Colorado Desert Coordinated Management Plan (NECO) area. Impacts to the Chuckwalla Desert Tortoise Critical Habitat Unit will be mitigated at a 5:1 ratio.

Wildlife Habitat Management Areas (WHMAs) address other special-status species and habitat management in the NECO planning area, and include two kinds: one for bighorn sheep, one for all other special status species and habitats. Bighorn sheep WHMAs overlay the entire range of their occurrence and movement corridors. Multi-species WHMAs are complementary to existing restricted areas and DWMAs, which also cover other special status species and habitats. The entire PSEGS project is within a multi-species WHMA. Because PSEGS falls within a specially-designated solar energy zone, no CDCA plan amendment is required. Typically the BLM requires increased mitigation ratios to off-set habitat loss when constructing in a DWMA. The proposed power plant and overhead transmission line require the BLM's approval of a right-of-way (ROW) grant and two CDCA Plan amendments, one amendment for the solar facility and one to allow the project's electric transmission line to be constructed outside a designated corridor. With the BLM's approval of the ROW grant and plan amendments, the PSEGS and the portion of the transmission line outside of the designated corridor would be consistent with the CDCA Plan. The project owner filed a revised plan of development with the BLM on February 13, 2013.

Endangered Species Act (Title 16 United States Code Section 1531 et seq.). Potential take of the desert tortoise, listed as threatened by the USFWS, requires compliance with the federal Endangered Species Act (ESA).“Take” of a federally listed species is prohibited without an Incidental Take Permit, which would be obtained through a Section 7 consultation between BLM and the USFWS. The project owner has submitted a Revised Draft Biological Assessment (BA) for the project to BLM. As of July 2013 the BLM submitted the BA to the USFWS and formal Section 7 consultation process has been reinitiated. The Revised Biological Assessment additionally included the Yuma clapper rail as a covered species. Take of any other federally threatened or endangered species would constitute a violation of ESA.

Bald and Golden Eagle Protection Act (Title 16, United States Code, Sections 668-668c) A recently issued Final Rule (September 2009) provides for a regulatory mechanism under the Bald and Golden Eagle Protection Act (Eagle Act) to permit take of bald or golden eagles comparable to incidental take permits under the ESA. This rule adds a new section at Title 50, Code of Federal Regulation is, section 22.26 to authorize the issuance of permits to take bald eagles and golden eagles on a limited basis. The PSEGS project could potentially result in “take” of the golden eagle from disturbance to nesting pairs, loss of foraging habitat. Operation of the project could also result in injury or death of bald and golden eagles that encounter concentrated solar flux over the heliostat field, potential collisions with project features such as power towers and heliostats, or electrocution via contact with power lines. While the risk of injury or death to bald or golden is unpredictable, staff believes there is the potential for take to occur over the 30-year life of the project. Implementation of Condition of Certification **BIO-16b** would avoid take of golden eagles by monitoring eagle nests during construction and implementing adaptive management measures, and **BIO-16a** would benefit bald and golden eagles by requiring project monitoring and providing funds for various habitat conservation and enhancement measures that would benefit both bald and golden eagles by improving habitat and lessening the risk of electrocution by contacting power lines. Conditions of Certification **BIO-12** and **BIO-21** would provide suitable bald and golden eagle foraging habitat by requiring the acquisition of desert tortoise habitat similar to that lost at the project site, as well as acquisition and permanent protection of desert dry wash habitat. While acquisition does not address the net loss of foraging habitat in the immediate future, it would prevent future losses of habitat by placing a permanent conservation easement and deed restrictions on private lands. The project owner has not elected to apply for an Eagle Conservation Permit at this time; take of an eagle would be considered a violation of the Bald and Golden Eagle Protection Act

NOTEWORTHY PUBLIC BENEFITS

Energy Commission staff considers the analysis of noteworthy public benefits unchanged since the 2010 Decision for the PSPP was released. The PSEGS project and its alternatives would still result in significant impacts to sensitive biological resources, and would permanently diminish the extent and value of native plant and animal communities in the region. Staff has therefore concluded that the PSEGS project would not provide any noteworthy public benefits related to biological resources, despite the contributions the project would make to meeting federal and state mandates for development of renewable energy resources.

START HERE RESPONSE TO COMMENTS

Staff received six comment letters during preparation of the PSA and comment letters on the Biological Resources section of the PSA for the PSEGS project. Energy Commission staff has summarized comments from these letters that raise biological resource issues and have provided the following responses. Responses received during the preparation of the PSA have been included; however, in certain cases the identified responses have changed since publication of the PSA. Changes in staff’s rationale or mitigation approach are reflected within the body of this FSA, and staff responses that are now inaccurate are marked accordingly, for clarity.

LA CUNA DE AZTLAN SACRED SITES PROTECTION CIRCLE, ALFREDO A. FIGUEROA, OPPOSITION LETTER, TN # 69254, JANUARY 21, 2013:

La Cuna Comment: The Palen Solar Power Project will destroy hibernating sites for the Nuttall's poorwill, as well as pristine desert, and has provided information on the occurrence of Nuttall's poorwill in Riverside County.

Response: The common poorwill (*Phalaenoptilus nuttallii*), or Nuttall's poorwill, occurs throughout the western United States, and year round in southern California. This species is covered under the Migratory Bird Treaty Act as well as Fish and Game Code as a migrant, but has no other special protections afforded it by either state or federal regulatory agencies. Habitat consists of dry, open, grassy or shrubby areas in arid lands, and it feeds on night-flying insects. Suitable foraging habitat for this species occurs onsite, and in the general project vicinity. During the months of November to February, consistent with cool weather, this bird enters into "torpor", a state of diminished physical activity and reduced metabolism, similar to hibernation, although not as deep. When the common poorwill enters into torpor, it chooses rocky crevices above the grounds' surface, for security. Additionally, birds may enter a daily torpor during spring or fall months, when food is unavailable or in short supply (Brigham 1992). Individuals in short-term daily torpor may be on the ground, and at risk of crushing from construction vehicles and ground disturbing activities. Staff is unaware of rocky crevices onsite that could support birds in a state of long-term torpor while overwintering. Night-foraging poorwills may be confused by heliostat reflections and be at an unknown risk of collision with heliostats or other project features.

Conditions of Certification **BIO-12** would require 4,834 acres of upland habitat offsets, and mitigation for loss of desert dry wash woodland, which would benefit the common poorwill through preservation of foraging habitat. Additionally, nesting bird surveys would be completed under **BIO-15**, and Conditions of Certification **BIO-16a** and **BIO-16b** provide for ongoing project monitoring, would implement a framework of adaptive management, and provide funding on an annual basis, over the life of the project, for a suite of habitat restoration and enhancement measures that would benefit the common poorwill. Staff believes that implementation of these conditions would avoid, minimize, and mitigate any impacts to common poorwill.

STATE OF CALIFORNIA, ENERGY RESOURCES CONSERVATION AND DEVELOPMENT COMMISSION/CENTER FOR BIOLOGICAL DIVERSITY (CBD), LISA T. BELENKY, STATUS REPORT, TN # 70180, MARCH 29, 2013:

CBD Comment #1: CBD comments that new desert tortoise surveys are needed because the surveys relied on for the original application are now more than five years out of date.

Response: Staff considered a number of factors regarding the age of the surveys conducted to support the PSEGS project. These included the number of tortoises found during the initial surveys; the current understanding of desert tortoise density in the region (specifically north of I-10); existing habitat conditions; and the supplemental surveys conducted in 2010 and 2013 on portions of the PSPP and PSEGS project footprints. Staff also took into consideration that the project owner had obtained all appropriate permits and theoretically could have fenced and cleared the project site of any desert tortoise, if compensatory mitigation was provided.

Staff is aware that surveys represent a “snapshot” in time and that conditions on the site may have changed (i.e., more tortoises could be there in 2013 compared to 2010). However, the project area has been subject to some levels of disturbance and desert tortoise densities are generally considered to be low in this region. Staff did not believe that conditions on the site have changed appreciably since the previous surveys and that requiring the project owner to resurvey would not provide meaningful data at this time. Performance of pre-construction surveys (**BIO-9**) and development of a translocation plan (**BIO-10**), will allow for desert tortoise and burrows to be documented and properly managed before commencement of ground-disturbing activities.

CBD Comment #2: CBD comments that additional analysis is needed regarding impacts to desert tortoise and other species connectivity in light of the new information available regarding this issue over the last four years, including but not limited to the U.S. Fish and Wildlife Service’s Priority Desert Tortoise Connectivity Habitat, the Linkage Network for the California Deserts, and the BLM’s Final Solar PEIS. CBD also note as part of the Final Solar PEIS, two north-south wildlife connectivity corridors are to be established through the Riverside East Solar Energy Zone (Solar PEIS at 9.4-50). CBD also note that based on the need to identify the location of these corridors, an analysis must be done of the potential impact from this project to these crucial wildlife corridors.

Response: Staff has reviewed the BLM solar PEIS and it appears the project site is not located in a proposed wildlife corridor. The sites’ location, abutting the Palen dunes likely reduces tortoise movement in portions of the Valley near the PSEGS site. Desert tortoise would have some access through existing culverts under I-10. Staff considers the analysis identified in the PSA (and this FSA) to adequately address potential barriers to desert tortoise that may occur as a result of the PSEGS project.

CBD Comment #3: CBD comments that additional appropriate avian species surveys are needed due to the change in technology (power tower) which will have much greater impacts to avian species than the approved project. CBD also noted that these types of impacts were not addressed in the earlier environmental review.

Response: Staff has requested and received a series of supplemental data on avian use in the project region including winter 2012 and spring of 2013 golden eagle surveys. The project owner has also committed to the continuation of avian surveys during 2013. While data collection is ongoing, staff has reviewed and considered this data in the PSA (and this FSA).

In regards to the changing technology, the PSA (and this FSA) provides a robust analysis of the potential impacts of this technology to desert and migratory birds and bats. In the absence of robust survey data, staff compiled a database of bird species based on personal observations, published reports, and peer-reviewed database entries including from list serves and bulletin boards such as “Inland County Birds” and the web-based “eBird”. The PSA (and this FSA) identifies risk to various groups of birds and identifies how their natural history traits could put them at risk from exposure to elevated levels of solar flux. Some of these factors are time of migration-daytime or nighttime, known flight characteristics (e.g., whether they soar; use thermal air currents, or move in slow and steady or fast flight), social patterns (e.g., whether the species typically moves within a flock, within an amorphous stream, or as individuals), and whether feeding occurs during stopovers or in flight

CBD Comment #4: CBD comments that new Mojave fringe toed lizard surveys are needed because the surveys relied on for the original application are 5 years out of date. CBD also states that in order to adequately assess the current distribution and density of Mojave fringe-toed lizards on the project site and assess direct, indirect, and cumulative impacts to the local population and its habitat, updated surveys are necessary, and must also consider potential impacts from construction and operation activities in the up wind areas of the sand transport corridor which include several large solar projects. CBD also notes that the Center has been informed and is investigating reports that construction activities for the Colorado River substation and use of the access road has had a very high impact on Mojave fringe-toed lizards—the potential for roads near and in sand habitat to become population sinks must be considered in this review.

Response: As noted in the PSA, nearly half of the Project Disturbance Area for the PSPP contained suitable habitat for the Mojave fringe-toed lizard including stabilized and partially stabilized sand dunes, some wash habitat, and other areas within Sonoran creosote scrub bush habitat with appropriate soils. Numerous Mojave fringe-toed lizards were found in the dune areas and in buffer locations during surveys conducted to support the PSPP. A total of 95 Mojave fringe-toed lizards were detected from 2009 and 2010 surveys within the PSPP Project Disturbance Area. This species or its sign was not reported to be observed during spring 2013 surveys for the PSEGS along the proposed generation tie-line or the natural gasline route.

The conclusions of this paragraph have been altered based on further analysis of impacts to the sand transport corridor. Please refer to staff’s updated analysis in the body of this FSA. Staff acknowledges this species is present on portions of the PSEGS site and in adjacent dune area, but considers additional surveys of the project site are not required at this time for a number of reasons. The PSEGS has been designed to eliminate the PSPP project’s 30 foot tall wind fences that contributed to disruption of the sand transport system associated with the PSPP project. Although the PSEGS project footprint is still within the sand transport corridor, this effect is expected to be less than significant with the implementation of proposed Conditions of Certification. Conditions prescribed for the PSPP project are now conservative, given the reduction in impacts stemming from the PSEGS project design. Additional surveys, while providing useful data, would not be expected to alter the significance conclusions for the PSEGS at this time.

Staff is aware of the recent and ongoing mortality to MFTL at the Colorado River substation

CBD Comment #5: CBD requests that alternatives that could avoid impacts to the Mojave fringe-toed lizard and its rare sand dune and stabilized sand habitats, soils and surface waters, desert tortoise movement, avian impacts from solar flux and heliostat collision and other resources must be re-considered in light of the new power tower proposal which the project owner has in the past stated has more flexibility in site design as compared with the solar trough project originally approved.

Response: This FSA includes an analysis of these three alternatives to the proposed PSEGS:

- Solar Photovoltaic Alternative with Single-Axis Tracking Technology
- Parabolic Trough Alternative (No Project Alternative)
- Reduced Acreage Alternative

Please review the **ALTERNATIVES** section for an overview of impacts to Mojave fringe-toed lizard.

CBD Comment #6: CBD comments that new detailed surveys of kit fox on the site are also needed. CBD further comments that due to the unfortunate outbreak of canine distemper in the state protected desert kit fox in the vicinity of the Palen project, additional analysis of project impacts to this species is required.

Response: Staff is aware of the recent outbreaks of disease in this species in the Chuckwalla Valley. Staff has provided additional analysis for this species in the PSA, and conducted significant coordination with REAT agency biologists during preparation of the PSA (and this FSA). Further, staff proposes revised Condition of Certification **BIO-17** which requires pre-construction surveys for badger and kit fox dens in and near the project area, and requires implementation of passive relocation measures to protect them from direct construction impacts. The revised **BIO-17** incorporates knowledge gained from other solar projects in the region, and clarifies how to manage kit fox burrows located during pre-construction surveys. Staff has not requested additional surveys for this species on the project site as this species is already known to occur, and the given the high mobility of the species, does not see a benefit in performance of further surveys, outside of preconstruction surveys.

CBD Comment #7: CBD comments that additional analysis of all cumulative impacts is needed in light of additional projects that have been proposed and approved in this area subsequent to the original decision, including Desert Harvest and McCoy solar projects as well as the adoption of the BLM Solar PEIS after that time and any new information learned from the construction of Desert Sunlight and Genesis projects and updating any new information on the Eagle Mountain Pumped Storage Project.

Response: Where available, staff presents monitoring data gathered from solar projects in the vicinity of the PSEGS, and routinely conferences with REAT agency biologists to receive anecdotal and new information. Staff has revised the cumulative analysis in the PSA (and this FSA), to reflect the changes in approved and proposed projects.

STATE OF CALIFORNIA, ENERGY RESOURCES CONSERVATION AND DEVELOPMENT COMMISSION/CENTER FOR BIOLOGICAL DIVERSITY (CBD), LISA T. BELENKY, STATUS REPORT, MAY 21, 2013:

CBD Comment #8: CBD reiterated its comments from March 29, 2013 above, (CBD Comment #1). CBD also stated that to date, it is the Center's understanding that the Applicant has not undertaken these needed surveys and the spring survey window is rapidly drawing to a close. CBD further states that the earliest time that these necessary surveys could be conducted is the fall of 2013—the PSA schedule must be delayed until after these surveys have been conducted and the data provided to all parties for analysis.

Response: Please see staff's response to comment CBD Comment #1, above. Please refer to the PSA "Summary of Conclusions", as well as staff's monthly Status Reports for updates on the project owner's data collection and checklist of outstanding data.

CBD Comment #9: CBD reiterated its comments from March 29, 2013 above, (CBD Comment #2). CBD also states that to date, the Center is unaware of any information indicating that staff or the applicant has undertaken this critical analysis.

Response: Please see staff's response to comment CBD Comment #2 (responses to CBD March 29, 2013 Status Report) from the section above.

CBD Comment #10: CBD reiterated its comments from March 29, 2013 above, (CBD Comment #3). CBD also states that at recent workshops the Applicant indicated that they have begun some avian surveys but there remain questions regarding the appropriateness of the methodology used, appropriate seasons and scope of the surveys. The Applicant also indicated that they may not be undertaking needed bat surveys and monitoring at this time. Moreover, as far as the Center is aware, none of the avian data, other than the Winter 2013 Golden Eagle Survey Results, collected to date by the Applicant have yet been provided to all parties and therefore would not be available for inclusion in the PSA if it is issued on the current, rushed, schedule.

Response: Please see staff's response to comment CBD Comment #3 and #8, above.

CBD Comment #11: CBD reiterated its comments from March 29, 2013 above, (CBD Comment #4). CBD also states that to date the Center is unaware of any new data or updated survey information regarding sand habitat and Mojave fringe-toed lizards being collected by the Applicant or provided by the Applicant to all parties. CBD also comments that Alternatives must be considered that avoid sand dune habitat impacts on the proposed site and avoid, minimize and mitigate any remaining impacts to the sand dunes natural communities and Mojave fringe-toed lizard.

Response: Please see staff's response to comment CBD Comment #4 and #8 (responses to CBD March 29, 2013 Status Report) from the section above.

CBD Comment #12: CBD reiterated its comments from March 29, 2013 above, (CBD Comment #5). CBD also states that this information should be included in the PSA when issued but cannot be included without the needed additional data on avian species and other resources.

Response: Please see staff's response to comment CBD Comments #3 and #8, above.

CBD Comment #13: CBD reiterated its comments from March 29, 2013 above, (CBD Comment #6). CBD also states that to date the Center is unaware of any new data or surveys for desert kit fox being collected by the Applicant or provided by the Applicant to all parties.

Response: Please see staff's response to comment CBD Comment #6, above.

CBD Comment #14: CBD reiterated its comments from March 29, 2013 above, (CBD Comment #7). CBD also states that this analysis should be included in the PSA when issued but cannot be included without the needed additional data on avian species and other resources.

Response: Please see staff's response to comment CBD Comment #7(responses to CBD March 29, 2013 Status Report) from the section above.

STATE OF CALIFORNIA, ENERGY RESOURCES CONSERVATION AND DEVELOPMENT COMMISSION/CENTER FOR BIOLOGICAL DIVERSITY (CBD), LISA T. BELENKY, COMMENTS ON THE PSA, DATED JULY 29, 2013:

CBD Comments on the PSA Heading B Paragraph 1-2: CBD suggests the PSA did not fully analyze impacts of the proposed BLM East Riverside Solar Energy Zone.

Response: Impacts from projects proposed in the region including projects identified in the BLM SEIS were considered in the cumulative analysis (see Special-Status Wildlife - Desert Tortoise). Staff considers the analysis adequate for the purposes of CEQA.

CBD Comments on the PSA Heading C Paragraph 1: CBD reiterated comments from March 29, 2013 above, (CBD Comment #1). CBD also states that the surveys are out of compliance with regulatory standards.

Response: Please see staff's response to comment CBD Comment #1 (responses to CBD March 29, 2013 Status Report) from the section above. In addition, the guidance regarding desert tortoise survey protocols and allows flexibility provided the project owner coordinates with agency staff. To date ongoing coordination has occurred between the applicant, USFWS, BLM, CDFW, and Commission staff. Staff considers the data for this project site adequate to address impacts and provide compensatory mitigation.

CBD Comments on the PSA Heading C Paragraphs 2-4: CBD reiterated comments from March 29, 2013 above, (CBD Comment #2). CBD further states that increased mitigation ratios are required to compensate for loss of connectivity and that mitigation ratios for other projects were higher.

Response: Please see staff's response to comment CBD Comment #2 (responses to CBD March 29, 2013 Status Report) from the section above. In addition, staff considered and addressed impacts to Wildlife Habitat Management Areas in the PSA and FSA (See Desert Tortoise Impacts-Connectivity). Regarding mitigation for desert tortoise; staff recognizes the importance of fully mitigating impacts to desert tortoise in compliance with the requirements of the California Endangered Species Act. However, staff believes that the mitigation ratios identified in the PSA (and this FSA) are adequate and were developed in coordination with agency staff from the USFWS, BLM, and CDFW. Staff considered a wide range of biotic and abiotic factors when developing the mitigation approach for desert tortoise including the sites location; existing vegetation communities; level of disturbance; soil composition; density of tortoise in this section of the Chuckwalla Valley; and proximity to adjacent lands supporting desert tortoise populations. Staff took into consideration the number and distribution of desert tortoise on the project site; the landscape level scale of the project; the projects location; the sites importance for connectivity and regional movement and gene flow; and the cumulative effects of other projects.

Staff weighed these factors in the development of mitigation ratios in light of the fact that project development ultimately results in a net loss of habitat range wide. To address this loss Conditions of Certification **BIO-8**, through **BIO-12**, and **BIO-13**, require a combination of minimization, salvage, and relocation activities; land acquisition, preservation and enhancement; and management activities such as regional raven control. Staff considers these measures adequate to fully mitigate impacts of the PSEGS to desert tortoise. Mitigation ratios developed for other projects including the HHSEGS project considered site and region specific factors which are different from the PSEGS project site.

CBD Comments on the PSA, Heading C Paragraph 5-11: CBD states the applicant for ISEGS significantly underestimated the number of desert tortoise on the project site. In addition, CBD raises concerns regarding the use of translocation as mitigation and suggests that the PSA lacks adequate information regarding the translocation plan.

Response: Staff considers the survey methodologies and estimated number of desert tortoise that may occur on the PSEGS site to be adequate to support compliance with CESA. Surveys completed by past and current project owners complied with the USFWS's recommended guidelines for conducting surveys in desert tortoise habitat. The estimates of adult and subadult desert tortoise calculated by USFWS and staff provide the best available estimates of juvenile desert tortoise and eggs that may occur on the project site As presented in the PSA these calculations are only theoretical estimates of the expected number of desert tortoise that could be present and use the best available scientific data on this species.

CBD states the USFWS Desert Tortoise Recovery Office's Scientific Advisory Committee states that "translocation is fraught with long-term uncertainties…and therefore, any translocations should be accompanied by specific monitoring or research to study the effectiveness or success of the translocation….." The PSA acknowledges this concern and includes this language in the analysis of potential impacts to desert tortoise from translocation activities. The PSA also provides information from the USFWS and other researchers that suggest translocation may be an effective management tool to minimize impacts to desert tortoise from development projects under certain circumstances.

Staff agrees that the current translocation plan is in Draft form however staff disagrees that the PSA fails to provide reasonable information to analysis project impacts to desert tortoise. Staff considers the conditions of certification in the PSA (and this FSA) to be legally adequate and the analysis reflects a good faith effort to investigate and disclose environmental impacts of the PSEGS (see CEQA Guidelines § 15003 (i) & 15144). This FSA includes conditions of certification that require the preparation of more precise plans after approval of the license amendment, which is acceptable under CEQA provided that practical considerations make it difficult to develop the plan at this stage of the planning process and the agency "commits itself to eventually devising measures that will satisfy specific performance criteria articulated at the time of approval" (Sacramento Old City Association v. City Council (1991) (229 Cal.App.3d 1011, 1028 1029). See also CEQA Guidelines (14 Cal. Code Regs 15123.4 (a) (1) (B)), which provides that mitigation measures may specify performance standards that would mitigate the significant effect of the project and that may be accomplished in more than one specific way. In addition, the desert tortoise translocation plan would require coordination with the USFWS, BLM, and CDFW and approval of the CPM prior to implementation. This plan is a requirement of Condition of Certification **BIO-10** which specifies a series of reporting, tracking, monitoring, and disease testing. In addition, this plan is expected to follow the USFWS guidelines on translocation. Staff considers the existing conditions of certification to be adequate and considers translocation to be an accepted tool for minimizing project related impacts to desert tortoise on the project site.

CBD Comments on the PSA, Heading D (Mojave Fringe-toed Lizard) Paragraph 1-2: CBD states the PSA lacks information required to complete the analysis of the fringe-toed lizard. In addition, CBD suggests the PSA fails to address impacts to this species from the use of roads.

Response: Staff noted the information regarding sand transport was not available during the preparation of the PSA; however this data was reviewed and considered in the analysis of this FSA.

Regarding the contention that impacts to this species were overlooked in the PSA; staff provided detailed information regarding the threats to this species from roads, including referencing that 118 Mojave fringe-toed lizards had been killed by vehicle strikes on the Colorado River Substation access road. Staff further considered potential operational impacts from vehicle use, vegetation maintenance, and cumulative effects. Staff considers the analysis adequate and recommended conditions of certification to reduce impacts to this species.

CBD Comments on the PSA, Heading E (Desert Kit Fox) Paragraphs 1-7: CBD reiterated its comments from March 29, 2013 above, (CBD Comment #6) CBD also states that additional more stringent measures should be developed.

Response: Please see staff response to comment #6 above. Staff has collaborated extensively with REAT members to develop revised measures for desert kit fox. These have been included in Condition of Certification **BIO-17**. Staff considers this condition to be adequate to reduce impacts of the PSEGS to desert kit fox. It is staffs contention that Condition of Certification **BIO-17** contains performance standards and detailed requirements for execution of successful minimization activities. Nonetheless, in response to comments and in an effort to further strengthen the condition, staff has revised the condition to provide greater specificity regarding the types of actions that would occur including monitoring and reporting requirements, management actions, and remedial actions.

CBD Comments on the PSA, Heading F (Bighorn Sheep) Paragraphs 1-4: CBD states the PSEGS will eliminate sheep connectivity; requests additional data on the effects of glint and glare to bighorn sheep; and highlights the importance of seeps and springs to this species.

Response: Bighorn sheep are known from the region and have been documented to use valley floors to support intermountain movement. As described in the PSA, (and this FSA), BLM's Draft Supplemental EIS for the PSEGS, and the NECO Plan the project is not located in an important sheep connectivity area. Impacts of the PSEGS would not pose a complete barrier to dispersal for this species and the project is not located in a constrained linkage area. The PSA (and this FSA) accurately assess impacts to this species and concluded the project would not result in significant impacts to bighorn sheep.

There is little data available regarding the effects of glint or glare to most species of wildlife including bighorn sheep. Staff used the best available data and considered the sites location in addressing impacts of the PSEGS to this species. Staff considers the PSA (and this FSA) to accurately assess impacts to this species.

As described in the PSA (and this FSA) impacts to groundwater are expected to be less than significant with Conditions of Certification (**BIO-23** and **BIO-24**). The modified project would use less groundwater during both construction and operation than the PSPP project. Construction groundwater use is stated to be 1,130 acre-feet per year (AFY), a reduction from the original permitted project groundwater consumption of 1,917 AFY. Operational groundwater use is stated as 201 AFY, a reduction of nearly 100 AFY. In addition the nearest seeps and springs are located approximately eight and 13 miles west of the PSEGS site. Water in these sites appear to originate from infiltration of precipitation that falls on the Chuckwalla Mountains as all three sites are located either within the Chuckwalla Mountains or are less than one mile downslope from the Chuckwalla Mountains. At this great distance and given the source of water to the sites, groundwater extracted from the PSEGS site will not affect these seeps.

CBD Comments on the PSA, Heading G (Rare Plants) paragraphs 1-5: CBD states that inadequate survey data is available to analyze project related impacts; that avoidance is the preferred alternative; that additional mitigation should be required including seed collection and preservation. .

Response: The preliminary analysis in the PSA was based on information collected for the approved PSPP project. Since that time the project owner has provided supplemental biological surveys of the proposed linear facilities. Condition of Certification BIO-19 describes measures for avoiding and minimizing effects to avoided occurrences of Harwood's milk-vetch, California ditaxis and other special-status plants occurring within 100 feet of the project boundary, and guidelines for minimizing direct effects along project linears. BIO-19 also contains guidelines for conducting fall 2013 botanical surveys, triggers for mitigation, and detailed specifications and performance standards to ensure that any.

CBD Comments on the PSA, Heading H (Avian Species): CBD states the PSA inadequately assesses potential impacts to avian species and fails to include migratory bird information.

Response: The PSA (and this FSA) provided a robust analysis of potential impacts to birds from exposure to elevated levels of solar flux. More importantly the PSA included analysis describing the risk of mortality and morbidity to the guilds of birds that would be found in the region. The PSA did not attempt to quantify the exact number of birds that would be lost as this information would be highly speculative.

CBD Comments on the PSA, Heading H Section 1 (Yuma Clapper Rail): CBD states the PSA inadequately assess potential impacts to Yuma clapper rail.

Response: Information regarding the risk to Yuma clapper rail is presented in this FSA. Staff provided an analysis of risk to a variety of birds with the potential to occur in the region and provided conditions of certification to reduce those risks. The presence of this species on or near the project site may occur however the risk to this species is speculative. Nonetheless this FSA has described potential impacts to this species in the context of CESA and as a fully protected species.

CBD Comment: CBD states the information regarding burrowing owls in the PSA is confusing; recommends additional surveys to augment existing data; suggests the mitigation approach is outdated; and states there is no scientific evidence that passive relocation is an effective management tool for their long term survival.

Response: Information regarding the presence of burrowing owl on the PSEGS site has been updated in this FSA. This information is based on protocol surveys of the modified linear facilities and ongoing avian surveys of the facility site. As described in this FSA, one burrowing owl has been detected along the modified linear facilities, although no active burrow could be detected, and up to 18 observations of burrowing owls have been detected on or adjacent to the PSEGS solar field. At this time staff is not aware of the breeding status of the birds identified on the project site. Given that 18 individual observations have been made and acknowledging that some of the observations are likely of the same bird at different times, it is possible that some of these may birds consist of breeding pairs. This FSA provides adequate information to analyze project level effects to burrowing owl. Neither CEQA nor the CEQA Guidelines require that protocol level surveys be performed and incorporated into a Draft EIR. (Association of Irritated Residents v. County of Madera (2003) 107 Cal.App.4th 1383.) As described in this FSA, the “environmental setting” is based on expert review and analysis of existing information provided by the project owner. Further, a complete assessment of all potential burrows for this species will be conducted prior to project disturbance to identify active burrows for implementation of minimization and avoidance measures.

Staff considers the information adequate to address impacts to burrowing owls at this time. While additional data would be useful, the proposed compensatory mitigation requirements identified in Condition of Certification **BIO-18** (Burrowing Owl Impact Avoidance, Minimization, and Compensation Measures) and the large scale land acquisition required in **BIO-12** (Desert Tortoise Compensation) will provide reasonable and feasible mitigation for this species. As described in the PSA and FSA the approach to mitigation accounts for the large home ranges used by burrowing owls in arid environments; the rationale for not substantially altering the mitigation approach is because the current mitigation approach for desert tortoise fundamentally provides the same acreages that would be specified using the updated guidance from CDFW.

The CBD suggests that there is no scientific evidence that passive relocation is an effective management tool for their long term survival. Staff acknowledges there is uncertainty regarding the effectiveness of passive relocation in some circumstances. However, staff is recommending an accepted and agency approved method for displacing burrowing owls from the project site. Further the preservation of offsite lands is an acceptable mitigation strategy for the purposes of CEQA (see CEQA Guidelines, Section 15370) and the PSA (and this FSA) is not required to include an analysis of the exact locations of proposed mitigation lands (see California Native Plant Society v. City Rancho Cordova [March 24, 2009] 172 Cal. App. 4th 603). Similarly, the acquisition of these lands prior to displacing the owls is not a requirement; although staff acknowledges this would likely benefit owls. However, condition of certification **BIO-12** (Desert Tortoise Compensation) and **BIO-18** (Burrowing Owl Impact Avoidance, Minimization, and Compensation Measures) would require the project owner to provide financial security prior to purchase of mitigation lands prior to construction.

CBD Comments on the PSA, Heading L (Waters of the State) Paragraph 1-3: CBD states the PSA relies on outdated information regarding state waters; proposes that the project avoid state waters; and recommends that on-site hydrology be maintained.

Response: This FSA has been revised to include updated information provided by the applicant for State waters including the proposed modified linear facilities. Staff also considered a variety of alternatives to reduce project impacts to State waters. CEQA states that an EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives (CEQA Guidelines 15126.6(a)).The PSA presents a reasonable range of alternatives that would have varying effects to State waters and biological resources. Regarding the maintenance of surface hydrology; the PSEGS project design would maintain on-site hydrology and allow for ground water recharge. A reduced acreage alternative would have the most minimal impacts to waters of the state, whereas the other alternatives would result in impacts that are comparable to the PSEGS.

CBD Comments on the PSA, Heading J (Nesting Mitigation): CBD states mitigation must occur in the region and specifically within the recovery unit for desert tortoise. CBD is concerned that nesting must assure that all species are actually mitigated and occur on the proposed compensatory mitigation lands.

Response: The preservation of offsite lands is an acceptable mitigation strategy for the purposes of CEQA (see CEQA Guidelines, Section 15370) and the PSA (and this FSA) is not required to include an analysis of the exact locations of proposed mitigation lands (see California Native Plant Society v. City Rancho Cordova [March 24, 2009] 172 Cal. App. 4th 603); however, Condition of Certification **BIO-12** outlines specific performance standards and selection criteria for mitigation lands including: requirements for acreage, types of habitat to be protected, the potential locations, and minimum qualifications of conservation easement holders. Completion of protocol surveys on mitigation lands is not required prior to approval of the amendment. As stated in the condition, the CPM, in consultation with CDFG and USFWS, will approve the proposed mitigation lands provided they meet the specified criteria. Staff also considers the nesting of mitigation to be appropriate should the lands support the target species and its habitat.

CBD Comments on the PSA, Heading K (Missing Plans): CBD states that numerous plans required as a component of various conditions of certification are missing which makes it impossible for the public or decision makers to evaluate the project.

Response: The PSA (and this FSA) identifies a number of conditions of certification that require the preparation of more precise mitigation plans after approval of the license amendment, which is acceptable under CEQA, provided that practical considerations make it difficult to develop the plan at this stage of the planning process and the agency "commits itself to eventually devising measures that will satisfy specific performance criteria articulated at the time of approval" (Sacramento Old City Association v. City Council (1991) (229 Cal.App.3d 1011, 1028 1029). See also CEQA Guidelines (Cal. Code Regs, tit. 14, § 15123.4 [a] [1] [B]), which provides that mitigation measures may specify performance standards that would mitigate the significant effect of the project and that may be accomplished in more than one specific way.

CEQA states that formulation of mitigation measures (conditions of certification) may specify performance standards which would mitigate the significant effects of the project and which may be accomplished in more than one specified way. CEQA Guidelines § 15126.4(a)(1)(B). CEQA case law provides that an agency may properly defer formulation of the specifics pending further study for kinds of impacts for which mitigation is known to be feasible so long as the mitigation measure describes the options that will be considered and identifies specific and mandatory performance standards. See San Joaquin Raptor v. County of Merced, 149 Cal.App.4th 645, 669 (2007) at 671.

It is common for formulation of a mitigation plan to be deferred when a regulatory agency other than the Lead Agency will be reviewing or approving the mitigation (i.e., Desert Tortoise Translocation Plan, Avian Plan, Weed Management Plan etc.) and can be expected to impose mitigation requirements independent of CEQA as a condition of the permit. These requirements are often worked out through a consultation and approval process with the CPM that takes place after the project is approved. In this type of situation, it often makes sense to defer formulation of the specifics of mitigation measures to ensure they will meet the regulatory agency's requirements. Compliance with regulatory agency standards for mitigation can be relied upon to ensure adequate mitigation under CEQA. As a result, regulatory approval of a mitigation program might serve as an adequate performance standard as long as the regulatory agency'' standards for adequate mitigation are identified. See Defend the Bay v. City of Irvine, 119 Cal.App.4th 1261, 1275 (2004) (holding no improper deferral of mitigation even though future investigations and consultation with regulatory agencies was required and further holding that an agency may defer defining the specifics of mitigation measures if it "commits itself to mitigation and lists the alternatives to be considered, analyzed and possibly incorporated in the mitigation plan"); Endangered Habitats League v. County of Orange, 131 Cal.App.4th 777, 794 (2005) (upholding habitat mitigation measure because the EIR called for either off-site preservation of habitat at a specified ratio or obtaining habitat loss permits from relevant agencies).

CBD Comments on the PSA, Heading L (Soils and Water resources): CBD raised concerns regarding groundwater pumping and recommends that additional studies are conducted to address impacts to seeps and springs. CBD is concerned with the loss of state jurisdictional habitat and crypto biotic soils.

Response: Regarding project related effects to groundwater please see response to comment on the PSA, Heading F (Bighorn Sheep) Paragraphs 1-4 above. The PSA (and this FSA) adequately assessed impacts to seeps and springs from potential groundwater declines. In addition, the PSA disclosed impacts to and provided mitigation for impacts to state jurisdictional waters. The acreages of impacts to state waters has been revised in this FSA based on supplemental surveys conducted by the project owner that were not available at the time the PSA was prepared.

The PSA disclosed impacts to biotic soils however the PSA (and this FSA) acknowledges that until the dispute about the sequestration benefits of alkaline soils and other carbon sinks is resolved, staff assumes that the answer may vary on a case-by-case basis. For example, project sites that are very sparsely vegetated with only a minor component of soil crusts may confer less sequestration capabilities than sites with a rich cover of biological soils crusts and succulent desert scrubs. Nevertheless, there is little dispute that the loss of desert vegetation and biological soil crusts on a solar thermal plant site permanently eliminates the carbon sequestration benefits, and the soil disturbance during grading and construction releases the stored carbon back into the atmosphere.

Staff believes that implementation of the conditions of certification for the PSEGS project would reduce potential adverse effects from the loss of carbon sequestration.

CBD Comments on the PSA, Heading M (Cumulative Impacts): CBD states that analysis of cumulative impacts has not been fully disclosed.

Response: The PSA (and this FSA) correctly analyzed potential cumulative projects to biological resources. The discussion of cumulative impacts must provide a summary of the cumulative environmental effects that are expected and a reasonable analysis of the cumulative impacts of the relevant projects [CEQA Guidelines § 15130(b)]. The discussion of cumulative impacts need not provide the same level of detail as is provided for project-specific effects [CEQA Guidelines § 15130(b)]. A Lead Agency is not required to provide evidence supporting every fact underlying the evaluation of cumulative impacts nor is an exhaustive analysis required [CEQA Guidelines § 15130(b)].

The CEQA Guidelines contain two methods of identifying the universe of past, present and future projects to account for in assessing the significant of cumulative impacts: the "list method" and the "summary of projections" method [CEQA Guidelines § 15130(b)]. When using the "list" method (the method used in the PSA), the Lead Agency is obligated to use "reasonable efforts" to discover, disclose and discuss related past, present and future projects, even if under review by other agencies. CEQA Guidelines Section 15130(b) further provides that cumulative impact analysis in CEQA documents "should be guided by the standards of practicality and reasonableness." Moreover, not every project should be placed on the list; rather, "factors to consider when determining whether to include a related project should include the nature of each environmental resource being examined, the location of the project and its type" (CEQA Guideline Section 15130(b)(2).

CBD Comments on the PSA, Heading N (Conformance with Desert Renewable Conservation Plan): CBD states that the PSA should conform to the DRECP and fails to provide an evaluation of conformance with the Plan.

Response: Staff reviewed the preliminary maps for the DRECP. To date, the DRECP has not been finalized and it is uncertain which alternative will be selected. However, even if the project site was proposed within an identified area of Conservation Opportunity, this would not preclude permitting or construction of the facility. Project analysis is completed on a case by case bases and compensatory mitigation is developed for each area. Projects located in conservation areas will likely have higher mitigation ratios because of the proposed conservation value of the area.

STATE OF CALIFORNIA, ENERGY RESOURCES CONSERVATION AND DEVELOPMENT COMMISSION/CENTER FOR BIOLOGICAL DIVERSITY (CBD), LISA T. BELENKY, ATTACHMENTS 1-17 TO THE COMMENTS ON THE PSA, JULY 29, 2013:

Comment: CBD provided a collection of scientific papers and studies regarding biological resources in attachments one through 17 to their comments on the PSA.

Response: Staff acknowledges receipt of these papers, several of which are referenced in the PSA (and this FSA). This information does not alter the conclusions presented in this FSA.

STATE OF CALIFORNIA, ENERGY RESOURCES CONSERVATION AND DEVELOPMENT COMMISSION/BASIN AND RANGE WATCH, KEVIN EMMERICH AND LAURA CUNNINGHAM, TN # 70178, MARCH 29, 2013:

Basin and Range Watch (BRW) Comment #15: The California Energy Commission should also examine a photovoltaic alternative for the Palen Site. While a PV alternative in the same location would still have some of the same impacts, it would reduce the visual, hydrologic and avian impacts.

Response: Staff has included an analysis of a PV alternative in this FSA. Please refer to staff's response to the Center for Biological Diversity's Comment #5.

BRW Comment #16: Regarding Mojave fringe-toed lizard (MFL), BRW points out that the new project design and footprint does not eliminate all impacts to the aeolian corridor, nor does it completely eliminate impacts to MFL. BRW further recommends that a regional management plan be developed for the MFL.

Response: The PSEGS project would directly affect 1,480 acres of Mojave fringe-toed lizard habitat. The project would have significant but mitigatable impacts to Mojave fringe-toed lizards, and would generally avoid interference with the sand transport corridor. This impact is comparable with the original PSPP, and staff believes that mitigation of these impacts is possible by implementation of Condition of Certification **BIO-20**.

Staff agrees that development of coordinated regional plans can often be beneficial to both special status species and resources, and supports these efforts. However, the authorities and responsibilities incumbent upon the California Energy Commission do not extend to formulation of management plans for either species or habitats. The BLM and the CDFW respectively have congressional and state constitutional authority to manage MFL.

BRW Comment #17: BRW states concern that the issue of a take permit for golden eagle has not been resolved, and notes that take of an eagle may be a violation of federal law, as well as a violation of state laws.

Response: The PSA (and this FSA) contains a full description of all applicable laws, ordinances, regulations, and standards (LORS) relative to the golden eagle, and staff agrees that take of fully protected species, such as golden eagle, bald eagle, or peregrine falcon, would not be in conformance with state Fish and Game Code, or with federal LORS such as the Eagle Act. Please refer to **Table 1** for a complete listing of applicable state and federal law. Staff has also recommended that the project owner undertake preparation of avian management plans (**BIO-16b**), including an eagle protection plan, to aid in characterizing, monitoring, and avoiding project effects. **BIO-16a** would require power line retrofits, as well as annual funding for avian mitigation, over the life of the project. Staff recommends the project owner continue to work with the REAT agencies to determine appropriate management of this and any other species potentially at risk of exposure to concentrated solar flux within the project airspace.

BRW Comment #18: BRW has requested species lists for bats and birds that might occur on or over the project site.

Response: Please refer to the **Biological Resources Table 3** and **Table 4,** for this information, which has been updated for the PSEGS project analysis, based on staff's site visits, agency coordination, information from the applicant, and literature searches. This FSA provides an analysis of the groups of birds considered to most at risk of adverse effects, based on behavioral characteristics.

BRW Comment #19: BRW has mentioned the distemper disease outbreaks in kit fox from the Genesis Electric Solar Generating Project, as well as the Colorado substation, and notes that Condition of Certification **BIO-17**, which was developed for the PSEGS project, may not provide enough protection.

Response: Please refer to staff's response to Center for Biological Diversity's comment #6, above.

BRW Comment #20: BRW states that phreatophytic vegetation, such as desert ironwood, palo verde, and mesquite, present on and off the project site, could be impacted by groundwater pumping, and has further asked if staff and the project owner would agree to a "stop pumping trigger" of groundwater drawdown if negative impacts are detected in microphyll woodland. BRW has also asked what monitoring will be undertaken to detect the effects of groundwater drawdown on sensitive communities.

Response: The PSEGS project proposes a substantial reduction in use of groundwater, as compared to the PSPP project. The analysis of effects to groundwater dependent ecosystems (GDEs) for the approved PSPP project, and the subsequent conditions of certification (**BIO-23** and **BIO-24**) developed for the original project, addressed greater impacts than the PSEGS project would have. Staff believes that these measures, unmodified, will now be conservative for the PSEGS project. No new analysis of GDEs has been performed by staff, or requested from the project owner.

STATE OF CALIFORNIA, ENERGY RESOURCES CONSERVATION AND DEVELOPMENT COMMISSION/BASIN AND RANGE WATCH, KEVIN EMMERICH AND LAURA CUNNINGHAM, STATUS REPORT NO. 2, TN # 70697, MAY 8, 2013:

BRW Comment #21: BRW requests that staff consider alternatives to the proposed PSPP project, including distributed generation, brownfields, or the Westlands Solar Park, to reduce impacts to biological resources.

Response: Please refer to staff's response to CBD comment #5, above.

BRW Comment #22: BRW asks for updated MFL survey data, and recommends development of a regional management plan for the MFL.

Response: Please refer to staff's responses to CBD comment #4 and BRW comment #16, above.

BRW Comment #23: Confirms BRW's position that the project should be halted until operational impacts are understood, pending receipt of data from another concentrating solar power tower project, the Ivanpah Solar Electric Generating System, and requests lists of avian and bat species likely to be adversely affected by the project.

Response: Please refer to the staff's response to BRW comments #17, and #18, regarding potential adverse effects of the proposed project and species lists. Staff cautions that while data collected from operating power towers certainly is applicable to projects employing similar technology, differences in habitat, avian and bat assemblages, and basic topography between the PSEGS and ISEGS project sites will result in impacts unique to each site. Uncertainty regarding the level of these impacts (that is, not only of what outcomes may result but also the numbers of individuals that might be affected) require site-specific studies to augment the knowledge base. Please review the PSA section titled "Operation Impacts to Flighted Species" for more information regarding bird and bat species accounts, and how behavioral and physical attributes may influence risk of adverse effects.

To gain site-specific avian and bat information, staff, in conjunction with the REAT agency biologists, has developed a survey protocol specifically for the PSEGS project site, with data collection recommended throughout the permitting process (CEC 2013i), to help inform monitoring plans implemented via staff's proposed Conditions of Certification **BIO-16a** (Avian Enhancement and Conservation Plan), and **BIO-16b** (Avian and Bat Protection Plan).

BRW Comment #24: BRW requests new surveys for kit fox as well as a baseline census, and further requests staff address issues of canine distemper and other health relevant to the species.

Response: Please refer to staff's response to CBD comment #6.

STATE OF CALIFORNIA, ENERGY RESOURCES CONSERVATION AND DEVELOPMENT COMMISSION/BASIN AND RANGE WATCH, KEVIN EMMERICH AND LAURA CUNNINGHAM, COMMENTS ON THE PSA, TN # 200078, JULY 29, 2013:

BRW Comment Page 1 (Expedited Schedule): BRW requests additional time to review the document and suggests the PSA contains information from other solar proceedings.

Response: The PSA and FSA are being processed as an amendment and are proceeding along the timeframes identified by the Committee. Information contained in the document includes relevant analysis that describes impacts to a given species. Where impacts are similar; the text of a previous proceeding may be appropriate to describe the impact. Staff considers the PSA to adequately describe impacts to sensitive biological resources and recommends mitigation where feasible to reduce impacts to less than significant levels.

BRW Comment Page 1-3 (Alternatives, Brownfield Sites, and Distributed Generation): BRW requests that staff review consider alternatives to the proposed PSPP project, including distributed generation, brownfields, or the Westlands Solar Park, to reduce impacts to biological resources.

Response: Please refer to staff's response to CBD comment #5, above.

BRW Comment Page 5-6 (Biological Resources – Mojave Fringe-Toed Lizards): BRW requests that staff review the recent submittal of the Geomorphic Assessment of Sand Transport for the Modified Project, submitted in July. BRW also suggests that this species will be subject to greater impacts than the originally approved project and that alternative sites be considered.

Response: The Geomorphic Assessment of Sand Transport for the Modified Project was not available during the preparation of the PSA; however staff has reviewed the document and incorporated this analysis into this FSA. Specific conditions of certification have been recommended to off-set impacts of the PSEGS to Mojave fringe-toed lizards or their habitat. Please see response to comment #5 regarding alternatives.

BRW Comment Page 5-6 (Biological Resources – Solar Flux, Lake Effect, Avian Slaughter): BRW identifies that numerous shore birds including a Yuma clapper rail have been found dead on solar projects in the region. BRW further identifies that large scale solar projects may act as an attractant to some birds who may consider the solar field as a lake. BRW notes that staff states for the HHSEGS proceeding that the project would kill golden eagles.

Response: Information regarding the risk to avian species including shore birds was considered in the PSA. The PSA included a discussion of the risk to birds from collision with facility structures; how the site may act as an attractant to some birds; and how light reflecting off the heliostats may be perceived as water by various birds. This FSA has been revised to include updated information regarding shorebirds detected at other solar facilities in the region.

Staff adequately addressed impacts to birds in the PSA from exposure to elevated levels of solar flux, given available data. This FSA identifies the risk to birds, including golden eagles, and concludes that it is uncertain, but possible, that the facility will result in mortality or morbidity to golden eagles.

EMAIL FROM ALTOS VISTA VILLAGIO/SIGNED, VEENA DOIJODE, PUBLIC COMMENT, TN #70449, APRIL 24, 2013:

Comment #25: The commenter has requested that staff assess impacts to a private parcel, where an agricultural crop of palm dates is being considered.

Response: The private parcel referenced in the comment is located 5.3 miles southeast of the PSEGS project site, midway between the PSEGS and the Genesis Solar Electric Generating Project. While staff does consider all past, present, and probable future impacts to biological resources in the context of cumulative impacts (CEQA Section 15130), without specific information as to the size of project and other details, staff is unable to provide an analysis of impacts of a palm date farm cumulative to the proposed PSEGS project. Biological resources staff does not analyze potential impacts to crops, however, for the purposes of CEQA, staff has performed a comprehensive analysis of potential project impacts to biological resources adjacent the project site such as desert dry washes, sand transport corridors, native habitat, and special status plant and wildlife species, as well as special habitat designations such as desert tortoise critical habitat, both on the project site and off. In some instances, staff’s analysis includes resources as far as 140 miles from the PSEGS project. Staff has recommended 27 conditions of certification to preserve the health and function of these biological resources, as well as the function of the broader, regional landscape, including the commenter’s parcel.

STATE OF CALIFORNIA, DEPARTMENT OF TRANSPORTATION, DANIEL KOPULSKY, TN # 200198, AUGUST 12, 2013:

Comment: Condition of Certification **BIO-9** requires installation of security and desert tortoise exclusionary fencing around the entire project and portions of I-10. Proper fence maintenance is a critical prevention of tortoise road mortality. The Department of Transportation (Caltrans) suggested an MOU (Memorandum of Understanding) be developed between PSEGS and Caltrans, to implement mitigation measures for PSEGS installation and maintenance of the fencing throughout the life of the project.

Response: Staff has discussed this comment with Caltrans staff (Rebecca Forbes) and has determined that Caltrans may only enter into a maintenance agreement with a state or federal agency. This means that the BLM or the Energy Commission would need to enter into a maintenance agreement; while the PSEGS project owner would supply the funding. Staff has added a CEQA assessment of the impacts of adding desert tortoise exclusion fencing to the existing Caltrans ROW fence.

COUNTY OF RIVERSIDE, COMMENTS ON PSA, TN # 200094, JULY 30, 2013:

Comment 1: The County comments that additional information is necessary for determination of impacts to avian species, and notes bird mortalities at other industrial-scale facilities.

Response: Staff is in agreement; data in addition to what is currently available would be helpful. Given that the currently proposed project is a scale-up from any existing plants, such as GEMASolar project in Spain, minimal data is available. Staff has already incorporated available data from operating power tower projects into this FSA, and has formulated adaptive mitigation for impacts, including **BIO-16a** and **BIO-16b**, in conjunction with habitat acquisition and a suite of other measures. Implementation of these conditions would allow the REAT agencies to generate answers to some of the questions posed by the County.

Comment 2: The County poses concerns regarding the use of habitat acquisition as a mitigation approach for biological resources lost or degraded from implementation of the project.

Response: Mitigation lands are not typically selected during the permitting phase; however, consistent with CEQA, the conditions of certification include selection criteria for the lands. For the PSEGS project, staff has recommended that compensation be provided for the loss of onsite habitat, including desert washes and Sonoran creosote shrub. These acquisitions may be one contiguous parcel of land, but more commonly, are often a conglomeration of parcels separated in space. This is all dependent on what is available for purchase at the time acquisitions are contemplated. Acquisition lands could be private or under the public domain, and are not limited to Riverside County, but rather, are recommended to occur within the desert tortoise's Colorado Desert Recovery Unit. The eastern boundary of the Colorado Desert Recovery Unit is near Blythe, California, extending north to Searchlight, Nevada, south through the Chocolate Mountains Gunnery Range, and west past Palm Springs (USFW 2011).

GALATI BLEK LLP'S, MARIE FLEMIN/PALEN SOLAR HOLDINGS, LLC (PSH), FINAL COMMENTS ON THE PSA, TN # 200077, JULY 29, 2013

PSH has provided staff comments that are restricted to the conditions of certification. Staff has incorporated many of these comments, and had an opportunity to publically discuss PSH preliminary comments at workshops held on June 25 through 26, 2013. Given that staff and the project owner have largely come to resolution on the majority of issues, staff herein only provides responses to those PSH comments where resolution is yet to be had.

Comment on Condition of Certification BIO-12: PSH recommended an alternative mitigation strategy for desert tortoise compensation based on the retirement of grazing allotments. During a workshop conducted on July 24, 2013 the project owner provided further information on the proposed ratios and how this may benefit desert tortoise. On July 31, 2013 the project owner filed additional revisions to Condition BIO-12 based on workshop discussions and recommended that up to 50 percent of the mitigation land requirement could be achieved through the retirement of grazing allotments. The project owner proposed mitigation ratios of 3:1 for areas outside of critical habitat and 15:1 ratios for habitat in the Chuckwalla Critical Habitat Unit.

Response: Staff considered the request for this change and acknowledges retirement of grazing allotments can benefit desert tortoise. However, after coordination with REAT agency biologists staff does not recommend adopting the revised language for this FSA. The current mitigation approach was considered and adopted by the Commission. The proposed changes are considerable; depart from the adopted mitigation strategy; have not been subject to public review; and the REAT agencies are not in full agreement on the efficacy of this approach for this project; or in full agreement if this change will ensure full mitigation.

Comment on COC BIO-16: PSH provided a number of recommendations, particularly in payment of annual mitigation fund, and verification language.

Response: Staff has revised the condition based on both project owner and REAT agency feedback.

PSH'S SUPPLEMENTAL COMMENTS ON THE 07/26/13 VERSION OF CONDITION OF CERTIFICATION BIO-17

Comment: Palen Solar provided additional comments to Condition of Certification BIO-17, based on workshop conversations (July 25-26, 2013).

Response: Staff has provided updated language in **BIO-17**.

USFWS EMAIL SENT FROM PALM SPRINGS FISH AND WILDLIFE OFFICE, JULY 13, 2013:

Comment: Assumptions used regarding impacts, conclusions, and supporting rationale have yet to be quantified.

Response: Staff agrees that uncertainty of risk is inherent when permitting an emerging technology. Please refer to staff's response to County of Riverside, Comment 1.

Comment: The USFWS recommends that the project owner implement a Bird and Bat Conservation Agreement to reduce, avoid, and mitigate impacts to birds and bats, and implement an Eagle Conservation Plan (ECP), to minimize effects to bald and golden eagles.

Response: Staff agrees. Please refer to Condition of Certification **BIO-16a** and **BIO-16b** for mitigation specific to adverse effects from collision and damaging exposure to concentrated solar flux. Per BIO-16b #8, staff has recommended development of an Eagle Protection Plan (EPP), the equivalent of an ECP. Development of an ECP is voluntary, however, the USFWS has been clear in noting that advance cooperation of the project owner is recommended, in the event of eagle take. Energy Commission staff believe that implementation of a EPP would be beneficial for eagles, and working in conjunction with the REAT agencies, can capture pertinent tenants of the ECP that are beneficial for eagles.

Comment: The USFWS is formulating monitoring criteria for solar thermal plants, and currently are recommending that 30 percent of the facility footprint be surveyed.

Response: Staff has amended the condition accordingly, to reflect that data collected must be statistically robust. While on-site monitoring is fundamental to understand the impacts of the technology, staff cautions that sub-lethal mortality rates may be much larger than mortality rates, injured birds may travel offsite, or far from where injuries were sustained, and on-site monitoring alone will not capture these events. Energy Commission staff recommend a holistic mitigation approach, considering both lethal and sub-lethal impacts.

Comment: The USWFS maintains concerns regarding impacts to Mojave fringe-toed lizard.

Response: Staff undertook independent assessment of impacts to the sand transport corridor, which in turn, provides insight as to potential project effects on sand dune species, including the Mojave fringe-toed lizard. Please review this FSA for updated analysis.

SHAUN GONZALES, PUBLIC COMMENT, TN # 200041, JULY 25, 2013:

Comment: Birds have been found dead or injured at the two project sites located near the proposed PSEGS site; the majority of the birds were water birds. One of the dead birds was an endangered Yuma clapper rail found at the Desert Sunlight facility near Desert Center. The USFWS Draft Revised Recovery Plan for the Yuma clapper rail (2010) indicates that the species mostly inhabits the Colorado River corridor, while USFWS websites also indicate the species has been spotted at the Salton Sea. Assuming the bird was attracted to the site from its habitat along the Colorado River or Salton Sea, the bird may have flown over 35 miles to reach the project where it perished.

The PSEGS Final Staff Assessment should include analysis to determine 1.) from what distance birds may spot a facility projecting “lake effect” and fly off course, 2.) what species of birds are most prone to collision and “lake effect” distraction, and 3.) if/how the lake effect can be reduced or eliminated. The mortality of water birds should be given significant consideration in analysis of the project’s impacts. Local birds also seem to be at high risk.

Response: Please refer to staff’s response to Basin and Range Watch Comment #23, and responses to County of Riverside Comments #1 and #2, regarding the lack of available data on avian effects from construction and operation of tower power projects.

Comment: What methods will PSEGS use to evict kit foxes from their dens on the site? It seems quite likely that the methods used by NextEra at the Genesis Solar power project caused a canine distemper outbreak among kit foxes in the local area. One beaconed collar previously worn by a kit fox being monitored by wildlife officials was also tracked to a worker’s locked toolbox, raising further questions about solar developers’ compliance with conditions of certification, and the unexpectedly high toll taken on wildlife in the region. It is not clear that California Department of Fish and Wildlife officials determined the cause of that outbreak, or the reason a collar was likely taken by one of the project’s workers.

Response: Tracking animals using transponder collars such as those used at or near the GSEP site is an inexact process, and depending on the user and frequency tuning, may result in inaccurate readings. At the GSEP site, the kit fox in question was eventually tracked and located on the project site. Staff has recommended that the project owner prepare a Badger and Kit Fox Management Plan, per **BIO-17**, to expand on the protective measures already prescribed in **BIO-17**. Staff has conducted significant, additional coordination and outreach with the resource agencies, and has updated relevant Condition of Certification **BIO-17**. Please review this updated condition.

COLORADO RIVER INDIAN TRIBES (CRIT), COMMENTS ON PSA, TN # 200058, JULY 29, 2013:

Comment: Redtail hawks are present in the project area; impacts to this species will adversely impact CRIT and its members. Yet this impact is never mentioned, much less adequately analyzed, in the PSA.

Response: Staff agrees that red-tail hawk might experience adverse effects from construction and operation of the proposed PSEGS project; however, the list of bird species occurring at the project site, and therefore at risk of adverse impacts, is expansive, and staff cannot name and treat every species individually. Therefore, staff has focused attention on those species considered to be afforded extra protection under Appendix G of the CEQA Guidelines and performance standards or thresholds identified by the Energy Commission staff. Mitigation afforded under staff’s recommended condition of certification **BIO-16a** and **BIO-16b**, as well as those conditions requiring habitat acquisition, are applicable to threatened and endangered species, as well non-listed species, such as red-tail hawk. Please review this FSA’s subsection titled “Operation Impacts to Flighted Species” for more information regarding bird and bat impacts.

CONCLUSIONS

Overview of Impacts to Biological Resources: The Palen Solar Electric Generating System (PSEGS project or modified project) would have significant impacts to biological resources that occur on the project site. Implementation of the PSEGS, including site grading, mowing of vegetation and fencing of the site would result in the functional loss of all of the Sonoran creosote bush scrub, sand dunes, desert washes and other native plant and wildlife communities within the approximately 3,794 acre site. The PSEGS project would also result in significant indirect effects to dunes and dune-dependent species downwind of the facility. The direct impacts of the PSPP to sand dune habitat would have been considered significant but would have been mitigated to less-than-significant levels. The impacts of the PSEGS to sand dune habitat would also be considered significant but would be mitigated to less-than-significant levels. The PSEGS would also eliminate habitat for desert tortoise and other special status species, but these impacts can be mitigated to less-than-significant levels.

Without mitigation, the PSEGS project would contribute to cumulatively significant impacts to many biological resources within the Chuckwalla Valley and the Northern and Eastern Colorado Desert Coordinated Management Plan (NECO) area. Staff proposed avoidance, minimization and compensatory mitigation in conditions of certification to compensate for the direct and indirect loss of habitat for several species or natural communities and to offset the PSPP project's contribution to cumulative effects and would. Impacts to the sand transport corridor and sand dunes and all other biological resources could likely be mitigated to less-than-significant levels with implementation of staff's proposed conditions of certification.

Mitigation for Desert Tortoise: Most of the project site provides low to moderate quality habitat for desert tortoise, a species listed as threatened under the federal and state endangered species acts. The project would impact 3,948 acres of desert tortoise habitat, including 228 acres within the Chuckwalla Desert Critical Habitat Unit. Construction and operation of the project would therefore require state and federal endangered species "take" authorization. In addition to direct loss of habitat and impacts to connectivity among desert tortoise populations, the PSEGS project would fragment and degrade adjacent native plant and wildlife communities, and could promote the spread of invasive non-native plants and desert tortoise predators such as ravens.

Conditions of Certification **BIO-9** through **BIO-11** would avoid and minimize potential take of desert tortoise during project construction and operation. To offset the direct and indirect loss of 3,948 acres of desert tortoise habitat, the Condition of Certification **BIO-12** requires habitat compensation at a 1:1 ratio for desert tortoise (i.e., acquisition and preservation of one acre of compensation lands for every acre lost) for disturbance to lands that are not located in Critical Habitat. For project impacts to 228 acres of Chuckwalla Desert Critical Habitat Unit, the mitigation ratio is 5:1. This compensatory mitigation is consistent with BLM guidance in the NECO, and with recommendations from the California Department of Fish and Wildlife (CDFW) and U.S. Fish and Wildlife Service (USFWS). Condition of Certification **BIO-12** requires that the land acquisitions be within the Colorado Desert Recovery Unit, and have potential to contribute to desert tortoise habitat connectivity and build linkages between desert tortoise populations and designated critical habitat. These conditions satisfy the CDFW's requirements under Section 2081 of the California Fish and Game Code.

Condition of Certification **BIO-13** requires implementation of a Raven Management and Monitoring Plan to address project-related increases in ravens, a desert tortoise predator, as well as contributions to help fund a USFWS regional raven management program.

Ephemeral Streams: The project would directly impact 374.7 acres of state jurisdictional waters, eliminating the hydrological, biogeochemical, and habitat functions of this network of ephemeral streams. As many as 32 acres of ephemeral streams downstream of the project area could also be indirectly impacted to some degree. Staff considers the direct, indirect, and cumulative impacts to ephemeral streams to be significant. Condition of Certification **BIO-21** would minimize and offset direct and indirect impacts to state waters to less-than-significant levels and would ensure compliance with CDFW codes that provide protection to these waters. **BIO-21** specifies acquisition of state waters within the Palen watershed, or adjacent watersheds within the Chuckwalla Valley basin at a 1:1 ratio for unvegetated ephemeral dry wash and at a 3:1 ratio for desert dry wash woodland.

Impacts to Groundwater-Dependent Ecosystems: The PSEGS would use 1,130 acre feet/year (afy) of groundwater for the 39-month construction period and 201 afy for the 30 years of operation. Groundwater pumping during construction and operation for the approved PSPP project would have resulted in a drawdown of the water table between 0.1 and 5 feet in an area that contains groundwater-dependent ecosystems such as mesquite groves and desert sink scrubs. The affected area would extend approximately 2 miles out from each well during construction, and includes the sensitive habitats along the southwestern margins of Palen Lake. By the end of operation the affected area would have extended to a 4-mile radius, to the Chuckwalla Valley Dune Thicket Area of Critical Environmental Concern on the southeastern side of Palen Lake; however, the drawdown at that distance would be minor, even under a worst-case analysis assuming no basin recharge. Because the PSEGS would use substantially less water during construction (i.e., 1,130 afy for PSEGS vs. 5,750 afy for PSPP) and operation (i.e., 201 afy for PSEGS vs. 300 afy for PSPP), staff expects the drawdown of ground water to be lower.

Staff anticipates that groundwater-dependent vegetation could experience significant adverse effects if the spring baseline water table drops below the effective rooting depth of the plants. It is uncertain what the maximum rooting depth is and the extent to which these plants depend on groundwater (versus surface flows or precipitation). Consequently, staff is requiring monitoring of groundwater levels and of groundwater-dependent vegetation in proposed Condition of Certification **BIO-23.** If the monitoring detects adverse effects as described in **BIO-23**, remedial action and compensatory mitigation would be implemented as described in proposed Condition of Certification **BIO-24**. With implementation of these mitigation measures the project impacts to groundwater-dependent plant communities would be reduced to less-than-significant levels.

Special-Status Plants: No federal- or state-listed plant species occur within the Project Disturbance Area, but three unlisted species of special-status plants were detected within the disturbance area during the spring 2010 surveys: Harwood's milk-vetch, a California Rare Plant Rank (RPR) List 2B.2 species, California ditaxis (RPR 3.2), and ribbed cryptantha (RPR 4.3 "watch list" species). Harwood's milk-vetch and California ditaxis are also CNDDB State Rank 2, meaning that they are documented from fewer than 20 viable occurrences statewide. Impacts to Harwood's milk-vetch were considered less than significant due to the small numbers of plants impacted by the PSPP project and impacts are similar for the PSEGS. Staff considers impacts to California ditaxis and ribbed cryptantha to be significant absent mitigation. Condition of Certification **BIO-19** describes measures for avoiding and minimizing effects to avoided occurrences of California ditaxis, ribbed cryptantha, and other special-status plants occurring within 100 feet of the project boundary, and contains guidelines for minimizing direct effects along project linears. **BIO-19** also contains guidelines for conducting fall 2013 botanical surveys, triggers for mitigation, and detailed specifications and performance standards to ensure that any additional special-status plants that would have been missed during the previous spring and fall surveys would be mitigated to a less-than-significant level.

Birds: Implementation of the proposed PSEGS project will result in the direct loss of foraging habitat for resident and migratory birds. Desert dry wash woodland, Sonoran creosote bush scrub and other habitat within the project area provides foraging, cover, and/or breeding habitat for resident and migratory birds, including a number of state and federally listed bird species potentially occurring at the site (Swainson's hawk, Yuma clapper rail, bald and golden eagle, gilded flicker, gila woodpecker), as well as various species of special concern (western burrowing owl, short-eared owl, Prairie falcon, yellow warbler, Leconte's thrasher). Migratory birds and their eggs and young are protected by the federal Migratory Bird Treaty Act and Fish and Game Code section 3503. Golden eagles are fully protected under state law, and a take of a golden eagle would violate the California Fish and Game Code. Take permits are not issued for fully protected species. With implementation of proposed conditions of certification, the project may comply with most laws, ordinances, regulations, and standards (LORS), and most direct, indirect, and cumulative impacts would be avoided, minimized, or mitigated to less than significant levels. However, even with the implementation of the proposed conditions of certification the project would kill or injure a large number of birds from either collisions with structures (including mirrors) or from solar flux damage. Birds at risk include golden eagles, a species often seen at the site. Should take of golden eagle occur, a federal permit for such would be required pursuant to federal law. Since state law does not allow take of golden eagle, such take could not be in compliance with state law.

Construction and operation of the project could result in the death or injury of resident and migratory birds. Conditions of Certification **BIO-8** (Impact Avoidance and Best Management Practices), **BIO-15** (Pre-construction Nest Surveys), and staff's newly proposed **BIO-16b** (Avian Protection Plan) would avoid these potentially significant impacts to resident and migratory birds. Potential impacts to burrowing owls would be mitigated by implementation of staff's proposed Condition of Certification **BIO-18.** This condition involves passive relocation of burrowing owls, as well as acquisition of 78 acres of off-site compensatory mitigation lands suitable for burrowing owl. **BIO-16b** requires surveys for nesting golden eagles within one mile of project boundaries, as well as monitoring of the project site for sublethal injury or mortality, and requires funding for a menu of habitat restoration and enhancement measures that would benefit resident and migratory birds. Additionally, **BIO-16b** requires implementation of power line retrofits that would lessen the risk of electrocution for large raptors such as bald and golden eagles, and Swainson's hawk (**BIO-16a**). Conditions of Certification **BIO-12** and **BIO-21** would mitigate for the loss of foraging habitat at the project site by requiring the acquisition of desert tortoise habitat and desert dry washes, which would provide forage and potential migratory stopover resting and shelter sites for birds.

Staff has adopted portions of the recommended mitigation approach provided by the project owner to off-set potential impact to birds from operation of the facility. The approach includes funding the retrofit and enhancement of existing utility lines and the dedication of funds to provide for migratory bird conservation. Staff recommends the project owner increase the amount of the endowment from $500,000.00 to $1,500,000.00. Dedication of this amount would provide an annual stipend that would be used to fund conservation activities during the operational life of the facility. At the conclusion of operation, these funds would be returned to the project owner, provided they complied with applicable facility closure activities.

Alternatively, the project owner may pay $50,000 annually to fund the conservation activities for the life of the project, not to exceed a period of 30 years. If the project owner elects to make annual payments, the annual payments would be adjusted for cost of living increases.

Staff believes significant impacts to avian species may not be fully mitigated even after the implementation of the proposed Conditions of Certification.

<u>Burrowing Mammals</u> American badgers and desert kit fox occur throughout the project area, and construction of the PSEGS is expected to result in direct effects to badgers and kit fox. Because of the large size of the project, badgers or kit foxes may be confined within the desert tortoise exclusion fence and subject to mortality from road kill, loss or alteration of foraging habitat, overlapping territories or barriers to dispersal. In order to construct the PSEGS, the project owner will passively relocate badgers and kit foxes form the site. State regulations (Fish and Game code) currently prohibit trapping of desert kit fox. However, American badger may be trapped as a last resort by a permitted trapper. Staff's proposed revised Condition of Certification **BIO-17** incorporates the project owner's proposed revisions as well as revisions based on coordination with BLM and CDFW. This condition requires pre-construction baseline surveys and avoidance measures to protect badgers and kit fox to reduce project impacts to less than significant levels, as well as an option to participate in the CDFW-led Desert Kit Fox Health Monitoring and Mitigation Program, when established.

<u>Impacts to Sand Dunes/Mojave Fringe-toed Lizards:</u> The PSPP (Reconfigured Alternatives 2 and 3) would have had significant but mitigatable impacts to Mojave fringe-toed lizards, and would have generally avoided interference with the sand transport corridor. The PSEGS would directly affect 1,480 acres of Mojave fringe-toed lizard habitat. The majority of the direct impacts for the PSEGS would be in the less sensitive Zone 3 sand transport corridor. Indirect impacts would occur from impacts to

the sand transport corridor, increased vehicle traffic, and the spread of invasive non-native species.

The Mojave fringe-toed lizards in the Chuckwalla Valley are at the southernmost portion of their range and the direct and indirect impacts of the PSEGS project would significantly increase the risk of local extirpation of already fragmented and isolated populations. Condition of Certification **BIO-20** recommends acquisition, protection and enhancement of core populations of Mojave fringe-toed lizard habitat elsewhere in the Chuckwalla Valley. This compensatory mitigation would offset impacts of the PSEGS to less-than-significant levels.

<u>Cumulative Effects:</u> Construction and operation of the PSEGS project would have cumulatively considerable impacts to many biological resources within the Chuckwalla Valley and NECO planning area, including: desert washes; Mojave fringe-toed lizard; desert tortoise habitat, movement and connectivity; golden eagle; burrowing owl; American badger and desert kit fox; LeConte's thrasher and other desert and migratory birds; the Chuckwalla Valley dune system, desert wash woodland, groundwater-dependent ecosystems, and other natural communities; and special-status plants.

The project's contribution to all impacts, except those to avian species, would be minimized to a level less than cumulatively considerable with implementation of staff's proposed conditions of certification. These conditions include general and species-specific measures for avoidance, minimization, and compensation, detailed monitoring and reporting requirements, and mitigation security and verification to ensure implementation. Staff's proposed conditions address individually minor but cumulatively considerable effects and include measures to minimize the spread of invasive non-native plants, fragmentation, an increase in raven predation, increased roadkills, bird collisions, electrocutions, exposure to solar flux, increased disturbance from noise and lighting, fugitive dust, chemical drift, unauthorized ORV use of temporary access roads, and accidental impacts during construction and operation.

PROPOSED CONDITIONS OF CERTIFICATION

Staff has proposed modifications to the **Biological Resources** conditions of certification as shown below. (**Note:** Deleted text is in ~~strikethrough~~, new text is **<u>bold and underlined</u>**).

The conditions of certification below are generally the same as those in the Commission Final Decision for the PSPP published in March 2010. However, staff has revised some of the conditions to reflect suggested changes and additional information from the project owner and other parties, changes from the approved project to the PSEGS project, and from new information available since the publication of the Commission Final Decision in 2010. In 2013, as mandated by AB 2402, California Department of Fish and Game (DFG) officially changed its name to California Department of Fish and Wildlife (CDFW), Staff has updated all relevant conditions of certification to reflect the new name. **Biological Resources Table 11** summarizes the changes to conditions of certification for the PSEGS from the Commission Final Decision for the PSPP.

Biological Resources Table 11
Summary of Changes to Conditions of Certification

Condition of Certification	Changes from RSA to PSPP Commission Final Decision
BIO-1 Designated Biologist Selection and Qualifications	Changed the timing of verification for the submittal of Designated Biologist resume from 30 days to 60 days to allow approval prior submittal of plans which require Designated Biologist review; clarified the verification timing to coordinate with key project definitions in the revised General Conditions.
BIO-2 Designated Biologist Duties	Clarified timing of performance of Designated Biologist monitoring activities to coordinate with key project definitions in the revised General Conditions; revised duties to address recent guidance regarding desert kit fox mortality reporting in response to outbreak of canine distemper in the region; revised duties regarding addressing standing water in response to lessons learned on other solar projects in region.
BIO-3 Biological Monitor Selection and Qualifications	Clarified the Designated Biologist must be approved prior to submitting Biological Monitor resumes; changed the timing of verification for the submittal of Biological Monitor resume from 30 days to45 days to allow approval prior to performance of required pre-construction surveys; clarified the verification timing to prior to pre-construction site mobilization.
BIO-4 Biological Monitor Duties	Clarified timing of performance of Biological Monitor monitoring activities to coordinate with key project definitions in the revised General Conditions.
BIO-5 Designated Biologist and Biological Monitor Authority	No change.
BIO-6 Worker Environmental Awareness Program	Clarified role of party responsible for developing WEAP; clarified training requirements to address providing more pertinent information regarding special-status species; modified content of training to address solar flux impacts during operations; clarified reporting of WEAP training; changed the timing of verification for the submittal of WEAP from 30 days to 45 days to allow approval prior to performance of required pre-construction surveys; clarified the verification timing to coordinate with key project definitions in the revised General Conditions.
BIO-7 Biological Resources Mitigation Implementation & Monitoring Plan	Added the American Badger and Kit Fox Management Plan to list of plans to be included in BRMIMP; added requirements to address canine distemper outbreak in regional desert kit fox population and issues with standing water on other solar projects in construction; added standard requirement to provide aerial photographs prior to disturbance and post-construction; changed the timing of verification for the submittal of draft BRMIMP from 30 days to 60 days and final BRMIMP from 7 days to 30 days to allow approval prior to performance of required pre-construction surveys; clarified the verification timing to coordinate with key project definitions in the revised General Conditions;
BIO-8 Impact Avoidance and Minimization Measures	Item 4 edited since vegetation will be left on site and that a Designated Biologist or Biological Monitor shall be onsite during all project activities that have potential to disturb previously undisturbed soil, vegetation or wildlife. Clarified drivers during project construction and operation shall abide posted speed limits on paved roads; clarified wildlife salvage requirements to address canine distemper outbreak in regional desert kit fox populations; added additional requirements regarding use of toxic substances; clarified guidance in most recent USFWS Desert Tortoise Field Manual will be followed; added reporting and handling requirements for desert kit fox in response to recent canine distemper

Condition of Certification	Changes from RSA to PSPP Commission Final Decision
	outbreak in regional population; add requirements to address noxious weeds to address impacts from leaving vegetation on site during project development and operations; added requirements to address Best Management Practices for vegetation management, clarified the verification timing to coordinate with key project definitions in the revised General Conditions
BIO-9 Desert Tortoise Clearance Surveys and Fencing	Clarified proposed alignments for permanent or temporary fencing shall be flagged; clarified guidance in most recent USFWS Desert Tortoise Field Manual will be followed.
BIO-10 Desert Tortoise Relocation/Translocation Plan	Revised to include requirement to submit revised draft plan based on previously submitted draft plan to incorporate changes to the project from the PSPP, clarified the verification timing to coordinate with key project definitions in the revised General Conditions
BIO-11 Desert Tortoise Compliance Verification	No change except updated CDFG to CDFW.
BIO-12 Desert Tortoise Compensatory Mitigation	Clarified that ground disturbance includes pre-construction site mobilization
BIO-13 Raven Management Plan	Revised to include requirement to submit revised draft plan based on previously submitted draft plan to incorporate changes to the project from the PSPP. Clarified the verification timing to coordinate with key project definitions in the revised General Conditions
BIO-14 Weed Management Plan	Added requirement that a copy of the BLM issued Pesticide Use Permit prior to using herbicides onsite. Clarified the verification timing to coordinate with key project definitions in the revised General Conditions
BIO-15 Pre-Construction Nest Surveys	No change.
BIO-16 Avian Protection Plan	Now revised into two parts, **BIO-16a** and **BIO-16b**. Now titled Avian Enhancement and Conservation Plan
BIO-16b	Avian and Bat Protection Plan
BIO-17 Badger and Kit Fox Avoidance and Minimization Measures-	Approved language deleted in its entirety. Extensively revised and expanded to address recent issues with canine distemper outbreak in desert kit fox populations in region of project. Updated based on PSH comments on PSA and coordination with BLM and CDFW. Incorporated newly proposed CDFW led Monitoring and Mitigation Program.
BIO-18 Burrowing Owl Impact Avoidance and Minimization Measures	Incorporated project owner proposed edits. Incorporated CDFW Staff Report on Burrowing Owl (2012) requirements. Clarified the verification timing to coordinate with key project definitions in the revised General Conditions
BIO-19 Special-Status Plant Impact Avoidance and Minimization	Updated fall plant survey requirements from 2010 to 2013. Incorporated project owner proposed edits. Clarified the verification timing to coordinate with key project definitions in the revised General Conditions
BIO-20 Sand Dune Community/Mojave Fringe-Toed Lizard Mitigation	Clarified the verification timing to coordinate with key project definitions in the revised General Conditions
BIO-21 Mitigation for Impacts to State Waters	Clarified the verification timing to coordinate with key project definitions in the revised General Conditions
BIO-22 Closure Plan	Clarified the verification timing to coordinate with key project definitions in the revised General Conditions
BIO-23 Groundwater Dependent Vegetation Monitoring	Removed language referencing 2010 start date of construction and updated map references for PSEGS.
BIO-24 Remedial Action for Adverse Effects to	No change

Condition of Certification	Changes from RSA to PSPP Commission Final Decision
Groundwater-dependent Biological Resources	
BIO-25 Golden Eagle Inventory and Monitoring	Staff has adapted the tenets of the Golden Eagle Inventory and Monitoring Plan within the revised Condition of Certification **BIO-16**, Avian and Bat Protection Plan; and therefore has deleted this condition.
BIO-26 Evaporation Pond Netting and Monitoring	No change.
BIO-27 Revegetation of Temporarily Disturbed Areas	**BIO-27** deleted as part PSPP Final Commission Decision,
BIO-28 In-Lieu Fee Mitigation Option	Incorporated project owner proposed edits
BIO-29 Phasing	Updated Tables 1-3 to include new impacts acreages and costs.

Compensatory mitigation securities, based on the REAT Biological Resources Mitigation/Compensation Cost Estimate Calculation Table dated July 23, 2010 (REAT 2010) (**Biological Resources Table 6b**) are included in **Biological Resources Table 22. Biological Resources Tables 23 and 24** include impacts and securities estimates based on a phased construction approach. Securities are subject to change based on updates to the REAT Biological Resources Table, and mitigation amounts are subject to change based on changes to the Project Disturbance Area impacts.

Biological Resources Table 12[1]
Compensatory Mitigation Securities

COC	Description	Security		
		PSEGS (proposed modified project)	PSPP Reconfigured Alternative 2 (approved project)	PSPP Reconfigured Alternative 3 (approved project)
BIO-12	Loss of desert tortoise habitat	$15,007,680	$16,169,290	$15,962,857
BIO-13	One-time USFWS Regional Raven Management Program fee[2]	$414,540	$458,430	$454,650
BIO-18	Impacts to burrowing owls	$250,089	$255,330	$255,330
BIO-20	Loss of Mojave fringe-toed lizards and habitat	$6,372,705	$5,765,569	$6,002,358
BIO-21	Impacts to state waters	$2,433,344	$2,580,835	$2,433,275

1– Securities (aside from Raven fees) based on REAT Biological Resources Mitigation/Compensation Cost Estimate Calculation Table - July 23, 2010 (REAT 2010) but assuming 160-acre parcels. Security amounts may change based on final project footprint. The final amount shall be determined by an updated appraisal conducted as described in **BIO-12.**
2 – Based on U.S. Fish and Wildlife Service Cost Allocation Methodology for Implementation of the Regional Raven Management Plan, dated July 9, 2010 (USFWS 2010b). Fee calculated at $105/acre for direct project impacts.

Biological Resources Table 13[1]
Compensatory Mitigation Acreage – Phased Approach

COC	Description	Compensatory Acreage		
		PSEGS (proposed modified project)	PSPP (approved project) Reconfigured Alternative 2	PSPP (approved project) Reconfigured Alternative 3
Phase 1				
BIO-12	Loss of desert tortoise habitat[2]	1658	3263	3120
BIO-13	Acres subject to the one-time USFWS Regional Raven Management Program fee	954	2398	2271
BIO-18	Impacts to 4 burrowing owls	78	78	78
BIO-20	Loss of Mojave fringe-toed lizards and habitat	27.7	827	827
BIO-21	Impacts to state waters	64.8	713	680
Phase 2				
BIO-12	Loss of desert tortoise habitat[2]	3203	1854	1929
BIO-13	One-time USFWS Regional Raven Management Program fee	2993.9	1968	2059
BIO-18	Impacts to 4 burrowing owls	0	0	0
BIO-20	Loss of Mojave fringe-toed lizards and habitat	2036	1060	1138
BIO-21	Impacts to state waters	723	101	91

1 – Sources: PSEGS project – estimate prepared by staff based on GIS files provide by Palen Solar Holdings (Palen 2013a)); Reconfigured Alternatives 2 and 3 - Solar Millennium 2010l.
2 – Impacts to desert tortoise critical habitat are assumed to be wholly within the Phase 1 Project Disturbance Area.
3 – Phase 1 impacts include some impacts that are indirect impacts of Phase 1, but direct impacts of Phase 2. Phase 2 impact acreages are adjusted to credit acreages already captured in Phase 1.

Biological Resources Table 14[1]
Compensatory Mitigation Securities – Phased Approach

COC	Description	Security: PSEGS (proposed modified project)	Security: PSPP (approved project) Reconfigured Alternative 2	Security: PSPP (approved project) Reconfigured Alternative 3
Phase 1				
BIO-12	Loss of desert tortoise habitat[2]	$5,116,816.00	$10,337,345	$9,884,387
BIO-13	One-time USFWS Regional Raven Management Program fee[3]	$100,181	$251,805	$238,430
BIO-18	Impacts to 4 burrowing owls [4]	$250,089	$255,330	$255,330
BIO-20	Loss of Mojave fringe-toed lizards and habitat[2]	$85,537	$2,529,118	$2,529,118
BIO-21	Impacts to state waters	$200,720	$2,257,200	$2,158,204
BIO-24	Remedial action for adverse effects to groundwater-dependent plants	Pending	Pending	Pending
Phase 2				
BIO-12	Loss of desert tortoise habitat[2]	$9,890,864	$5,892,485	$6,139,011
BIO-13	One-time USFWS Regional Raven Management Program fee[3]	$314,360	$206,625	$216,220
BIO-18	Impacts to 4 burrowing owls (78 acres of compensatory mitigation) [4]	0	0	0
BIO-20	Loss of Mojave fringe-toed lizards and habitat[2]	$6,287,168	$3,236,451	$3,473,241
BIO-21	Impacts to state waters	$2,232,624	$325,213	$293,641

1– Securities (aside from Raven fees) based on REAT Biological Resources Mitigation/Compensation Cost Estimate Calculation Table - July 23, 2010 (REAT 2010) but assuming 160-acre parcels. Security amounts may change based on final project footprint. The final amount shall be determined by an updated appraisal conducted as described in **BIO-12.** Total securities for desert tortoise and state water mitigation under the phased approach may be higher than the lump sum total described in **Biological Resources Table 12**; some fees included in the REAT (2010) table are based on the number of transactions, which would be higher under the phased approach.
2 – Impacts to desert tortoise critical habitat are assumed to be wholly within the Phase 1 Project Disturbance Area.
3 – Based on U.S. Fish and Wildlife Service Cost Allocation Methodology for Implementation of the Regional Raven Management Plan, dated July 9, 2010 (USFWS 2010b). Fee calculated at $105/acre for direct project impacts.
4 –Phase 1 securities include some securities for impacts that are indirect impacts in Phase 1, but direct impacts of Phase 2. Phase 2 securities are adjusted to credit securities already captured in Phase 1.

DESIGNATED BIOLOGIST SELECTION AND QUALIFICATIONS[7]

BIO-1 The Project owner shall assign at least one Designated Biologist to the Project. The Project owner shall submit the resume of the proposed Designated Biologist(s), with at least three references and contact information, to the Energy Commission Compliance Project Manager (CPM) for approval in consultation with CDF~~G~~**W** and USFWS.

The Designated Biologist must meet the following minimum qualifications:

1. Bachelor's degree in biological sciences, zoology, botany, ecology, or a closely related field;

2. Three years of experience in field biology or current certification of a nationally recognized biological society, such as The Ecological Society of America or The Wildlife Society;

3. Have at least one year of field experience with biological resources found in or near the Project area;

4. Meet the current USFWS Authorized Biologist qualifications criteria (www.fws.gov/ventura/speciesinfo/protocols_guidelines), demonstrate familiarity with protocols and guidelines for the desert tortoise, and be approved by the USFWS; and

5. Possess a California ESA Memorandum of Understanding pursuant to Section 2081(a) for desert tortoise.

In lieu of the above requirements, the resume shall demonstrate to the satisfaction of the CPM, in consultation with CDF~~G~~**W** and USFWS, that the proposed Designated Biologist or alternate has the appropriate training and background to effectively implement the Conditions of Certification.

Verification: At least ~~30~~ **60** days prior to ~~construction-related ground disturbance~~ **site mobilization or construction activities**, the Project owner shall submit the resumes of the Designated Biologists(s) along with the completed USFWS Desert Tortoise Authorized Biologist Request Form (www.fws.gov/ventura/speciesinfo/protocols_guidelines) and submit it to the USFWS and the CPM for review and final approval.

No site mobilization or construction-related ground disturbance ~~, grading, boring, or trenching~~ shall commence until an approved Designated Biologist is available to be on site.

[7] USFWS <www.fws.gov/ventura/speciesinfo/protocols_guidelines/docs/dt> designates biologists who are approved to handle tortoises as "Authorized Biologists." Such biologists have demonstrated to the USFWS that they possess sufficient desert tortoise knowledge and experience to handle and move tortoises appropriately, and have received USFWS approval. Authorized Biologists are permitted to then approve specific monitors to handle tortoises, at their discretion. The California Department of Fish and Wildlife (CDFW) must also approve such biologists, potentially including individual approvals for monitors approved by the Authorized Biologist. **Designated Biologists are the equivalent of Authorized Biologists.** Only Designated Biologists and certain Biological Monitors who have been approved by the Designated Biologist would be allowed to handle desert tortoises

If a Designated Biologist needs to be replaced, the specified information of the proposed replacement must be submitted to the CPM at least 10 working days prior to the termination or release of the preceding Designated Biologist. In an emergency, the Project owner shall immediately notify the CPM to discuss the qualifications and approval of a short-term replacement while a permanent Designated Biologist is proposed to the CPM for consideration.

DESIGNATED BIOLOGIST DUTIES

BIO-2 The Project owner shall ensure that the Designated Biologist performs the activities described below during any site mobilization **and construction** ~~activities, construction-related ground disturbance, grading, boring, or trenching activities,~~ **commissioning, operation, non-operation or closure, or other activities that may impact biological resources**. The Designated Biologist may be assisted by the approved Biological Monitor(s) but remains the contact for the Project owner and the CPM. The Designated Biologist Duties shall include the following:

1. Advise the Project owner's Construction and Operation Managers on the implementation of the biological resources conditions of certification;

2. Consult on the preparation of the Biological Resources Mitigation Implementation and Monitoring Plan (BRMIMP) to be submitted by the Project owner;

3. Be available to supervise, conduct and coordinate mitigation, monitoring, and other biological resources compliance efforts, particularly in areas requiring avoidance or containing sensitive biological resources, such as special-status species or their habitat;

4. Clearly mark sensitive biological resource areas and inspect these areas at appropriate intervals for compliance with regulatory terms and conditions;

5. Inspect active construction areas where animals may have become trapped prior to construction commencing each day. At the end of the day, inspect for the installation of structures that prevent entrapment or allow escape during periods of construction inactivity. Periodically inspect areas with high vehicle activity (e.g., parking lots) for animals in harm’s way;

6. Notify the Project owner and the CPM of any non-compliance with any biological resources condition of certification;

7. Respond directly to inquiries of the CPM regarding biological resource issues;

8. **Determine and oversee implementation of remedial actions any time water has been observed standing onsite in accordance with Condition of Certification BIO-8. The project owner shall initiate remedial methods in consultation with the Designated Biologist in accordance with Condition of Certification BIO-8 after standing water**

has been observed on the project site. Remedial methods may include grading, pumping spraying, tilling, or any other means to disperse or ensure evaporation and/or absorption of standing water. Other remedial efforts may be determined in conjunction with CPM review and approval. Descriptions of remedial efforts, including photo documentation, and discussion of results of remedial efforts must be included in the Monthly Compliance Report;

9. **Respond to reports of onsite kit fox mortality or injury, and to the extent possible, reports of dead or injured kit fox offsite and immediately adjacent the project boundaries or on access roads in accordance with Condition of Certification BIO-17, and undertake restorative and/or disease prevention actions as specified within the American Badger and Kit Fox Management Plan prepared in accordance with Condition of Certification BIO-17;**

10. Maintain written records of the tasks specified above and those included in the BRMIMP. Summaries of these records shall be submitted in the Monthly Compliance Report and the Annual Compliance Report;

11. Train the Biological Monitors as appropriate, and ensure their familiarity with the BRMIMP, Worker Environmental Awareness Program (WEAP) training, and USFWS guidelines on desert tortoise surveys and handling procedures <www.fws.gov/ventura/speciesinfo/protocols_guidelines>; and

12. Maintain the ability to be in regular, direct communication with representatives of CDF~~G~~**W**, USFWS, and the CPM, including notifying these agencies of dead or injured listed species and reporting special-status species observations to the California Natural Diversity Database (CNDDB).

Verification: The Designated Biologist shall provide copies of all written reports and summaries that document biological resources compliance activities in the Monthly Compliance Reports submitted to the CPM. If actions may affect biological resources during operation a Designated Biologist shall be available for monitoring and reporting. During Project operation, the Designated Biologist shall submit record summaries in the Annual Compliance Report unless his or her duties cease, as approved by the CPM.

BIOLOGICAL MONITOR SELECTION AND QUALIFICATIONS

BIO-3 The **project owner's approved** Designated Biologist shall submit the resume, at least three references, and contact information of the proposed Biological Monitors to the CPM. The resume shall demonstrate, to the satisfaction of the CPM, the appropriate education and experience to accomplish the assigned biological resource tasks. The Biological Monitor is the equivalent of the USFWS designated Desert Tortoise Monitor (USFWS 2008).

Biological Monitor(s) training by the Designated Biologist shall include familiarity with the conditions of certification, BRMIMP, WEAP, and USFWS guidelines on desert tortoise surveys and handling procedures <www.fws.gov/ventura/speciesinfo/protocols_guidelines>.

Verification: The Project owner shall submit the specified information to the CPM for approval at least ~~30~~ **45** days prior to the start of any site mobilization or construction **activities**~~-related ground disturbance, grading, boring, and trenching~~. The Designated Biologist shall submit a written statement to the CPM confirming that individual Biological Monitor(s) has been trained including the date when training was completed. If additional biological monitors are needed during construction the specified information shall be submitted to the CPM for approval at least 10 days prior to their first day of monitoring activities.

BIOLOGICAL MONITOR DUTIES

BIO-4 The Biological Monitors shall assist the Designated Biologist in conducting surveys and in monitoring of site mobilization ~~activities,~~ **and** construction **including**~~-related~~ ground disturbance**, site preparation, or permanent installation activities, including installation of desert tortoise exclusion fencing,** ~~grading, boring, trenching,~~ or reporting. The Designated Biologist shall remain the contact for the Project owner and the CPM.

Verification: The Designated Biologist shall submit in the Monthly Compliance Report to the CPM copies of all written reports and summaries that document biological resources compliance activities, including those conducted by Biological Monitors. If actions may affect biological resources during operation a Biological Monitor, under the supervision of the Designated Biologist, shall be available for monitoring and reporting.

DESIGNATED BIOLOGIST AND BIOLOGICAL MONITOR AUTHORITY

BIO-5 The Project owner's construction/operation manager shall act on the advice of the Designated Biologist and Biological Monitor(s) to ensure conformance with the biological resources conditions of certification. The Project owner shall provide Energy Commission staff with reasonable access to the Project site under the control of the Project owner and shall otherwise fully cooperate with the Energy Commission's efforts to verify the Project owner's compliance with, or the effectiveness of, mitigation measures set forth in the conditions of certification. The Designated Biologist shall have the authority to immediately stop any activity that is not in compliance with these conditions and/or order any reasonable measure to avoid take of an individual of a listed species. If required by the Designated Biologist and Biological Monitor(s) the Project owner's construction/operation manager shall halt all site mobilization **and construction**, **including** ground disturbance, **site preparation, or permanent installation activities, including installation of desert tortoise exclusion fencing**~~, grading, boring, trenching~~, and operation activities in areas specified by the Designated Biologist. The Designated Biologist shall:

1. Require a halt to all activities in any area when determined that there would be an unauthorized adverse impact to biological resources if the activities continued;

2. Inform the Project owner and the construction/operation manager when to resume activities; and

3. Notify the CPM if there is a halt of any activities and advise them of any corrective actions that have been taken or would be instituted as a result of the work stoppage. If the work stoppage relates to desert tortoise or any other federal- or state-listed species, the ~~Carlsbad~~ **Palm Springs** Office of the USFWS and the Ontario Office of the CDF~~G~~**W** shall also be notified.

If the Designated Biologist is unavailable for direct consultation, the Biological Monitor shall act on behalf of the Designated Biologist. **It is expected the Designated Biologist will be onsite during construction or otherwise available by phone.**

Verification: The Project owner shall ensure that the Designated Biologist or Biological Monitor notifies the CPM and BLM immediately (and no later than the morning following the incident, or Monday morning in the case of a weekend) of any non-compliance or a halt of any site mobilization, ground disturbance, grading, construction, or operation activities. If the non-compliance or halt to construction or operation relates to desert tortoise or any other federal- or state-listed species, the Project owner shall also notify ~~Carlsbad~~ **Palm Springs** Office of the USFWS and the Ontario Office of the CDF~~G~~**W** at the same time. The Project owner shall notify the CPM of the circumstances and actions being taken to resolve the problem.

Whenever corrective action is taken by the Project owner, a determination of success or failure will be made by the CPM in consultation with BLM, USFWS and CDF~~G~~**W** within 5 working days after receipt of notice that corrective action is completed, or the Project owner would be notified by the CPM that coordination with other agencies would require additional time before a determination can be made.

WORKER ENVIRONMENTAL AWARENESS PROGRAM (WEAP)

BIO-6 The Project owner shall develop and implement a Project-specific Worker Environmental Awareness Program (WEAP) and shall secure approval for the WEAP from the CPM. The Project owner shall also provide the USFWS and CDF~~G~~**W** a copy of all portions of the WEAP relating to desert tortoise and any other federal or state-listed species for review and comment. The WEAP shall be administered to all onsite personnel including surveyors, construction engineers, employees, contractors, contractor's employees, supervisors, inspectors, subcontractors, and delivery personnel. The WEAP shall be implemented during site **mobilization and** ~~preconstruction,~~ construction, **commissioning,** operation, **non-operation,** and closure. The WEAP shall:

1. Be developed by or in consultation with the Designated Biologist and consist of an on-site or training center presentation in which supporting written material and electronic media, including photographs of protected species **and their habitat**, is made available to all participants;

2. Discuss the locations and types of sensitive biological resources on the Project site and adjacent areas, and explain the reasons for protecting these resources; provide information to participants that no snakes or

other wildlife shall be **intentionally** harmed **(unless posing a reasonable and immediate threat to humans)**;

3. Place special emphasis on desert tortoise, including **pictures and** information on physical characteristics, distribution, behavior, ecology, sensitivity to human activities, legal protection, penalties for violations, reporting requirements, and protection measures;

4. **Provide pictures of golden eagles, American badger, desert kit fox, Mojave fringe-toed lizard, and burrowing owl, provide information on sensitivity to human activities, legal protection, reporting requirements, and how to identify construction avoidance zones for these species as marked by flagging, staking, or other means, also describe the protections for bird nests and provide information as described above;**

5. **Provide overview for staff of potential impacts to reptiles and amphibians from vehicle strikes on all project roads (paved and unpaved) during construction, operations, closure phases, reporting requirements, and protection measures;**

6. **Provide overview of potential impacts to avian species from concentrated solar flux created during start up and operations phase, reporting requirements, and protection measures;**

7. Include a discussion of fire prevention measures to be implemented by workers during Project activities and request workers to: a) dispose of cigarettes and cigars appropriately and not leave them on the ground or buried, b) keep vehicles on graveled or well-maintained roads at all times to prevent vehicle exhaust systems from coming in contact with roadside weeds, c) use and maintain approved spark arresters on all power equipment, and d) keep a fire extinguisher on hand at all times

8. Describe the temporary and permanent habitat protection measures to be implemented at the Project site;

9. Identify whom to contact if there are further comments and questions about the material discussed in the program; and

10. Include a training acknowledgment form to be signed by each worker indicating that they received training and shall abide by the guidelines.

The specific program can be administered by a competent individual(s) acceptable to the Designated Biologist, **and documented within the Monthly Compliance Report.**

Verification: At least ~~30~~ **45** days prior to start of **site mobilization and** construction~~-related ground disturbance~~, the Project owner shall provide to the CPM for review and approval and to BLM, USFWS and **CDFW**~~G~~ a copy of the final WEAP and all supporting written materials and electronic media prepared or reviewed by the Designated Biologist and a resume of the person(s) administering the program.

The project owner shall provide in the Monthly Compliance Report the number of persons who have completed the training in the prior month and a running total of all persons who have completed the training to date. At least 10 days prior to **site mobilization and** construction~~-related ground disturbance activities~~ the project owner shall submit two copies of the approved final WEAP **and implement the training for all workers.**

Training acknowledgement forms signed during construction shall be kept on file by the project owner for at least 6 months after the start of commercial operation.

Throughout the life of the project, the WEAP shall be repeated annually for permanent employees, and shall be routinely administered within 1 week of arrival to any new construction personnel, foremen, contractors, subcontractors, and other personnel potentially working within the project area. Upon completion of the orientation, employees shall sign a form stating that they attended the program and understand all protection measures. These forms shall be maintained by the project owner and shall be made available to the CPM, BLM, USFWS and ~~CDFG~~ **CDFW** and upon request. Workers shall receive and be required to visibly display a hardhat sticker or certificate that they have completed the training.

During Project operation, signed statements for operational personnel shall be kept on file for 6 months following the termination of an individual's employment.

BIOLOGICAL RESOURCES MITIGATION IMPLEMENTATION AND MONITORING PLAN

BIO-7 The Project owner shall develop a Biological Resources Mitigation Implementation and Monitoring Plan (BRMIMP), and shall submit two copies of the proposed BRMIMP to the CPM and BLM for review and approval and USFWS and CDF~~G~~**W** for review. The Project owner shall implement the measures identified in the approved BRMIMP. The BRMIMP shall incorporate avoidance and minimization measures described in final versions of the Desert Tortoise Translocation Plan~~, **the Biological Opinion,**~~ the Raven Management Plan, the Closure, Conceptual Restoration Plan, **the American Badger and Kit Fox Management Plan,** the Burrowing Owl Mitigation and Monitoring Plan, the Weed Management Plan, and all other individual biological mitigation and/or monitoring plans associated with the Project. The Project owner shall provide to CDF~~GW~~ and USFWS a copy of all portions of the BRMIMP relating to desert tortoise and any other federal or state-listed species for review and comment.

The BRMIMP shall be prepared in consultation with the Designated Biologist and shall include accurate and up-to-date maps depicting the location of sensitive biological resources that require temporary or permanent protection during construction and operation. The BRMIMP shall include complete and detailed descriptions of the following:

1. All biological resources mitigation, monitoring, and compliance measures proposed and agreed to by the Project owner;

2. All biological resources conditions of certification identified as necessary to avoid or mitigate impacts;

3. All biological resource mitigation, monitoring, and compliance measures required in federal agency terms and conditions, such as those provided in the USFWS Biological Opinion;

4. All sensitive biological resources to be impacted, avoided, or mitigated by Project construction, operation, and closure;

5. All required mitigation measures for each sensitive biological resource, **including remedial actions for standing water onsite in accordance with Condition of Certification BIO-8 and known or suspected disease outbreaks on the project site in accordance with Condition of Certification BIO-17**;

6. **Aerial photographs, at an approved scale, of all areas to be disturbed during project construction activities; include one set prior to any site or related facilities mobilization disturbance and one set subsequent to completion of project construction. Provide planned timing of aerial photography and a description of why times were chosen. Provide a final accounting of the before/after whole acreages and a determination of whether more or less habitat compensation is necessary in the Construction Termination Report prepared in accordance with BIO-29**

7. All measures that shall be taken to avoid or mitigate temporary disturbances from construction activities;

8. Duration for each type of monitoring and a description of monitoring methodologies and frequency;

9. Performance standards to be used to help decide if/when proposed mitigation is or is not successful;

10. All performance standards and remedial measures to be implemented if performance standards are not met;

11. Biological resources-related facility closure measures including a description of funding mechanism(s);

12. A process for proposing plan modifications to the CPM and appropriate agencies for review and approval; and

13. A requirement to submit any sightings of any special-status species that are observed on or in proximity to the Project site, or during Project surveys, to the CNDDB per CDF~~G~~**W** and BLM requirements.

Verification: The Project owner shall submit the draft BRMIMP to the CPM and BLM at least ~~30~~ **45** days prior to start of any **site mobilization and construction** ~~preconstruction site mobilization and construction-related ground disturbance, grading, boring, and trenching~~. At the same time the Project owner shall provide to CDF~~G~~**W** and USFWS a copy of all portions of the draft BRMIMP relating to desert tortoise and any other federal or state-listed species. The Project owner shall provide final BRMIMP to the CPM, BLM, CDF~~G~~**W** and USFWS at least 7 days prior to start of any ~~**preconstruction**~~ **site mobilization and** construction~~-related ground disturbance, grading, boring, and trenching~~. The BRMIMP shall contain all of the required measures included in all biological conditions of certification. No **site mobilization or**~~-~~construction **activities**~~-related ground disturbance, grading, boring, or trenching~~ may occur prior to approval of the final BRMIMP by the CPM and BLM.

If any permits have not yet been received when the final BRMIMP is submitted, these permits shall be submitted to the CPM within 5 days of their receipt, and the BRMIMP shall be revised or supplemented to reflect the permit condition(s). The Project owner shall submit to the CPM and BLM the revised or supplemented BRMIMP within 10 days following the Project owner's receipt of any additional permits. Under no circumstances shall ground disturbance proceed without implementation of all permit conditions.

To verify that the extent of construction disturbance does not exceed that described in these conditions, the Project owner shall submit aerial photographs, at an approved scale, taken before and after construction to the CPM, BLM, USFWS and CDF~~G~~**W**. The first set of aerial photographs shall reflect site conditions prior to any ~~preconstruction~~ site mobilization and construction **activities**~~-related ground disturbance, grading, boring, and trenching,~~ and shall be submitted prior to initiation of such activities. The second set of aerial photographs shall be taken subsequent to completion of construction, and shall be submitted to the CPM, BLM, USFWS and CDF~~G~~**W** no later than 90 days after completion of construction. The Project owner shall also provide a final accounting in whole acres of vegetation communities/cover types present before and after construction. Construction acreages shall be rounded to the nearest acre.

Any changes to the approved BRMIMP must be approved by the CPM and BLM in consultation with CDF~~G~~**W** and USFWS.

Implementation of BRMIMP measures (for example, construction activities that were monitored, species observed) shall be reported in the Monthly Compliance Reports by the Designated Biologist. Within 30 days after completion of Project construction, the Project owner shall provide to the CPM, for review and approval, a written construction termination report identifying which items of the BRMIMP have been completed, a summary of all modifications to mitigation measures made during the Project's ~~preconstruction~~ site mobilization and construction **activities**~~-related ground disturbance,~~

~~grading, boring, and trenching~~, and which mitigation and monitoring items are still outstanding.

IMPACT AVOIDANCE AND MINIMIZATION MEASURES

BIO-8 The Project owner shall undertake the following measures to manage the Project site and related facilities during **site mobilization,** construction, operation and maintenance in a manner to avoid or minimize impacts to biological resources:

1. Limit Disturbance Areas. Minimize soil disturbance by locating staging areas, laydowns, and temporary parking or storage for linears in existing disturbed areas. Equipment maintenance and refueling shall not be conducted within 100 feet of any sensitive resource (for example, waters of the state, desert dry wash woodland, dune habitats and rare plant populations). Limit the width of the work area near sensitive resources. Avoid blading temporary access roads where feasible and instead drive over and crush the vegetation to preserve the seed bank and biotic soil crusts. The boundaries of all areas to be disturbed (including staging areas, access roads, and sites for temporary placement of spoils) shall be delineated with stakes and flagging prior to **site mobilization and** construction activities in consultation with the Designated Biologist. Spoils and topsoil shall be stockpiled in disturbed areas lacking native vegetation and which do not provide habitat for special-status species. Parking areas, staging and disposal site locations shall similarly be located in areas without native vegetation or special-status species habitat. All disturbances, Project vehicles and equipment shall be confined to the flagged areas.

2. Minimize Road Impacts. New and existing roads that are planned for construction, widening, or other improvements shall not extend beyond the flagged impact area as described above. All vehicles passing or turning around would do so within the planned impact area or in previously disturbed areas. Where new access is required outside of existing roads or the construction zone, the route shall be clearly marked (i.e., flagged and/or staked) prior to the onset of construction.

3. Minimize Traffic Impacts. Vehicular traffic during Project **site mobilization,** construction and operation shall be confined to existing routes of travel to and from the Project site, and cross country vehicle and equipment use outside designated work areas shall be prohibited. The speed limit shall not exceed 25 miles per hour **on paved or stabilized unpaved roads** within the Project area, on maintenance roads for linear facilities, or on access roads to the Project site. **No vehicle shall exceed 10 miles per hour on unpaved areas within the project site, except on stabilized unpaved roads. Project vehicles shall abide by posted speed limits on public paved access roads outside the project site. Additional speed limit signs shall be posted within areas where Mojave fringe toed lizard are known to occur or have the potential to occur on site.**

4. Monitor During Construction. In areas that have not been fenced with desert tortoise exclusion fencing and cleared, the Designated Biologist shall be present at the construction site during all Project activities that have potential to disturb soil, vegetation, and wildlife. **Upon completion of desert tortoise fencing installation and clearing the Designated Biologist or Biological Monitor shall be present at the construction site during all Project activities that have potential to disturb soil, vegetation, and wildlife**. The Designated Biologist or Biological Monitor shall clear ahead of equipment during brushing and grading activities. If desert tortoises are found during construction monitoring, procedures outlined in **BIO-9** shall be implemented.

5. **Salvage or Relocate Wildlife during Ground Disturbance Activities. The Designated Biologist or Biological Monitor shall salvage or relocate sensitive wildlife during ground disturbance activities including clearing, grubbing, and grading operations when feasible to off-site habitat or out of harm's way. The species shall be salvaged or relocated when conditions will not jeopardize the health and safety of the monitor.**

6. Minimize Impacts of Transmission/Pipeline Alignments, Roads, and Staging Areas. Staging areas for construction on the plant site shall be within the area that has been fenced with desert tortoise exclusion fencing and cleared. For construction activities outside of the plant site (transmission line, pipeline alignments) access roads, pulling sites, and storage and parking areas shall be **desi**gned, installed, and maintained with the goal of minimizing impacts to native plant communities and sensitive biological resources. Transmission lines and all electrical components shall be designed, installed, and maintained in accordance with the Avian Power Line Interaction Committee's (APLIC's) S*uggested Practices for Avian Protection on Power Lines* (APLIC 2006) and *Mitigating Bird Collisions with Power Lines* (APLIC 1994) to reduce the likelihood of large bird electrocutions and collisions. Where feasible avoid impacts to desert washes and special-status plants by adjusting the locations of poles and laydown areas, and the alignment of the roads and pipelines. Construction drawings and grading plans shall depict the locations of sensitive resources and demonstrate where temporary impacts to sensitive resources can be avoided and where they cannot.

7. Avoid Use of Toxic Substances. Soil bonding and weighting agents used on unpaved surfaces shall be non-toxic to wildlife and plants. **Anticoagulants shall not be used for rodent control. Pre-emergents and other herbicides with documented residual toxicity shall not be used. Herbicides shall be applied in conformance with federal, State, and local laws and according to the guidelines for wildlife-safe use of herbicides in BIO-14 (Weed Management Plan).**

8. Minimize Lighting Impacts. Facility lighting shall be designed, installed, and maintained to prevent side casting of light towards wildlife habitat.

9. Minimize Noise Impacts. A continuous low-pressure technique shall be used for steam blows, to the extent possible, in order to reduce noise levels in sensitive habitat proximate to the Project site. Loud construction activities (e.g., unsilenced high pressure steam blowing, pile driving, or other) shall be avoided from February 15 to April 15, when it would result in noise levels over 65 dBA in nesting habitat (excluding noise from passing vehicles). Loud construction activities may be permitted from February 15 to April 15 only if:

   a. The Designated Biologist provides documentation (i.e., nesting bird data collected using methods described in **BIO-15** and maps depicting location of the nest survey area in relation to noisy construction) to the CPM indicating that no active nests would be subject to 65 dBA noise, OR

   b. The Designated Biologist or Biological Monitor monitors active nests within the range of construction-related noise exceeding 65 dBA. The monitoring shall be conducted in accordance with Nesting Bird Monitoring and Management Plan approved by the CPM. The Plan shall include adaptive management measures to prevent disturbance to nesting birds from construction related noise. Triggers for adaptive management shall be evidence of Project-related disturbance to nesting birds such as: agitation behavior (displacement, avoidance, and defense); increased vigilance behavior at nest sites; changes in foraging and feeding behavior, or nest site abandonment. The Nesting Bird Monitoring and Management Plan shall include a description of adaptive management actions, which shall include, but not be limited to, cessation of construction activities that are deemed by the Designated Biologist to be the source of disturbance to the nesting bird.

10. Avoid Vehicle Impacts to Desert Tortoise. Parking and storage shall occur within the area enclosed by desert tortoise exclusion fencing to the extent feasible. No vehicles or construction equipment parked outside the fenced area shall be moved prior to an inspection of the ground beneath the vehicle for the presence of desert tortoise. If a desert tortoise is observed outside the areas fenced with desert tortoise exclusion fencing it shall be left to move on its own. If it does not move within 15 minutes, a Designated Biologist or Biological Monitor under the Designated Biologist’s direct supervision may move it out of harm’s way as described in the USFWS Desert Tortoise Field Manual (USFWS 2009a)

11. Install Box Culvert. To provide for connectivity for desert tortoise and other wildlife, the Project owner shall install a box culvert suitable for passage by desert tortoise and other wildlife under the Project Site Access Road. The box culvert shall be a concrete structure no less than 4 feet high and 6 feet wide with 3:1 side slopes and shall maintain a minimum of 18 inches of native material on the floor of the culvert at all times to facilitate tortoise movement.

12. Avoid Wildlife Pitfalls. To avoid trapping desert tortoise and other wildlife in trenches, pipes or culverts, the following measures shall be implemented:

    a. Backfill Trenches. At the end of each work day, the Designated Biologist **or Biological Monitor** shall ensure that all potential wildlife pitfalls (trenches, bores, and other excavations) outside the area fenced with desert tortoise exclusion fencing have been backfilled. If backfilling is not feasible, all trenches, bores, and other excavations shall be sloped at a 3:1 ratio at the ends to provide wildlife escape ramps, or covered completely to prevent wildlife access, or fully enclosed with desert tortoise-exclusion fencing. All trenches, bores, and other excavations outside the areas permanently fenced with desert tortoise exclusion fencing shall be inspected periodically throughout the day, at the end of each workday, and at the beginning of each day by the Designated Biologist or a Biological Monitor. Should a tortoise or other wildlife become trapped, the Designated Biologist or Biological Monitor shall move the tortoise out of harm's way as described in the **most recent** USFWS Desert Tortoise Field Manual (**currently** USFWS 2009a). Any wildlife encountered during the course of construction shall be allowed to leave the construction area unharmed.

    b. Avoid Entrapment of Desert Tortoise. Any construction pipe, culvert, or similar structure with a diameter greater than 3 inches, stored less than 8 inches aboveground and within desert tortoise habitat (i.e., outside the permanently fenced area) for one or more nights, shall be inspected for tortoises before the material is moved, buried or capped. As an alternative, all such structures may be capped before being stored outside the fenced area, or placed on elevated pipe racks. These materials would not need to be inspected or capped if they are stored within the permanently fenced area after the clearance surveys have been completed.

13. Minimize Standing Water. Water applied to dirt roads and construction areas (trenches or spoil piles) for dust abatement shall use the minimal amount needed to meet safety and air quality standards in an effort to prevent the formation of puddles, which could attract desert tortoises and common ravens to construction sites. A Biological Monitor shall patrol these areas to ensure water does not puddle and shall take appropriate action to reduce water application where necessary.

14. Dispose of Road-killed Animals. Road killed animals or other carcasses detected by personnel on roads associated with the Project area will be reported immediately to a Biological Monitor or Designated Biologist (or Project Environmental Compliance Monitor, during Project operations), who will promptly remove the roadkill. For special-status species road-kill, the Biological Monitor or Designated Biologist (or Project Environmental Compliance Monitor, during Project operations) shall contact **the CPM,** CDF**W**~~G~~**,** and USFWS within 1 working day of detection **(within 8 hours in the case of a desert kit fox)** of the carcass for guidance on disposal or

storage of the carcass; all other road kill shall be disposed of promptly. **Handling of desert kit fox carcasses shall follow handling requirements included in the BIO-18 American Badger and Kit Fox Management Plan.** The Biological Monitor shall provide the special-status species record as described in **BIO-11** below.

15. Minimize Spills of Hazardous Materials. All vehicles and equipment shall be maintained in proper working condition to minimize the potential for fugitive emissions of motor oil, antifreeze, hydraulic fluid, grease, or other hazardous materials. The Designated Biologist shall be informed of any hazardous spills immediately as directed in the Project Hazardous Materials Plan. Hazardous spills shall be immediately cleaned up and the contaminated soil properly disposed of at a licensed facility. Servicing of construction equipment shall take place only at a designated area. Service/maintenance vehicles shall carry a bucket and pads to absorb leaks or spills.

16. Worker Guidelines. During construction all trash and food-related waste shall be placed in self-closing containers and removed daily from the site. Workers shall not feed wildlife or bring pets to the Project site. Except for law enforcement personnel, no workers or visitors to the site shall bring firearms or weapons. ~~Vehicular traffic shall be confined to existing routes of travel to and from the Project site, and cross country vehicle and equipment use outside designated work areas shall be prohibited. The speed limit when traveling on dirt access routes within desert tortoise habitat shall not exceed 25 miles per hour.~~

17. **Avoid Spread of Noxious Weeds. The project owner shall implement the following Best Management Practices during construction and operation, and all other measures as required in the final approved Weed Management Plan (BIO-14) to prevent the spread and propagation of noxious weeds and other invasive plants:**

    a. **For work outside the project facility fenceline, limit the size of any vegetation and/or ground disturbance and limit ingress and egress to defined routes;**

    b. **Prevent spread of non-native plants via vehicular sources by implementing Trackclean™ or other methods of vehicle cleaning for vehicles coming and going from construction sites. Earth-moving equipment shall be cleaned prior to transport to the construction site; and**

    c. **Use only weed-free straw, hay bales, and seed for erosion control and sediment barrier installations.**

18. Implement Sediment Control Measures Near Desert Washes. Standard erosion control measures shall be implemented for all phases of construction and operation where sediment run-off from exposed slopes threatens to enter waters of the state. Sediment and other flow-restricting

materials shall be moved to a location where they shall not be washed back into the stream. Areas of disturbed soils (access and staging areas) which slope toward drainages shall be stabilized to reduce erosion potential.

19. Monitor Ground Disturbing Activities Prior to Pre-Construction Site Mobilization. If pre-construction site mobilization requires ground-disturbing activities such as for geotechnical borings or hazardous waste evaluations, a Designated Biologist or Biological Monitor shall be present to monitor any actions that could disturb soil, vegetation, or wildlife.

~~20. Control Unauthorized Use of the Project Access Roads. The secondary access road shall be gated at both ends and restricted to emergency response personnel as per proposed **COC WORKER SAFETY-6**. The Project owner shall also monitor and control any unauthorized use of the Project roads with gates, signage, and fencing as necessary to minimize traffic-related roadkills and ORV disturbance off-roads.~~

21. Implement Erosion Control Measures. All disturbed soils and roads within the Project site shall be stabilized to reduce erosion potential, both during and following construction. All areas subject to temporary disturbance shall be restored to pre-project grade and stabilized to prevent erosion and promote natural revegetation. Temporarily disturbed areas within the Project area include, but are not limited to: linear facilities, temporary access roads, temporary lay-down and staging areas. If erosion control measures include the use of seed, only locally native plant species from a local seed source shall be used. Local seed includes seeds from plants within the Chuckwalla Valley or Colorado River Hydrologic Units.

22. Avoid Spreading Weeds. Prior to the start of **site mobilization and** construction, flag and avoid dense populations of highly invasive noxious weeds. If these areas cannot be avoided, they shall be pre-treated by the methods described in **BIO-14** (Weed Management Plan). Noxious weeds and other invasive non-native plants in the temporarily disturbed areas shall be managed according to the requirements in BIO-14.

21. Salvage Topsoil. Topsoil from the Project site shall be salvaged, preserved and re-used for restoration of temporarily disturbed areas. Salvaged topsoil shall be collected, stored and applied in a way that maintains the viability of seed and soil crusts. The Project owner shall excavate and collect the upper soil layer (the top 1 to 2 inches that includes the seed bank and biotic soil crust) as well as the lower soil layer up to a depth of 6 to 8 inches. The upper and lower soil layers shall be stockpiled separately in areas that will not be impacted by other grading, flooding, erosion, or pollutants. If the soil is to be stored more than 2 weeks it shall be spread out to a depth of no more than 6 inches to maintain the seed and soil crust viability. The Project owner shall install temporary construction fencing around stockpiled topsoil, and signage that indicates whether the pile is the upper layer seed bank, or the lower layer, and clearly indicates that

the piles are for use only in erosion control. After construction, the Project owner shall replace the topsoil in the temporarily disturbed areas in the reverse order of stockpiling, starting with the 6-8 inch layer of subsoil, and then the seed-containing upper layer using a harrow or similar equipment to thinly distribute the layer to depths no greater than 1 to 2 inches.

22. Decommission Temporary Access Roads with Vertical Mulching. Discourage ORV use of temporary construction roads by installing vertical mulching at the head of the road to a distance necessary to obscure the road from view. Boulder barricades and gates shall not be used unless the remainder of the site is fenced to prevent driving around the gate or barricade. Designated ORV routes and roads shall not be closed.

21. Vegetation Management Best Management Practices. All Mowing and Vegetation Management will follow the Best Management Practices (BMPs) for Wildlife Habitat as defined by BLM Handbook H-1601-1 or most current BLM guidance:

   a. Minimize direct impacts to species of concern through appropriate mitigation measures (e.g. season of activity, etc.). Avoid treatments during critical periods for wildlife (e.g. breeding, nesting, foaling, etc.).

   b. Consider habitat needs of bird populations (both migratory and non-migratory). Avoid activities that may disrupt nesting and breeding of sensitive bird species.

Verification: All mitigation measures and their implementation methods shall be included in the BRMIMP and implemented. Implementation of the measures shall be reported in the Monthly Compliance Reports by the Designated Biologist. Within 30 days after completion of Project construction, the Project owner shall provide to the CPM, for review and approval, a written construction termination report identifying how measures have been completed. As part of the Annual Compliance Report, each year following construction the Designated Biologist shall provide a report to the CPM that describes compliance with avoidance and minimization measures to be implemented during operation (for example, a summary of the incidence of roadkilled animals during the year, implementation of measures to avoid toxic spills, erosion and sedimentation, efforts to enforce worker guidelines, etc.).

No less than 30 days prior to **site mobilization and construction** ~~construction-related ground disturbance~~ the Project owner shall provide the CPM, USFWS and CDF**W**~~G~~ with plans showing the design of a culvert under the Project Site Access Road that would provide access for desert tortoise and other wildlife. No less than 30 days after of completion of construction of the Project site access road the Project owner shall provide as-built drawings of the culvert.

If loud construction activities are proposed between February 15 to April 15 which would result in noise levels over 65 dBA in nesting habitat, the Project owner shall submit nest survey results (as described in 8a) to the CPM no more than 7 days before initiating such construction. If an active nest is detected within this survey area the Project owner shall submit a Nesting Bird Monitoring and Management Plan to the CPM for review and approval no more than 7 days before initiating noisy construction.

DESERT TORTOISE CLEARANCE SURVEYS AND FENCING

BIO-9 The project owner shall undertake appropriate measures to manage the project site and related facilities in a manner to avoid or minimize impacts to desert tortoise**.** Methods for clearance surveys, fence specification and installation, tortoise handling, artificial burrow construction, egg handling and other procedures shall be consistent with those described in the **most recent** USFWS~~'~~ Desert Tortoise Field Manual (**currently** USFWS 2009**a**) http://www.fws.gov/ventura/speciesinfo/protocols_guidelines ~~or more current guidance provided by CDFG**W** and USFWS~~. The project owner shall also implement all terms and conditions described in the Biological Opinion prepared by USFWS. The project owner shall implement the following measures:

1. Desert Tortoise Fencing along Interstate 10. To avoid increases in vehicular-related mortality from disruption of local movement patterns along the existing ephemeral wash systems, permanent desert tortoise-proof fencing shall be installed along the existing freeway right-of-way fencing, on both sides of Interstate 10 (I-10) between the wash on the westernmost end of the ~~proposed Project~~ **PSEGS** site and the easternmost wash associated with the ~~proposed Project~~ **PSEGS** site (labeled as #10 and #**13**~~12~~ in Wildlife Movement and Desert Tortoise Habitat [tn56755], AECOM 2010f). The project owner shall secure approval from California Department of Transportation (Caltrans) for the installation and maintenance of desert tortoise exclusion fencing prior to construction or repair. ~~If either Reconfigured Alternative 2 or Reconfigured Alternative 3 is selected, the fence shall extend from the westernmost wash (#10) to the wash immediately east of the alternative disturbance area (#13).~~ The tortoise fencing shall be designed to direct tortoises to existing undercrossing to provide safe passage under the freeway, and shall be inspected per 2.d. and maintained for the life of the Project.

2. Desert Tortoise Exclusion Fence Installation. To avoid impacts to desert tortoises, permanent exclusion fencing shall be installed along the permanent perimeter security fence (boundaries) as phases are constructed. Temporary fencing shall be installed along any subset of the plant site phasing that does not correspond to permanent perimeter fencing. Temporary fencing shall be installed along linear features unless a Biological Monitor is present in the immediate vicinity of construction activities for the linear facility. All **proposed alignments for permanent or temporary desert tortoise** fencing shall be flagged and surveyed within 24 hours prior to the initiation of fence construction. Clearance surveys of the desert tortoise exclusionary fence and utility rights-of-way alignments shall be conducted by the Designated Biologist(s) using techniques outlined in the **most recent USFWS** Desert Tortoise Field Manual (**currently** USFWS 2009**a**), ~~or more recent guidance approved by the CPM~~, and may be conducted in any season with USFWS and CDF~~G~~**W**

approval. Biological Monitors may assist the Designated Biologist under his or her supervision. These fence clearance surveys shall provide 100-percent coverage of all areas to be disturbed and an additional transect along both sides of the fence line. Disturbance associated with desert tortoise exclusionary fence construction shall not exceed 30 feet on either side of the proposed fence alignment. Prior to the surveys the project owner shall provide to the CPM, CDF~~G~~**W** and USFWS a figure clearly depicting the limits of construction disturbance for the proposed fence installation. The fence line survey area shall be 90 feet wide centered on the fence alignment. Where construction disturbance for fence line installation can be limited to 15 feet on either side of the fence line, this fence line survey area may be reduced to an area approximately 60 feet wide centered on the fence alignment. Transects shall be no greater than 15 feet apart. For the I-10 desert tortoise exclusion fence, the Project Owner may have a Designated Biologist present to clear ahead of fence construction and be present in the immediate vicinity of fence installation activities. Desert tortoise located within the utility ROW alignments shall be moved out of harm's way in accordance with the USFWS Desert Tortoise Field Manual (USFWS 2009**a**), or more recent guidance approved by the CPM. Any desert tortoise detected during clearance surveys for fencing within the plant site and along the perimeter fence alignment shall be translocated and monitored in accordance with the Desert Tortoise Relocation/Translocation Plan (**BIO-10**). Tortoise shall be handled by the Designated Biologist(s) in accordance with the USFWS' Desert Tortoise Field Manual (USFWS 2009).

a. Timing and Supervision of Fence Installation. The exclusion fencing shall be installed in any area subject to disturbance prior to the onset of site clearing and grubbing in that area. The fence installation shall be supervised by the Designated Biologist and monitored by the Biological Monitors to ensure the safety of any tortoise present.

b. Fence Material and Installation. All desert tortoise exclusionary fencing shall be constructed in accordance with the **most recent** USFWS' Desert Tortoise Field Manual (**currently** USFWS 2009) (Chapter 8 – Desert Tortoise Exclusion Fence)).

c. Security Gates. Security gates shall be designed with minimal ground clearance to deter ingress by tortoises. The gates may be electronically activated to open and close immediately after the vehicle(s) have entered or exited to prevent the gates from being kept open for long periods of time.

d. Fence Inspections. Following installation of the desert tortoise exclusion fencing for both the permanent and temporary fencing, the fencing shall be regularly inspected. If tortoise were moved out of harm's way during fence construction, permanent and temporary fencing shall be inspected at least two times a day for the first 7 days to ensure a recently moved tortoise has not been trapped within the fence. Thereafter, permanent fencing shall be inspected monthly and within 24 hours following all major rainfall events or after notification of an accident. A major rainfall event is defined as one for which flow is detectable within the fenced drainage. Any damage to the fencing shall be temporarily repaired immediately to keep tortoises out of the site, and permanently repaired within 48 hours of observing damage. Repairs on I-10 fencing shall occur after any required authorization from Caltrans for work within their Right-of-Way. Inspections of permanent site fencing shall occur for the life of the project. Temporary fencing shall be inspected weekly and, where drainages intersect the fencing, during and within 24 hours following major rainfall events. All temporary fencing shall be repaired immediately upon discovery and, if the fence may have permitted tortoise entry while damaged, the Designated Biologist shall inspect the area for tortoise.

3. Desert Tortoise Clearance Surveys within the Plant Site. Clearance surveys shall be conducted in accordance with the USFWS Desert Tortoise Field Manual (USFWS 2009) (Chapter 6 – Clearance Survey Protocol for the Desert Tortoise – Mojave Population) **or the most recent USFWS Desert Tortoise Field Manual (currently USFWS 2009a**) and shall consist of two surveys covering 100 percent the project area by walking transects no more than 15-feet apart. If a desert tortoise is located on the second survey, a third survey shall be conducted. **To maximize the opportunity to find all tortoises, each** separate survey shall be walked in a different direction**, in opposite directions, and/or offset** to allow opposing angles of observation**, or as directed in the Biological Opinion**. Clearance surveys of the plant site may only be conducted when tortoises are most active (April through May or September through October) unless the project receives approval from CDF~~G~~**W** and USFWS. Clearance surveys of linear features may be conducted during anytime of the year. Any tortoise located during clearance surveys of the power plant site and linear features shall be translocated or relocated and monitored in accordance with the Desert Tortoise Relocation/Translocation Plan:

   a. Burrow Searches. During clearance surveys all desert tortoise burrows, and burrows constructed by other species that might be used by desert tortoises, shall be examined by the Designated Biologist, who may be assisted by the Biological Monitors, to assess occupancy of each burrow by desert tortoises and handled in accordance with the USFWS Desert Tortoise Field Manual (USFWS 2009**a**). To prevent reentry by a tortoise or other wildlife, all burrows shall be collapsed once absence has been determined in accordance with the Desert Tortoise Relocation/Translocation Plan. Tortoises taken from burrows and from elsewhere on the power plant site shall be relocated or translocated as described in the Desert Tortoise Relocation/Translocation Plan.

   b. Burrow Excavation/Handling. All potential desert tortoise burrows located during clearance surveys would be excavated by hand, tortoises removed, and collapsed or blocked to prevent occupation by desert tortoises in accordance with the Desert Tortoise Relocation/Translocation Plan. All desert tortoise handling, and removal, and burrow excavations, including nests, would be conducted by the Designated Biologist, who may be assisted by a Biological Monitor in accordance with the USFWS Desert Tortoise Field Manual (USFWS 2009) or more recent guidance approved by the CPM.

4. Monitoring Following Clearing. Following the desert tortoise clearance and removal from the power plant site and utility corridors, workers and heavy equipment shall be allowed to enter the project site to perform clearing, grubbing, leveling, and trenching activities. A Designated Biologist or Biological Monitor shall be onsite for clearing and grading activities to move tortoises missed during the initial tortoise clearance survey. Should a tortoise be discovered, it shall be relocated or translocated as described in the Desert Tortoise Relocation/Translocation Plan.

5. Reporting. The Designated Biologist shall record the following information for any desert tortoises handled: a) the locations (narrative and maps) and dates of observation; b) general condition and health, including injuries, state of healing and whether desert tortoise voided their bladders; c) location moved from and location moved to (using GPS technology); d) gender, carapace length, and diagnostic markings (i.e., identification numbers or marked lateral scutes); e) ambient temperature when handled and released; and f) digital photograph of each handled desert. Desert tortoise moved from within project areas shall be marked and monitored in accordance with the Desert Tortoise Relocation/Translocation Plan.

Verification: All mitigation measures and their implementation methods shall be included in the BRMIMP and implemented. Implementation of the measures shall be reported in the Monthly Compliance Reports by the Designated Biologist. Within 30 days after completion of desert tortoise clearance surveys the Designated Biologist shall submit a report to BLM, the CPM, USFWS, and CDF~~G~~**W** describing implementation of each of the mitigation measures listed above. The report shall include the desert tortoise survey results, capture and release locations of any relocated desert tortoises, and any other information needed to demonstrate compliance with the measures described above.

Within 6 months of completion of desert tortoise exclusion fence ~~for Phase 1~~, I-10 desert tortoise exclusion fencing shall be installed. Within 3 months of completion of I-10 desert tortoise exclusion fence construction, the Project owner shall provide the CPM, BLM, USFWS, and CDF~~G~~**W** with maps as well as photographic documentation showing the design and location of the fencing on both sides of I-10 south of the Project site.

The Project Owner shall provide evidence of approval from Caltrans for installation of desert tortoise fencing along I-10 within their right-of-way at least 30-days prior to construction of the fencing.

DESERT TORTOISE RELOCATION/TRANSLOCATION PLAN

BIO-10 The Project owner shall develop and implement a final Desert Tortoise Relocation/Translocation Plan (Plan) that is consistent with current USFWS approved guidelines, and meets the approval of the CPM. The Plan shall include guidance specific to each of the two phases of Project construction, as described in **BIO-29** (Phasing), and shall include measures to minimize the potential for repeated translocations of individual desert tortoises. The goals of the Desert Tortoise Relocation/Translocation Plan shall be to: relocate/translocate all desert tortoises from the project site to nearby suitable habitat; minimize impacts on resident desert tortoises outside the project site; minimize stress, disturbance, and injuries to relocated/translocated tortoises; and assess the success of the translocation effort through monitoring**.** The ~~final~~ **revised draft** Plan shall be based on the draft Desert Tortoise Relocation/Translocation Plan prepared by the **prior project owner**~~Applicant~~ (AECOM 2010a, DR-BIO-55) and shall include all revisions deemed necessary by BLM, USFWS, CDF~~G~~**W** and the Energy Commission staff.

Verification: **At least 60 days prior to site mobilization and construction the Project owner shall provide the CPM with a revised draft of a Plan to the CPM for review and approval in consultation with BLM, USFWS and CDFW.** At least 30 days prior to site mobilization **and construction**, the Project owner shall provide the CPM with the final version of a Plan that has been reviewed and approved by the CPM in consultation with BLM, USFWS and CDF~~G~~**W**. All modifications to the approved Plan shall be made only after approval by the CPM, in consultation with BLM, USFWS and CDF~~G~~**W**.

Within 30 days after initiation of relocation and/or translocation activities, the Designated Biologist shall provide to the CPM for review and approval, a written report identifying which items of the Plan have been completed, and a summary of all modifications to measures made during implementation of the Plan.

DESERT TORTOISE COMPLIANCE VERIFICATION

BIO-11 The Project owner shall provide Energy Commission, BLM, CDF~~G~~**W**, and USFWS staff with reasonable access to the Project site and compensation lands under the control of the Project owner and shall otherwise fully cooperate with the Energy Commission's and BLM's efforts to verify the Project owner's compliance with, or the effectiveness of, mitigation measures set forth in the conditions of certification. The Designated Biologist shall do all of the following:

1. Notification. Notify the CPM at least 14 calendar days before initiating ~~construction-related ground disturbance~~ **site mobilization and construction** activities; immediately notify the CPM in writing if the Project owner is not in compliance with any conditions of certification, including but not limited to any actual or anticipated failure to implement mitigation measures within the time periods specified in the conditions of certification;

2. Monitoring During Grubbing and Grading. Remain onsite daily while vegetation salvage, grubbing, grading and other ground-disturbance construction activities are taking place to avoid or minimize take of listed species, and verify personally or use Biological Monitors to check for compliance with all impact avoidance and minimization measures, including checking all exclusion zones to ensure that signs, stakes, and fencing are intact and that human activities are restricted in these protective zones.

3. Monthly Compliance Inspections. Conduct compliance inspections at a minimum of once per month after **ground disturbance activities including** clearing, grubbing, and grading are completed and submit a monthly compliance report to the CPM, BLM, USFWS and CDF~~G~~**W** during construction

4. Notification of Injured or Dead Listed Species. If an injured or dead listed species is detected within or near the Project Disturbance Area the CPM, BLM, the Ontario Office of CDF~~G~~**W**, and the ~~Carlsbad~~ **Palm Springs** Office of USFWS shall be notified immediately by phone **and email**. Notification shall occur no later than noon on the business day following the event if it occurs outside normal business hours so that the agencies can determine if further actions are required to protect listed species **(within 8 hours in the case of desert kit fox).** Written follow-up notification via FAX or electronic communication shall be submitted to these agencies within two calendar days of the incident and include the following information as relevant:

   a. Injured Desert Tortoise. If a desert tortoise is injured as a result of Project-related activities during construction, the Designated Biologist or approved Biological Monitor shall immediately take it to a CDF~~G~~**W**-approved wildlife rehabilitation and/or veterinarian clinic. Any veterinarian bills for such injured animals shall be paid by the Project owner. Following phone notification as required above, the CPM, CDF~~G~~**W**, and USFWS shall determine the final disposition of the injured animal, if it recovers. Written notification shall include, at a minimum, the date, time, and location, circumstances of the incident, and the name of the facility where the animal was taken.

   b. Desert Tortoise Fatality. If a desert tortoise is killed by Project-related activities during construction or operation, a written report with the same information as an injury report shall be submitted to the CPM, BLM, the Ontario Office of CDF ~~G~~**W**, and the ~~Carlsbad~~ **Palm Springs** Office of USFWS. These desert tortoises shall be salvaged according to guidelines described in *Salvaging Injured, Recently Dead, Ill, and Dying Wild, Free-Roaming Desert Tortoise* (Berry 2001) **or most recent guidelines approved by the CPM.** The Project owner shall pay to have the desert tortoises transported and necropsied. The report shall include the date and time of the finding or incident.

5. Final Listed Species Report. The Designated Biologist shall provide the CPM and BLM a Final Listed Species Mitigation Report that includes, at a minimum: 1) a copy of the table in the BRMIMP with notes showing when each of the mitigation measures was implemented; 2) all available information about Project-related incidental take of listed species; 3) information about other Project impacts on the listed species; 4) construction dates; 5) an assessment of the effectiveness of conditions of certification in minimizing and compensating for Project impacts; 6) recommendations on how mitigation measures might be changed to more effectively minimize and mitigate the impacts of future Projects on the listed species; and 7) any other pertinent information, including the level of take of the listed species associated with the Project.

6. Stop Work Order. The CPM may issue the Project owner a written stop work order to suspend any activity related to the construction or operation of the Project to prevent or remedy a violation of one or more conditions of certification (including but not limited to failure to comply with reporting, monitoring, or habitat acquisition obligations) or to prevent the illegal take of an endangered, threatened, or candidate species. The Project owner shall comply with the stop work order immediately upon receipt thereof.

Verification: No later than 2 days following the above required notification of a sighting, injury, kill, or relocation of a listed species, the Project owner shall deliver to the CPM, BLM, CDF~~G~~**W**, and USFWS via FAX or electronic communication the written report from the Designated Biologist describing all reported incidents of injury, kill, or relocation of a listed species, identifying who was notified, and explaining when the incidents occurred. In the case of a sighting in an active construction area, the Project owner shall, at the same time, submit a map (e.g., using Geographic Information Systems) depicting both the limits of construction and sighting location to the CPM, BLM, CDF~~G~~**W** and USFWS.

No later than 45 days after initiation of Project operation the Designated Biologist shall provide the CPM and BLM a Final Listed Species Mitigation Report.

Beginning with the first month after clearing, grubbing and grading are completed and continuing every month until construction is complete the Project owner shall submit a report describing the results of Monthly Compliance Inspections to the CPM, BLM, USFWS and CDF~~G~~**W**.

DESERT TORTOISE COMPENSATORY MITIGATION

BIO-12 To fully mitigate for habitat loss and potential take of desert tortoise, the Project owner shall provide compensatory mitigation per **BIO-29** – Table 2, adjusted to reflect the final Project footprint. For purposes of this condition, the Project footprint means all lands disturbed in the construction and operation of the Palen Project, including all Project linears, as well as undeveloped areas inside the Project's boundaries that will no longer provide viable long-term habitat for the desert tortoise. To satisfy this condition, the Project owner shall acquire, protect and transfer 5 acres of desert tortoise habitat for every acre of habitat within critical habitat and within the final

Project footprint, and 1 acre of desert tortoise habitat for every acre of habitat outside of critical habitat but within the final Project footprint, and provide associated funding for the acquired lands, as specified below. Condition **BIO-28** may provide the Project owner with one means for satisfying some or all of the requirements in this condition. In lieu of acquiring lands itself, the Project owner may satisfy the requirements of this condition by depositing funds into the Renewable Energy Action Team (REAT) **or with another CPM-approved entity**

~~Account established with the National Fish and Wildlife Foundation (NFWF)~~, as provided below in section 3.i. of this condition.

The timing of the mitigation shall correspond with the timing of the site disturbance activities as stated in **BIO-29** (phasing). If compensation lands are acquired in fee title or in easement, the requirements for acquisition, initial improvement and long-term management of compensation lands include all of the following:

1. Selection Criteria for Compensation Lands. The compensation lands selected for acquisition in fee title or in easement shall:
   a. be within the Colorado Desert Recovery Unit, with potential to contribute to desert tortoise habitat connectivity and build linkages between desert tortoise designated critical habitat, known populations of desert tortoise, and/or other preserve lands;

   b. provide habitat for desert tortoise with capacity to regenerate naturally when disturbances are removed;

   c. be prioritized near larger blocks of lands that are either already protected or planned for protection, such as DWMAs within the Colorado Desert Recovery Unit (Chuckwalla DWMA as first priority, Chemehuevi DMWA as the second) or which could feasibly be protected long-term by a public resource agency or a non-governmental organization dedicated to habitat preservation;

   d. be connected to lands with desert tortoise habitat equal to or better quality than the Project Site, ideally with populations that are stable, recovering, or likely to recover;

   e. not have a history of intensive recreational use or other disturbance that does not have the capacity to regenerate naturally when disturbances are removed or might make habitat recovery and restoration infeasible;

   f. not be characterized by high densities of invasive species, either on or immediately adjacent to the parcels under consideration, that might jeopardize habitat recovery and restoration;

   g. not contain hazardous wastes that cannot be removed to the extent that the site could not provide suitable habitat; and

h. have water and mineral rights included as part of the acquisition, unless the CPM, in consultation with CDFW, BLM and USFWS, agrees in writing to the acceptability of the land.

2. Review and Approval of Compensation Lands Prior to Acquisition. The Project owner shall submit a formal acquisition proposal to the CPM, CDF~~G~~**W**, USFWS, and BLM describing the parcel(s) intended for purchase. This acquisition proposal shall discuss the suitability of the proposed parcel(s) as compensation lands for desert tortoise in relation to the criteria listed above. Approval from the CPM and CDF~~G~~**W**, in consultation with BLM and the USFWS, shall be required for acquisition of all compensatory mitigation parcels.

3. Compensation Lands Acquisition Requirements. The Project owner shall comply with the following requirements relating to acquisition of the compensation lands after the CPM and CDF~~G~~**W**, in consultation with BLM and the USFWS, have approved the proposed compensation lands:

   a. Preliminary Report. The Project owner, or approved third party, shall provide a recent preliminary title report, initial hazardous materials survey report, biological analysis, and other necessary or requested documents for the proposed compensation land to the CPM and CDF~~G~~**W**. All documents conveying or conserving compensation lands and all conditions of title are subject to review and approval by the CPM and CDF~~G~~**W**, in consultation with BLM and the USFWS. For conveyances to the State, approval may also be required from the California Department of General Services, the Fish and Game Commission and the Wildlife Conservation Board.

   b. Title/Conveyance. The Project owner shall transfer fee title to the compensation lands, a conservation easement over the lands, or both fee title and conservation easement as required by the CPM and CDF~~G~~**W**. Transfer of either fee title or an approved conservation easement will usually be sufficient, but some situations, e.g., the donation of lands burdened by a conservation easement to BLM, will require that both types of transfers be completed. Any transfer of a conservation easement or fee title must be to CDF~~G~~**W**, a non-profit organization qualified to hold title to and manage compensation lands (pursuant to California Government Code section 65965), or to BLM under terms approved by the CPM and CDF~~G~~**W**. If an approved non-profit organization holds title to the compensation lands, a conservation easement shall be recorded in favor of CDF~~G~~**W** in a form approved by CDF~~G~~**W**. If an approved non-profit holds a conservation easement, CDFW shall be named a third party beneficiary. **If a Security is provided, the project owner or an approved third party shall complete the proposed compensation lands acquisition within 18 months of the start of project ground-disturbing activities.**

c. <u>Initial Habitat Improvement Fund.</u> The Project owner shall fund the initial protection and habitat improvement of the compensation lands. Alternatively, a non-profit organization may hold the habitat improvement funds if it is qualified to manage the compensation lands (pursuant to California Government Code section 65965) and if it meets the approval of CDF~~G~~**W** and the CPM. If CDF~~G~~**W** takes fee title to the compensation lands, the habitat improvement fund must be paid to CDF~~G~~**W** or its designee.

d. <u>Property Analysis Record.</u> Upon identification of the compensation lands, the Project owner shall conduct a Property Analysis Record (PAR) or PAR-like analysis to establish the appropriate long-term maintenance and management fee to fund the in-perpetuity management of the acquired mitigation lands.

e. <u>Long-term Maintenance and Management Fund.</u> In accordance with **BIO-29** (phasing), the Project owner shall deposit in~~NFWF's~~ REAT Account, **<u>or with another CPM-approved entity</u>**, a capital long-term maintenance and management fee in the amount determined through the Property Analysis Record (PAR) or PAR-like analysis conducted for the compensation lands.

   The CPM, in consultation with CDF~~G~~**<u>W</u>**, may designate another non-profit organization to hold the long-term maintenance and management fee if the organization is qualified to manage the compensation lands in perpetuity. If CDF~~G~~**<u>W</u>** takes fee title to the compensation lands, CDF~~G~~**<u>W</u>** shall determine whether it will hold the long-term management fee in the special deposit fund, leave the money in the REAT Account, or designate another entity to manage the long-term maintenance and management fee for CDF~~G~~**<u>W</u>** and with CDF~~G~~**<u>W</u>** supervision.

f. <u>Interest, Principal, and Pooling of Funds</u>. The Project owner shall ensure that an agreement is in place with the long-term maintenance and management fee holder/manager to ensure the following conditions:

   i. <u>Interest</u>. Interest generated from the initial capital long-term maintenance and management fee shall be available for reinvestment into the principal and for the long-term operation, management, and protection of the approved compensation lands, including reasonable administrative overhead, biological monitoring, improvements to carrying capacity, law enforcement measures, and any other action approved by CDF~~G~~**W** designed to protect or improve the habitat values of the compensation lands.

ii. Withdrawal of Principal. The long-term maintenance and management fee principal shall not be drawn upon unless such withdrawal is deemed necessary by the CDF~~G~~**W** or the approved third-party long-term maintenance and management fee manager to ensure the continued viability of the species on the compensation lands. If CDF~~G~~**W** takes fee title to the compensation lands, monies received by CDF~~G~~**W** pursuant to this provision shall be deposited in a special deposit fund established solely for the purpose to manage lands in perpetuity unless CDF~~G~~**W** designates ~~NFWF or~~ another entity to manage the long-term maintenance and management fee for CDF~~G~~**W**.

iii. Pooling Long-Term Maintenance and Management Fee Funds. CDFW, or a CPM-and CDF~~G~~**W**-approved non-profit organization qualified to hold long-term maintenance and management fees solely for the purpose to manage lands in perpetuity, may pool the endowment with other endowments for the operation, management, and protection of the compensation lands for local populations of desert tortoise. However, for reporting purposes, the long-term maintenance and management fee fund must be tracked and reported individually to the CDF~~G~~**W** and CPM.

g. Other expenses. In addition to the costs listed above, the Project owner shall be responsible for all other costs related to acquisition of compensation lands and conservation easements, including but not limited to title and document review costs, expenses incurred from other state agency reviews, and overhead related to providing compensation lands to CDF~~G~~**W** or an approved third party; escrow fees or costs; environmental contaminants clearance; and other site cleanup measures.

h. Mitigation Security. The Project owner shall provide financial assurances in accordance with **BIO-29** (phasing) to the CPM and CDF~~G~~**W** with copies of the document(s) to BLM and the USFWS, to guarantee that an adequate level of funding is available to implement the mitigation measures described in this condition. These funds shall be used solely for implementation of the measures associated with the Project in the event the Project owner fails to comply with the requirements specified in this condition, or shall be returned to the Project owner upon successful compliance with the requirements in this condition. The CPM's or CDF~~G~~**W**'s use of the security to implement measures in this condition may not fully satisfy the Project owner's obligations under this condition. Financial assurance can be provided to the CPM and CDF~~G~~**W** in the form of an irrevocable letter of credit, a pledged savings account or another form of security ("Security"). Prior to submitting the Security to the CPM, the Project owner shall obtain the CPM's approval in consultation with CDF~~G~~**W**. BLM and the USFWS, of the form of the Security. Security shall be provided as described in **BIO-29 – Table 3** and the beginning of the conditions of certification subsection. The actual costs to comply with this condition will vary depending on the final footprint of the Project and its two phases, and the actual costs of acquiring, improving and managing the compensation lands.

i. ~~NFWF~~ REAT Account. The Project owner may elect to fund the acquisition and initial improvement of compensation lands ~~through NFWF~~ by depositing funds for that purpose into ~~NFWF's~~**the** REAT Account. Initial deposits for this purpose must be made in the same amounts as the security required in section 3.h., above, and may be provided in lieu of security. If this option is used for the acquisition and initial improvement, the Project owner shall make an additional deposit into the REAT Account if necessary to cover the actual acquisition costs and administrative costs and fees of the compensation land purchase once land is identified and the actual costs are known. If the actual costs for acquisition and administrative costs and fees are less than described in **Biological Resources Table 6b**, the excess money deposited in the REAT Account shall be returned to the Project owner. Money deposited for the initial protection and improvement of the compensation lands shall not be returned to the Project owner.

The responsibility for acquisition of compensation lands may be delegated to **an authorized** third party~~other than NFWF~~, such as a non-governmental organization supportive of desert habitat conservation, by written agreement of the Energy Commission and CDF~~G~~**W**. Such delegation shall be subject to approval by the CPM and CDF~~G~~**W**, in consultation with BLM and USFWS, prior to land acquisition, initial protection or maintenance and management activities. Agreements to delegate land acquisition to an approved third party, or to manage compensation lands, shall be implemented with 18 months of the Energy Commission's approval.

Verification: If the mitigation actions required under this condition are not completed prior to the start of ground-disturbing activities **including site mobilization construction**, the Project owner shall provide the CPM and CDF~~G~~**W** with an approved form of Security in accordance with this condition of certification no later than 30 days prior to beginning Project ground-disturbing activities**, including site mobilization and construction**. Actual Security shall be provided no later than 7 days prior to the beginning of Project ground-disturbing activities. If Security is provided, the Project owner, or an approved third party, shall complete and provide written verification to the CPM, CDF~~G~~**W**, BLM and USFWS of the compensation lands acquisition and transfer within 18 months of the start of Project ground-disturbing activities**, including site mobilization construction**.

The Project owner may elect to fund the acquisition and initial improvement of compensation lands through ~~NFWF~~ **the REAT** or other approved third party by depositing funds for that purpose into ~~NFWF's~~ **the** REAT Account. Initial deposits for this purpose must be made in the same amounts as the Security required in section 3.h.

of this condition. Payment of the initial funds for acquisition and initial improvement must be made at least 30 days prior to the start of ground-disturbing activities.

No fewer than 90 days prior to acquisition of the property, the Project owner shall submit a formal acquisition proposal to the CPM, CDF~~G~~**W** , USFWS, and BLM describing the parcels intended for purchase and shall obtain approval from the CPM and CDFW prior to the acquisition.

No fewer than 30 days after acquisition of the property the Project owner shall deposit the funds required by Section 3e above (long term management and maintenance fee) and provide proof of the deposit to the CPM.

The Project owner, or an approved third party, shall provide the CPM, CDF~~G~~**W**, BLM, and USFWS with a management plan for the compensation lands within 180 days of the land or easement purchase, as determined by the date on the title. The CPM shall review and approve the management plan for the compensatory mitigation lands, in consultation with CDF~~G~~**W**, BLM and the USFWS.

Within 90 days after completion of all project related ground disturbance, the Project owner shall provide to the CPM, CDF~~G~~**W**, BLM and USFWS an analysis, based on aerial photography, with the final accounting of the amount of habitat disturbed during Project construction. This shall be the basis for the final number of acres required to be acquired.

RAVEN MANAGEMENT PLAN AND FEE

BIO-13 The Project owner shall implement a Raven Monitoring, Management, and Control Plan (Raven Plan) that is consistent with the most current USFWS-approved raven management guidelines, and which meets the approval of the ~~CMP~~ **CPM**, in consultation with USFWS and CDF~~G~~**W**. The draft Common Raven Monitoring, Management, and Control Plan submitted by the **project owner** (AECOM 2010a, Attachment DR-BIO-57) shall provide the basis for the **revised draft and** final Raven Plan, subject to review, revisions and approval from the CPM, CDF~~G~~**W** and USFWS. The Raven Plan shall include but not be limited to a program to monitor raven presence in the Project vicinity, determine if raven numbers are increasing, and to implement raven control measures as needed based on that monitoring. The purpose of the plan is to avoid any Project-related increases in raven numbers during construction, operation, and ~~decommissioning~~ **closure**. In addition, the Project owner shall also provide funding for implementation of the USFWS Regional Raven Management Program, as described below.

1. The Raven Plan shall:
    a. Identify conditions associated with the Project that might provide raven subsidies or attractants;
    b. Describe management practices to avoid or minimize conditions that might increase raven numbers and predatory activities;
    c. Describe control practices for ravens;

d. Establish thresholds that would trigger implementation of control practices;

e. Address monitoring and nest removal during construction and for the life of the Project, and;

f. Discuss reporting requirements.

2. <u>USFWS Regional Raven Management Program</u>. The Project owner shall submit payment to the project sub-account of the REAT Account ~~held by the National Fish and Wildlife Foundation (NFWF)~~ to support the USFWS Regional Raven Management Program. The one-time fee shall be as described by the USFWS in the *Renewable Energy Development and Common Raven Predation on the Desert Tortoise – Summary, dated May 2010* (USFWS 2010a) and the Cost Allocation Methodology for Implementation of the Regional Raven Management Plan, dated July 9, 2010) or more current guidance as provided by USFWS or CDFG~~W~~ (USFWS 2010b).

<u>**Verification:**</u> <u>**At least 45 days prior to any project-related ground disturbance activities, the project owner shall submit the revised draft Raven Plan to the CPM for review and approval and CDFW and USFWS for review and comment.**</u> No less than 10 days prior to the start of any Project-related ground disturbance activities, <u>**including pre-construction site mobilization**</u>, the Project owner shall provide the CPM, USFWS, and CDFW with the final version of a Raven Plan. All modifications to the approved Raven Plan shall be made only with approval of the CPM in consultation with USFWS and CDFW.

No less than 10 days prior to the start of any Project-related ground disturbance, <u>**including pre-construction site mobilization**</u>, activities for each phase of Project construction as described in **BIO-29**, the Project owner shall provide documentation to the CPM, CDFW and USFWS that the one-time fee for the USFWS Regional Raven Management Program of has been deposited to the REAT-NFWS subaccount for the Project. Payment of the fees may be phased as described in **BIO-29 – Table 3**.

Within 30 days after completion of Project construction, the Project owner shall provide to the CPM for review and approval, a written report identifying which items of the Raven Plan have been completed, a summary of all modifications to mitigation measures made during the Project's construction phase, and which items are still outstanding.

As part of the annual compliance report, each year following construction the Designated Biologist shall provide a report to the CPM that includes: a summary of the results of raven management and control activities for the year; a discussion of whether raven control and management goals for the year were met; and recommendations for raven management activities for the upcoming year.

WEED MANAGEMENT PLAN

BIO-14 The Project owner shall implement a Weed Management Plan (Plan) that meets the approval of the CPM. The objective of the Plan shall be to prevent the introduction of any new weeds and the spread of existing weeds as a result of Project **site mobilization,** construction, operation, and **closure**~~decommissioning~~. The Draft Weed Management Plan, submitted by the~~ Applicant~~ **project owner (Palen 2013u, Response to Data Request 52)** shall provide the basis for the final Plan, subject to review and revisions from the CPM **and the BLM**. The Plan shall include the following:

1. **Weed Plan Requirements**. The Project owner shall provide a map to the CPM indicating the location of the Weed Management Area, which shall include all areas within 100 feet of the Project Disturbance Area, access roads, staging and laydown sites, and all other areas subject to temporary disturbance. The Project owner shall provide a Plan for the Weed Management Area includes at a minimum the following information: specific weed management objectives and measures for each target non-native weed species; baseline conditions; a map of the Weed Management Areas; map of existing populations of target weeds within 100 feet of the Project Disturbance Area and access roads; weed risk assessment; measures to prevent the introduction and spread of weeds; measures to minimize the risk of unintended harm to wildlife and other plants from weed control activities; monitoring and surveying methods; and reporting requirements. Weed control described in the Plan shall focus on prevention, early detection of new infestations, and early eradication for the life of the Project. Weed control along the Project linears shall be limited to the areas where soils were disturbed during construction. Weed monitoring shall occur a minimum of once per year during the early spring months (March-April) to detect seedlings before they set seed. The focus of the Plan shall be on avoiding the introduction of new invasive weeds or the spread of highly invasive species, such as Sahara mustard. Non-native species with low ecological risk, or that are very widespread, such as Mediterranean grass, shall be noted but control shall not be required. When detected, infestations of high priority species shall be eradicated immediately.

2. **Avoidance and Treatment of Dense Weed Populations**. The Plan shall include a requirement to flag and avoid dense populations of the most invasive non-native weeds during any Project-related construction operation in or adjacent to infestations. If these areas cannot be avoided, they shall be pre-treated by one of the following methods: a) treating the infested areas in the season prior to construction by removing and properly disposing of seed heads by hand, prior to maturity, or spraying the new crop of plants that emerge in early spring, the season prior to construction, to reduce the viable seed contained in the soil, or b) removing and disposing the upper 2 inches of soil and disposing it offsite at a sanitary landfill or other site approved by the County Agricultural Commissioner , or burying the infested soil, e.g., under the solar facility or

in a pit, and covering the infested soil with at least three feet of uncontaminated soil.

3. **Cleaning Vehicles and Equipment**. The Plan shall include specifications and requirements for the cleaning and removal of weed seed and weed plant parts from vehicles and equipment involved in Project-related construction and operation. Vehicles and equipment working in weed-infested areas (including previous job sites) shall be required to clean the equipment tires, tracks, and undercarriage *before* entering the Project area and before moving to infested areas of the Project Disturbance Area to uninfested areas. Cleaning shall be conducted on all track and bucket/blade components to adequately remove all visible dirt and plant debris. Cleaning using hand tools, such as brushes, brooms, rakes, or shovels, is preferred. If water must be used, the water/slurry shall be contained to prevent seeds and plant parts from washing into adjacent habitat.

4. **Safe Use of Herbicides**. The final Plan shall include detailed specifications for avoiding herbicide and soil stabilizer drift, and shall include a list of herbicides and soil stabilizers that will be used on the Project with manufacturer's guidance on appropriate use **and include a copy of the Pesticide Use Permit issued by BLM**. The Plan shall indicate where the herbicides will be used, and what techniques will be used to avoid chemical drift or residual toxicity to special-status species and their pollinators, and consistent with the Nature Conservancy guidelines and the criteria under #2, below. Only weed control measures for target weeds with a demonstrated record of success shall be used, based on the best available information from sources such as The Nature Conservancy's The Global Invasive Species Team, California Invasive Plant Council: http://www.cal-ipc.org/ip/management/plant_profiles/index.php, and the California Department of Food & Agriculture Encycloweedia: http://www.cdfa.ca.gov/phpps/ipc/encycloweedia/encycloweedia_h p.htm.

5. The methods for weed control described in the final Plan shall meet the following criteria:

   a. Manual: Well-timed removal of plants or seed heads with hand tools; seed heads and plants must be disposed of in accordance with guidelines from the Riverside County Agricultural Commissioner.

   b. Chemical: Herbicides known to have residual toxicity, such as pre-emergents and pellets, shall not be used in natural areas or within the engineered channels. Only the following application methods may be used: wick (wiping onto leaves); inner bark injection; cut stump; frill or hack and squirt (into cuts in the trunk); basal bark girdling; foliar spot spraying with backpack sprayers or pump sprayers at low pressure or with a shield attachment to control drift, and only on windless days, or with a squeeze bottle for small infestations (see Nature Conservancy guidelines described above);

c. Biological: Biological methods may be used subject to review and approval by CDF~~G~~**W** and USFWS and only if approved for such use by CDFA, and are either locally native species or have no demonstrated threat of naturalizing or hybridizing with native species;

d. Mechanical: Disking, tilling, and mechanical mowers or other heavy equipment shall not be employed in natural areas but hand weed trimmers (electric or gas-powered) may be used. Mechanical trimmers shall not be used during periods of high fire risk and shall only be used with implementation of fire prevention measures.

Verification: No less than 10 days prior to start of any Project-related ground disturbance activities **including site mobilization and construction**, the Project owner shall provide the CPM with the final version of a Weed Management Plan that has been reviewed by BLM and Energy Commission staff. Modifications to the approved Weed Control Plan shall be made only with approval from the CPM in consultation with BLM.

Within 30 days after completion of Project construction, the Project owner shall provide to the CPM for review and approval, a written report identifying which items of the Weed Management Plan have been completed, a summary of all modifications to mitigation measures made during the Project's construction phase, and which items are still outstanding.

As part of the Annual Compliance Report, each year following construction the Designated Biologist shall provide a report to the CPM and BLM that includes: a summary of the results of noxious weeds surveys and management activities for the year; a discussion of whether weed management goals for the year were met; and recommendations for weed management activities for the upcoming year.

PRE-CONSTRUCTION NEST SURVEYS AND AVOIDANCE MEASURES

BIO-15 Pre-construction nest surveys shall be conducted if **site mobilization and** construction activities would occur from February 1 through July 31. The Designated Biologist or Biological Monitor conducting the surveys shall be experienced bird surveyors familiar with standard nest-locating techniques such as those described in Martin and Guepel (1993). The goal of the nesting surveys shall be to identify the general location of the nest sites, sufficient to establish a protective buffer zone around the potential nest site, and need not include identification of the precise nest locations. Surveyors performing nest surveys shall not concurrently be conducting desert tortoise surveys. The bird surveyors shall perform surveys in accordance with the following guidelines:

1. Surveys shall cover all potential nesting habitat in areas that could be disturbed by each phase of construction, as described in **BIO-29** (Phasing). Surveys shall also include areas within 500 feet of the boundaries of the active construction areas (including linear facilities);

2. At least two pre-construction surveys shall be conducted, separated by a minimum 10-day interval. One of the surveys shall be conducted within the 14-day period preceding initiation of construction activity. Additional follow-up surveys may be required if periods of construction inactivity exceed

three weeks, an interval during which birds may establish a nesting territory and initiate egg laying and incubation;

3. If active nests or suspected active nests are detected during the survey, a buffer zone (protected area surrounding the nest, the size of which is to be determined by the Designated Biologist in consultation with CDFW) and monitoring plan shall be developed. Nest locations shall be mapped and submitted, along with a report stating the survey results, to the CPM; and

4. The Designated Biologist or Biological Monitor shall monitor the nest until he or she determines that nestlings have fledged and dispersed; activities that might, in the opinion of the Designated Biologist, disturb nesting activities, shall be prohibited within the buffer zone until such a determination is made.

Verification: At least 10 days prior to the start of any site mobilization and construction -related ground disturbance activities during the nesting season, the Project owner shall provide the CPM a letter-report describing the findings of the pre-construction nest surveys, including the time, date, and duration of the survey; identity and qualifications of the surveyor (s); and a list of species observed. If active or suspected active nests are detected during the survey, the report shall include a map or aerial photo identifying the location or suspected location of the nest and shall depict the boundaries of the no-disturbance buffer zone around the nest(s) that would be avoided during Project construction.

Each year during construction as part of the annual compliance report a follow-up report shall be provided to the CPM, BLM, CDF~~G~~**W**, and USFWS describing the success of the buffer zones in preventing disturbance to nesting activity and a brief description of the outcome of the nesting effort (for example, whether young were successfully fledged from the nest or if the nest failed).

~~AVIAN PROTECTION PLAN~~

~~**BIO-16**~~ ~~The Project owner shall prepare and implement an Avian Protection Plan to monitor the death and injury of birds from collisions with facility features such as transmission lines, reflective mirror-like surfaces and from heat, and bright light from concentrating sunlight. The monitoring data shall be used to inform an adaptive management program that would avoid and minimize Project-related avian impacts. The study design shall be approved by the CPM in consultation with BLM, CDFG and USFWS, and shall be consistent with guidance from the USFWS on development of avian and bat protection plans (USFWS 2010c). The monitoring and adaptive management measures described in the Avian Protection Plan shall be incorporated into the Project's BRMIMP and implemented. The Avian Protection Plan shall include detailed specifications on data and carcass collection protocol and a rationale justifying the proposed schedule of carcass searches. The plan shall also include seasonal trials to assess bias from carcass removal by scavengers as well as searcher bias.~~

~~**Verification:** At least 30 days prior to the start of commercial operation of any of the power plant units the Project owner shall submit to the CPM, USFWS, and CDFG a final Avian Protection Plan. Modifications to the Avian Protection Plan shall be made only after approval from the CPM.~~

~~For one year following the beginning of power plant operation the Designated Biologist shall submit quarterly reports to the CPM, BLM, CDFG, and USFWS describing the dates, durations, and results of monitoring. The quarterly reports shall provide a detailed description of any Project-related bird deaths or injuries detected during the monitoring study or at any other time, and describe adaptive management measures implemented to avoid or minimize deaths or injuries. Following the completion of the fourth quarter of monitoring the Designated Biologist shall prepare an Annual Report that summarizes the year's data, analyzes any Project-related bird fatalities or injuries detected, and provides recommendations for future monitoring and any adaptive management actions needed.~~

~~The Annual Report shall be provided to the CPM, BLM, CDFG, and USFWS. Quarterly reporting shall continue until the CPM, in consultation with CDFG and USFWS determine whether more years of monitoring are needed, and whether mitigation and adaptive management measures are necessary.~~

AVIAN ENHANCEMENT AND CONSERVATION PLAN

BIO-16a **The Project owner shall implement the following measure to conserve and enhance avian populations in the vicinity of the project and throughout the region:**

1. **Regional Avian Electrocution Risk and Cable Collision Avoidance Measures. Consistent with the DRECP framework (DRECP 2012), the project owner shall, prior to the commencement of commercial operations at the facility, fund the retrofitting of non-compliant utility poles in the vicinity of the project to APLIC (2006) standards or fund the installation of bird diverters in the vicinity of the Project. A total amount of $300,000 will be provided for these enhancements. The funding shall be provided to an independent third party who will perform the actual retrofitting, pursuant to a Retrofit Plan approved by the CPM.**

   The Retrofit Plan will develop a tiered approach to minimizing electrocution and collision risk, wherein the first funding is applied to retrofit poles in areas where either mortalities are highest or area use is highest. The second tier of retrofitted poles would be areas of lesser importance. If funds remain available after first and second tier poles have been retrofitted, then the CPM may apply the remaining funds to other avian protection objectives outlined by the DRECP, in conjunction with BLM, USFWS, and CDFW. As an alternative to the Retrofitting Plan and the use of a CPM-approved third party, the total funding can be accomplished by making a payment in the amount of $300,000 to the National Fish and Wildlife Foundation's Bald and Golden Eagle Protection Act account.

2. Additional Migratory Bird Conservation: The Project owner shall, prior to the commencement of commercial operation of the facility, provide funds for mitigation in one of two ways:

   a. Pay $1,500,000.00 to fund the activities of a CPM-approved third party that will perform additional migratory bird conservation measures. Alternatively, the project owner may prepare a promissory note to deposit said funds at the onset of operations while at the same time providing funding of the initial year of mitigation in the non-refundable amount of $50,000.00 to a project fund as determined by CPM, in conjunction with BLM, CDFW, and USFWS, for the initial year of mitigation in the absence of accrued interest.

   b. Alternatively, the project owner may pay $50,000 annually to fund the annual activities of the CPM-approved third party for the life of the project, not to exceed a period of 30 years, commencing at commercial operation. If the project owner elects to make annual payments, the annual payments should be adjusted for cost of living increases using the CPI-U (All Urban Consumers) for the Los Angeles CMSA (includes the counties of Los Angeles, Orange, Riverside, San Bernardino and Ventura) as calculated and published by the California Department of Finance (http://www.dof.ca.gov/html/fs_data/latestecondata/FS_Price.htm). To avoid the adjustment, the project owner may elect to place the amount of $50,000 in an interest bearing account that would allow the cost of living increases to be paid from such account.

3. Such measures shall be approved by the CPM and may include, but not be limited to: (i) restoration of degraded habitat with native vegetation; (ii) restoration of agricultural fields to bird habitat; (iii) management of agricultural fields to enhance bird populations; (iv) invasive plant species and artificial food or water source management; (v) control and cleanup of potential avian hazards, such as lead or microtrash; (vi) retrofitting of buildings to minimize collisions; (vii) retrofitting of conductors and above ground cables to minimize collisions; (viii) animal control programs; (ix) support for avian and bat research and/or management efforts conducted by entities approved by the CPM within the project's mitigation lands or other approved locations; (x) funding efforts to address avian diseases or depredation due to the expansion of predators in response to anthropomorphic subsidies that may adversely affect birds that use the mitigation lands or other approved locations; and (xi) contribute to the Migratory Bird Conservation Fund managed by the Migratory Bird Conservation Commission.

a. Neither the principal of the fund nor its earned interest is redeemable by project owner during the life of the project; specifically, the investment instrument will be prepared such that an independent investment firm/management entity manages and distributes monies. When developing the fund instrument, criteria will be established that will trigger the release of the fund residual to the project owner only at the conclusion of the project, or, in the event that an alternative technology is implemented to replace the currently proposed solar energy generating facility.

b. The investment fund residual will be transferred to the project owner under specified conditions:

   1. At end of the project's life after infrastructure removal has been completed and permit-specified site reclamation criteria have been met;

   2. If the proposed project is converted to an alternative technology that does not impose a similar threat to migratory birds or to bats.

Verification: For power line retrofits:

1. At least six months prior to commercial operation, the project owner shall submit the draft Retrofit Plan to the CPM for review and approval and CDFW and USFWS for review and comment. At least 30 days prior to ~~start of any flux generation~~ commercial operation, the project owner shall provide the CPM the final version of the Retrofit Plan. Any modifications to the approved Retrofit Plan must be approved by the CPM in consultation with USFWS, BLM, and CDFW. The project owner shall notify the CPM no less than five working days before implementing any CPM approved modifications to the Retrofit Plan; alternately, the project owner may elect to deposit funds into the National Fish and Wildlife Foundation's Bald and Golden Eagle Protection Act account.

2. If the project owner elects not to fund a third party to perform retrofits, then no less than 30 days prior to beginning commercial operations, the project owner shall provide written verification to the CPM that security has been established in the National Fish and Wildlife Foundation's Bald and Golden Eagle Protection Act account, in accordance with this condition of certification.

3. The project owner shall provide an annual summary of the actions taken, an accounting of money distributed, and a map of retrofitted power lines as per the Retrofit Plan. If the project owner elects to fund the National Fish and Wildlife Foundation's Bald and Golden Eagle Protection Act account, then the project owner shall, within five (5) years of starting commercial operations, provide a summary specifying how the National Fish and Wildlife Foundation has or is using the funds.

For interest bearing fund:

1. **No later than 30 days prior to commercial operation, the project owner shall provide the CPM written verification of selection of a ~~non-wasting~~ interest-bearing account held by an approved investment entity, in accordance with this condition of certification. The account shall be fully funded no later than 7 days prior to commercial operation.**

2. **If the project owner elects to provide a promissory note for $1,500,000.00 the CPM must be provided the note within 30 days of starting operations, and must also fund $50,000 for the first year's benefit, within 7 days of starting operations.**

3. **The project owner, or the account's administrator (investment entity) shall submit to the CPM an annual report summarizing the performance of the fund and describing all restoration/enhancement actions taken.**

AVIAN AND BAT PROTECTION PLAN

BIO-16b The Project owner shall prepare a Bird and Bat Conservation Strategy (BBCS) and submit it to the CPM for review and approval, in conjunction with BLM, CDFW, and USFWS for review and comment. The BBCS shall provide for the following:

- **Survey and monitor onsite and offsite avian use and behavior to document species composition on and offsite, compare onsite and offsite rates of avian and bat use, document changes in avian and bat use over time, and evaluate the general behavior of birds in and near the facility.**
- **Implement an onsite and offsite (if feasible) avian and bat mortality and injury monitoring program to identify the extent of potential avian or bat mortality or injury from collisions with facility structures or from elevated levels of solar flux that may be encountered within the facility airspace, including:**
  - **assessing levels of collision-related mortality and injury with heliostats, perimeter fences and power tower structures;**
  - **calculating rates of solar flux-related avian mortality and injury, if any;**
  - **documenting seasonal, temporal, and weather-related patterns associated with collision- or solar flux-related mortality and injury, if any; and**
  - **documenting flight spatial patterns that may be associated with collision- or flux-related mortality and injury, if any.**
  - **documenting spatial patterns that may be associated with avoidance of the facility.**
- **Identify specific conservation measures and/or programs to minimize impacts and evaluate the effectiveness of those measures.**

- Implement an adaptive management and decision-making framework for reviewing, characterizing, and responding to quantitative survey and monitoring results.

BBCS Components

The project owner shall prepare and implement a BBCS adopting all requirements applicable to solar generation in current guidelines recommended by the USFWS (currently 2012 USFWS Land Based Wind Energy Guidelines). The BBCS shall include the following components:

1. Preconstruction Baseline survey results. A description and summary of the baseline survey methods and results.

2. Formation of a technical advisory committee (TAC). The TAC will facilitate concurrent project owner, CPM, and state and federal wildlife agency review of seasonal and annual survey results, the effectiveness of the adaptive management measures implemented by the project owner, modification of the surveys in response to the results, if necessary, and the identification of additional mitigation responses that are commensurate with the extent of impacts that may be identified in the monitoring studies. A meeting schedule for the TAC will be indentified, for regular review of avian and bat injury and mortality monitoring results, and recommend any necessary changes to monitoring, adaptive management, and appropriate dissemination of mitigation funds per BIO-16a #2. The TAC will also assist the CPM in implementing the following provisions #3 - #8.

3. Avian and bat use and behavior surveys. Avian and bat site-use behavior surveys shall be conducted. The program will outline survey methodology and field documentation, identification of appropriate onsite and offsite survey locations, control sites, and the seasonal considerations. Prey abundance surveys will also be conducted to identify the locations and changes in the abundance of prey species. Bat acoustic sampling may be implemented depending on results of the baseline study.

4. Golden eagle nest surveys and monitoring. Results of annual pedestrian and/or helicopter surveys of golden eagle nesting sites within a 10-mile radius of the project site, including a summary of available information concerning golden eagle nesting activity in the project vicinity.

5. Avian and bat mortality and injury monitoring: An avian and bat injury and mortality monitoring program shall be implemented, including:

   (a) Onsite monitoring that will systematically survey representative locations within the facility, at a level that will produce statistically robust data; account for potential spatial bias and allow for the extrapolation of survey results to unsurveyed areas and the survey interval based on scavenger and searcher efficiency trials and detection rates.

(b) Offsite monitoring, to the extent that access can be reasonably and feasibly obtained by the project owner, of one or more locations adjacent to the project facilities using the same or comparable methods as implemented for the onsite monitoring to identify which avian species potentially injured by collisions or solar flux within adjacent areas.

(c) Low-visibility and high-wind weather event monitoring to document potential weather-related collision risks that may be associated with the power towers at the facility, including foggy, highly overcast, or rainy night-time weather typically associated with an advancing frontal system, and high wind events (40 miles per hour winds) are sustained for period of greater than 4 hours. The monitoring report shall include survey frequency, locations and methods.

(d) Scavenger and searcher efficiency trials to document the extent to which avian or bat fatalities remain visible over time and can be detected within the project area and to adjust the survey timing and survey results to reflect scavenger and searcher efficiency rates.

(e) Statistical methods used to generate facility estimates of potential avian and bat impacts based on the observed number of detections during standardized searches during the monitoring season for which the cause of death can be determined and is determined to be facility-related.

(f) Field detection and mortality or injury identification, cause attribution, handling and reporting protocols consistent with applicable legal requirements.

6. Survey schedule and period. All surveys and monitoring studies included in the BBCS shall be conducted for three years following commercial operation and approval of the BBCS by the CPM. At the end of the three-year period, the project owner and the CPM shall meet and confer to determine whether the survey program shall be continued for subsequent periods. The monitoring program may be modified with the approval of the CPM in response to survey results, identified scavenging efficiency rates, or other factors to increase monitoring accuracy and reliability or in accordance with the adaptive management decision-making framework included in the BBCS.

7. **Adaptive management. An adaptive management program shall be developed to identify and implement reasonable and feasible measures that would reduce any biologically significant levels of avian or bat mortality or injury attributable to project operations and facilities. Any such impact reduction measures must be commensurate (in terms of factors that include geographic scope, costs, and scale of effort) to the level of avian or bat mortality or injury that is specifically and clearly attributable to the project facilities. The adaptive management program shall include the following elements:**

   (a) **Reasonable measures for characterizing the extent and significance of detected mortality and injuries clearly attributable to the project.**

   (b) **Measures that the project owner will implement to adaptively respond to detected mortality and injuries attributable to the project, including passive avian diverter installations along the perimeter or at other locations within the project to avoid site use, the use of sound, light or other means to discourage site use consistent with applicable legal requirements, onsite prey or habitat control measures consistent with applicable legal requirements, and additional perch and nest proofing of project facilities.**

8. **Eagle Protection Plan (EPP): The project owner shall prepare and implement an Eagle Protection Plan adopting all requirements applicable to solar generation as outlined in guidelines recommended by the USFWS (currently 2012 USFWS Land Based Wind Energy Guidelines2011b). The EPP may be prepared as a stand-alone document or included as a chapter within the BBCS. The EPP shall describe all available baseline data on golden eagle occurrence, seasonality, activity, and behavior throughout the project area and vicinity. The EPP shall outline a study protocol consistent with Item 5 above to include annual pedestrian and/or helicopter surveys of golden eagle breeding sites within a 10 mile radius of the project site, to be reviewed and approved by the CPM, in consultation with the USFWS, BLM, and CDFW.**

The EPP shall describe all proposed measures to prevent death and injury of eagles from (1) collisions with facility features including the heliostats, power towers, and gen-tie line towers or transmission lines, (2) electrocutions on transmission lines or other project components, and (3) concentrated solar flux created over the solar field. The EPP shall describe efforts taken pursuant to BIO-16a.

The EPP shall also include any feasible adaptive modifications to heliostat positioning during operation (including day time and night time) in order to minimize collisions and/or risk of exposure to concentrated solar flux. Any such adaptive minimization measures must

be commensurate (in terms of factors that include geographic scope, costs, and scale of effort) to the level of avian or bat risk that is specifically and clearly attributable to the project facilities. The EPP shall provide a reporting schedule for all monitoring or other activities related to bird or bat conservation or protection during project construction or operation. The EPP shall be subject to review and approval by the CPM in consultation with CDFW, BLM, and USFWS, and shall be incorporated into the project's BRMIMP and BBCS, and implemented.

Verification: The BBCS shall be submitted to the CPM for review and approval and to CDFW, BLM, and USFWS for review and comment no less than 60 days after start of construction. The project owner shall provide the CPM with copies of any written or electronic transmittal from the USFWS, BLM, or CDFW related to the BBCS within 30 days of receiving any such transmittal. Survey reports shall be submitted to the CPM after each season and in an annual summary report throughout the course of the three-year study period and as set forth in the approved monitoring study plan. The reports will include all monitoring data required as part of the monitoring program.

Methods and results of the Monitoring Study shall be submitted to the CPM in Monthly and Annual Compliance Reports throughout the course of the study, or as otherwise directed by the CPM. The Monitoring Study shall continue ~~and~~ until the CPM, in consultation with CDFW, BLM, and USFWS, concludes that the cumulative monitoring data provide sufficient basis for estimating long-term bird mortality for the project. The reports will include all monitoring data required as part of the monitoring program.

The reports shall also summarize any additional wildlife mortality or injury documented on the project site during the year, regardless of cause, and assess any adaptive management measure implemented during the prior year as approved by the CPM. After the third year of the monitoring program, the CPM shall meet and confer with the TAC to determine if the study period shall be extended based on data quality and sufficiency of analysis, or if needed, to document efficacy of any adaptive management measures undertaken by the project owner. If a carcass of a golden eagle or any state or federally listed threatened or endangered species is found at any time by the monitoring study or project operations staff, the project owner, Designated Biologist, or other qualified biologist that may be identified by the Designated Biologist shall contact the CPM, CDFW and USFWS by email, fax or other electronic means within one working day of any such detection.

~~**Verification:** The BBCS shall be submitted to the CPM for review and approval and to CDFW and USFWS for review and comment no less than 120 days prior to the commercial operation of the first unit. The Project owner shall provide the CPM with copies of any written or electronic transmittal from the USFWS, BLM, or CDFW related to the BBCS within 30 days of receiving any such transmittal. Survey reports shall be submitted to the CPM after each season and in an annual summary report throughout the course of the three-year study period and as set forth in the approved monitoring~~

~~study plan. The reports will include all monitoring data required as part of the monitoring program.~~

~~Methods and results of the Monitoring Study shall be submitted to the CPM in Monthly and Annual Compliance Reports throughout the course of the study and until the CPM, in consultation with the other agencies, concludes that the cumulative monitoring data provide sufficient basis for estimating long-term bird mortality for the project. The Reports will include all monitoring data required as part of the monitoring program.~~

~~The reports also shall summarize any additional wildlife mortality or injury documented on the project site during the year, regardless of cause, and assess any adaptive management measure implemented during the prior year as approved by the CPM. After the third year of the monitoring program, the CPM shall meet and confer with the project owner to determine of the study period should be extended based on data quality and sufficiency of analysis or if needed to document efficacy of any adaptive management measures undertaken by the Project owner. The study period may be extended up to five years from the commencement of facility operations. If a carcass of a golden eagle or any state or federally listed threatened or endangered species is found at any time by the monitoring study or Project operations staff, the Project owner, Designated Biologist, or other qualified biologist that may be identified by the Designated Biologist shall contact the CPM, CDFW and USFWS by email, fax or other electronic means within one working day of any such detection.~~

~~AMERICAN BADGER AND DESERT KIT FOX IMPACT AVOIDANCE AND MINIMIZATION MEASURES~~

~~**BIO-17**~~ ~~To avoid direct impacts to American badgers and desert kit fox, pre-construction surveys shall be conducted for these species concurrent with the desert tortoise surveys to facilitate passive relocation. Surveys shall be conducted as described below:~~

1. ~~Biological Monitors shall perform pre-construction surveys for badger and kit fox dens in the Project disturbance area and a 20-foot buffer beyond the Project disturbance area, including utility corridors and access roads. If dens are detected each den shall be classified as inactive, potentially active, or definitely active. Surveys may be concurrent with desert tortoise surveys.~~

2. ~~Inactive dens that would be directly impacted by construction activities shall be excavated by hand and backfilled to prevent reuse by badgers or kit fox.~~

3. ~~Potentially and definitely active dens that would be directly impacted by construction activities shall be monitored by the Biological Monitor for three consecutive nights using a tracking medium (such as diatomaceous earth or fire clay) and/or infrared camera stations at the entrance.~~

4. ~~If no tracks are observed in the tracking medium or no photos of the target species are captured after three nights, the den shall be excavated and backfilled by hand.~~

5. ~~If tracks are observed, the den shall be progressively blocked with natural materials (rocks, dirt, sticks, and vegetation piled in front of the entrance) for the next three to five nights to discourage the badger or kit fox from continued use. After verification that the den is unoccupied it shall then be excavated and backfilled by hand to ensure that no badgers or kit fox are trapped in the den. BLM approval may be required prior to release of badgers on public lands.~~

~~**Verification:** The Project owner shall submit a report to the CPM, BLM and CDFG within 30 days of completion of badger and kit fox surveys. The report shall describe survey methods, results, impact avoidance and minimization measures implemented, and the results of those measures.~~

AMERICAN BADGER AND DESERT KIT FOX IMPACT AVOIDANCE AND MINIMIZATION MEASURES

BIO-17 The project owner shall contract a qualified biologist to conduct a baseline pre-construction desert kit fox and American badger survey and develop and implement an American Badger and Desert Kit Fox Mitigation and Monitoring Plan (Plan). The survey data will be used to revise the final Plan, as necessary, with the most recent species data from the project site.

The project owner shall conduct a baseline kit fox census survey and submit a summary report that includes the following procedures:

1. **A qualified biologist with demonstrated mammal experience shall complete a baseline pre-construction survey of desert kit fox and American badger populations on the project site and the anticipated dispersal areas for passive relocation between 30 and 60 days prior to initiation of any ground disturbing activities, including site assessment and construction activities that include installation of desert tortoise fencing. The anticipated dispersal areas shall be defined as all suitable desert kit fox habitat within 500 meters of the project boundaries where desert kit fox would likely be displaced. The survey shall identify and record the locations of all potential dens throughout the project site (or phase) and shall characterize the approximate number and distribution of the badger and kit foxes on the site and anticipated dispersal areas. Depending on the season of the surveys (i.e. breeding or non-breeding) other demographic data will be collected if possible to determine. The baseline pre-construction survey shall include the following components:**

   a. **An inventory and mapped locations of desert kit fox dens and burrows on the project site (including all project disturbance areas) and in the anticipated dispersal areas, and an evaluation whether each burrow is occupied, and reproductive status of kit foxes (single animal, mated pair, or family group with young), if known. If status unknown measures as required under Item 2b, below, will be implemented.**

b. **Reporting: The project owner shall provide a draft Summary Report of the Baseline American Badger and Desert Kit Fox Survey to the CPM and BLM for review in consultation with CDFW. The project owner and the project owner's Designated Biologist shall consult with the CPM and BLM on any changes to the final Plan that would result from the baseline pre-construction survey data provided in the Summary Report. The project owner shall not implement the American Badger and Desert Kit Fox Mitigation and Monitoring Plan (below) until receiving the CPM and BLM's written approval of the final Plan.**

The objective of the plan shall be to avoid direct impacts to the American badger and desert kit fox as a result of site mobilization and construction of the power plant and linear facilities, as well as during project operation and non-operation and closure. The final plan is subject to review and comment by BLM and revision and approval by the CPM, in consultation with California Department of Fish and Wildlife (CDFW). The final Plan shall include, but is not limited to, the following procedures and impact avoidance measures:

2. **Describe pre-construction survey and clearance field protocol, to determine the number and locations of single or paired kit foxes or badgers on the project site that would need to be avoided or passively relocated and the number and locations of desert kit fox or badger burrows or burrow complexes that would need to be collapsed to prevent re-occupancy by the animals.**

   a. Pre-Construction Surveys. A baseline, preconstruction survey shall be conducted as described above under Item 1. Surveys may be concurrent with desert tortoise and burrowing owl surveys to the extent it does not conflict with desert tortoise and burrowing owl agency protocols. Depending on the timing of the project phases and time between phases, surveys may need to be conducted for each phase of construction Options for timing of surveys shall be detailed in the Plan. If dens are detected during the survey(s), each den shall be classified as inactive, potentially active, definitely active den, or natal den.

   b. Monitoring and Protection Measures, Passive Hazing, and Den Excavation: The plan will include details on monitoring requirements, types and methods of passive hazing, and methods and timing of den excavation, including, but not limited to the following:

      i. Inactive dens. Inactive dens (e.g. inactive dens are dens that are mostly or entirely silted in and ones in which the back of the den can clearly be seen (e.g., the den isn't deep and doesn't curve) that would be directly impacted by construction activities shall be excavated by hand and backfilled to prevent reuse by badger or kit fox.

ii. Potentially and definitely active dens. Potentially and definitely active dens that would be directly impacted by construction activities shall be monitored by the Biological Monitor for three consecutive nights using a tracking medium (such as diatomaceous earth or fire clay) and/or infrared camera stations at the entrance. If no tracks are observed in the tracking medium or no photos of the target species are captured after three nights, the den shall be excavated and backfilled by hand. If tracks are observed, the den shall be progressively blocked with natural materials (rocks, dirt, sticks, and vegetation piled in front of the entrance) for the next three to five nights to discourage the badger or kit fox from continued use. After verification that the den is unoccupied it shall then be excavated and backfilled by hand to ensure that no badgers or kit fox are trapped in the den. If the den is proven inactive then den may be collapsed during whelping season. BLM approval may be required prior to release of badgers on public lands.

iii. Active natal/pupping dens. If an active natal den (a den with pups) is detected on the site, the project owner shall proceed to implement the approved Plan and shall also notify the BLM, CPM, and CDFW within 24 hours. If the situation is unusual and/or not addressed by the approved Plan, then the project owner's biologist shall consult with the CPM,BLM, and CDFW to determine the appropriate course of action to minimize the potential for animal harm or mortality. The course of action would depend on the age of the pups, location of the den on the site (e.g. is the den in a central area or in a perimeter location), status of the perimeter site fence (completed or not), and the pending construction activities proposed near the den. A 500-foot no-disturbance buffer shall be maintained around all active dens. The denning season for American badger is approximately March to August, and for desert kit fox the denning season is approximately Mid-January to pup independence typically by July 1 (or with confirmation of pup independence based on monitoring data). If the den is active during the whelping season, even if pups are not seen, disturbance is not allowed. Active natal/pupping dens will not be excavated or passively relocated.

c. Exception for American badger. In the event that passive relocation techniques fail for badgers, outside the denning season, or during the denning season if individual badgers can be verified to not have a litter, then live-trapping by a CDFW and CPM approved trapper is an option that may be employed to safely perform active removal as a last resort. A live-trapping plan including trapping methods as well as the name and resume, including documentation of relevant handling permits of the

proposed trapper, would be included in detail as part of the approved Plan. In the event live-trapping would be employed as a last resort, written notification would be submitted to the CPM for review and approval in consultation with BLM and CDFW. The CPM, BLM and CDFW would be notified in writing no less than 1 week prior to live trapping of badger. The notification would at a minimum include what passive relocation methods have been attempted to date and the justification for live-trapping as a last resort. In addition timing, and location of release of the individual badger as well as the name of the proposed trapper and resume, including documentation of relevant handling permits if not previously included and approved in the Plan shall be included in the notification. BLM approval may be required prior to release of badgers on public lands.

3. **Address other factors and procedures that may affect the success of kit fox and American badger relocation offsite, such as:**

   a. **Qualitative discussion of availability of suitable habitat on off-site surrounding lands within 10 miles of the project boundary, and evaluation of kit fox burrows with 500 meters of the project boundary, in areas where onsite foxes may disperse (e.g., by inventorying burrow numbers in selected representative sample areas) as identified in the pre-construction surveys above;**

   b. **Estimates of the distances kit foxes would need to travel across the project site and across adjacent lands to safely access suitable habitat (including burrows) off-site;**

   c. **Proposed scheduling of the passive relocation effort;**

   d. **Methods to minimize likelihood that the animals will return to the project site;**

   e. **Descriptions of any proposed or potential ground disturbing activities related to kit fox relocation, and locations of those activities (e.g., artificial burrow construction);**

   f. **A monitoring and reporting plan to evaluate success of the relocation efforts and any subsequent re-occupation of the project site; and**

   g. **A plan to subsequently relocate any animals that may return to the site (e.g., by digging beneath fences).**

4. **Address notification procedures for notifying the CPM, BLM and CDFW if injured, sick, or dead badger or kit fox are detected. Notify the CPM, BLM and CDFW if injured, sick, or dead American badger and desert kit fox are found. If an injured, sick, or dead animal is detected on any area associated with the solar project site or**

associated linear facilities, the CPM, BLM Palm Springs/ South Coast Field Office and the Ontario CDFW Office as well as the CDFW Wildlife Investigation Lab (WIL) shall be notified immediately by phone (8 hours in the case of a fatality). Written follow-up notification via FAX or electronic communication shall be submitted to the CPM, BLM and CDFW within 24 hours of the incident and shall include the following information as appropriate:

a. Injured animals. If an American badger or desert kit fox is injured because of any project-related activities, the Designated Biologist or approved Biological Monitor shall immediately notify the CPM, BLM and CDFW personnel regarding the capture and transport of the animal to CDFW-approved wildlife rehabilitation and/or veterinarian clinic. Following the phone notification, the CPM and CDFW shall determine the final disposition of the injured animal, if it recovers. A written notification of the incident shall be sent to the CPM, BLM and CDFW containing, at a minimum, the date, time, location, and circumstances of the incident.

b. Sick animals. If an American badger or desert kit fox is found sick and incapacitated on any area associated with the project site or associated linear facilities, the Designated Biologist or approved Biological Monitor shall immediately notify the CPM, BLM and CDFW personnel for immediate capture and transport of the animal to a CDFW-approved wildlife rehabilitation and/or veterinarian clinic. Following the phone notification, the CPM and CDFW shall determine the final disposition of the sick animal, if it recovers. A necropsy shall be performed by a CDFW-approved facility to determine the cause of death. The project owner shall pay to have the animal transported and a necropsy performed. A written notification of the incident shall be sent to the CPM, BLM and CDFW and contain, at a minimum, the date, time, location, and circumstances of the incident.

c. Fatalities. If an American badger or desert kit fox is killed because of any project-related activities during construction, operation, and closure or is found dead on the project site or along associated linear facilities, the Designated Biologist or approved Biological Monitor shall immediately refrigerate the carcass and notify the CPM, BLM and CDFW personnel within 24 hours (8 hours in the case of desert kit fox) of the discovery to receive further instructions on the handling of the animal. Handling of a dead kit fox shall follow the most recently issued Guidelines for Handling a Desert Kit Fox Carcass (currently CDFW WIL 2011) or. A necropsy shall be performed by a CDFW-approved facility to determine the cause of death. The project owner shall pay to have the animal transported and a necropsy performed.

5. **Additional protection measures to be included in the Plan and implemented:**

   a. **All pipes within the project disturbance area must be capped and/or covered every evening or when not in use to prevent desert kit foxes or other animals from accessing the pipes.**

   b. **All project-related water sources shall be covered and secured when not in use to prevent drowning.**

   c. **The project owner shall coordinate with CDFW to identify any additional fence design features to maximize the effectiveness of the fence to exclude kit foxes from the project.**

   d. **Incorporate and implement the CDFW Veterinarian's guidance regarding impact avoidance measures including measures to prevent disease spread among desert kit foxes.**

   e. **Include measures to reduce traffic impacts to wildlife if the project owner anticipates night-time construction. The plan must also include a discussion of what information will be provided to all night-time workers, including truck drivers, to educate them about the threats to kit fox, what they need to do to avoid impacts to kit fox, and what to report if they see a live, injured, or dead kit fox.**

   f. **In order to reduce the likelihood of distemper transmission:**

      i. **No pets shall be allowed on the site prior to or during site mobilization and construction, operation, and non-operation and closure, with the possible exception of vaccinated kit fox scat detection dogs during preconstruction surveys, and then only with prior CPM and CDFW approval;**

      ii. **Any hazing activities that include the use of chemical or other repellents (e.g. ultrasonic noise makers, or non-animal-based chemical repellents) must be cleared through the CPM and CDFW prior to use. The use of animal tissue or excretion based repellents (e.g. coyote urine, anal gland products) is not permitted.**

      iii. **Any sick or diseased kit fox, or documented kit fox mortality shall be reported to the CPM, CDFW, and the BLM immediately upon identification (within 8 hours for mortality). If a dead kit fox is observed, it shall be collected and stored according to established protocols distributed by CDFW WIL, and the WIL shall be contacted to determine carcass suitability for necropsy.**

6. **The project owner may opt to participate in the CDFW-led fee-based Monitoring and Mitigation Program if in place prior to start of site mobilization and construction in lieu of implementation of certain items in above 3f, 4b, 4c, 5d, 5f and other items above if included in the program when established. This includes financial responsibility for transportation and necropsy of desert kit fox mortalities due to project-related activities or sick animals found on or near the project site or associated linears as well as measures to address other factors and procedures that may affect the success of kit fox and American badger relocation offsite. If in place, the CDFW Monitoring and Mitigation Program activities associated with the Project and associated fees will be fully described in the final Plan. The project owner may also opt to participate in the program if established at a later date during site mobilization and construction or operation and will submit a revised Plan that includes the program information when established and confirmation that fees are paid.**

Verification: No fewer than 90 days prior to the start of any site mobilization and construction the project owner shall provide the CPM, BLM, and CDFW with a draft American Badger and Desert Kit Fox Mitigation and Monitoring Plan for review and comment.

Between 30 to 60 days prior to initiation of site mobilization and construction activities, a qualified biologist with demonstrated mammal experience shall complete a baseline study of American badger and desert kit fox populations on the project site and the anticipated dispersal areas for passive relocation.

The Project owner shall submit a summary report to the CPM, BLM and CDFW within 7 days of completion of any badger and kit fox surveys. The report shall describe survey methods and results of the surveys. The project owner and the Designated Biologist shall consult with the CPM and BLM upon submitting the summary report regarding any changes to the final Plan.

No fewer than 15 days prior to start of any site mobilization and construction, the project owner shall provide an electronic copy of the CPM-approved final Plan to the CPM, BLM and CDFW and implement the Plan.

No later than 24 hours following a phone notification of an injured, sick, or dead American badger or desert kit fox, the project owner shall provide to the CPM, BLM and CDFW, via FAX or electronic communication, a written report from the Designated Biologist describing the incident of sickness, injury, or death of an American badger or desert kit fox, when the incident occurred, and who else was notified.

Beginning with the first month after start of construction and continuing every month until construction is completed, the Designated Biologist shall include a summary of events regarding the American badger and desert kit fox in each Monthly Compliance Reports (MCR). The impact avoidance and minimization measure(s) implemented and the results of implementation of those measures shall be reported in each MCR.

No later than 45 days after initiation of project operation, the Designated Biologist shall provide the CPM and BLM a final American Badger and Desert Kit Fox Mitigation and Monitoring Plan Report that includes: 1) a discussion of all mitigation measures that were and currently are being implemented; 2) all information about project-related kit fox and badger injuries and/or deaths; 3) all information regarding sick kit fox and badger found within the project site and along related linear facilities; and 4) recommendations on how mitigation measures might be changed to more effectively minimize and mitigate the impacts of future projects on the American badger and desert kit fox.

Within 30 days of participation in the CDFW-led fee-based Monitoring and Mitigation Program during site mobilization and construction or operation, the project owner will submit a revised Plan that includes the program information related to the project and confirmation that all fees are paid.

BURROWING OWL IMPACT AVOIDANCE, MINIMIZATION, AND COMPENSATION MEASURES

BIO-18 The Project owner shall implement the following measures to avoid, minimize and offset impacts to burrowing owls:

1. Pre-Construction Surveys. The Designated Biologist or Biological Monitor shall conduct pre-construction surveys for burrowing owls no more than 30 days prior to initiation of **site mobilization and** construction activities **in accordance with CDFW guidelines (CDFW 2012).** Surveys shall be focused exclusively on detecting burrowing owls, and shall be conducted from two hours before sunset to 1 hour after or from 1 hour before to 2 hours after sunrise. The survey area shall include the Project Disturbance Area and surrounding 500 foot survey buffer for each phase of construction in accordance with **BIO-29** (phasing).

2. Implement Burrowing Owl Mitigation Plan. The Project owner shall implement measures described in the final Burrowing Owl Mitigation Plan. The final Burrowing Owl Mitigation Plan shall be approved by the CPM, in consultation with BLM, USFWS and CDF~~G~~**W**, and shall:

    a. identify suitable sites within 1 mile of the Project Disturbance Areas for creation or enhancement of burrows prior to passive relocation efforts;

    b. provide guidelines for creation or enhancement of at least two natural or artificial burrows per relocated owl; **design of the artificial burrows shall be consistent with CDFW guidelines (CDFW 2012) and shall be approved by the CPM in consultation with CDFW and USFWS;**

    c. provide detailed methods and guidance for passive relocation of burrowing owls occurring within the Project Disturbance Area; and

    d. describe monitoring and management of the passive relocation effort, including the created or enhanced burrow location and the project area where burrowing owls were relocated from, and provide a reporting plan.

3. Implement Avoidance Measures. If an active burrowing owl burrow is detected within 500 feet from the Project Disturbance Area the following avoidance and minimization measures shall be implemented:

   a. Establish Non-Disturbance Buffer. Fencing shall be installed at a 250-foot radius from the occupied burrow to create a non-disturbance buffer around the burrow. The non-disturbance buffer and fence line may be reduced to 160 feet if all Project-related activities that might disturb burrowing owls would be conducted during the non-breeding season (September 1 through January 31). Signs shall be posted in English and Spanish at the fence line indicating no entry or disturbance is permitted within the fenced buffer.

   b. Monitoring: If construction activities would occur within 500 feet of the occupied burrow during the nesting season (February 1 – August 31) the Designated Biologist or Biological Monitor shall monitor to determine if these activities have potential to adversely affect nesting efforts, and shall make recommendations to minimize or avoid such disturbance.

4. Acquire Burrowing Owl Habitat. The Project owner shall acquire, in fee or in easement land suitable to support a resident population of burrowing owls and shall provide funding for the enhancement and long-term management of these compensation lands. The responsibilities for acquisition and management of the compensation lands may be delegated by written agreement to CDF~~G~~**W** or to a third party, such as a non-governmental organization dedicated to habitat conservation, subject to approval by the CPM, in consultation with CDF~~G~~**W** and USFWS prior to land acquisition or management activities. Additional funds shall be based on the adjusted market value of compensation lands at the time of construction to acquire and manage habitat.

   a. Criteria for Burrowing Owl Mitigation Lands. The terms and conditions of this acquisition or easement shall be as described in **BIO-12** [Desert Tortoise Compensatory Mitigation], with the additional criteria to include: 1) mitigation land per **BIO-29 - Table 2** that must provide suitable habitat for burrowing owls, and 2) the acquisition lands must either currently support burrowing owls or be **within dispersal distance from areas occupied by burrowing owls (generally approximately five miles).** ~~no farther than 5 miles from an active burrowing owl nesting territory.~~ The burrowing owl mitigation lands may be included with the desert tortoise mitigation lands ONLY if these two burrowing owl criteria are met. If the burrowing owl mitigation land is separate from the acreage required for desert tortoise compensation lands, the Project owner shall fulfill the requirements described below in this condition.

   b. Security. If the burrowing owl mitigation land is separate from the acreage required for desert tortoise compensation lands the Project owner or an approved third party shall complete acquisition of the proposed compensation lands within the time period specified for this acquisition (see the verification section at the end of this condition). Alternatively, financial assurance can be provided by the Project owner to the CPM and CDF~~G~~**W**, according to the measures outlined in **BIO-12**. The amount of the Security shall be as described in **BIO-29 – Table 3** for the proposed Project or any of the Project alternatives. These funds shall be used solely for implementation of the measures associated with the Project. Financial assurance can be provided to the CPM in the form of an irrevocable letter of credit, a pledged savings account or another form of security ("Security") prior to initiating ground-disturbing Project activities. Prior to submittal to the CPM, the Security shall be approved by the CPM, in consultation with CDF~~G~~**W** and the USFWS to ensure funding. The final amount due will be determined by an updated appraisal and PAR analysis conducted as described in **BIO-12**.

Verification: If pre-construction surveys detect burrowing owls within the Project Disturbance Area and relocation of the owls is required, within 30 days of completion of the burrowing owl pre-construction surveys the Project owner shall submit to the CPM, BLM, CDF~~G~~**W**, and USFWS a Burrowing Owl Mitigation Plan. The Burrowing Owl Mitigation Plan shall identify suitable areas for construction of burrows and the other passive relocation as described above. As part of the Annual Compliance Report each year following construction for a period of five years, the Designated Biologist shall provide a report to the CPM, BLM, USFWS and CDF~~G~~**W** that describes the results of monitoring and management of the burrowing owl burrow creation or enhancement area(s).

If pre-construction surveys detect burrowing owls within 500 feet of proposed construction activities, at least 10 days prior to the start of any Project-related site disturbance activities the Designated Biologist shall provide to the CPM, BLM, CDF~~G~~**W**, and USFWS documentation indicating that non-disturbance buffer fencing has been installed as described above. The Project owner shall report monthly to the CPM, BLM, CDF~~G~~**W** and USFWS for the duration of construction on the implementation of burrowing owl avoidance and minimization measures. Within 30 days after completion of construction the Project owner shall provide to the CPM and CDF~~G~~**W** a written report identifying how mitigation measures described in the plan have been completed.

No less than 30 days prior to the start of **site mobilization and construction** ~~Project ground-disturbing~~ activities the Project owner shall provide the CPM with an approved form of Security in accordance with this condition of certification. Actual Security for acquisition of 78 acres of burrowing owl habitat shall be provided no later than 7 days prior to the beginning of **site mobilization and construction** ~~Project ground-disturbing~~ activities.

No fewer than 90 days prior to the land or easement purchase, as determined by the date on the title, the Project owner shall provide the CPM with a management plan for review and approval, in consultation with CDF~~G~~**W**, BLM, and USFWS, for the compensation lands and associated funds.

No later than 18 months from initiation of construction, the Project owner shall provide written verification to the CPM that the compensation lands or conservation easements have been acquired and recorded in favor of the approved recipient.

SPECIAL-STATUS PLANT IMPACT AVOIDANCE, MINIMIZATION AND COMPENSATION

BIO-19 This condition contains the following four sections:

- **Section A: Special-Status Plant Impact Avoidance and Minimization Measures** contains the Best Management Practices and other measures designed to avoid accidental indirect impacts to plants during **site mobilization,** construction, operation, and closure. The measures are required for special-status plants located outside of the Project Disturbance Area and within 100 feet of the Project Disturbance Area. The same measures shall also be implemented for plants within the Project Disturbance Area that are avoided pursuant to Section C of this condition.
- **Section B: Conduct Late Season Botanical Surveys** describes guidelines for conducting summer-fall 201~~0~~**3** surveys to detect special-status plants that would have been missed during the spring 201~~0~~**3** surveys.
- **Section C: Avoidance Requirements for Special-Status Plants** Detected **in the Summer/Fall 201~~0~~3 Surveys** outlines the level of on-site avoidance required for any special-status plants detected during the summer-fall surveys, and specifies when off-site mitigation is required..
- **Section D: Off-Site Compensatory Mitigation for Special-Status Plants** describes performance standards for off-site mitigation through acquisition or restoration/enhancement.

"Project Disturbance Area" encompasses all areas to be temporarily and permanently disturbed by the Project, including the plant site, linear facilities, and areas disturbed by temporary access roads, fence installation, construction work lay-down and staging areas, parking, storage, or by any other activities resulting in disturbance to soil or vegetation. The term "Permanent Project Disturbance Area" refers only to the solar facility; "linears" includes transmission lines, laydown areas, pipelines, and access roads.

The Project owner shall implement the following measures in Section A, B, C, and D to avoid, minimize, and compensate for direct, indirect, and cumulative impacts to special-status plant species:

Section A: Special-Status Plant Impact Avoidance and Minimization Measures

To protect all special-status plants[8][9]located outside of the Project Disturbance Area and within 100 feet of the permitted Project Disturbance Area from accidental and indirect impacts during **site mobilization** construction, operation, and closure, the Project owner shall implement the following measures:

1. Designated Botanist. An experienced botanist who meets the qualifications described in Section **B-2** below shall oversee compliance with all special-status plant avoidance, minimization, and compensation measures described in this condition throughout construction and closure. The Designated Botanist shall oversee and train all other Biological Monitors tasked with conducting botanical survey and monitoring work. During operation of the Project, the Designated Biologist shall be responsible for protecting special-status plant occurrences within 100 feet of the Project boundaries.

2. Special-Status Plant Impact Avoidance and Minimization Measures. The Project owner shall incorporate all measures for protecting special-status plants in close proximity to the site into the BRMIMP (**BIO-7**). These measures shall include the following elements:

   a. Site Design Modifications: i) Incorporate s modifications to site design or construction techniques to minimize direct and indirect impacts to special-status plants along the Project linears to include: limiting the width of the work area; adjusting the location of staging areas, lay downs, spur roads and poles or towers; driving and crushing vegetation as an alternative to blading temporary roads to preserve the seed bank, and minor adjustments to the alignment of the roads and pipelines within the constraints of the ROW; ~~ii)modify diffusers on engineered channel to ensure discharge into existing small channels that were deprived of flows from diversion into engineered channel to minimize impacts downstream and maintain the natural surface drainage patterns and sediment transport critical to wash-dependent special-status plants; iii~~**ii**) These modifications shall be clearly depicted on the grading and construction plans, and on report-sized maps in the BRMIMP.

[8] This shall include special-status plants found during the fall 2010 surveys and the following species found during the spring 2009-2010 surveys: Harwood's milk-vetch; Harwood's woolly-star; California ditaxis; ribbed cryptantha, and the "Palen Lake atriplex (Andre sp. nov.).

[9] Staff defines special-status plants as described in *Protocols for Surveying and Evaluating Impacts to Special-Status Native Plant Populations and Natural Communities* (California Natural Resources Agency, Department of Fish and Game, issued November 24, 2009). "List 3 plants may be analyzed under CEQA §15380 if sufficient information is available to assess potential impacts to such plants. Factors such as regional rarity vs. statewide rarity should be considered in determining whether cumulative impacts to a List 4 plant are significant even if individual project impacts are not."

b. Establish Environmentally Sensitive Areas (ESAs). Prior to the start of any ground- or vegetation-disturbing activities, the Designated Botanist shall establish ESAs to protect avoided[10] special-status plants located outside of the Project Disturbance Areas and within 100 feet of the boundary of construction. This includes plant occurrences identified during the **all** spring ~~2009-2010 surveys and the~~ **and** late season ~~2010~~ surveys **previously conducted**. The locations of ESAs shall be clearly depicted on construction drawings, which shall also include all avoidance and minimization measures on the margins of the construction plans. The boundaries of the ESAs shall be placed a minimum of 20 feet from the uphill side of the occurrence and 10 feet from the downhill side. Where this is not possible due to construction constraints, other protection measures such as silt-fencing and sediment controls may be employed to protect the occurrences. Equipment and vehicle maintenance areas, and wash areas, shall be located 100 feet from the uphill side of any ESAs. ESAs shall be clearly delineated in the field with temporary construction fencing and signs prohibiting movement of the fencing or sediment controls under penalty of work stoppages and additional compensatory mitigation. ESAs shall also be clearly identified (with signage or by mapping on site plans) to ensure that avoided plants are not inadvertently harmed during construction, operation, or closure.

c. Special-Status Plant Worker Environmental Awareness Program (WEAP). The WEAP **(BIO-6)** shall include training components specific to protection of special-status plants as outlined in this condition.

d. Herbicide and Soil Stabilizer Drift Control Measures. Special-status plant occurrences within 100 feet of the Project Disturbance Area, and any occurrences avoided within the Project Disturbance Area[3] shall be protected from herbicide and soil stabilizer drift. The Weed **Management Plan** ~~Control Program~~ (**BIO-14**) shall include measures to avoid chemical drift or residual toxicity to special-status plants consistent with guidelines such as those provided by the Nature Conservancy's *The Global Invasive Species Team*[11] , the U.S. Environmental Protection Agency, and the Pesticide Action Network Database[12].

---

[10] "Avoided" includes plants occurring within 100 feet outside of the Project boundary, and all plants within the Project Disturbance Area (linears or solar facility) that were avoided pursuant to Section C of this condition.

[11] Hillmer, J. & D. Liedtke. 2003. Safe herbicide handling: a guide for land stewards and volunteer stewards. Ohio Chapter, The Nature Conservancy, Dublin, OH. 20 pp. Online: <http://www.invasive.org/gist/products.html.

e. Erosion and Sediment Control Measures. Erosion and sediment control measures shall not inadvertently impact special-status plants by using invasive or non-native plants in seed mixes, introducing pest plants through contaminated seed or straw, accidental burial by mulches, etc. These specifications shall be incorporated in the Drainage, Erosion, and Sedimentation Control Plan required under **SOIL&WATER-1**.

f. Locate Staging, Parking, Spoils, and Storage Areas Away from Special-Status Plant Occurrences. Areas for spoils, equipment, vehicles, and materials storage areas; parking; equipment and vehicle maintenance areas, and wash areas shall be placed at least 100 feet from any ESAs. These specifications shall be incorporated in the Drainage, Erosion, and Sedimentation Control Plan required under **SOIL&WATER-1**.

g. Pre-Construction Seed Collection. For all significant impacts to special-status plants, mitigation shall include seed collection from the affected special-status plants population on-site prior to construction to conserve the germplasm and provide a seed source for restoration efforts. Seed collection shall follow the guidelines described in Section D.III.3 of this condition.

h. Monitoring and Reporting Requirements. The Designated Botanist, or B**iological** M**onitor** under supervision of the Designated Botanist, shall conduct weekly monitoring of the ESAs that protect special-status plant occurrences during construction and ~~decommissioning~~ **closure** activities.

Section B: Conduct Late-Season Botanical Surveys

The Project owner shall conduct late-summer/fall botanical surveys for late-season special-status plants prior to start of construction or by the end of 201~~0~~**3**, as described below:

1. Survey Timing. Surveys shall be timed to detect: a) summer annuals triggered to germinate by the warm, tropical summer storms (which may occur any time between June and October), and b) fall-blooming perennials that respond to the cooler, later season storms (typically beginning in September or October). For those species that are identified by vegetative characteristics, surveys do not have to be timed for blooming or fruiting. The surveys shall not be timed to coincide with the statistical peak bloom period of the target species but shall instead, if possible, be based on plant phenology and the timing of a significant storm event (e. g., a 10mm or greater rain or multiple storm events of sufficient volume to trigger germination as determined by a qualified botanist.). If possible, surveys shall occur at the appropriate time to capture the characteristics necessary to identify the taxon. Construction is authorized to commence following a 201~~0~~**3** late season survey.

2. Surveyor Qualifications and Training. Surveys shall be conducted by a qualified botanist knowledgeable in the complex biology of the local flora, and consistent with CDFG (2009) and BLM (2009) guidelines for surveyor qualifications. Each surveyor shall be equipped with a GPS unit and record a complete tracklog; these data shall be compiled and submitted along with the Summer-Fall Survey Botanical Report (described below). Prior to the start of surveys, all crew members shall, at a minimum, visit reference sites (where available) and/or review herbarium specimens of all BLM Sensitive plants, ~~CNPS List~~ **California Rare Plant Rank (RPR)** 1B or 2 (Nature Serve rank S1 and S2) or proposed ~~List~~ **RPR** 1B or 2 taxa, and any new reported or documented taxa, to obtain a search image. Because the potential for range extensions is unknown, the list of potentially occurring special-status plants shall include all special-status taxa known to occur within the Sonoran Desert region and the eastern portion of the Mojave in California. The list shall also include taxa with bloom seasons that begin in fall and extend into the early spring as many of these are reported to be easier to detect in fall, following the start of the fall rains.

3. Survey Coverage. The survey coverage or intensity shall be in accordance with **most recent** BLM Survey Protocols (**currently** issued July 2009)[13], which specify that intuitive controlled surveys shall only be accomplished by botanists familiar with the habitats and species that may reasonably be expected to occur in the project area.

4. Pre-Construction Seed Collection. For all significant impacts to special-status plants, mitigation shall include seed collection from the affected special-status plants population on-site prior to construction to conserve the germplasm and provide a seed source for restoration efforts. Seed collection shall be conducted during the late-season surveys follow the guidelines described in Section D.III.3 of this condition.

5. Documenting Occurrences. If a special-status plant is detected, the full extent of the population onsite shall be recorded using GPS in accordance with BLM survey protocols. Additionally, the extent of the population within one mile of Project boundaries shall be assessed at least qualitatively to facilitate an accurate estimation of the proportion of the population affected by the Project. For populations that are very dense or very large, the population size may be estimated by simple sampling techniques. When populations are very extensive or locally abundant, the surveyor must provide some basis for this assertion and roughly map the extent on a topographic map. All but the smallest populations (e.g., a population occupying less than 100 square feet) shall be recorded as area polygons; the smallest populations may be recorded as point features. All GPS-recorded occurrences shall include: the number of plants, phenology, observed threats (e.g., OHV or invasive exotics), and habitat or

[13] Bureau of Land Management (BLM), California State Office. *Survey Protocols Required for NEPA/ESA Compliance for BLM Special Status Plant Species*. Issued July 2009.

community type. The map of occurrences submitted with the final botanical report shall be prepared to ensure consistency with definition of an occurrence by CNDDB, i.e., occurrences found within 0.25 miles of another occurrence of the same taxon, and not separated by significant habitat discontinuities, shall be combined into a single 'occurrence'. The Project owner shall also submit the raw GPS shape files and metadata, and completed CNDDB forms for each 'occurrence' (as defined by CNDDB).

6. Reporting. Raw GPS data, metadata, and CNDDB field forms shall be provided to the CPM and the BLM State Botanist within ~~two~~ **four** weeks of the completion of each survey. If surveys are split into two or more periods (e.g., a late summer survey and a fall survey), then a summary letter shall be submitted following each survey period.

   The Final Summer-Fall Botanical Survey Report shall be prepared consistent with CDF~~G~~**W** guidelines (**currently** CDFG 2009), and **currently** BLM 2009 guidelines **(or the most recent version of CDFW and BLM guidelines)** and shall include all of the following components:

   a. the BLM designation, NatureServe Global and State Rank of each species or taxon found (or proposed rank, or CNPS List);

   b. the number or percent of the occurrence that will be directly affected, and indirectly affected by changes in drainage patterns or altered geomorphic processes;

   c. the habitat or plant community that supports the occurrence and the total acres of that habitat or community type that occurs in the Project Disturbance Area;

   d. an indication of whether the occurrence has any local or regional significance (e.g., if it exhibits any unusual morphology, occurs at the periphery of its range in California, represents a significant range extension or disjunct occurrence, or occurs in an atypical habitat or substrate);

   e. a completed CNDDB field form for every occurrence (occurrences of the same species within one-quarter mile or less of each other combined as one occurrence, consistent with CNDDB methodology), and

   f. two maps: one that depicts the raw GPS data (as collected in the field) on a topographic base map with Project features; and a second map that follows the CNDDB protocol for occurrence mapping.

Section C: Avoidance Requirements for Special-Status Plants Detected in the Summer/Fall ~~2010~~2013 Surveys

The Project owner shall apply the following avoidance and mitigation standards for impacts to late blooming special-status plants that might be detected during late summer/fall season surveys. The Project owner shall immediately notify the CDF~~G~~**W**, USFWS, BLM State Botanist, and the CPM if any State- or Federal-listed species or BLM Sensitive species are detected. Avoidance and/or the off-site mitigation measures described in Section D below would reduce impacts to these special-status plant species to less-than-significant levels. Plants shall be considered impacted if they are within the Project footprint, or if they would be affected by Project-related hydrologic changes or changes to the local sand transport system Downstream/ downwind impacts from altered hydrology or geomorphic processes shall be considered direct impacts.

Mitigation for CNDDB **State** Rank 1 Plants (Critically Imperiled). If late blooming species with a CNDDB **State** rank **(S rank)** of 1[14] are detected within the Project Disturbance Area, complete avoidance is mandatory along the linears and within construction laydown areas. The Project owner shall limit the width of the work area; adjusting the location of staging areas, lay downs, spur roads and poles or towers; driving and crushing vegetation as an alternative to blading temporary roads, and other construction or design modifications as necessary to achieve avoidance of any Rank 1 plants detected.

If late-season **State** Rank **(S)** 1 plants are detected on the solar facility, the Project owner shall avoid all plants around the perimeter[15] of the facility as necessary to achieve 75 percent avoidance of the local population of the affected species. The local population shall be measured by the number of individuals occurring on the Project Site and within the immediate watershed of the Project for wash dependent-species or species of unknown dispersal mechanism, or within the local sand transport corridor for wind dispersed species. Measurement of percent avoidance shall be based on population for perennials and on habitat for annuals (habitat containing the species' micro-habitat preferences, such as "fine silts and moist depressions"). Avoidance within the central portion of the solar facility is not recommended because it would create fragmented conditions that would not sustain persistence of the affected species. For all portions of the local population not avoided, the Project owner shall implement off-site mitigation at a ratio of 3:1. The off-site mitigation may include land acquisition or implementation of a restoration/enhancement program for the species, and shall meet the

[14] The CNDDB **State** Rank is provided in the California Natural Diversity Database (CNDDB) **is a Natural Heritage rank that is generated using a rank calculator from the Heritage program, and in California this ranking process is managed by CNDDB and refers to the imperilment status only within California's state boundaries**. Plants with a Rank of 1 are "Critically imperiled in the nation or state/province because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state."

[15] The inside "perimeter" is used here to describe the distance or length equal to two troughs.

performance standards described in section D of this Condition. The Applicant must demonstrate, subject to review and approval by the CPM, that the impacts, after mitigation, will not cause a loss of viability[16] for that species. The Project owner shall prepare and implement a Special-Status Plant Mitigation Plan (Plan). The content of the Plan and definitions shall be as described above in subsection C.3, below.

1. Mitigation for CNDDB **State** Rank 2[17] Plants (Imperiled). If late-season CNDDB **State** Rank **(S)** 2 species are detected within the Project Disturbance Area avoidance is mandatory along the linears **unless such avoidance would cause disturbance to areas not previously surveyed for biological resources or would create greater environmental impacts in all other disciplines (e.g. Cultural Resource Sites) or other restrictions (e.g., FAA or other restrictions for placement of transmission poles), except for the known population of California ditaxis. The Project owner shall provide compensatory mitigation, at a ratio of 2:1, as described below in Section D for impacts to S2 plants that could not be avoided.** ~~and~~ **.Complete avoidance is mandatory on** construction laydown areas. The Project owner shall limit the width of the work area, adjusting the location of staging areas, lay downs, spur roads and poles or towers; driving and crushing vegetation as an alternative to blading temporary roads, and other construction or design modifications as necessary to achieve avoidance of any ~~Rank~~ **S**2 plants detected[18].

   If late-season ~~Rank~~ **S**2 plants are detected on the solar facility, the Project owner shall implement off-site mitigation, at a ratio of 2:1, for any impacts exceeding 25 percent of the local population. The off-site mitigation may include land acquisition or implementation of a restoration/enhancement program for the species, and shall meet the performance standards described in section D of this Condition. The Project owner must demonstrate, subject to review and approval by the CPM, that the impacts, after mitigation, will not cause a loss of viability for that species.

[16] A "viable" species is one consisting of self-sustaining and interacting populations that are well-distributed throughout the species' range. "Self-sustaining populations" are those that are sufficiently abundant and have sufficient diversity to display the array of life history strategies and forms to provide for their long-term persistence and adaptability over time. The definition of the term "well-distributed" can vary based on current, historic, and potential population and habitat conditions. Maintaining viability is a means of ensuring, as much as possible, that a species will not go extinct in the foreseeable future. Because species and their environments are dynamic, there is not a single population size above which a species is viable and below which it will become extinct. Viability is best expressed as a level of risk of extinction.

[17] CNDDB State Rank 2 plants are "Imperiled in the nation or state/province because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the state".

[18] The CNDDB State Rank 2 plants California ditaxis was detected along the linears within the Project Disturbance Area (Solar Millenium 2010p). Staff concluded the impact was significant and all terms and conditions of Section C.2 shall be implemented. Staff concluded that the direct impacts to Harwood's milk-vetch were minor and no compensatory mitigation is required beyond the avoidance and minimization measures described in Section A of this condition.

The Project owner shall prepare and implement a Special-Status Plant Mitigation Plan (Plan). The content of the Plan and definitions shall be as described above in subsection C.3, below.

2. Mitigation for CNDDB **State** Rank 3[19] Plants (Vulnerable). If CNDDB **State** Rank **(S)** 3 plants are detected (which constitutes most **RPR** 4 plants), mitigation is not required unless the occurrence has local or regional significance, in which case the plant occurrence shall be treated as a CNDDB ~~Rank~~ **S**2 plant; avoidance and mitigation would be as described above under C.2. A plant occurrence would be considered to have local or regional significance if:

   a. It occurs at the outermost periphery of its range in California;

   b. It occurs in an atypical habitat, region, or elevation for the taxon that suggests that the occurrence may have genetic significance (e.g., that may increase its ability to survive future threats), or;

   c. It exhibits any unusual morphology that is not clearly attributable to environmental factors that may indicate a potential new variety or sub-species.

3. Prepare Special-Status Plant Mitigation Plan. If the project will impact any CNDDB ~~Rank~~ **S**1 or ~~Rank~~ **S**2 plants, or ~~Rank~~ **S**3 plants of local or regional significance, or new taxa, the Project owner shall prepare and implement a Special-Status Plant Mitigation Plan (Plan). Compensatory mitigation, as described in Section D of this condition, and at a mitigation ratio of 3:1 for Rank 1 plants, and 2:1 for R~~ank~~ **S**2 plants and ~~Rank~~ **S**1 plants of local or regional significance, and new taxa. The Plan shall include, at a minimum, the following components and definitions:

   a. A description of the occurrences of the affected special-status species, ecological characteristics such as soil, hydrology, and other micro-habitat requirements, ecosystem processes required for maintenance of the species or its habitat, reproduction and dispersal mechanisms, pollinators, local distribution, a description of the extent of the population off-site, the percentage of the local population affected, and a description of how these occurrences would be impacted by the Project, including direct and indirect effects. Occurrences shall be considered impacted if they are within the Project footprint, and if they would be affected by Project-related hydrologic changes or changes to the local sand transport system.

   b. A description of the avoidance and minimization measures that would achieve complete avoidance of occurrences on the Project linears and construction laydown areas. If avoidance is also required on the solar facility (Rank 1 species), provide a description of the measures that

[19] CNDDB State Rank 3 plants are "Vulnerable in the nation or state/province due to a restricted range, relatively few populations (often 80or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation.

would be implemented to avoid or minimize impacts to occurrences on the solar facility. “Avoidance” shall include protection of the ecosystem processes essential for maintenance of the protected plant occurrence, and protection of the seed bank. Isolated ‘islands’ of protected plants disconnected by the Project from natural fluvial, aeolian (wind), or other processes essential for maintenance of the species, shall not be considered avoidance.

c. If off-site mitigation is also required, pursuant to C.1 –C.3 above, the Plan shall include a description of the proposed mitigation (acquisition or restoration/enhancement) and demonstrate how the mitigation will meet the performance standards described in Section D of this condition.

   For CNDDB Rank 1 plants that cannot be avoided (i.e., plants located in the central portion of the solar facility), the Plan must demonstrate that the impacts (after mitigation) will not cause a loss of viability for that species. The assessment of viability shall include: *i*) current literature compilation and review on the affected species, it’s documented and reported occurrences, range and distribution, habitat, and the ecological conditions needed to support it; *ii)* consultation with scientists and others with expertise and local knowledge of the species to gather unpublished data and other information to supplement the literature review findings, and (if available) *iii*) information on species’ habitat relationships, demographics, genetics, and risk factors.

Section D: Off-Site Compensatory Mitigation for Special-Status Plants

Where compensatory mitigation is required under the terms of Section C, above, the Project owner shall mitigate Project impacts to special-status plant occurrences with compensatory mitigation. Compensatory mitigation shall consist of acquisition of habitat supporting the target species, or restoration/enhancement of populations of the target species, and shall meet the performance standards for mitigation described below. In the event that no opportunities for acquisition or restoration/enhancement exist, the Project owner can fund a species distribution study designed to promote the future preservation, protection or recovery of the species. Compensatory mitigation shall be at a ratio of 3:1 for Rank 1 plants, with three acres of habitat acquired or restored/enhanced for every acre of habitat occupied by the special status plant that will be disturbed by the Project Disturbance Area (for example if the area occupied by the special status plant collectively measured is ¼ acre than the compensatory mitigation will be ¾ of an acre). The mitigation ratio for Rank 2 plants shall be 2:1. So, for the example above, the mitigation ratio would be one-half acre for the Rank 2 plants.

The Project owner shall provide funding for the acquisition and/or restoration/enhancement, initial improvement, and long-term maintenance and management of the acquired or restored lands. The actual costs to comply with this condition will vary depending on the Project Disturbance Area, the actual costs of acquiring compensation habitat, the actual costs of initially improving the habitat, the actual costs of long-term management as determined by a Property Analysis Record (PAR) report, and other transactional costs related to the use of compensatory mitigation.

The Project owner shall comply with other related requirements in this condition:

I. Compensatory Mitigation by Acquisition: The requirements for the acquisition, initial protection and habitat improvement, and long-term maintenance and management of special-status plant compensation lands include all of the following:

1. Selection Criteria for Acquisition Lands. The compensation lands selected for acquisition may include any of the following three categories:

    a. Occupied Habitat, No Habitat Threats. The compensation lands selected for acquisition shall be occupied by the target plant population and shall be characterized by site integrity and habitat quality that are required to support the target species, and shall be of equal or better habitat quality than that of the affected occurrence. The occurrence of the target special-status plant on the proposed acquisition lands should be viable, stable or increasing (in size and reproduction).

    b. Occupied Habitat, Habitat Threats. Occupied compensation lands characterized by habitat threats may also be acquired as long as the population could be reasonably expected to recover with habitat restoration efforts (e.g., OHV or grazing exclusion, or removal of invasive non-native plants) and is accompanied by a Habitat Enhancement/Restoration Plan as described in Section D.II, below.

    c. Unoccupied but Adjacent. The Project owner may also acquire habitat for which occupancy by the target species has not been documented, if the proposed acquisition lands are adjacent to occupied habitat. The Project owner shall provide evidence that acquisitions of such unoccupied lands would improve the defensibility and long-term sustainability of the occupied habitat by providing a protective buffer around the occurrence and by enhancing connectivity with undisturbed habitat. This acquisition may include habitat restoration efforts where appropriate, particularly when these restoration efforts will benefit adjacent habitat that is occupied by the target species.

2. Review and Approval of Compensation Lands Prior to Acquisition. The Project owner shall submit a formal acquisition proposal to the CPM describing the parcel(s) intended for purchase. This acquisition proposal shall discuss the suitability of the proposed parcel(s) as compensation lands for special-status plants in relation to the criteria listed above, and must be approved by the CPM.

3. Management Plan. The Project owner or approved third party shall prepare a management plan for the compensation lands in consultation with the entity that will be managing the lands. The goal of the management plan shall be to support and enhance the long-term viability of the target special-status plant occurrences. The Management Plan shall be submitted for review and approval to the CPM.

4. Integrating Special-Status Plant Mitigation with Other Mitigation lands. If all or any portion of the acquired Desert Tortoise, Waters of the State, or other required compensation lands meets the criteria above for special-status plant compensation lands, the portion of the other species' or habitat compensation lands that meets any of the criteria above may be used to fulfill that portion of the obligation for special-status plant mitigation.

5. Compensation Lands Acquisition Requirements. The Project owner shall comply with the following requirements relating to acquisition of the compensation lands after the CPM, has approved the proposed compensation lands:

   a. Preliminary Report. The Project owner, or an approved third party, shall provide a recent preliminary title report, initial hazardous materials survey report, biological analysis, and other necessary or requested documents for the proposed compensation land to the CPM. All documents conveying or conserving compensation lands and all conditions of title are subject to review and approval by the CPM. For conveyances to the State, approval may also be required from the California Department of General Services, the Fish and Game Commission and the Wildlife Conservation Board.

   b. Title/Conveyance. The Project owner shall acquire and transfer fee title to the compensation lands, a conservation easement over the lands, or both fee title and conservation easement, as required by the CPM. Any transfer of a conservation easement or fee title must be to ~~CDFG~~ **CDFW**, a non-profit organization qualified to hold title to and manage compensation lands (pursuant to California Government Code section 65965), or to BLM or other public agency approved by the CPM. If an approved non-profit organization holds fee title to the compensation lands, a conservation easement shall be recorded in favor of ~~CDFG~~ **CDFW** or another entity approved by the CPM. If an entity other than ~~CDFG~~ **CDFW** holds a conservation easement over the compensation lands, the CPM may require that ~~CDFG~~ **CDFW** or another entity approved by the CPM, in consultation with ~~CDFG~~ **CDFW**, be named a third party beneficiary of the conservation easement. The Project owner shall obtain approval of the CPM of the terms of any transfer of fee title or conservation easement to the compensation lands.

c. Initial Protection and Habitat Improvement. The Project owner shall fund activities that the CPM requires for the initial protection and habitat improvement of the compensation lands. These activities will vary depending on the condition and location of the land acquired, but may include trash removal, construction and repair of fences, invasive plant removal, and similar measures to protect habitat and improve habitat quality on the compensation lands. The costs of these activities would use the estimated cost per acre for Desert Tortoise mitigation as a best available proxy, at the ratio of 3:1 for Rank 1 plants and 2:1 for Rank 2 plants, but actual costs will vary depending on the measures that are required for the compensation lands. A non-profit organization, ~~CDFG~~ **CDFW** or another public agency may hold and expend the habitat improvement funds if it is qualified to manage the compensation lands (pursuant to California Government Code section 65965), if it meets the approval of the CPM in consultation with ~~CDFG~~ **CDFW**, and if it is authorized to participate in implementing the required activities on the compensation lands. If ~~CDFG~~ **CDFW** takes fee title to the compensation lands, the habitat improvement fund must be paid to ~~CDFG~~ **CDFW** or its designee.

d. Property Analysis Record. Upon identification of the compensation lands, the Project owner shall conduct a Property Analysis Record (PAR) or PAR-like analysis to establish the appropriate amount of the long-term maintenance and management fund to pay the in-perpetuity management of the compensation lands. The PAR or PAR-like analysis must be approved by the CPM before it can be used to establish funding levels or management activities for the compensation lands.

e. Long-term Maintenance and Management Funding. The Project owner shall deposit in~~NFWF's~~ **the** REAT Account, **or other CPM approved entity,** a capital long-term maintenance and management fee in the amount determined through the Property Analysis Record (PAR) or PAR-like analysis conducted for the compensation lands.

The CPM, in consultation with **CDFW** , may designate another non-profit organization to hold the long-term maintenance and management fee if the organization is qualified to manage the compensation lands in perpetuity. If ~~CDFG~~ **CDFW** takes fee title to the compensation lands, ~~CDFG~~ **CDFW** shall determine whether it will hold the long-term management fee in the special deposit fund, leave the money in the REAT Account, or designate another entity to manage the long-term maintenance and management fee for ~~CDFG~~ **CDFW** and with ~~CDFG~~ **CDFW** supervision.

Interest, Principal, and Pooling of Funds. The Project owner shall ensure that an agreement is in place with the long-term maintenance and management fund (endowment) holder/manager to ensure the following requirements are met:

i. Interest. Interest generated from the initial capital long-term maintenance and management fund shall be available for reinvestment into the principal and for the long-term operation, management, and protection of the approved compensation lands, including reasonable administrative overhead, biological monitoring, improvements to carrying capacity, law enforcement measures, and any other action that is approved by the CPM and is designed to protect or improve the habitat values of the compensation lands.

ii. Withdrawal of Principal. The long-term maintenance and management fund principal shall not be drawn upon unless such withdrawal is deemed necessary by the CPM or by the approved third-party long-term maintenance and management fund manager, to ensure the continued viability of the species on the compensation lands.

iii. Pooling Long-Term Maintenance and Management Funds. An entity approved to hold long-term maintenance and management funds for the Project may pool those funds with similar funds that it holds from other projects for long-term maintenance and management of compensation lands for special-status plants. However, for reporting purposes, the long-term maintenance and management funds for this Project must be tracked and reported individually to the CPM.

f. Other Expenses. In addition to the costs listed above, the Project owner shall be responsible for all other costs related to acquisition of compensation lands and conservation easements, including but not limited to the title and document review costs incurred from other state agency reviews, overhead related to providing compensation lands to ~~CDFG~~ **CDFW** or an approved third party, escrow fees or costs, environmental contaminants clearance, and other site cleanup measures.

g. Mitigation Security. The Project owner shall provide financial assurances to the CPM to guarantee that an adequate level of funding is available to implement any of the mitigation measures required by this condition that are not completed prior to the start of ground-disturbing Project activities. Financial assurances shall be provided to the CPM in the form of an irrevocable letter of credit, a pledged savings account or another form of security ("Security") approved by the CPM. The amount of the Security shall use the estimated cost per acre for Desert Tortoise mitigation as a best available proxy, at a ratio of 3:1 for Rank 1 plants and 2:1 for Rank 2 plants, for every acre of habitat supporting the target special-status plant species which is significantly impacted by the project. The actual costs to comply with this condition will vary depending on the actual costs of acquiring compensation habitat, the costs of initially improving the habitat, and the actual costs of long-term management as determined by a PAR report. Prior to submitting the Security to the CPM, the Project owner shall obtain the CPM's approval of the form of the Security. The CPM may draw on the Security if the CPM determines the Project owner has failed to comply with the requirements specified in this condition. The CPM may use money from the Security solely for implementation of the requirements of this condition. The CPM's use of the Security to implement measures in this condition may not fully satisfy the Project owner's obligations under this condition, and the Project owner remains responsible for satisfying the obligations under this condition if the Security is insufficient. The unused Security shall be returned to the Project owner in whole or in part upon successful completion of the associated requirements in this condition.

h. ~~NFWF~~ REAT Account. The Project owner may elect to comply with the requirements in this condition for acquisition of compensation lands, initial protection and habitat improvement on the compensation lands, or long-term maintenance and management of the compensation lands by funding, or any combination of these three requirements, by providing funds to implement those measures into the Renewable Energy Action Team (REAT) Account~~established with the National Fish and Wildlife Foundation (NFWF~~**).** To use this option, the Project owner must make an initial deposit to the REAT Account in an amount equal to the estimated costs (as set forth in the Security section of this condition) of implementing the requirement. If the actual cost of the acquisition, initial protection and habitat improvements, or long-term funding is more than the estimated amount initially paid by the Project owner, the Project owner shall make an additional deposit into the REAT Account sufficient to cover the actual acquisition costs, the actual costs of initial protection and habitat improvement on the compensation lands, and the long-term funding requirements as established in an approved PAR or PAR-like analysis. If those actual costs or PAR projections are less than the amount initially transferred by the Applicant, the remaining balance shall be returned to the Project owner.

The responsibility for acquisition of compensation lands may be delegated to a third party~~other than NFWF~~, such as a non-governmental organization supportive of desert habitat conservation, by written agreement of the Energy Commission. Such delegation shall be subject to approval by the CPM, in consultation with ~~CDFG~~ **CDFW**, BLM and USFWS, prior to land acquisition, enhancement or management activities. Agreements to delegate land acquisition to an approved third party, or to manage compensation lands, shall be executed and implemented within 18 months of the start of ground disturbance.

II. Compensatory Mitigation by Habitat Enhancement/Restoration: As an alternative or adjunct to land acquisition for compensatory mitigation the Project owner may undertake habitat enhancement or restoration for the target special-status plant species. Habitat enhancement or restoration activities must achieve protection at a 3:1 ratio for Rank 1 plants and 2:1 for Rank 2 plants, with improvements applied to three acres, or two acres, respectively, of habitat for every acre special-status plant habitat directly or indirectly disturbed by the Project Disturbance Area (for example if the area occupied by the special status plant collectively measured is 1/4 acre than the improvements would be applied to an area equal to 3/4 of an acre at a 3:1 ratio, or one-half acre at a 2:1 ratio). Examples of suitable enhancement projects include but are not limited to the following: i) control unauthorized vehicle use into an occurrence (or pedestrian use if clearly damaging to the species); ii) control of invasive non-native plants that infest or pose an immediate threat to an occurrence; iii) exclude grazing by wild burros or livestock from an occurrence; or iv) restore lost or degraded hydrologic or geomorphic functions critical to the species by restoring previously diverted flows, removing obstructions to the wind sand transport corridor above an occurrence, or increasing groundwater availability for dependent species.

If the Project owner elects to undertake a habitat enhancement project for mitigation, the project must meet the following performance standards: The proposed enhancement project shall achieve rescue of an off-site occurrence that is currently assessed, based on the NatureServe threat ranking system[20] with one of the following threat ranks: a) long-term decline >30%; b) an immediate threat that affects >30% of the population, or c) has an overall threat impact that is High to Very High. "Rescue" would be considered successful if it achieves an improvement in the occurrence trend to "stable" or "increasing" status, or downgrading of the overall threat rank to slight or low (from "High" to "Very High").

[20] Master, L., D. Faber-Langendoen, R. Bittman, G. A., Hammerson, B. Heidel, J. Nichols, L. Ramsay, and A. Tomaino. 2009. *NatureServe Conservation Status Assessments: Factors for Assessing Extinction Risk.* NatureServe, Arlington, VA. Online: http://www.natureserve.org/publications/ConsStatusAssess_StatusFactors.pdf, "Threats". See also: Morse, L.E., J.M. Randall, N. Benton, R. Hiebert, and S. Lu. 2004. An Invasive Species Assessment Protocol: Evaluating Non-Native Plants for Their Impact on Biodiversity. Version 1. NatureServe, Arlington, Virginia. Online: http://www.natureserve.org/publications/pubs/invasiveSpecies.pdf

If the Project owner elects to undertake a habitat enhancement project for mitigation, they shall submit a Habitat Enhancement/Restoration Plan to the CPM for review and approval, and shall provide sufficient funding for implementation and monitoring of the Plan. The amount of the Security shall use the estimated cost per acre for Desert Tortoise mitigation as a best available proxy, at the ratio of 3:1 for Rank 1 plants and 2:1 for Rank 2 plants, for every acre of habitat supporting the target special-status plant species which is directly or indirectly impacted by the project. The amount of the security may be adjusted based on the actual costs of implementing the enhancement, restoration and monitoring. The implementation and monitoring of the enhancement/restoration may be undertaken by an appropriate third party~~such as NFWF,~~ subject to approval by the CPM. The Habitat Enhancement/Restoration Plan shall include each of the following:

1. Goals and Objectives. Define the goals of the restoration or enhancement project and a measurable course of action developed to achieve those goals. The objective of the proposed habitat enhancement plan shall include restoration of a target special-status plant occurrence that is currently threatened with a long-term decline. The proposed enhancement plan shall achieve an improvement in the occurrence trend to “stable” or “increasing” status, or downgrading of the overall threat rank to slight or low (from “High” to “Very High”).

2. Historical Conditions. Provide a description of the pre-impact or historical conditions (before the site was degraded by weeds or grazing or ORV, etc.), and the desired conditions.

3. Site Characteristics. Describe other site characteristics relevant to the restoration or enhancement project (e.g., composition of native and pest plants, topography and drainage patterns, soil types, geomorphic and hydrologic processes important to the site or species.

4. Ecological Factors. Describe other important ecological factors of the species being protected, restored, or enhanced such as total population, reproduction, distribution, pollinators, etc.

5. Methods. Describe the restoration methods that will be used (e.g., invasive exotics control, site protection, seedling protection, propagation techniques, etc.) and the long-term maintenance required. The implementation phase of the enhancement must be completed within five years.

6. Budget. Provide a detailed budget and time-line, and develop clear, measurable, objective-driven annual success criteria.

7. Monitoring. Develop clear, measurable monitoring methods that can be used to evaluate the effectiveness of the restoration and the benefit to the affected species. The Plan shall include a minimum of five years of quarterly monitoring, and then annual monitoring for the remainder of

the enhancement project, and until the performance standards for rescue of a threatened occurrence are met. At a minimum the progress reports shall include: quantitative measurements of the projects progress in meeting the enhancement project success criteria, detailed description of remedial actions taken or proposed, and contact information for the responsible parties.

8. Reporting Program. The Plan shall ensure accountability with a reporting program that includes progress toward goals and success criteria. Include names of responsible parties.

9. Contingency Plan. Describe the contingency plan for failure to meet annual goals.

10. Long-term Protection. Include proof of long-term protection for the restoration site. For private lands this would include conservations easements or other deed restrictions; projects on public lands must be contained in a Desert Wildlife Management Area, Wildlife Habitat Management Area, or other land use protections that will protect the mitigation site and target species.

II. Contingency Measures

1. Preservation of the Germplasm of Affected Special-Status Plants. For all significant impacts to special-status plants, mitigation shall also include seed collection from the affected special-status plants population on-site prior to construction to conserve the germplasm and provide a seed source for restoration efforts. The seed shall be collected under the supervision or guidance of a reputable seed storage facility such as the Rancho Santa Ana Botanical Garden Seed Conservation Program, San Diego Natural History Museum, or the Missouri Botanical Garden. The costs associated with the long-term storage of the seed shall be the responsibility of the Project owner. Any efforts to propagate and reintroduce special-status plants from seeds in the wild shall be carried out under the direct supervision of specialists such as those listed above and as part of a Habitat Restoration/Enhancement Plan approved by the CPM.

2. Compensatory Mitigation by Conducting or Contributing to a Management Plan for the Affected Species. Subject to approval of the CPM, as a contingency measure in the event there are no opportunities for mitigation through acquisition or restoration/enhancement to meet the obligations for off-site mitigation as described in Section C.1-3 of this condition, , a Management Plan for the affected special-status plant species may be conducted or funded. The goal of the Management Plan is to devise a science-based, region-wide strategy to ensure the long-term viability of the affected species, and to acquire, protect, and restore existing populations and the habitat that supports them. The information gathered shall be used to develop conservation approaches to address

the identified risk factors. These approaches include land allocations, restoration needs, identifying and preserving important refugia to facilitate species dispersal and maintain biodiversity in the face of climate change, recommending Best Management Practices or other measures that could be used to minimize threats, and identifying planning needs at the regional level. The results of the study would also be provided to the resource agencies, conservation organizations, and academic institutions, as well as the state's Natural Diversity Database and Consortium of California Herbaria.

3. Under this contingency measure, the Project owner shall acquire all available information on the distribution, status or health of known occurrences, ecological requirements, and ownership and management opportunities of the affected special-status plant species and other special status plants known to occur in the Chuckwalla Valley. Some of these late blooming species are only known from a few viable occurrences in California, and historic occurrences that have not been re-located or surveyed since they were first documented. At a minimum, the study shall include the following:

    a. <u>Occurrence and Life History Review</u>. The Study shall include an evaluation of all documented, historical and reported localities for the affected species, and a review of current information on the species life history. This would include a review of the CNDDB database, records from regional and national herbaria, literature review, consultation with U.C. Riverside, San Diego Natural History Museum, and other educational institutions or natural heritage organizations in California, Arizona, and Nevada, etc.), other biotechnical survey reports from the region, and information from regional botanical experts.

    b. <u>Conduct Site Visits to Documented and Reported Localities.</u> Documented and reported occurrences would be evaluated in the field during the appropriate time of the year for each late blooming species. If located, these occurrences would be evaluated for population size (area and quantity), population trend, ecological characteristics, soils, habitat quality, potential threats, degree and immediacy of threats, ownership and management opportunities. GPS location data would also be collected during these site visits.

    c. <u>Survey Surrounding Areas.</u> Areas surrounding the occurrences that contain habitat suitable to support the affected species shall be surveyed to determine the full extent of its range and distribution. If additional populations are found, collect data (GPS and assessment) on these additional populations consistent with III.2 above.

    d. <u>Prepare Report on Status, Distribution, and Management Needs.</u> A report shall be prepared that contains the results of the surveys and assessment. The report shall contain the following components: a)

Range and Distribution (including maps and GPS data); b) Abundance and Population Trends; c) Life History; d) Habitat Necessary for Survival; d) Factors Affecting Ability to Survive and Reproduce; e) Degree and Immediacy of Threat; f) Ownership and Management Opportunities for Protection or Recovery; g) Sources of Information, and g) Conclusions. The conclusions shall contain an explanation of whether the species' survival is threatened by any of the following factors: i) present or threatened modification or destruction of its habitat; ii) competition; iii) disease; iv) other natural occurrences (such as climate change) or human-related activities. This valuable information will provide a better understanding of the ecological factors driving the distribution of these species, and will identify opportunities for mitigation and management opportunities for recovery. All data from this study will be submitted for incorporation into the CNDDB system and the study report will be made available to resource agencies, and conservation groups, and other interested parties.

e. The cost to implement or fund the study shall be no greater than the cost for acquisition, enhancement, and long-term management of compensatory mitigation lands based on the specifications and standards for acquisition or restoration/enhancement described above under D.I and D.II.

<u>Verification:</u> The Special-Status Plant Impact Avoidance and Minimization Measures shall be incorporated into the BRMIMP as required under Condition of Certification **BIO-7.**

The Project owner shall notify the CPM and the BLM State Botanist no less than 14 days prior to the start of late-season surveys and provide a target list of late season special-status plants that will be considered. Concurrently, the Project owner shall coordinate with BLM to obtain a permit for seed collection. Seed collection is required for all special-status plants located within the Project Disturbance Area and shall be conducted according to the specifications in Section D.III.1 of this condition and with all terms and conditions of the BLM permit.

Raw GPS data, metadata, and CNDDB field forms shall be submitted to the CPM and **<u>the BLM State Botanist</u>** within ~~two~~**<u>four</u>** weeks of the completion of each survey. A preliminary summary of results for the late summer/fall botanical surveys, prepared according to guidelines in Section B of this condition, shall also be submitted to the CPM and BLM's State Botanist within two weeks following the completion of the surveys. If surveys are split into more than one period, then a summary letter shall be submitted following each survey period. The Final Summer-Fall Botanical Survey Report, GIS shape files and metadata shall be submitted to the BLM State Botanist and the CPM no less than 30 days prior to the start of **<u>site mobilization and construction</u>** ~~ground-disturbing~~ activities. The Final Report shall include a detailed accounting of the acreage of Project impacts to special-status plant occurrences.

For any special-status plant species located within the Project Disturbance Area, the Project owner shall submit to the CPM to less than 30 days prior to the start of **site mobilization and construction** ~~ground-disturbing~~ activities proof, in the form of a letter or receipt, of the seed or other propagules collected pursuant to Section D.III #1 of this Condition.

The draft conceptual Special-Status Plant Mitigation Plan, as described under Section C.4 of this condition, shall be submitted to the CPM for review and approval no less than 30 days prior to the start of **site mobilization and construction** ~~ground-disturbing~~ activities.

The Project owner shall immediately provide written notification to the CPM, ~~CDFG~~**CDFW**, USFWS, and BLM State Botanist if it detects a State- or Federal-Listed Species, or BLM Sensitive Species at any time during its late summer/fall botanical surveys or at any time thereafter through the life of the Project, including conclusion of Project **closure** ~~decommissioning~~.

No less than 30 days prior to the start of ground-disturbing activities the Project owner shall submit grading plans and construction drawings to the CPM which depict the location of Environmentally Sensitive Areas and the Avoidance and Minimization Measures contained in Section A of this Condition, and under Section C.1-3.

If compensatory mitigation is required, pursuant to Section C.1-3, no less than 30 days prior to the start of **site mobilization and construction** ~~ground-disturbing~~ activities the Project owner shall submit to the CPM the form of Security adequate to acquire compensatory mitigation lands and/or undertake habitat enhancement or restoration activities, as described in this condition. Actual Security shall be provided 7 days prior to start of **site mobilization and construction** ~~ground-disturbing~~ activities.

No fewer than 90 days prior to acquisition of compensatory mitigation lands, the Project owner shall submit a formal acquisition proposal and draft Management Plan for the proposed lands to the CPM, with copies to ~~CDFG~~**CDFW**, USFWS, and BLM, describing the parcels intended for purchase and shall obtain approval from the CPM prior to the acquisition. No fewer than 90 days prior to acquisition of compensatory mitigation lands, the Project owner shall submit to the CPM and obtain CPM approval of any agreements to delegate land acquisition to an approved third party, or to manage compensation lands; such agreement shall be executed and implemented within 18 months of the start of ground disturbance.

No fewer than 30 days after acquisition of the property the Project owner shall deposit the funds required by Section I e above (long term management and maintenance fee) and provide proof of the deposit to the CPM.

The Project owner or an approved third party shall complete the acquisition and all required transfers of the compensation lands, and provide written verification to the CPM of such completion no later than 18 months after the start of **site mobilization and construction** ~~Project ground-disturbing~~ activities. If ~~NFWF or another approved~~ **a** third party is being used for the acquisition, the Project owner shall ensure that funds needed to accomplish the acquisition are transferred in timely manner to facilitate the planned acquisition and to ensure the land can be acquired and transferred prior to the 18-month deadline. If habitat enhancement is proposed, no later than six months following the start of ground-disturbing activities, the Project owner shall obtain CPM approval of the final Habitat Enhancement/Restoration Plan, prepared in accordance with Section D, and submit to the CPM or a third party approved by the CPM Security adequate for long-term implementation and monitoring of the Habitat Enhancement/Restoration Plan.

Enhancement/restoration activities shall be initiated no later than 12 months from the start of construction. The implementation phase of the enhancement project shall be completed within five years of initiation. Until completion of the five-year implementation portion of the enhancement action, a report shall be prepared and submitted as part of the Annual Compliance Report. This report shall provide, at a minimum: a summary of activities for the preceding year and a summary of activities for the following year; quantitative measurements of the Project's progress in meeting the enhancement project success criteria; detailed description of remedial actions taken or proposed; and contact information for the responsible parties.

If a contingency measure is required, as described in Section D.III of this condition, the Project owner shall submit commence no later than six months following the start of ground-disturbing activities. The draft study shall be submitted to the CPM and BLM State Botanist for review and approval no more than two years following the start of ground-disturbing activities. The final study shall be submitted no more than 30 months following the start of ground-disturbing activities.

If a Distribution Study is implemented as contingency mitigation, the study shall be initiated no later than 6 months from the start of construction. The implementation phase of the study shall be completed within two years of the start of construction.

Within 18 months of **site mobilization and construction** activities, the Project owner shall transfer to the CPM or an approved third party the difference between the Security paid and the actual costs of (1) acquiring compensatory mitigation lands, completing initial protection and habitat improvement , and funding the long-term maintenance and management of compensatory mitigation lands; and/or (2) implementing and providing for the long-term protection and monitoring of habitat enhancement or restoration activities.

Implementation of the special-status plant impact avoidance and minimization measures shall be reported in the Monthly Compliance Reports prepared by the Designated Botanist. Within 30 days after completion of Project construction, the Project owner shall provide to the CPM, for review and approval, in consultation with the BLM State Botanist, a written construction termination report identifying how measures have been completed.

The Project owner shall submit a monitoring report every year for the life of the project to monitor effectiveness of protection measures for all avoided special-status plants to the CPM and BLM State Botanist. The monitoring report shall include: dates of worker awareness training sessions and attendees, completed CNDDB field forms for each avoided occurrence on-site and within 100 feet of the Project boundary off-site, and description of the remedial action, if warranted and planned for the upcoming year. The completed forms shall include an inventory of the special-status plant occurrences and description of the habitat conditions, an indication of population and habitat quality trends.

SAND DUNE/MOJAVE FRINGE-TOED LIZARD MITIGATION

BIO-20 To mitigate for habitat loss and direct impacts to Mojave fringe-toed lizards the Project owner shall provide compensatory mitigation, which may include compensation lands purchased in fee or in easement in whole or in part, at the following ratios:

- 3:1 mitigation for direct impacts to stabilized and partially stabilized sand dunes (per **BIO-29 – Table 2** or final acreage impacted by the Project footprint);
- 1:1 mitigation for direct impacts non-dune Mojave fringe-toed lizard habitat (per **BIO-29 – Table 2** or final acreage impacted by the Project footprint); and
- 0.5:1 mitigation for indirect impacts to stabilized and partially stabilized sand dunes (per **BIO-29 – Table 2** or final acreage impacted by the Project footprint).

If compensation lands are acquired, the Project owner shall provide funding for the acquisition in fee title or in easement, initial habitat improvements, and long-term maintenance and management of the compensation lands. In addition, the compensation lands must include, at a minimum, the number acres of stabilized and partially stabilized sand dune habitat shown in **BIO-29 Table 2**.

1. <u>Criteria for Compensation Lands</u>: The compensation lands selected for acquisition shall:
   a. Provide suitable habitat for Mojave fringe-toed lizards, and, aside from the minimum amount of stabilized and partially stabilized sand dunes, may include stabilized and partially stabilized desert dunes, sand drifts over playas, or Sonoran creosote bush scrub;

   b. Be within the Palen or Chuckwalla valleys with potential to contribute to Mojave fringe-toed lizard habitat connectivity and build linkages between known populations of Mojave fringe-toed lizards and preserve lands with suitable habitat;

   c. Be prioritized near larger blocks of lands that are either already protected or planned for protection, or which could feasibly be protected long-term by a public resource agency or a non-governmental organization dedicated to habitat preservation;

   d. Provide quality habitat for Mojave fringe-toed lizard that has the capacity to regenerate naturally when disturbances are removed;

e. Not have a history of intensive recreational use or other disturbance that might make habitat recovery and restoration infeasible;

f. Not be characterized by high densities of invasive species, either on or immediately adjacent to the parcels under consideration, that might jeopardize habitat recovery and restoration;

g. Not contain hazardous wastes that cannot be removed to the extent the site is suitable for habitat;

h. Have water and mineral rights included as part of the acquisition, unless the CPM, in consultation with ~~CDFG~~**CDFW**, BLM and USFWS, agrees in writing to the acceptability of the land; and

i. Be on land for which long-term management is feasible.

2. Security for Implementation of Mitigation: The Project owner shall provide financial assurances to the CPM to guarantee that an adequate level of funding is available to implement the acquisitions and enhancement of Mojave fringe-toed lizard habitat as described in this condition. These funds shall be used solely for implementation of the measures associated with the Project. Financial assurance can be provided to the CPM according to the measures outlined in **BIO-12**, and within the time period specified for this assurance (see the verification section at the end of this condition). The final amount due will be determined by an updated appraisal and a PAR analysis conducted as described in **BIO-12**, but current estimates are included in **Biological Resources Tables ~~2~~12** and ~~2~~**13** located at the beginning of the conditions of certification subsection.

3. Preparation of Management Plan: The Project owner shall submit to the CPM, BLM, and ~~CDFG~~**CDFW** a draft Management Plan that reflects site-specific enhancement measures for the Mojave fringe-toed lizard habitat on the acquired compensation lands. The objective of the Management Plan shall be to enhance the value of the compensation lands for Mojave fringe-toed lizards, and may include enhancement actions such as weed control, fencing to exclude livestock, erosion control, or protection of sand sources or sand transport corridors.

Verification: No later than 30 days prior to beginning **site mobilization and construction** ~~Project ground-disturbing~~ activities, the Project owner shall provide written verification of an approved form of Security in accordance with this condition of certification. Actual Security shall be provided no later than 7 days prior to the beginning of Project ground-disturbing activities for each Project phase as described in **BIO-29**. The Project owner, or an approved third party, shall complete and provide written verification of the proposed compensation lands acquisition within 18 months of the start of Project ground-disturbing activities for each Project phase.

No less than 90 days prior to acquisition of the property, the Project owner shall submit a formal acquisition proposal to the CPM, ~~CDFG~~ **CDFW**, and USFWS describing the parcels intended for purchase.

The Project owner, or an approved third party, shall provide the CPM, BLM, and ~~CDFG~~ **CDFW**, with a management plan for the compensation lands and associated funds within 180 days of the land or easement purchase, as determined by the date on the title. The CPM shall review and approve the management plan, in consultation with BLM and ~~CDFG~~ **CDFW**.

Within 90 days after completion of Project construction, the Project owner shall provide to the CPM and ~~CDFG~~ **CDFW** an analysis with the final accounting of the amount (detailed by habitat type) of Mojave fringe-toed lizard habitat disturbed during Project construction.

The Project owner shall provide written verification to the CPM, and ~~CDFG~~ **CDFW** that the compensation lands or conservation easements have been acquired and recorded in favor of the approved recipient no later than 18 months from the start of ground-disturbing activities.

MITIGATION FOR IMPACTS TO STATE WATERS

BIO-21 The Project owner shall implement the following measures to avoid, minimize and mitigate for direct and indirect impacts to waters of the state and to satisfy requirements of California Fish and Game Code sections 1600 and 1607.

1. Acquire Off-Site State Waters: The Project owner shall acquire, in fee or in easement, a parcel or parcels of land that includes state jurisdictional waters per **BIO-29 – Table 2**, or the area of state waters directly or indirectly impacted by the final Project footprint. The Project footprint means all lands disturbed by construction and operation of the Palen Project, including all linears. The parcel or parcels comprising the ephemeral washes shall include desert dry wash woodland per **BIO-29 – Table 2**, or the acreage of desert dry was woodland impacted by the final Project footprint at a 3:1 ratio. The terms and conditions of this acquisition or easement shall be as described in Condition of Certification **BIO 12**, and the timing associated with **BIO-29** (phasing). The current estimated costs are included in **BIO-29 – Table 3** located at the beginning of the Conditions of Certification subsection. Mitigation for impacts to state waters shall occur within the Chuckwalla, East Salton Sea, Hayfield, Rice, or portion of Whitewater within the NECO, Hydrologic Units (HUs) or the Palo Verde Watershed and be prioritized within the Chuckwalla HU in the Palen or adjacent watersheds.

2. Security for Implementation of Mitigation: The Project owner shall provide financial assurances to the CPM and CDF~~G~~**W** to guarantee that an adequate level of funding is available to implement the acquisitions and enhancement of state waters as described in this condition. These funds shall be used solely for implementation of the measures associated with the Project. Financial assurance can be provided to the CPM and CDF~~G~~**W**in the form of an irrevocable letter of credit, a pledged savings account or Security prior to initiating ground-disturbing Project activities. Prior to submittal to the CPM, the Security shall be approved by the CPM,

in consultation with CDF~~G~~**W**, to ensure funding. The final amount due shall be determined by updated appraisals and the PAR analysis conducted pursuant to **BIO-12.**

3. Preparation of Management Plan: The Project owner shall submit to the CPM and CDFW a draft Management Plan that reflects site-specific enhancement measures for the drainages on the acquired compensation lands. The objective of the Management Plan shall be to enhance the wildlife value of the drainages, and may include enhancement actions such as weed control, fencing to exclude livestock, or erosion control.

4. Code of Regulations: The Project owner shall provide a copy of this condition (Condition of Certification **BIO-21**) from the Energy Commission Decision to all contractors, subcontractors, and the Applicant's Project supervisors. Copies shall be readily available at work sites at all times during periods of active work and must be presented to any CDF~~G~~**W** personnel upon demand. The CPM reserves the right to issue a stop work order or allow CDF~~G~~**W** to issue a stop work order after giving notice to the Project owner and the CPM, if the CPM in consultation with CDF~~G~~**W**, determines that the Project owner has breached any of the terms or conditions or for other reasons, including but not limited to the following:

   a. The information provided by the Applicant regarding impacts to waters of the state is incomplete or inaccurate;

   b. New information becomes available that was not known in preparing the terms and conditions; or

   c. The Project or Project activities as described in the Revised Staff Assessment have changed.

5. Road Crossings at Streams. The Project owner shall preserve pre-development downstream flows and sediment transport in washes crossed by permanent roads by incorporating culverts and Arizona crossings at stream crossings. Arizona crossings are the preferred option and shall be employed wherever such crossings do not present a safety hazard and where the roadbed elevation allows the construction of such crossings. Drainages that have been graded for temporary construction access shall be restored to original contours and surface drainage patterns and shall be revegetated according to specifications in **BIO-8**.

~~6. Diffuser Design. The Project owner shall maintain pre-project flow patterns (location and volume of flows) downstream of the Project boundaries. Flows shall not be discharged indiscriminately as sheet flow across the entire length of the diffusers, irrespective of the natural surface drainage patterns, but rather shall be designed to discharge into existing natural washes downslope of the Project.~~

7. Best Management Practices: The Project owner shall also comply with the following conditions to protect drainages near the Project Disturbance Area:

   a. The Project owner shall minimize road building, construction activities and vegetation clearing within ephemeral drainages to the extent feasible.

   b. The Project owner shall not allow water containing mud, silt, or other pollutants from grading, aggregate washing, or other activities to enter ephemeral drainages or be placed in locations that may be subjected to high storm flows.

   c. The Project owner shall comply with all litter and pollution laws. All contractors, subcontractors, and employees shall also obey these laws, and it shall be the responsibility of the Project owner to ensure compliance.

   d. Spoil sites shall be located at least 30 feet from the boundaries and drainages or in locations that may be subjected to high storm flows, where spoils might be washed back into drainages.

   e. Raw cement/concrete or washings thereof, asphalt, paint or other coating material, oil or other petroleum products, or any other substances that could be hazardous to vegetation or wildlife resources, resulting from Project-related activities, shall be prevented from contaminating the soil and/or entering waters of the state. These materials, placed within or where they may enter a drainage, shall be removed immediately.

   f. No broken concrete, debris, soil, silt, sand, bark, slash, sawdust, rubbish, cement or concrete or washings thereof, oil or petroleum products or other organic or earthen material from any construction or associated activity of whatever nature shall be allowed to enter into, or placed where it may be washed by rainfall or runoff into, waters of the state.

   g. When operations are completed, any excess materials or debris shall be removed from the work area. No rubbish shall be deposited within 150 feet of the high water mark of any drainage.

   h. No equipment maintenance shall occur within 150 feet of any ephemeral drainage where petroleum products or other pollutants from the equipment may enter these areas under any flow.

8. Changes of Conditions. A notifying report shall be provided to the CPM and CDF~~G~~**W** if a change of conditions is identified. As used here, change of condition refers to the process, procedures, and methods of operation of a Project; the biological and physical characteristics of a Project area; or the laws or regulations pertinent to the Project as defined below. A copy

of the notifying change of conditions report shall be included in the annual reports or until it is deemed unnecessary by the CPM, in consultation with CDF~~G~~**W**.

a. Biological Conditions: a change in biological conditions includes, but is not limited to, the following: 1) the presence of biological resources within or adjacent to the Project area, whether native or non-native, not previously known to occur in the area; or 2) the presence of biological resources within or adjacent to the Project area, whether native or non-native, the status of which has changed to endangered, rare, or threatened, as defined in section 15380 of Title 14 of the California Code of Regulations.

b. Physical Conditions: a change in physical conditions includes, but is not limited to, the following: 1) a change in the morphology of a river, stream, or lake, such as the lowering of a bed or scouring of a bank, or substantial changes in stream form and configuration caused by storm events; 2) the movement of a river or stream channel to a different location; 3) a reduction of or other change in vegetation on the bed, channel, or bank of a drainage, or 4) changes to the hydrologic regime such as fluctuations in the timing or volume of water flows in a river or stream.

c. Legal Conditions: a change in legal conditions includes, but is not limited to, a change in Regulations, Statutory Law, a Judicial or Court decision, or the listing of a species, the status of which has changed to endangered, rare, or threatened, as defined in section 15380 of Title 14 of the California Code of Regulations.

Verification: No less than 30 days prior to the start of **site mobilization and** construction-related ground disturbance activities potentially affecting waters of the state, the Project owner shall provide written verification (i.e., through incorporation into the BRMIMP) to the CPM that the above best management practices will be implemented. The Project owner shall also provide a discussion of work in waters of the state in Annual Compliance Reports for the duration of the Project.

No less than 30 days prior to beginning Project ground-disturbing activities for each project phase as described in **BIO-29**, the Project owner shall provide to the CPM design drawings ~~of drainage diffusers depicting how these structures restore~~ **demonstrating how** pre-development drainage patterns (location and volume of flows) to drainages downstream of the Project boundaries **will be unaffected**. At the same time the Project owner shall provide design drawings for temporary and permanent stream crossings.

No less than 30 days prior to beginning Project ground-disturbing activities, the Project owner shall provide the form of Security in accordance with this condition of certification. No later than 7 days prior to beginning Project ground-disturbing activities, the Project owner shall provide written verification of the actual Security. The Project owner, or an approved third party, shall complete and provide written verification of the proposed compensation lands acquisition within 18 months of the start of Project ground-disturbing activities.

The Project owner, or an approved third party, shall provide the CPM, BLM, CDF~~G~~**W,** and USFWS with a management plan for the compensation lands and associated funds within 180 days of the land or easement purchase, as determined by the date on the title. The CPM shall review and approve the management plan, in consultation with CDF~~G~~**W** and the USFWS.

Within 90 days after completion of Project construction, the Project owner shall provide to the CPM, BLM, USFWS, and CDF~~G~~**W** an analysis with the final accounting of the amount of jurisdictional state waters disturbed during Project construction.

The Project owner shall provide written verification to the CPM, BLM, USFWS and CDF~~G~~**W** that the compensation lands or conservation easements have been acquired and recorded in favor of the approved recipient no later than 18 months of the start of Project ground-disturbing activities.

The Project owner shall notify the CPM and CDF~~G~~**W**, in writing, at least five days prior to initiation of Project ground-disturbing activities in jurisdictional state waters and at least five days prior to completion of Project activities in jurisdictional areas. The Project owner shall notify the CPM and CDF~~G~~**W** of any change of conditions to the Project, impacts to state waters, or the mitigation efforts.

~~DECOMMISSIONING~~ CLOSURE AND RECLAMATION PLAN

BIO-22 Upon Project closure the Project owner shall implement a final ~~Decommissioning~~ **Closure** and Reclamation Plan. The ~~Decommissioning~~ **Closure** and Reclamation Plan shall include a cost estimate for implementing the proposed ~~decommissioning~~ **closure** and reclamation activities, and shall be consistent with the guidelines in BLM's 43 CFR 3809.550 et seq.

Verification: No fewer than 30 days prior to the start of **site mobilization and construction** ~~Project-related ground disturbing~~ activities or alternate date as agreed to with the BLM, the Project owner shall provide to the CPM (for review) and BLM (for review and approval) a draft ~~Decommissioning~~ **Closure** and Reclamation Plan. The plan shall be finalized prior to the start of commercial operation and reviewed every five years thereafter and submitted to the CPM for review and to the BLM for approval. Modifications to the approved ~~Decommissioning~~ **Closure** and Reclamation Plan shall be made only after approval from the BLM. The Project owner shall provide a copy of the approved ~~Decommissioning~~ **Closure** and Reclamation Plan and any BLM approved revisions to the CPM.

GROUNDWATER DEPENDENT VEGETATION MONITORING

BIO-23 The Project owner shall prepare a Groundwater-Dependent Vegetation Monitoring Plan for monitoring the Project effects of groundwater pumping on groundwater dependent vegetation. The monitoring shall encompass the area depicted in *Figure Soil and Water-~~3~~**14*** (*~~Project Only Revised Operational Water Supply End of 30 Years~~**Chuckwalla Valley Groundwater Basin Impacts to Groundwater Basin Impacts to Groundwater Levels, End of***

Operation) within the 0.1-foot drawdown polygon of the Model Predicted Drawdown ~~(Galati & Blek 2010i)~~. The vegetation and groundwater data collected as part of the Plan shall be used to determine if remedial action is required, as described in **BIO-24.**

The Project owner may forgo development of a Groundwater Dependent Vegetation Monitoring Plan, or may cease implementation of such a plan, by providing evidence to the CPM that the source of water for the GDEs is a shallow perched water-bearing zone rather than the regional groundwater system and that the shallow perched water-bearing zone is unrelated and not influenced by the regional groundwater system that the Project owner proposes to use for water as described below under 15a – 15d.

The Project owner shall develop and implement a Groundwater-Dependent Vegetation Monitoring Plan (Plan) that meets the performance standards described below and includes the following components:

1. Monitoring Objectives and Performance Standards. The objectives of the Plan shall be to monitor the Project effects of groundwater pumping on vegetation and groundwater-dependent ecosystems (GDEs) and, in conjunction with the remedial action described in **BIO-24**, to ensure that the Project groundwater pumping has a less than significant effect on biological resources. Monitoring shall be conducted at a level of detail adequate for detecting adverse effects, as reflected in vegetation attributes and groundwater levels in the shallow (alluvial) aquifer. The baseline for groundwater levels shall be the lowest baseline water level as measured at the Project site prior to the start of groundwater pumping.

2. Location of Monitoring Plots. The monitoring plots shall be established within the area depicted in *Figure Soil and Water -~~3~~**14** (Project Only Revised Operational Water Supply End of 30 Years~~ Years~~**Chuckwalla Valley Groundwater Basin Impacts to Groundwater Basin Impacts to Groundwater Levels, End of Operation**)* within the Model Predicted Drawdown showing the 0.1-foot drawdown polygon ~~(Galati & Blek 2010i)~~. The majority of the plots shall be in the area north and east of the Project site, where groundwater-dependent ecosystems (GDEs) and the intersection of the ground surface and shallow groundwater are located, in the topographic lows in the valley.

3. Monitoring Plots and Controls. Because of the variation in vegetation types and depth to groundwater within the predicted groundwater drawdown zone, the study design shall treat the monitoring plot with a corresponding control plot as a pair (versus comparing the mean of all treatment plots to the mean of all control plots). The “control” plots shall consist of the data collected at the same plot during the baseline (pre-disturbance) monitoring for a pre-disturbance vs. post-disturbance comparison. Appropriate statistical methods shall be used to analyze the

differences between the control and monitoring plots (for example, a one-tailed paired-sample statistical test (Manly 2008)[21]).

4. Off-Site Reference Plots: Off-site monitoring plots shall be established as reference sites to distinguish changes in plant vigor seen at the site from the effects of a region-wide drought. The off-site reference plots can be located within Chuckwalla Valley but shall be within areas that would not be affected hydrologically by groundwater pumping for the Project or other projects or agricultural operations. Off-site monitoring reference plots shall be located in the same general hydrologic and geologic setting (i.e., playa margins), in the same climatic region (Sonoran Desert region of California), and contain the same natural communities or vegetation alliances as those to which they are being compared. Impacts from pests and diseases, if present, must also be considered and excluded or adjusted for as part of the analysis. Data on climate and surface runoff in the study area shall be collected to identify "drought" conditions and correlate groundwater changes and weather changes.

5. Sample Size and Design The number of monitoring sites shall be established using appropriate statistical methods (for example, by a "priori power analysis" (Elzinga et al. 1998)) and shall be sufficient to achieve adequate (90%) statistical power. Following collection of the baseline data a statistical analysis shall be conducted to refine the power analysis and evaluate the adequacy of the sampling design. If the analysis of baseline data indicates that the sampling design is insufficient to achieve adequate statistical power, the design shall be modified (for example, by adding additional monitoring sites).

6. Water Table Monitoring. The Project owner shall install piezometers at each of the dominant vegetation community types within or near the monitoring plots. The number, location, depth and monitoring frequency of the piezometers shall be sufficient to establish the effect of Project groundwater pumping on the shallow aquifer water levels. At a minimum, each piezometer shall be monitored twice per year, in early spring (March) and post-monsoon (September). The piezometers shall be designed to monitor the maximum expected fluctuation in the water table and to last the duration of the Project. Data collected from the Project wells and piezometers for **SOIL &WATER-4** (Groundwater Level Monitoring, Mitigation, and Reporting) and **S&W-6** (groundwater monitoring for the evaporation ponds and land treatment unit) shall be used to refine the modeling of the predicted groundwater drawdown and zone of influence after two years of data collection following the start of groundwater production. The Project owner shall submit to the CPM, for review and approval, a report on the results of the refined modeling. The report shall include all calculations and assumptions made in development of report data and interpretations, and all well monitoring data and piezometer data

[21] Manly, B. 2008. Statistics for Environmental Science and Management (2nd ed). CRC Press/Chapman and Hall. 292 pages.

collected and used in the calculations. If the results indicate that the drawdown and zone of influence is greater than the effect predicted in the GRI, and the GDE are found to be drawing groundwater that is hydraulically connected to the regional groundwater system, then the project owner will submit a revised monitoring plan for GDE areas outside of the original monitoring area.

7. Soil Monitoring. Soil salinity and pH shall be monitored annually at every monitoring plot. The Plan shall describe the monitoring devices and techniques used to collect and interpret this data, relative to ecosystem function. One soil core sample per community type shall be collected as part of the baseline data to establish the approximate rooting depth of the phreatophytes, and thereafter shall be repeated every five years. The coring method must provide a continuous core that will provide visual examination of roots and root nodules, soil profile, and soil moisture.

8. Baseline and Long-term Data Collection. At a minimum, baseline data shall be collected at all monitoring sites prior to the start of pumping; however, vegetation data collected from sites farther from the nearest wells will allow for the collection of multiple years of “pre-disturbance” data. ~~Although the project proposes to begin construction (and pumping) by December 2010, it appears that the effects of pumping would not reach the areas supporting the GDEs or phreatophytic plants for several years (see C.9 **Soil and Water Resources**).~~ Because the proposed well in the northeast portion of the ~~P~~roject (Soil & Water Figure 1**4**, ~~Galati & Blek 2010i~~) is located in very close proximity to known phreatophytes, this well shall not be used within the first 3 years of the ~~P~~roject in order to allow an adequate period for baseline data collection in the area northeast of the Project. Subject to approval by the CPM, if groundwater pumping ceases or is replaced by other water sources, groundwater and vegetation monitoring shall continue for a period of 5 years or until refined modeling indicates that the groundwater levels have returned to baseline levels and the decline in plant vigor has been restored to pre-disturbance conditions.

9. Target Vegetation Population. The monitoring sites shall include GDEs and other vegetation potentially affected by the drawdown that occur**s** within the zone of influence. The following phreatophytes have been documented to occur around Palen Lake: honey mesquite (*Prosopis glandulosa*); iodine bush (*Allenrolfea occidentalis*), bush seep-weed (*Suaeda moquinii*), jackass clover (*Wislizenia refracta*), four-wing saltbush (*Atriplex canescens*), allscale (*A. polycarpa*), spinescale (*A. spinifera*), a potentially new taxon of saltbush (*Atriplex* sp. nov. Andre), ironwood (*Olneya tesota*), palo verde (*Cercidium microphyllum*), cat’s claw (*Acacia greggii*), and smoke tree (*Psorothamnus spinosus).*The final number of each community type sample needed shall be based on the *priori* power test conducted after the first year of baseline data collection.

10. Fine-Scale Vegetation Mapping. Within the monitoring sites vegetation shall be mapped to the alliance level, consistent with classification protocol in the *Manual of California, 2nd edition* (Sawyer et al. 2009) but any important associations shall also be mapped. Mapping shall be done using minimum 1 meter resolution color orthophotos or higher resolution infrared imagery. The mapping shall also be used to determine the acreages of GDEs and establish the amount of security to be deposited in the event that adverse effects are detected during the monitoring. Boundaries of the permanent plots and any off-site reference sites shall be recorded using GPS technology and depicted on the geo-referenced aerials. GIS shapefiles and metadata shall be submitted along with the draft Plan and any subsequent revisions to the Plan (i.e., following the collection of baseline data and subsequent power analysis).

11. Guidelines for the Monitoring Plan. The Groundwater-Dependent Vegetation Monitoring Plan (Plan) shall be prepared with guidance from *Measuring and Monitoring Plant Populations* (Elzinga et al. 1998). The Plan shall provide a detailed description of each of the following components:

    a. Sampling Design. The sampling design shall include a description of: a) the populations (vegetation types) sampled; b) number, size, and shape of the sampling units; c) layout of the sampling units; d) methods for permanently marking plots in the field; e) monitoring schedule/frequency; f) vegetation and other attributes sampled; and g) sampling objectives (target/threshold, change/trend-based) for each attribute.

    b. Habitat Function and Values. The Plan shall describe the hydrologic, geologic/geomorphic, geochemical, biological and ecological characteristics of the GDEs, and shall also describe whether species are obligate or facultative; root growth and water acquisition characteristics; morphological adaptations to the desert environment; reproduction and germination characteristics; general and micro-habitat preferences; obligate or facultative halophytes and phreatophytes; role in the morphology of dunes; and importance to wildlife, etc.

    c. Field techniques for measuring vegetation. This will include the vegetation (or other) attributes selected based on a demonstrated knowledge of the biology and morphology of the species, and include a discussion of the limitations involved in each measurement. Examples of appropriate field techniques for measuring drought response include: percent dieback; live crown density; crown height and width, percent cover of live (versus dead or residual) vegetation, percent cover/frequency of associated species; percent composition of native versus non-native species; and percent cover based on wetland status codes (OBL, FACW, FAC, FACU, UPL[22]) and status as phreatophytes or halophytes. Photo monitoring shall not be considered an acceptable monitoring method but may be useful to conduct periodically (e.g., every 3 to 5 years).

d. Data Management. Including how the data will be recorded in the field (e.g., using a GPS data dictionary), processed and stored.

e. Training of personnel. Describe minimum standards for training and monitoring personnel.

f. Statistical analysis. Describe statistical methods used to analyze the monitoring data (incorporating the minimum standards for statistical power and error rate described above).

12. Peer Review of the Plan. The draft Plan shall undergo a peer review by recognized experts, which shall include one or more scientists with expertise in: the preparation of monitoring plans for plant populations; the physiological responses of desert phreatophytes to drought stress; assessing the effects of groundwater withdrawal on vegetation in the desert region; and biostatistics. The Project owner shall provide the resumes of suggested peer reviewers to the CPM for review and approval.

13. Annual Monitoring Report. Annual Monitoring Reports shall be submitted to the CPM and BLM and shall include, at a minimum: a) names and contact information for the responsible parties and monitoring personnel; b) summaries of the results of the monitoring as required in **Soil&Water-4 and Soil&Water-6**; c) piezometer monitoring results**,** and a comparison of predicted versus actual water table declines; d) summary of the results of vegetation, groundwater, and soil monitoring data compared to the baseline data for each plot (pre- versus post-disturbance comparison); e) description of sampling and monitoring techniques used for each attribute; f) description of the data management and statistical analysis; g) photos; h) conclusions and recommendations for remedial action, if the monitoring data indicates that the threshold described below has been met.

The first Annual Monitoring Report shall include an appropriate statistical analysis using the first year baseline monitoring data to assess whether the sampling design was adequate to provide statistically meaningful data, as described above. If warranted, the first year Annual Monitoring Report shall include recommendations for revisions to the Plan based on this analysis.

[22] OBL= Obligate Wetland; FACW= Facultative Wetland; FAC= Facultative; FACU= Facultative Upland UPL= Obligate Upland. *In;* U.S. Fish and Wildlife Service. 1993. **1993 supplement to list of plant species that occur in wetlands: Northwest (Region 9).** Supplement to U.S. Fish & Wildlife Service Biological Report 88 (24.9). Online: http://plants.usda.gov/wetinfo.html

14. Threshold for Remedial Action: The Project owner shall implement remedial action, as described in Condition of Certification **BIO-24,** if the monitoring described in **BIO-23** detects a decline in plant vigor of 20 percent or more compared to the same plots pre-disturbance AND also detects a decline in the alluvial (shallow) aquifer confirmed by two consecutive annual water monitoring events in any amount greater than the lowest baseline water level as measured prior to groundwater pumping. If regional drought, off-site pumping or other activities unrelated to the Project are also contributing to the decline in water table, the Project owner shall only be responsible for the portion of the effect that can be statistically demonstrated to be the result of Project pumping. To determine whether declines in plant vigor are related to Project pumping as opposed to region wide drought or offsite pumping conditions the Project owner shall install a network background monitoring piezometers and incorporate these data in the assessment of Project-related effects on GDEs.

15. To understand the source of the water for the GDEs, the Project owner shall prepare a groundwater investigation work plan for submittal to the CPM that will outline steps to determine if the source of water for the GDEs is a shallow perched water-bearing zone rather than the regional groundwater system, and that the shallow perched water-bearing zone is not hydraulically connected to the regional groundwater system. The groundwater investigation will be comprised of the following components:

    a. A continuous soil coring program at five locations to be identified based on field mapping of GDEs in the area shown on the Figure *Soil and Water-~~3~~**14** (~~Project Only Revised Operational Water Supply End of 30 Years~~)* within the 0.1-foot drawdown polygon of the Model Predicted Drawdown (~~Galati & Blek 2010i~~). One of the five borings will be drilled adjacent to a GDE containing mesquite, and the other four located to provide an assessment of the range of plant communities within GDEs in the area of interest (i.e., to assess the variability of GDE plant type water requirements and root zone depth).

    b. The soil cores shall extend a minimum of 20 feet below the deepest root zones of the GDEs investigated to demonstrate separation between the shallow and regional water zones. At a minimum the soil cores shall show that 20 feet of unsaturated conditions are present below the deepest root zones of the plant communities investigated. The soil cores will be logged by a professional geologist in the State of California, and the coring program will be overseen by a qualified biologist with experienced in the plant communities identified within each GDE.

    c. A sampling plan for selective analysis of soil moisture content and saturation will also be conducted for each soil core advanced adjacent to a GDE. The number and frequency of soil samples shall be established to confirm field observations of soil moisture content in the shallow water-bearing zone, through the root zone and in the deeper sediments below the root zone above the regional water table. Soil samples shall be analyzed for moisture content after ASTM Method D2216.

d. Depending on the results of the soil coring program, piezometers may be installed as monitoring points for the regional water table and to monitoring changes in the shallow water-bearing zone from Project pumping. In the report of results from the soil coring program, a water-level monitoring program shall be proposed if it is shown that the regional water table is in direct hydraulic connection to the source of water to the GDE's. If the field data clearly shows an unsaturated zone of 20 feet or more below the deepest root zones of the GDEs, then piezometers will not be installed.

If the results of the pre-construction field observations and soil sampling demonstrate 20 feet or more of unsaturated sediments between the deepest root zones of the GDEs and the regional water table, there will be no requirements to implement any of the underlying conditions as provided for in **BIO-23** and **BIO-24**, as sufficient evidence will have been provided to demonstrate that the groundwater is not the source for the GDE's.

If the refined modeling of the predicted groundwater drawdown and zone of influence after two years of data collection (following the start of groundwater production), as described in Subsection 6 of this condition and in **SOIL&WATER-4** and **SOIL&WATER-6**, indicates the drawdown or zone of influence would be greater than predicted in the Project owner's Groundwater Resources Investigation (GRI), and the GDE are found to be drawing groundwater that is hydraulically connected to the regional groundwater system, then the project owner will submit a revised monitoring plan for GDE areas outside of the original monitoring area .

Verification: At least 30 days prior to operation of project pumping wells, the Project owner shall submit to the CPM and BLM for review and approval a draft Groundwater-Dependent Vegetation Monitoring Plan (Plan). The final plan shall incorporate recommendations from the peer review and shall be submitted to the CPM and BLM no less than 15 days prior to the start of groundwater pumping.

No less than 15 days prior to the start of groundwater pumping the Project owner shall submit as-built drawings indicating the location and depth of piezometers, and shall provide evidence that the piezometers are operational.

Baseline groundwater and groundwater-dependent vegetation monitoring shall begin 15 days prior to construction and shall occur every year during the same one to two week time period in early spring (March) and post-monsoon (September).

The First Annual Monitoring Report shall be provided to the CPM and BLM no later than January 31 following the first year of data collection, and shall include an assessment of whether the sampling design would provide statistically adequate monitoring data and whether modifications to the monitoring design would be needed. If the first Annual

Monitoring Report recommends a revised sampling design, the Project owner shall submit the revised Plan to the CPM and BLM no later than March 1.

Thereafter the Project owner shall submit a Groundwater-Dependent Vegetation Annual Monitoring Report to the CPM and BLM no later than January 31 of each year for the duration of Project operation.

If the project owner elects to prepare a geologic and groundwater investigation (as described in Subsection 15 a-d of this condition) to determine if the source of water for the GDEs is a shallow perched water-bearing zone rather than the regional groundwater system, and that the shallow perched water-bearing zone is not hydraulically connected to the regional groundwater system that the Project owner proposes to use for water supply, the project owner shall submit the resumes of at least two independent, qualified peer reviewers 45 days prior to submittal of the report to the CPM and BLM for review and approval. The Project owner must submit the results of their investigation, subject to review and approval by the CPM, prior to the start of construction or Project groundwater use.

If the refined modeling conducted according subsection 6 of this condition indicates that the drawdown and zone of influence is greater than the effect predicted in the GRI, and the GDE are found to be drawing groundwater that is hydraulically connected to the regional groundwater system, then the Project owner shall submit a revised monitoring plan for GDE areas outside of the original monitoring area. The Revised Monitoring Plan shall be submitted no later than January 31 in the third year following the start of groundwater pumping and well monitoring.

REMEDIAL ACTION AND COMPENSATION FOR ADVERSE EFFECTS TO GROUNDWATER-DEPENDENT BIOLOGICAL RESOURCES

BIO-24 If monitoring detects Project-related adverse impacts to groundwater dependent ecosystems (GDEs), as described in **BIO-23** and the impacts are shown to be the result of a decline in the regional groundwater table due to Project pumping, the Project owner shall determine which well(s) are the source of the adverse impacts and shall implement remedial measures as outlined below. If regional drought, off-site pumping or other activities unrelated to the Project are also contributing to the decline in water table, the Project owner shall only be responsible for the portion of the effect that can be demonstrated to be the result of Project pumping. The remedial measures shall be implemented with the objective of restoring the groundwater levels to the baseline described in **BIO-23**, and shall compensate for impacts to GDEs with off-site habitat acquisition or restoration. The Project owner shall do all of the following:

1. <u>Modification and/or Cessation of Pumping</u>: The Project owner shall provide to the CPM evidence based on groundwater monitoring and modeling indicating which wells are likely to be causing adverse impacts to GDEs. The Project owner shall initially modify operation of those wells to reduce the offsite drawdown in the areas of the GDEs.

2. Remedial Action Plan: The objective of remedial action shall be restoration of the spring groundwater table in the alluvial (shallow) aquifer to baseline levels, as described in **BIO-23**. The Remedial Action Plan shall include one or more of the following measures: 1) Begin rotational operation of the site water supply wells reducing pumping in wells that are the most proximal to the GDEs, 2) reducing the pumping rate in the wells that have been identified as the cause of the drawdown in the area of the GDEs, 3) focus pumping on wells on the southern portion of the project site away from the GDEs 4) cease operation of the well(s) that are the cause of the drawdown. Groundwater water level monitoring shall increase to a frequency necessary to document change and recovery in the drawdown from the changes in the pumping program.

   The Remedial Action Plan shall include a water level monitoring program of sufficient frequency to document changes in operation of the water supply wells, and demonstrate that the water table has been restored to baseline levels.

   The Project owner shall use the following guidelines for determining if an ecosystem (or species) is phreatophytic (Brown et al 2007; LeMaitre et al 1999; Froend & Loomes 2004):

   a. It is not known or documented to depend on groundwater, based on scientific literature or expert opinion (local knowledge can be useful in making a determination as some species' dependence varies by setting);

   b. The species are not known to have roots extending over a meter in depth;

   c. The community does not occur in an area where the water table is known to be 'near' the surface (relative to the documented rooting depths of the species);

   d. The herbaceous or shrub vegetation is not still green and/or does not have a high leaf area late in the dry season (compared to other dry areas in the same watershed that do not have access to groundwater).

3. Compensate for Loss of Ecosystem Function. If the decline in the water table in the alluvial (shallow) aquifer is accompanied by a corresponding decline in plant vigor greater than 20 percent (as described in BIO-23), the Project owner shall compensate for the loss of habitat functions and values in the affected groundwater-dependent ecosystems. The amount of compensation shall be at a 3:1 ratio based on area of affected area, using mapping as described in **BIO-23**. The Project owner shall acquire, in fee or in easement, a parcel or parcels of land that include an amount of groundwater-dependent vegetation that is of the same habitat-type as the community affected (e.g., mesquite woodland, alkali sink scrubs, or microphyll woodland) and of an equal or greater habitat quality. The compensation lands shall be located within the watersheds encompassing

the Chuckwalla or Palen valleys. As an alternative to habitat compensation, the Project owner may submit a plan that achieves restoration of lost habitat function and value at another location within the Chuckwalla Groundwater Basin that contains the same habitats as those affected.

a. Review and Approval of Compensation Lands Prior to Acquisition or Restoration. The Project owner shall submit a formal acquisition proposal to the CPM describing the parcel(s) intended for purchase. This acquisition proposal shall discuss the suitability of the proposed parcel(s) as compensation lands in relation to the criteria listed above. Approval from the CPM shall be required for acquisition of all compensatory mitigation parcels.

b. Preparation of Management Plan: The Project owner shall submit to the CPM and CDFW a draft Management Plan that reflects site-specific enhancement measures for the acquired compensation lands. The objective of the Management Plan shall be to maintain the functions and values of the acquired GDE plant communities and may include enhancement actions such as weed control, fencing to exclude livestock, or erosion control.

c. Delegation of Acquisition. The responsibility for acquisition of compensation lands may be delegated to ~~NFWF or another~~ **a** third party ~~other than NFWF,~~ such as a non-governmental organization supportive of desert habitat conservation, by written agreement of the Energy Commission. Such delegation shall be subject to approval by the CPM prior to land acquisition, enhancement or management activities.

Verification: No more than 30 days following submission of the Groundwater Dependent Vegetation Annual Monitoring Report the Project owner shall submit to the CPM for review and approval a draft Remedial Action Plan if that report indicates that the threshold for remedial action as described in **BIO-23** has been met. At the same time the Project owner shall submit written evidence that the Project wells responsible for impacts to groundwater levels and GDEs have modified their operation or ceased operation.

A final Remedial Action Plan shall be submitted to the CPM within 30 days of receipt of the CPM's comments on the draft plan. No later than 6 months following approval of the final Remedial Action Plan, the Project owner shall provide to the CPM written documentation of the effectiveness of the completed remedial action.

No more than 30 days following submission of the Groundwater-Dependent Vegetation Annual Monitoring Report**,** the Project owner shall provide to the CPM a final accounting of the amount of GDE habitat affected by Project groundwater pumping.

No more than 6 months following submission of the Groundwater-Dependent Vegetation Annual Monitoring Report the Project owner shall submit a formal acquisition or restoration proposal to the CPM, describing the mitigation parcels intended for purchase or restoration. The acquisition/restoration proposal shall describe how the proposed parcels meet the acquisition or restoration criteria described in this condition.

No fewer than 90 days prior to compensatory acquisition or restoration, the Project owner shall submit to the CPM and obtain CPM approval of any agreements to delegate land acquisition to an approved third party, or to manage compensation lands; such agreement shall be executed and implemented no more than months following approval of the acquisition proposal.

The Project owner shall provide written verification to the CPM that the compensation lands or conservation easements have been acquired and recorded in favor of the approved recipient no later than 18 months from submission of the Groundwater-Dependent Vegetation Annual Monitoring Report.

~~GOLDEN EAGLE INVENTORY AND MONITORING~~

~~**BIO-25**~~ ~~The Project owner shall implement the following measures to avoid or minimize Project-related construction impacts to golden eagles.~~

1. ~~Annual Inventory During Construction. For each calendar year during which construction will occur an inventory shall be conducted to determine if golden eagle territories occur within one mile of the Project boundaries. Survey methods for the inventory shall be as described in the Interim Golden Eagle Inventory and Monitoring Protocols; and Other Recommendations (Pagel et al. 2010) or more current guidance from the USFWS.~~

2. ~~Inventory Data: Data collected during the inventory shall include at least the following: territory status (unknown, vacant, occupied, breeding successful, breeding unsuccessful); nest location, nest elevation; age class of golden eagles observed; nesting chronology; number of young at each visit; digital photographs; and substrate upon which nest is placed.~~

3. ~~Determination of Unoccupied Territory Status: A nesting territory or inventoried habitat shall be considered unoccupied by golden eagles ONLY after completing at least 2 full surveys in a single breeding season. In circumstances where ground observation occurs rather than aerial surveys, at least 2 ground observation periods lasting at least 4 hours or more are necessary to designate an inventoried habitat or territory as unoccupied as long as all potential nest sites and alternate nests are visible and monitored. These observation periods shall be at least 30 days apart for an inventory, and at least 30 days apart for monitoring of known territories.~~

4. ~~Monitoring and Adaptive Management Plan: If an occupied[23] nest is detected within one mile of the Project boundaries, the Project owner shall prepare and implement a Golden Eagle Monitoring and Adaptive Management Plan for the duration of construction to ensure that Project construction activities do not result in injury or disturbance to golden eagles. The monitoring methods shall be consistent with those described in the Interim Golden Eagle Inventory and Monitoring Protocols; and Other Recommendations (Pagel et al. 2010) or more current guidance from the USFWS. The Monitoring and Management Plan shall be prepared in consultation with the USFWS. Triggers for adaptive management shall include any evidence of Project-related disturbance to nesting golden eagles, including but not limited to: agitation behavior (displacement, avoidance, and defense); increased vigilance behavior at nest sites; changes in foraging and feeding behavior, or nest site abandonment. The Monitoring and Adaptive Management Plan shall include a description of adaptive management actions, which shall include, but not be limited to, cessation of construction activities that are deemed by the Designated Biologist to be the source of golden eagle disturbance.~~

~~**Verification:** No fewer than 30 days from completion of the golden eagle inventory the project owner shall submit a report to the CPM, BLM, CDFGCDFW, and USFWS documenting the results of the inventory.~~

~~If an occupied nest is detected within one mile of the Project boundary during the inventory the Project owner shall contact staff at the USFWS Carlsbad Office and CDFGCDFW within one working day of detection of the nest for interim guidance on monitoring and nest protection. The project owner shall provide the CPM, CDFGCDFW, and USFWS with the final version of the Golden Eagle Monitoring and Management Plan within 30 days after detection of the nest. This final Plan shall have been reviewed and approved by the CPM in consultation with USFWS and CDFGCDFW.~~

EVAPORATION POND NETTING AND MONITORING

BIO-26 The Project owner shall cover the evaporation ponds prior to any discharge with 1.5-inch mesh netting designed to exclude birds and other wildlife from drinking or landing on the water of the ponds. Netting with mesh sizes other than 1.5-inches may be installed if approved by the CPM in consultation with CDFW and USFWS. The netted ponds shall be monitored regularly to verify that the netting remains intact, is fulfilling its function in excluding birds and other wildlife from the ponds, and does not pose an entanglement threat to birds and other wildlife. The ponds shall include a visual deterrent in addition to the netting, and the pond shall be designed such that the netting shall

[23] An occupied nest is one used for breeding by a pair of golden eagles in the current year. Presence of an adult, eggs, or young, freshly molted feathers or plucked down, or current years' mutes (whitewash) also indicate site occupancy. Additionally, all breeding sites within a breeding territory are deemed occupied while raptors are demonstrating pair bonding activities and developing an affinity to a given area. If this culminates in an individual nest being selected for use by a breeding pair, then the other nests in the nesting territory will no longer be considered occupied for the current breeding season. A nest site is considered occupied throughout the periods of initial courtship and pair bonding, egg-laying, incubation, brooding, fledging, and post-fledging dependency of the young.

never contact the water. Monitoring of the evaporation ponds shall include the following:

1. Monthly Monitoring. The Designated Biologist or Biological Monitor shall regularly survey the ponds at least once per month starting with the first month of operation of the evaporation ponds. The purpose of the surveys shall be to determine if the netted ponds are effective in excluding birds, if the nets pose an entrapment hazard to birds and wildlife, and to assess the structural integrity of the nets. The monthly survey shall be conducted in 1 day for a minimum of 2 hours following sunrise (i.e., dawn), a minimum of 1 hour mid-day (i.e., 1100 to 1300), and a minimum of 2 hours preceding sunset (i.e., dusk) in order to provide an accurate assessment of bird and wildlife use of the ponds during all seasons. Surveyors shall be experienced with bird identification and survey techniques. Operations staff at the Project site shall also report finding any dead birds or other wildlife at the evaporation ponds to the Designated Biologist within 1 day of the detection of the carcass. The Designated Biologists shall report any bird or other wildlife deaths or entanglements within 2 days of the discovery to the CPM, CDFW, and USFWS.

2. Dead or Entangled Birds. If dead or entangled birds are detected, the Designated Biologist shall take immediate action to correct the source of mortality or entanglement. The Designated Biologist shall make immediate efforts to contact and consult the CPM, CDFW, and USFWS by phone and electronic communications prior to taking remedial action upon detection of the problem, but the inability to reach these parties shall not delay taking action that would, in the judgment of the Designated Biologist, prevent further mortality of birds or other wildlife at the evaporation ponds.

3. Quarterly Monitoring. If after 12 consecutive monthly site visits no bird or wildlife deaths or entanglements are detected at the evaporation ponds by or reported to the Designated Biologist, monitoring, as described in paragraph 1, can be conducted on a quarterly basis.

4. Biannual Monitoring. If after 12 consecutive quarterly site visits no bird or wildlife deaths or entanglements are detected by or reported to the Designated Biologist and with approval from the CPM, USFWS, and CDFW, future surveys may be reduced to 2 surveys per year, during the spring nesting season and during fall migration. If approved by the CPM, USFWS, and CDFW, monitoring outside the nesting season may be conducted by the Environmental Compliance Manager.

5. Modification of Monitoring Program. CDFW or USFWS may submit a request for modifications to the evaporation pond monitoring program based on information acquired during monitoring, and may also suggest adaptive management measures to remedy any problems that are detected during monitoring or modifications if bird impacts are not observed. Modifications to the evaporation pond monitoring described above and implementation of adaptive management measures shall be

made only after approval from the CPM, in consultation with USFWS and CDFW.

Verification: No less than 30 days prior to operation of the evaporation ponds the project owner shall provide to the CPM as-built drawings and photographs of the ponds indicating that the bird exclusion netting has been installed. For the first year of operation the Designated Biologist shall submit quarterly reports to the CPM, BLM, CDF~~G~~**W**, and USFWS describing the dates, durations and results of site visits conducted at the evaporation ponds. Thereafter the Designated Biologist shall submit annual monitoring reports with this information. The quarterly and annual reports shall fully describe any bird or wildlife death or entanglements detected during the site visits or at any other time, and shall describe actions taken to remedy these problems. The annual report shall be submitted to the CPM, BLM, CDF~~G~~**W**, and USFWS no later than January 31 of every year for the life of the project.

REVEGETATION & RESTORATION OF TEMPORARILY DISTURBED AREAS

~~**BIO-27**~~ *Staff and the prior project owner agreed to delete this condition.*

IN-LIEU FEE MITIGATION OPTION

BIO-28 The Project owner may choose to satisfy its mitigation obligations by paying an in-lieu fee instead of acquiring compensation lands, pursuant to Fish and Game code sections 2069 and 2099. **Alternately, the CPM, in conjunction with the BLM, CDFW, and USFWS, may approve the project owner's use of another mitigation program** or any other applicable in-lieu fee provision, provided that the Project's in-lieu fee proposal **or mitigation program** is found by the ~~Commission~~ **CPM** to the mitigate the impacts identified herein. If the in-lieu fee proposal **or mitigation program** is found by the ~~Commission~~ **CPM, in coordination with the BLM, CDFW, and USFWS** to be in compliance, and the Project Owner chooses to satisfy its mitigation obligations through the in-lieu fee, the Project Owner shall provide proof of the in-lieu fee payment to the CPM prior to construction related ground disturbance.

Verification: If electing to use this provision, the Project owner shall notify the **CPM** ~~Commission and all parties to the proceeding~~ that it would like a determination that the Project's in-lieu fee proposal would mitigate for the impacts identified herein. Prior to **site mobilization and** construction related ground disturbance the Project Owner shall provide proof of the in lieu fee payment to the CPM.

PROJECT CONSTRUCTION PHASING PLAN

BIO-29 The Project Owner shall provide compensatory mitigation for the total Project Disturbance Area and may provide such mitigation in two phases for ~~Units 1 and 2 as described in Figures BIO-5 and BIO-6 in the July 19, 2010 Response to Data Request (AECOM 2010u~~) **as depicted in Figure 1 (Palen Solar - Construction Phases) in the Supplement No. 1 Petition to Amend dated February 8, 2013 or updated figure provided by project owner and approved by the CPM.** For purposes of this condition, the Project

Disturbance Area means all lands disturbed in the construction and operation of the ~~Palen~~ **Palen Solar Energy Generating System** Project or its phases, including all linears and ancillary facilities, as well as undeveloped areas inside the Project's boundaries that would no longer provide viable long-term habitat.

The disturbance area for each project Phase and resource type is provided in **BIO-29** Table 1 below. Mitigation is shown in **BIO-29** Table 2, and mitigation security is shown in **BIO-29 Table 3,** below**.** This table shall be refined prior to the start of each construction phase with the disturbance area adjusted to reflect the final Project footprint for each phase. Prior to initiating each phase of construction the Project owner shall submit the actual construction schedule, a figure depicting the locations of proposed construction and amount of acres to be disturbed. Mitigation acres are calculated based on the compensation requirements for each resource type as described in the above Conditions of Certification – **BIO-12** (Desert Tortoise), **BIO-20** (Mojave Fringe-toed Lizard), **BIO-18** (Western Burrowing Owl), and **BIO-22** (State Waters). Compensatory mitigation for each phase shall be implemented according to the timing required by each condition.

Raven Fee Impacts[2]	$100,181	$314,360
WBO Habitat	$250,089	$00.00
Jurisdictional Waters	$200,720	$2,232,624
Total	$5,753,343	$18,725,016

1– Securities (aside from Raven fees) based on REAT Biological Resources Mitigation/Compensation Cost Estimate Calculation Table - July 23, 2010 (REAT 2010), adjusted to reflect a 160-acre parcel size estimate. Security does not include authorized entity fees. Security amounts may change based on final Project footprint. The final amount shall be determined by an updated appraisal conducted as described in BIO-12.
2 – Based on U.S. Fish and Wildlife Service Cost Allocation Methodology for Implementation of the Regional Raven Management Plan, dated July 9, 2010 (USFWS 2010b). Fee calculated at $105/acre for direct project impacts.

Verification: The Project owner shall not disturb any area outside of the area that has been approved for that phase of construction and for the previously approved phases of construction.

No less than 30 days prior to the start of desert tortoise clearance surveys for each phase, the Project owner shall submit a description of the proposed construction activities for that phase to CDFW, USFWS and BLM for review and to the CPM for review and approval. The description for each phase shall include the proposed construction schedule, a figure depicting the locations of proposed construction, and amount of acres of each habitat type to be disturbed.

No less than 30 days prior to beginning Project ground-disturbing activities for each phase, the Project owner shall provide the form of Security in accordance with this Condition of Certification in the amounts described in **BIO-29 Table 3.** No later than 7 days prior to beginning Project ground-disturbing activities for each phase, the Project owner shall provide written verification of the actual Security. The Project owner, or an approved third party, shall complete and provide written verification of the proposed compensation lands acquisition within 18 months of the start of Project ground-disturbing activities for each phase.

Palen 2012a Palen Solar Holdings, LLC/Galati Blek, Scott Galati (TN 68910). Palen Solar Holdings LLC's Petition for Amendment, dated December 17, 2012. Submitted to CEC/C. Stora on December 18, 2012

Palen 2013a – Galati Blek/Scott A. Galati (TN 69471). Supplement No. 1 to Support Palen Solar Holdings, LLC's Petition for Amendment, dated February 8, 2013. Submitted to CEC/C. Stora on February 14, 2013

Palen 2013c – Galati Blek/Marie Fleming (TN 69601). Palen Solar Holdings, LLC's Response to Staff's Issue Identification Report, dated February 19, 2013. Submitted to CEC/Dockets Unit on February 19, 2013

Palen 2013d – Palen Solar Holdings, LLC/Galati Blek LLP, Scott Galati (TN 69909). Supplement No. 2 – Complete Air Quality and Public Health Sections. Submitted to CEC/C. Stora on March 13, 2013

Palen 2013e – Palen Solar/Galati Blek LLP, Marie Fleming (TN 69931). Palen Solar's Relocated Natural Gas Pipeline Drawing. Submitted to CEC/Docket Unit on March 15, 2013

Palen 2013f – Galati Blek/Marie Fleming (TN 70015). Preliminary Draft Construction Drainage, Erosion and Sedimentation Control Plan/Storm water Pollution Prevention Plan, dated March 21, 2013. Submitted to CEC/Dockets Unit on April 15, 2013

Palen 2013g – Palen Solar Holdings, LLC (TN 70096). Palen Solar Holdings, LLC's Response to CEC Data Request Set 1 (1-18). Submitted to CEC/Docket Unit on March 25, 2013

Palen 2013j – Palen Solar Holdings, LLC (TN 70200). Palen Solar Holdings, LLC's Supplemental Response to CEC Staff Data Request Five. Submitted to CEC/C. Stora on March 29, 2013

Palen 2013k – Galati Blek/Marie Fleming (TN 70242). Palen Solar Electric Generating System Winter 2013 Golden Eagle Survey Results, dated April 8, 2013. Submitted to CEC/Docket Unit on April 8, 2013

Palen 2013m – Galati Blek/Scott A. Galati (TN 70448). Palen Solar Holdings, LLC's Supplement No. 3, dated April 24, 2013. Submitted to CEC/C. Stora on April 24, 2013

Palen 2013p – Galati Blek/Scott A. Galati (TN 70785). Palen Solar Holdings, LLC's Response to Workshop Queries, dated May 13, 2013. Submitted to CEC/C. Stora on May 13, 2013

Palen 2013r – Galati Blek/Scott A. Galati (TN 70896). Palen Solar Holdings, LLC's Response to CEC Staff Data Request Set 2 (19-39), date May 20, 2013. Submitted to CEC/C. Stora on May 21, 2013

Palen 2013s – Galati Blek/M. Fleming (TN 70897). Palen Solar Electric Generating System Summary of Spring Wildlife and Plant Surveys, dated May 21, 2013. Submitted to CEC/Docket Unit on May 21, 2013

Palen 2013u – Galati Blek/Marie Fleming (TN 70991). Draft Weed Management Plan, dated May 28, 2013. Submitted to CEC/Docket Unit on May 28, 2013

Palen 2013v – Galati Blek/Marie Fleming (TN 71087). Joshua Tree National Park Visual Resources Analysis Report, dated May 31, 2013. Submitted to CEC/Docket Unit on May 31, 2013

Palen 2013x – Galati Blek/Marie Fleming (TN 71123). PSEGS Spring 2013 Golden Eagle Nest Survey Results Interim Report, dated June 5, 2013. Submitted to CEC/Docket Unit on June 5, 2013

Palen 2013y – Galati Blek/Marie Fleming (TN 71131). PSEGS Summary of Survey for Jurisdictional State Waters, dated June 5, 2013. Submitted to CEC/Docket Unit on June 5, 2013

Palen 2013z – Galati Blek/Marie Fleming (TN 71153). PSEGS Preliminary Spring 2013 Pre-Construction Avian Field Survey Results, dated June 5, 2013. Submitted to CEC/Docket Unit on June 5, 2013

Palen 2013aa – Galati Blek/Marie Fleming (TN 71154). Scope of Work for PSEGS Summer 2013 Pre-Construction Avian Field Surveys, dated June 6, 2013. Submitted to CEC/Docket Unit on June 6, 2013

Palen 2013cc – Galati Blek/Scott Galati (TN 71280). Palen Solar Holdings, LLC's Response to CEC Staff Data Request Set 3 (40-72), dated June 14, 2013. Submitted to CEC/C. Stora on June 14, 2013

Palen 2013dd – Galati Blek/Marie Fleming (TN 71551). Palen Solar Holdings, LLC's Initial Comments on the Preliminary Staff Assessment, dated July 11, 2013. Submitted to CEC/Docket Unit on July 11, 2013

Palen 2013hh – Galati Blek/Marie Fleming (TN 200009). Palen Solar Holdings, LLC's Bat Habitat Assessment, dated July 22, 2013. Submitted to CEC/Docket Unit on July 23, 2013

Palen 2013ii – Galati Blek/Marie Fleming (TN 200010). Palen Solar Holdings, LLC's Spring 2013 Avian Survey Results, dated July 23, 2013. Submitted to CEC/Docket Unit on July 23, 2013

Palen 2013jj – Galati Blek/Marie Fleming (TN 200011). Palen Solar Holdings, LLC's Supplemental Spring 2013 Biological Surveys, dated July 23, 2013. Submitted to CEC/Docket Unit on July 23, 2013

Palen 2013kk – Galati Blek/Marie Fleming (TN 200012). Palen Solar Holdings, LLC's Final Sand Transport Study, dated July 23, 2013. Submitted to CEC/Docket Unit on July 23, 2013

Palen 2013pp – Galati Blek/Marie Fleming (TN 200077). Palen Solar Holdings, LLC's Final Comments on the Preliminary Staff Assessment, dated July 29, 2013. Submitted to CEC/Docket Unit on July 29, 2013

Palen 2013qq – Galati Blek/Marie Fleming (TN 200085). Palen Solar Holdings, LLC's Supplemental Comments on the 07/26/13 Version of Condition of Certification BIO-17, dated July 30, 2013. Submitted to CEC/Docket Unit on July 30, 2013

Palen 2013ss – Galati Blek/Scott Galati (TN 200098). Palen Solar Holdings, LLC's Response to CEC Staff Data Request Set 4 (73-89), dated July 31, 2013. Submitted to CEC/C. Stora on July 31, 2013

Palen 2013zz – Galati Blek/Marie Fleming (TN 200188). PSH's Response to Staff's 8/2/13 Email Request - Additional Data Sheets and CNDDB Report Forms for Spring 2013 Supplemental Biological Resource Surveys, dated August 13, 2013. Submitted to CEC/Docket Unit on August 13, 2013

Palen 2013aaa – Galati Blek/Marie Fleming (TN 200204). Palen Solar Holdings, LLC's Lake or Streambed Alteration Agreement Amendment Notification, dated August 15, 2013. Submitted to CEC/Docket Unit on August 15, 2013

Palen 2013bbb - Galati Blek/Marie Fleming (TN 200213).Palen Solar Holdings, LLC's Final Sand Transport Study Supplement No. 1, dated August 19, 2013. Submitted to CEC/Docket Unit on August 19, 2013

APPENDIX BIO1 - BIOLOGICAL RESOURCES RISK ASSESSMENT OF AVIAN EXPOSURE TO CONCENTRATED SOLAR RADIATION

Geoff Lesh PE, Rick Tyler, Alvin Greenberg Ph.D., and William E. Hass MS

SUMMARY OF CONCLUSIONS

The risk assessment examines the potential effect of avian exposure to concentrated solar radiation. Staff examines the nature and probability of adverse effects to birds, when exposed to concentrated solar electromagnetic radiation, including infrared, visible and ultraviolet light.

Staff's analysis of avian exposure to concentrated solar radiation indicates that a threshold of safe exposure does not exist above a solar flux density of 4 kilowatts per square meter or kW/m^2 for a one-minute exposure. The analysis also indicates that both the Hidden Hills and Rio Mesa facilities pose significant risk to avian populations that may encounter the air space in the facilities where concentrated flux density is above the safe levels, potentially resulting in avian morbidity and mortality. The available data regarding avian impacts is very limited; however, such data does provide at least some perspective regarding potential for impact.

There are significant questions regarding extrapolation from the available information regarding avian impacts. The most vexing is the complete absence of data that would allow estimation of avian morbidity. Staff's assessment provides estimates of exposure and dose that can lead to injury and late fatality. In addition, there are major unknowns in estimation of differences in avian populations from one site to the next. These limitations in the available data require exercise of considerable judgment in extrapolation of data from one site to another. However, the errors introduced by the lack of site specific data are likely to be small in comparison to the absence of morbidity estimates and effects of dramatically increased potential exposure duration resulting from the increased volume of the air space affected by concentrated solar flux at commercial-sized facilities like Hidden Hills as compared to pilot-scale facilities.

Staff reviewed the following list of submittals provided by Bright Source regarding potential for impacts on avian resources as a result of potential exposure to concentrated solar flux. While providing descriptions of the heat flux field strengths around the solar receiver steam generator tower, the references are unpublished, lack peer review, are of very limited duration, and are from facilities that are much smaller than the proposed facility with regard to observed adverse avian effects of concentrated solar radiation.

Bright Source contends based on this information that the proposed Hidden Hills Project poses no significant risk to birds that would be exposed to the concentrated flux field associated with the project. They also contend that $50kW/m^2$ is a safe level of exposure for a duration of 30 seconds and that exposures to lower flux densities are without consequence. Staff disagrees with these conclusions, and provides its own independent analysis, with references, of the potential for impacts on avian resources associated with the proposed Hidden Hills Project.

SETTING

Concentrating solar thermal power plants, like Hidden Hills and Rio Mesa, collect ambient solar radiation and concentrate it onto a solar receiver to generate steam for the steam turbine generator. The concentration of the solar radiation creates a range of solar radiation flux densities between the solar receiver steam generator located atop the power tower and the reflecting mirrors arrayed on the ground. At ground level, nominal solar radiation, or solar energy per unit area, is about 1 kilowatt per square meter (kW/m^2). At the solar receiver steam generator, the reflected concentrated solar radiation is about 600 kW/m^2.

However, because the heliostat mirror arrays do not form a continuous reflective surface across the solar field due to gaps from roads or non-uniform spacing due to terrain or maintenance spacing, the solar flux density does not increase linearly with increasing elevation up to the maximum at the receiver. Gaps in the mirror array result in discontinuities in flux overlaps at elevations closer to the mirrors.

The applicant provided flux density modeling results of the proposed Rio Mesa solar flux fields in response to Staff Data Request 159. Staff relied upon these modeling results for this analysis, but has not been provided the necessary information to independently verify the modeling results. Consequently, staff's analysis remains subject to additional information and analysis of the flux fields. Nevertheless, as expected, values are low near the surface of the mirrors and increase in a non-linear manner in close proximity to the receiver. When the mirrors are concentrating sunlight onto the receiver, the shape of the higher flux regions between the receiver and mirror is an inverted cone, with a small section at the receiver that broadens as you descend towards the solar field. When the mirrors are directed off the receiver in standby mode, the shape of the higher flux regions are like two cones, one facing downward towards the mirrors and one upward away from the focal point (BS 2012u, Fig. 5).

Note that our sun emits a broad spectrum of radiation, including radio waves, visible light, and x-rays. The earth's atmospheric layers filter much of the radiation, diminishing and/or eliminating certain wavelengths particularly in the ultraviolet (UV) spectrum. And the solar field heliostat mirrors further diminish the reflected solar radiation of the shorter (e.g., UV) wave lengths.

It may not be obvious to the reader what the nature of these various flux intensities is, or at what point they could become dangerous. It is instructive because typically people are unaware of the level of flux exposure they are undergoing, aside from being under a sunny clear sky (a level of 1 kW/m^2), whether it is near a fireplace, radiant heater, or other warm device. Thus, to give some perspective to the lower range of values discussed herein, the following **Appendix BIO1 Table 1** (Drysdale 1998, p. 61) shows the effects of thermal radiation (flux) on various organic materials. Reported experiments have shown that several polymeric materials can be heated to beyond 300°C by radiant flux levels ranging from 11 to 15 kW/m^2. Similarly, experiments have shown that wood can be heated to 350 °C by 12 kW/m^2 and to 600°C by 28 kW/m^2 (Drysdale 1998, p. 221, Table 6.5). Staffs notes that these effects are for still air, and surface temperatures would be reduced somewhat in moving air.

Appendix BIO1 Table 1 Effects of thermal radiation

Radiant Heat flux (kW/m^2)	Observed effect
0.67	Summer sunshine in UK[a]
1	Maximum for indefinite skin exposure
6.4	Pain after 8 s skin exposure[b]
10.4	Pain after 3 s skin exposure[a]
12.5	Volatiles from wood may be ignited by pilot after prolonged exposure
16	Blistering of skin after 5 s[b]
29	Wood ignites spontaneously after prolonged exposure[a]
52	Fibreboard ignites spontaneously in 5 s[a]

[a]D. I. Lawson (1954) [b]S.H. Tan (1967)

The data quoted for human exposure are essentially in agreement with information given by Purser (1995) and Mudan and Croce (1995)

Table source: Drysdale 1998, An introduction to Fire Dynamics, 2nd Ed., by Dougal Drysdale, Publ. John Wiley and Sons, 1998, Table 2.8, P. 61

HIDDEN HILLS

The Hidden Hills Solar Electric Generating System (HHSEGS) would be located on Old Spanish Highway, near the community of Charleston View on approximately 3,277 acres (5.12 square miles) of privately owned land in Inyo County, California, adjacent to the Nevada border. The project site is approximately 8 miles south of Pahrump, Nevada, and approximately 45 miles west of Las Vegas, Nevada.

HHSEGS would consist of two 250 MW solar plants. Each solar plant would use heliostats which are elevated mirrors mounted on a pylon to focus the sun's rays on one solar receiver steam generator (SRSG) or receiver atop a 750-foot tall solar power tower near the center of each solar field. In each solar plant, one Rankine-cycle steam turbine would receive steam from the SRSG (or solar boiler) to generate electricity. The solar field and power generation equipment would start each morning after sunrise and would shut down when insolation[1] drops below the level required keeping the turbine online, or during upsets and emergencies.

Each of the heliostat assemblies would be composed of two mirrors, each approximately 12 feet high by 8.5 feet wide with a total reflecting surface of approximately 204 square feet (19 square meters – m^2). Each heliostat assembly would be mounted on a single pylon, along with a computer-programmed aiming control system that directs the motion of the heliostat to track the movement of the sun. The 85,000 heliostats have an effective total reflective area of approximately 1.7 million m^2. These heliostats concentrate solar radiation on the solar receiver boiler and superheater

[1] **Insolation** is a measure of solar radiation energy received on a given surface area and recorded during a given time. It is also called solar irradiation and expressed as hourly irradiation if recorded during an hour, daily irradiation if recorded during a day.

sections (the SRSG is four -sided, with boiler tube walls on the outside to be heated by the concentrated solar radiation).

The receiver absorbs the concentrated radiation from the heliostats and transfers the resultant heat into water and steam in steel tubes at the receiver surface. The efficiency of the Rankine-cycle (steam cycle) is about 43 percent under optimum conditions (summer mid-day). This equates to a solar energy transfer of about 610 million watts (610 MW) between the heliostats and the receiver. While the concentration to an energy density of 600 kW/m^2 is roughly analogous to focusing a 3 inch magnifying glass down to a 1/8 inch point, the power tower does not focus the reflected sun to a point, but rather overlays thousand of heliostat reflections onto the boiler tube walls of the receiver.

The total concentrated solar energy of 610 MWhr is approximately equal to burning 17,000 gallons of gasoline per hour. The solar flux density is intense enough that if the water and steam in the boiler were to stop flowing and the heliostats remained focused on the receiver, it would be destroyed in a short period of time.

RIO MESA

The Rio Mesa Solar Electric Generating Facility (RMSEGF) is very similar to the Hidden Hills facility and consists of two 250-megawatt (MW) (nominal) solar concentration thermal power plants situated on the Palo Verde Mesa in Riverside County, California, 13 miles southwest of Blythe, and is located partially on private land and partially on public land administered by BLM. Design aspects of the RMSEGF are essentially the same as for the HHSEGS.

ANALYTICAL APPROACH

Staff’s analysis includes the following analytical steps in estimating the avian mortality and morbidly from exposure to concentrated solar radiation:

a. Hazard Assessment -- the determination of whether a particular environmental exposure is or is not causally linked to particular health effects on the receptors.

b. Dose-Response Assessment -- the determination of the relation between the magnitude of exposure and the probability of occurrence of the health effects in question.

c. Exposure Assessment -- the determination of the extent of receptor exposure before or after application of regulatory controls.

d. Risk Characterization -- the description of the nature and often the magnitude of receptor risk.

e. Analysis of Uncertainty -- Uncertainty represents a discussion of the gaps in knowledge about factors such as adverse effects or exposure levels which may be reduced with additional study. Generally, risk assessments carry several categories of uncertainty, and each merits consideration. Measurement uncertainty refers to the usual error that accompanies scientific measurements -- standard statistical techniques can often be used to express measurement uncertainty. An amount of uncertainty is often inherent in environmental sampling. There are likewise uncertainties associated with the use of scientific models, e.g., dose-response models, models of the physical environment, the assumed values of material properties that may vary in nature or not be well characterized, the probability of occurrence of particular circumstances, etc.

Birds are exposed to this concentrated solar radiation when they enter the flux field and receive the incident radiant energy that is reflected from the array of heliostats on the ground. The radiant energy that exists in the flux field is converted to heat when it is absorbed on any solid opaque surface that receives the transmission of the radiant energy through an otherwise transparent medium (air).

The absorption efficiency of radiant flux is governed by the emissivity of the surface of the object that receives it. Emissivity can range from 0 to 1 with 0 representing perfect reflection of all the incident radiation and 1 representing complete absorption and conversion to heat. It is also governed by the angle of incidence between the radiant flux and the surface that receives it. A mirror is an example of a surface with a low emissivity (typically below 0.05) absorbing and converting to heat less than 5 percent of the incident light. Black pavement is an example of a surface with high emissivity (about 0.95) absorbing 95 percent of the incident light. This is the reason that blacktop becomes so hot when exposed to sunlight.

In actual circumstances the rise in temperature of a surface exposed to radiant flux is often diminished by the transfer of heat to the surrounding air from that surface. This is typically referred to as convective heat transfer. The amount of heat removed by convection is governed by the speed and turbulence of the air passing over the surface and the temperature difference between the air and the heated surface. In the case of birds, the speed of flight through the air is equivalent to a velocity of air over the surface.

The convective heat transfer between bird feathers and the ambient air is analogous to the convective heat transfer between the heated boiler tubes in the receiver and the water and steam flowing in the receivers at the Hidden Hills and Rio Mesa power plants. In the absence of this continuous convective heat removal by the water and steam inside the boiler tubes (i.e. if the tubes were too empty) the temperature of the boiler tubes would rise rapidly to a new higher equilibrium temperature much higher than the normal 540 ^{o}C operating temperature. The surface of the receiver would be damaged unless the incident radiation is removed by putting the heliostats in a standby mode whereby radiant flux is no longer directed on to the receiver.

The potential for injury to birds that fly through a concentrated solar flux field results from heating of the outer surface feathers and subsequent conduction of heat into the exposed feathers causing breakdown of their molecular structure. Conduction is the transfer of heat into a solid object due to the temperature difference between the object and its surroundings. While exposure could also cause a rise in body temperature it is likely that severe damage to the outer feathers would occur much more quickly as a result of the insulating effect of the plumage covering the bird’s body.

In this analysis, staff has attempted to estimate levels of exposure to concentrated radiant flux that are safe and would result in little or no damage to exposed birds. It can then be concluded that exposures above such safe levels would result in irreversible and potentially significant impact to exposed birds that enter the flux field.

HAZARD ASSESSMENT

While the highest flux density occurs at the surface of the receiver, high concentration solar flux densities also occur in other parts of the air space above the heliostats, ranging continuously from 1 up to 600 times the background solar radiation of about 1 kW per square meter (1.0 kW/m^2). The applicant's response to Data Request 159 (BS 2012u) provides maps of flux densities throughout the air space above the Rio Mesa Solar fields. Similar flux density fields will exist at the proposed Hidden Hills facility.

When high solar flux densities impinge on objects, for example, a bird's flight feathers (primary, secondary, and tail feathers), the solar radiant flux is converted to heat, which can cause damage resulting in injury or death depending on the exposure level and duration of exposure (i.e. dose). For example, for exposed (bare) human skin, at an exposure level of 5 kW/m^2, first-degree burns would occur within 20 seconds of continuous exposure; second-degree burns would occur within 30 seconds; and third-degree burns would occur within 50 seconds with a 1 percent fatality rate. Because feathers are effectively dead structural protein similar to hair without nerves and other physiological activity, bare human skin is more sensitive than avian feathers to the effects of thermal radiation but does serve as a useful comparison.

Exposures of birds to concentrated solar flux did actually occur at the Solar One facility near Daggett California (McCrary et. al. 1986). Birds were found dead on the site that had clear evidence of thermally induced damage to flight feathers caused by exposure to concentrated solar flux. The birds had near complete removal of both barbules and barbs of flight feathers leaving only the rachis (the main central shaft of the flight feather) remaining. This suggests that the flight feathers had reached temperatures in excess of 300 ^oC and demonstrates the potential for damage to flight feathers resulting from exposure to concentrated solar flux. The barbules, which comprise the major resistance to air flow through surface of the feather, are essential to the creation of lift by wing flapping. The barbules are very small (less than 1/1000 of an inch thick) and have very low mass. Thus, damage to barbules from exposure to concentrated flux will be virtually instantaneous, and damage to barbs, feathers and birds very likely.

DOSE RESPONSE ASSESSMENT

This assessment provides an analysis of the potential damage to flight feathers of the bird associated with exposure to concentrated solar flux. Staff has determined that damage to surface feathers is one of the most sensitive types of adverse effects that can occur in avian species from such exposure. Staff's dose response assessment provides analysis of the relationship of potential feather damage associated with increasing levels of concentrated radiant flux exposure. Staff's analysis identifies levels of concentrated solar flux exposure that are just below the levels that could cause irreversible damage to flight feathers as the criteria to establish safe avian exposure levels.

Bird feathers are composed predominantly of keratin which is a naturally occurring polymeric protein chain. These polymer chains of keratins also form secondary structures creating hard natural fibers (for example hair and wool) and hard fibrous sheets (for example feathers, claws, nails, and hooves). The keratin in feathers is the beta form of keratin, or β-keratin. It has a macromolecular secondary form resulting from folding and cross linking at the edges of the poly peptide polymer primary chains. The β-keratin in feathers also typically contains small amounts of both loosely bound water and more tightly bound water that exists in the molecular structures of the secondary proteins (Conn et al 1987 pages 84-99) (Mazur and Harrow 1968 pages 61-72) (Greenwold and Sawer 2010 page1).

The structural properties (strength, stiffness, elasticity etc.) of the keratin that makes up feathers is central to the feathers function in flight (Bachmann et. al. 2007) (Bachmann and Wagner 2011) (Videler 2005 pages 46 -55). Intact keratin structure is also essential to maintenance of the feather's aerodynamic shape and surface smoothness. Both structural and molecular changes occur when keratin is exposed to temperatures above about 160 ^{o}C (Takahashi et. al. 2004) (Senoz.et.al. 2011) (Istrate et. al. 2011). Alpha and Beta keratin from wool, hair, and feathers have remarkably similar thermal decomposition characteristics (Brebu et. al. 2011).

At ambient, atmospheric pressure, feathers lose unbound water before the feather surface temperature can rise above 100 ^{o}C. Unbound water can also be lost through evaporation at temperatures below 100 ^{o}C with low relative humidity. Heating above 100 ^{o}C in the absence of water is often referred to as heating in the dry state. Keratin is more resistant to thermal degradation when heated in a dry state than in a wet state (Takahashi et. all 2004). Because unbound water cannot exist in the keratin at temperatures above 100 ^{o}C at ambient atmospheric pressure, exposures to concentrated radiant solar flux at ambient conditions will result in dry heating.

Loss of water that is unbound (not molecularly bound) is reversible. Typically the presence of unbound water would result in a transient period before temperatures inside the feather would rise upon heating above 100 ^{o}C due to latent heat required to vaporize the unbound water. However, in the environment of the project site in summer the elevated ambient temperatures and low humidity would suggest very low moisture content in the feathers of indigenous birds, particularly for the flight feathers.

At about 160 ^{o}C, bonds in the molecular structure of secondary proteins are broken leading to loss of structural integrity of the β-keratin molecular structure and a permanently weakened feather. The keratin begins to melt at about 250 ^{o}C. At temperatures of 250 to 450 ^{o}C, bonds in the primary polymer protein chains are broken into smaller molecular compounds through pyrolysis (Senoz et. al. 2011) (Brebu et. al. 2011). When temperatures reach 450 to 500 ^{o}C, keratin will almost completely break down and carbon will be the primary constituent of what remains.

Once bonds on the ends of the protein chains are broken, damage to the keratin is not reversible and thus the structural properties of the secondary proteins and ultimately the exposed feathers are adversely affected. This breaking of the chemical bonds that secure the secondary molecular structure of keratin, which leads to structural changes without affecting the primary protein chains is referred to as denaturing (Istrate 2011)

(Takahashi et. al. 2004). This is very similar to the boiling of an egg where the protein structures in the albumin (egg whites) are permanently changed but the basic protein chains are not disrupted. Ultimately the level of damage to the flight feathers will be a function of both the magnitude of exposure and its duration. The dose will thus have units of kilowatt-seconds per square meter or kW-s/m^2.

Based on the results of staff's thermodynamic equilibrium analysis discussed below, exposure to solar flux greater than 4kW/m^2 can result in temperatures above 160 ^oC with 60 seconds of exposure. Exposure of 4kW/m^2 can be considered a no observed adverse effect level (NOAEL). Exposures above this level can compromise the keratin molecular structure of a bird's flight feathers, therefore potentially causing irreversibly weakening of feathers leading to an irreversible adverse impact on the feathers. While molting may ultimately replace some damaged feathers, it will in most cases not occur for some time after that damage occurs. Feathers, in which the quill was heated enough to damage the follicle from which the feather grows, might not get replaced during molt.

EXPOSURE ASSESSMENT

To estimate exposure staff modeled the change in surface temperature of flight feathers of a bird during flight when the bird's feathers are exposed on their underside to a concentrated flux in a solar heliostat field. The intensity of exposure depends on the path the bird traverses from the point where it enters a space with concentrated flux until it exits that space. The figures in the applicant's response to Data Request 159 (BS 2012u) are contour plot depictions of concentrated flux density isopleths indicating the locations of flux density levels of 5, 10, 25, 50, 100, and 150 kW/m^2.

To evaluate the potential for damage, it is necessary to convert the radiant flux to a resultant increase in the temperature at the surface of the exposed feathers. During flight, concentrated solar radiation is reflected from the heliostats on to the bottom surface of the feather, causing heating of the surface. The rate of heating depends upon the intensity, or flux, and how fast the surface is simultaneously being cooled. By summing the heat being gained from the incoming flux together with the heat losses occurring through convection and radiation, the resulting feather surface temperature can be estimated.

Potential cooling of the exposed feather surface results from the ongoing heat loss from the bottom surface of the wing feather by multiple mechanisms. The most important of these is convection of heat to the air stream passing under the wing bottom surface (at the bird's air speed). Additional losses include re-radiation of heat (energy) from the hot surface, and by conduction of heat through the feather to its backside, where it can be lost through convection to the air stream passing over the top side of the feather, but only for those areas of the backside that are exposed to topside airflow. Staff has assumed that most flux-exposed feathers will have much of their backside surfaces covered by either other feathers or body skin. Therefore, for purposes of conducting a worst-case risk analysis, staff has ignored the potential heat loss mechanisms of back-side convection and back-side re-radiation (i.e. heat loss from the top of the wing). Staff modeled convective loss from the wing using a heat transfer coefficient from a flat or cambered plate assuming laminar flow over the plate (McArthur 2008, Mueller 1999, Pelletier and Muller 2000, Tucker 1987, Tucker and Parrot 1969). Approximation of a wing using a flat or cambered plate model is the accepted method of modeling fluid flow over wings and is, therefore, also the best method for modeling heat transfer to and from a wing, particularly on the underside where there is no issue of flow separation from the wing surface (Ward 1999), (Withers 1981), Holman 1976), (Incroera 2007), Cengel 2007), (MERM 2001).

These loss mechanisms depend upon the difference between the surface temperature of the feather and the temperature of the ambient air, and they increase in effectiveness as the temperature difference increases. Thus, as the feather surface temperature heats from solar radiation exposure, the heat losses increase until they collectively match in their heat loss rate, the heat gain rate caused by the concentrated solar radiation. At that point the surface temperature stabilizes, and becomes what is called "steady-state." Due to the extremely small size and low mass density of the keratin micro structures that make up the surface of the feather, at realistic bird flight speeds in the gradually changing solar flux densities of a solar field, surface temperatures reach to within a few degrees of this steady-state temperature virtually instantaneously. During realistic flight conditions in the power plant's solar field, flux densities change continuously with location, so any sudden change is an unrealistic simplification of actual conditions experienced in flying through the air space having concentrated flux densities.

Because changes in flux density occur gradually during flight, there are no large "step changes", so temperature rise-times for re-equilibration to changing flux levels can be ignored. After conducting dynamic analyses and examination of several plausible flight paths and comparing those results to the simple assumption of instantaneous equilibrium, staff used the assumption of instantaneous equilibrium to establish safe exposure criteria as this assumption created little error in the result. Assuming instantaneous equilibrium eliminates the dependence on flight path in analyzing potential avian exposures to concentrated solar radiation. **Appendix BIO1 Tables 1** and **2** below provide estimates of equilibrium temperatures for a range of plausible exposure intensities and exposure conditions, a flight speed of 18 miles-per-hour (about 8 meters-per-second), an ambient temperature of 45 ^oC, and at incidence angles of 0 degrees and 71 degrees off-perpendicular to the feather surfaces.

Appendix BIO1 Figures 1 through **4** below show the results of dynamic modeling of a range of plausible flight paths. The simplification of using instantaneous equilibrium, allows staff to reduce multiple variables (flux level, emissivity, angle of incidence, flight speed, path through solar field) down to a simpler set of only two variables (flux level and exposure time). Equilibrium surface temperatures are also largely dependent on the cord length of the bird wing (i.e. the distance from the front of the wing to the trailing edge). **Appendix BIO 1 Figure 5** provides an analysis of flux levels causing 160 ^oC surface temperatures for different cord lengths and flight speeds. The vast majority of bird species fly within a range of 6 to 16 meters-per-second (Videler 2005 Pages 154 and 155) (Alerstam et. al.)). During flap gliding flight, birds fly at the lower end of the range. Therefore, staff used a flight speed of 8 meters-per-second or 18 miles-per-hour.

Dynamic modeling was conducted by choosing several plausible straight-line flight paths through the solar field, utilizing the isopleth solar field diagrams provided by the applicant. This was be done by re-calculating the feather surface temperature at onehundredth of a second intervals along a presumed flight path by adjusting for the incoming radiant flux and convective and radiative loses that would be occurring at each interval using the assumed ambient air temperature, flight speed, and incidence angle, etc.

Staff used linear interpolation to estimate flux intensities between isopleths, then plotted temperature on a continuous basis during the flight path through the field. Points where exposure resulted in estimated surface temperatures above 160 ^{o}C, and 300 ^{o}C were noted. **Appendix BIO1 Tables 2** and **3** provide estimates and comparisons of maximum surface temperatures reached based on varying flux densities, and flight paths to assumed steady-state exposure to flux levels.

Appendix BIO1 Table 2 Feather Surface Temperatures vs Flux Intensity

Flux Intensity (kW/m^2)	Steady State Temp (deg C)	Flight Condition		
		Directly at Tower Temp (deg C)	Tangent to 100yds off Tower (deg C)	Flying upward near tower (deg C)
1	80	70	68	60
5	170	160	160	140
10	260	240	240	160
25	430	360	410	220
50	610	600	na	410
100	810	740	na	Na
150	950	930	na	Na

All at 18mph, View factor = 1 (Angle of incidence = 0 deg)

Appendix BIO1 Table 3 Feather Surface Temperatures vs Flux Intensity

Flux Intensity (kW/m^2)	Steady State Temp (deg C)	Flight Condition	
		Directly at Tower Temp (deg C)	Tangent to 100yds off Tower (deg C)
1	60	54	55
5	90	87	88
10	130	120	120
25	220	160	200
50	340	330	na
100	500	380	na
150	600	500	na

All at 18mph, View factor = 0.33 (Angle of incidence = 71 deg)

Staff modeled absorption of flux by the feather to occur in the initial half-thickness of material, at and just beneath the surface of the feather. The resultant heating is the cause of the temperature rise in the feather material and of the subsequent damage to the fragile keratin structures and molecules that provide the structural integrity of feathers.

CHARACTERIZATION OF RISK

In flying completely across areas of the facility with flux densities above 5kW/m^2, maximum distances would be between 900 to 1000 meters. At a flight speed of 4.5 meters per second (about 10 miles per hour), the flight would take about 200 seconds and at 18 meters per second (about 40 miles per hour) it would take about 50 seconds to traverse 900 meters. During such flight, the bird would receive exposures ranging from 5 kW/m^2 up to possibly 500 kW/m^2 of varying duration depending on the flight path taken. This exposure including heat loss mechanisms and duration is integrated along the flight path to obtain a time / temperature profile. Integrating flux level and duration along the flight path provides an exposure dose.

As stated previously, when the exposure and duration are sufficient to cause the feather to reach temperatures above 160 ^{o}C, the bird would suffer some level of irreversible damage to feathers that are critical to its ability to fly. This damage can lead to secondary effects such as collision with towers, heliostats and the ground if damage is sufficient to impair normal flight, or even the ability to become and remain air-borne.

Feather damage that results in impairment of flight capability could also decrease the bird's overall probability of survival and life expectancy. For birds of prey, the ability to carry small animals that are caught could be severely compromised leading to potential malnutrition or even starvation of the bird or its young. The carrying of prey significantly increases load-carrying demands placed on the wings and critical flight feathers. For other birds, damaged feathers will impair their ability to forage or to flee predators.

In conducting any risk assessment where fatality is used as the metric to evaluate risk to an exposed population the analyst should always be cognizant that the existence of fatality implies the high likelihood of a significantly higher number of injuries (i.e. morbidity). The ratio of morbidity to mortality can range from less than 5 to one to over 100 to one for different hazards and levels of injury deemed significant. For example, for every death from an explosion, one should expect about 5 serious injuries (K.T. Bogen, E.D. Jones 2005) (Stellman 1998, Table 39.10). For hazards that result in direct trauma to the exposed receptor there is a general relationship of level of damage and level of energy or power to which the receptor is exposed (Frank P. Lees 1980). McCrary did not, nor would it have been practical, to survey a region of sufficient size surrounding the project to account for scavenging of injured birds or latent fatality offsite. Thus staff cannot, based on available data, define morbidity due to exposure to concentrated solar radiation from actual survey data. Staff believes that the hazard to birds from this facility is most analogous to explosive hazards as both have high energy or power levels at a central point with energy levels decreasing exponentially with distance radially from the center. Based on this analogy the level of seriously injured birds for every death is likely to be between 5 and 10.

Thus, the potential damage caused by avian exposure to concentrated solar flux can range from minor impairment (and potentially leading to death) to near immediate fatality depending on the dose received. Low doses of 5 kW/m^2 to 15 kW/m^2 for short exposure periods may not cause effects that are observable to the naked eye but could nonetheless result in significant flight impairment. For example if a significant portion of the feather barbules (the fragile micro structure between barbs) (See Reddy and Yang 2007) were lost the feather's structural integrity would be impaired. Because loss of barbules would significantly compromise integrity of a large portion of the feathers surface area, the differential pressure between the top and bottom of the feather necessary to produce lift and thrust (Videler 2005 Page 55) will also be compromised (Werner and Patone 1998). Such impairment could reduce the bird's level and climbing flight speeds. Longer but still short term exposures to the 10 to 25 kW/m^2 flux densities could cause nearly complete loss of barbules or even complete feather vanes on one or both sides of the rachis and result in loss of flight capability and inability to remain airborne. Staff has identified 4kW/m^2 as a safe level for short exposures (less than 60 seconds). This level of exposure should not result in any damage to flight feathers.

Using the only available data on avian mortality, provided by (McCrary et. al. 1986), staff estimates that the proposed Hidden Hills and Rio Mesa facilities could each result in avian mortality in excess of 22 times that of the Solar One facility previously studied based on linear extrapolation from total relative mirror surface area of the two facilities. This extrapolation is based on mirror area as collision with mirrors played a major role in the total avian fatalities documented at the Solar One facility. It should be noted that the McCrary study provides no data to assess avian morbidity. It should be recognized that estimates of avian mortality that ignore excess morbidity will necessarily underestimate ultimate fatality that will be associated with that excess morbidity (i.e. latent fatality). It should also be noted that damage to flight feathers could be cumulative if flights through concentrated flux are repeated. Such factors would be expected to contribute to substantial underestimation of avian impacts.

In addition to these concerns extrapolation from a 10 MW pilot plant to a 250 MW facility with many thousands of heliostats and a much taller receiver tower "may produce non-linear increases in the rate of avian mortality when compared to Solar One…" according to McCrary. Also, the volume of the air space with solar flux densities greater than 4 kW/m^2 (i.e. the hazardous air space) would increase with increasing power output rating or solar field size, increasing the likelihood of avian exposure. The effect of a larger volume of the proposed projects would have a greater effect on bird mortality and morbidity given that exposure duration at high intensities would be much greater.

To evaluate the potential for non-linear effect of scale-up in facility size from a pilot scale to a commercial scale, staff estimated the relative volume of air space and relative dose for both a facility the size of Solar One and Hidden Hills/Rio Mesa (see **Appendix BIO1 Figures 5** and **6**) below. Staff chose a range of plausible straight-line flight paths past a Rio Mesa-like facility re-scaled to the reduced size of the Solar One heliostat field having a heliostat field of approximately one-fourth the diameter of Rio Mesa. Three paths were taken from this Solar One model: one having a closest approach distance to the tower at the radius of the 5 kW/m^2 isopleth, another at one-half of that closest approach distance, and a third at one-fourth of that closest approach distance, providing three hypothetical flight paths at distances of 120 feet, 60 feet and 30 feet from the assumed center of the receiver tower. Exposure doses were calculated using these three flight paths at Solar One. Staff then calculated the comparative doses associated with the analogous three hypothetical flight paths, again at distances of 120 feet, 60 feet and 30 feet from the center of the receiver tower at the Rio Mesa facility. **Appendix BIO1 Tables 4** and **5** below provide the results of this comparative analysis.

The volume of the flux field at the Hidden Hills / Rio Mesa size facility with concentrated flux above 5 kW/m^2 is about 20 times larger than the similar flux field volume of the Solar One size facility. The magnitude of the doses resulting from flights at the same distances from the receiver towers described above is between 5 and 6 times larger at the Rio Mesa-size than at the Solar One-sized facility. The product of increased dose and volume is about 100 times larger at Hidden Hills / Rio Mesa as compared to Solar One. This analysis confirms the validity of McCrary's concern regarding the potential for non-linear increase in scaling of adverse effects on avian populations associated with exposure to concentrated solar flux from scale up of a small 10 MW pilot plant like Solar One to a 250 MW or greater facility like Hidden Hills / Rio Mesa.

ANALYSIS OF UNCERTAINTY

There are significant uncertainties associated with staff's analysis of risk to avian plumage potentially resulting from exposure to concentrated solar flux. Evaluation of the relative sensitivity to various inputs to the thermodynamic equilibrium calculation indicates that the orientation of the bird in the flux field causes the greatest effect on the resultant radiant exposure. This is the result of the strong effect of the angle of incidence on effective flux density. This is reflected in the view factor of the incident rays on the surface (i.e., the angle of the rays to the object's surface). The view factor used in staff's model can vary from about 0.25 to 1 depending on the bird's orientation in the radiant field. This can result in a fourfold change in effective exposure level between level flight and flight that causes the feathers to be perpendicular to the incident solar radiation.

The choice of chord length of the potentially exposed bird wing has the next largest effect on the estimated feather surface temperature. Cord lengths for potentially exposed birds range from about 2 to about 20 inches with the longest cord lengths resulting in the most impact. Choice of chord length can change the analysis outcome by about a factor of three.

The choice of flight speed of the bird is also an important variable in estimation of the resultant surface temperature reached. A decrease in flight speed from 40 miles per hour to 20 miles per hour would increase resultant relative surface temperature rise by about 50 percent. This is the result of decreased convective heat transfer from the feather surface to the ambient air at lower flight speeds.

The emissivity (the fraction of the incident radiation that is absorbed or not reflected from the surface) of the feather would also affect the resultant temperature. However, staff used an emissivity of 0.95 as a plausible worst case eliminating the potential variability associated with differences in emissivity of different feathers. It should also be noted that the micro structure of the feathers may allow radiant energy to penetrate deeply into the feather below the boundary of the outer surface. For example the radiant energy could first contact the barbules that are well within the feather. This could substantially reduce the effect of convection and substantially increase the rate of temperature rise on these surfaces. If this does in fact occur, staff's analysis could substantially underestimate the effect of flight feather damage associated with exposure to concentrated flux.

It is also conceivable that conduction of heat down the quill of the feather could result in damage to the follicle resulting in complete loss of the feather and loss of ability to re-grow a new feather during subsequent molting cycles.

Another uncertainty is the effect of exposure of the feather surface to UV radiation with concurrent exposure to high temperatures. Staff was not able to include the potential effect of increased keratin molecular bond scission that could be associated with concurrent exposures. Such exposure could result in adverse effects on keratin integrity at lower surface temperatures than would otherwise be required, accelerating the rate of damage.

Exposure to summer ambient conditions mid-day results in exposure to solar flux of 1 kW/m^2, and is thus the base line beyond which excess damage can occur. Preexisting exposure of 1 kW/m^2 with or without the existence of the proposed facilities places a lower limit on exposure. An exposure to 5 kW/m^2 is the lowest exposure that results in a surface temperature of 160 ^{o}C which can be considered a lowest observed adverse effect level (LOAEL). Use of an uncertainty factor greater than 5 and a LOAEL of 5 kW/m^2 would render the exposure criteria moot as it would require exposure to remain below the preexisting background of 1kW/m^2. Exposures below 4 kW/m^2 did not result in surface temperatures of above 160^o C and can be considered a NOAEL. Use of an uncertainty factor of 2 and a LOAEL of 5 kW/m^2 results in an estimated safe exposure level of 2.5 kW/m^2. Based on this analysis, staff estimates that a one-time exposure to a solar flux density between 2.5 kW/m^2 and 4 kW/m^2, for a duration not exceeding 1 minute or so, would cause little if any damage to flight feathers and can be considered safe.

CONCLUSIONS

Staff's analysis of avian exposure to concentrated solar radiation indicates that a threshold of safe exposure does not exist above a solar flux density of about 4 kW/m^2. The analysis also indicates that both the Hidden Hills and Rio Mesa facilities pose potentially significant risk to avian populations that may encounter the air space in the facilities where concentrated flux density is above staff's estimated safe levels, resulting in avian morbidity and mortality. The available data regarding avian impacts is very limited; however, such data does provide at least some perspective regarding potential for impact.

There are significant questions regarding extrapolation from the available information regarding avian impacts. The most vexing is the complete absence of data that would allow estimation of avian morbidity (i.e. reliable dose response data). Staff's assessment provides estimates of exposure and dose that can lead to injury and late fatality. In addition, there are major unknowns in estimation of differences in avian populations from one site to the next. These limitations in the available data require exercise of considerable judgment in extrapolation of data from one site to another. However, the errors introduced by the lack of site specific data are likely to be small in comparison to the absence of morbidity estimates and effects of dramatically increased potential exposure duration resulting from the increased volume of the air space affected by concentrated solar flux of the proposed project.

APPENDIX BIO1A - PROCEDURAL MODEL AND CALCULATIONS USED TO ESTIMATE AVIAN EXPOSURE TO CONCENTRATED SOLAR RADIATION

Geoff Lesh, P.E. and Rick Tyler

FOR HIDDEN HILLS BIOLOGY RESOURCES APPENDIX BIO1

INTRODUCTION

A surface exposed to and thus absorbing incident concentrated solar flux will convert the absorbed flux to heat and rise in temperature until it reaches a thermal equilibrium with its surroundings, including the incident flux. The heat loss mechanisms of convection and radiation will increase their rate of removing heat from the surface until they together match the rate of incoming heat from the incoming solar flux, then the temperature will stabilize. The stable temperature at which this thermal equilibrium occurs is determined by the level of incoming solar flux and parameters that affect the loss mechanisms such as flight speed, ambient temperature, and the view factor. Thus it is possible to, within a reasonable degree of accuracy (with some dependence on materials and circumstances), to relate an incoming solar flux level to the steady-state temperature to which a material surface may rise.

To determine this relationship between solar flux and temperature, staff modeled the temperature response of exposed feather surfaces to concentrated solar flux using a dynamic iterative method that allows for the examination of the various mechanisms of cooling that begin to operate when the material is heated. This method allows for the variation of material properties and allows examination of changing external conditions (e.g. flux levels with position). Transient responses of the material being heated (i.e. the time needed for the material to respond to those changes of external conditions) can also be examined to see how quickly the surface temperature rises and falls.

The surface temperature model is driven by the incoming thermal radiation (flux) to the surface. The absorbed flux causes the absorbing material (the feather in this case) to rise in temperature. The rising temperature causes the material to heat to a temperature above its surroundings, and so the material starts to lose heat back to its surroundings through convection and re-radiation. These three mechanisms are well understood and characterized and can be found in nearly any college level textbook on heat transfer and fluid mechanics (Holman 1976) (Incropera 2007) (Cengel 2007) (MERM 2001).

The model assumes that the material being heated maintains its integrity throughout the modeled flight path regardless of temperatures predicted so that potential temperature rise and response to changing input flux can be observed. The observation of steady-state as well as transient responses help to verify that the model is responding according to well established and verified expected thermal behaviors.

In the real world, most organic materials will begin to decompose (pyrolize) at some elevated temperature (about 160 °C for keratin, the material of feathers), and the material's properties (mass, thickness, stiffness, composition, toughness, brittleness, density, dimensions, etc.) will begin to change. Shrinkage and melting of filamentary structures is expected to occur by approximately 300 °C. Upon reaching a temperature of 400 °C the remaining material would be mostly carbon and have little if any remaining structural integrity. Therefore, for the purpose of risk assessment to evaluate potential damage to feathers, accurately predicting temperatures very much over 300 °C is not meaningful. By then the keratin will have pyrolized and out-gassed most of its volatile components leaving behind a mostly carbonaceous material. For more information and references on this see **APPENDIX BIO1**. References listed throughout this document refer to the list of references published at the end of **APPENDIX BIO1.**

The following is an outline of the logical steps through which the computerized model proceeds to predict the temperature response of a feather-covered surface (i.e. bird's wing) as it flies along some chosen path above and across a solar concentrated flux field. Some assumptions regarding the material properties and the actual scenario must be made, and attempts have been made to choose reasonable and realistic values and cases for use in conducting a risk assessment of avian exposure to concentrated flux.

OUTLINE OF STEPS FOLLOWED IN BIRD FLIGHT MODEL (WITH REFERENCES WHERE APPLICABLE)

1) Set path conditions
   a) Pick a straight-line path through the applicant-provided flux map (provided in **Response to Data Request, Set 2A, #159**). Note: The diagram used for cross-field paths and to get location and flux density values along that path is included in the top half of the applicant's Figure 3, page 9 of the data response. Most paths were directed northeast, passing at some selected distance of nearest approach to the tower on its northwest side.
   b) Measure the distances to each of the flux contours across the heliostat field
      i) Assume flux = 0 at edge of field, linearly interpolated elsewhere between flux levels indicated on the diagram. (Note: Where paths penetrated inside an indicated contour, but did not penetrate the next higher contour before passing the tower, flux levels were not taken to increase beyond the last penetrated contour. This assumption would tend to underestimate the actual maximum flux level along the path.)
      ii) Make a linear interpolation table of distance and path / flux level. This table is comprised of two vectors (nSunsVect and distData) included for each path shown in the **pathData()** section of the computer program code. The paths modeled are mostly straight lines crossing the solar field coming within some selected nearest approach distance to the solar receiver tower. One reported path involves a short path upward from the ground near the tower at an angle of approximately 45 degrees, to simulate a bird leaving the ground, and flying up through the flux pattern to a level above the tower.
2) Set environmental and flight conditions
   a) Ambient temperature Tambient = 45°C (113 °F). This is a temperature that is near the expected maximum, but which would still be expected to occur several

times during the summer months. Ultimately, a shift in the assumed ambient temperature affects the flux-exposed equilibrium temperature by an amount similar to the temperature shift for temperature of interest (less than 300 °C). Thus, an ambient temperature shift of 4 °C, would affect the flux level to reach 160 °C on a surface by about 0.2 kW/m^2.

b) Flight speed V = 18 mph is used in the risk assessment. This is a speed, within the lower-middle range of speeds (Alerstam 2007) that would be expected of birds at these solar sites.

c) Angle of incidence of flux to feather surface (angle from perpendicular incidence) “offVert”. Values used were (a) 71 degrees as a likely angle to the underside of a horizontal surface (e.g. bird wing) estimated from applicants flux maps, and (b) 0 degrees as there would always be some portion of the surface of any three-dimensional object (e.g. bird) exposed to the flux at this angle. The term “view factor” is equal to the trigonometric cosine of the incidence angle, (i.e. cosine (offVert angle)) is used to indicate the heating “effectiveness” of incident flux on a surface.

d) Wing chord length (distance from leading to trailing edge of a wing) “L” (6 inches was chosen as representative), is a factor used in determination of the fluid mechanics-related Reynolds number, and thus is a factor in whether airflow over the wing surface is laminar or turbulent, which in turn affects rate of convective cooling of the surface. The L = 6” assumption yields a Reynolds number of approximately 70,000, well within the range spanning bird flight (Videler 2005, p. 17). With the commonly used for air flow over a wing “external flow over a flat plate” analogy model (Ward 1999), the resulting Reynolds number for the underside of the wing remains well below the accepted critical value of 500,000 where air flow would be expected to become turbulent. For all considered cases of bird flight, the air flow passing the underside of the wing is considered to be laminar (Withers 1981). This choice drives the equations used for determining the appropriate convective heat transfer coefficient (Holman 1976) (Incropera 2007) (Cengel 2007) (MERM 2001).

3) Assume feather’s physical properties

a) Thickness = 600 microns (assumed)

b) Optical emissivity = 0.95 (assumes a dark colored bird) (Ward 1999) Staff assumes for this risk assessment that the absorbance coefficient for solar flux will be the same as the emissivity of the surface for re-radiation of infrared radiation. This assumption is based on reported data on values reported for black plumage, the effects of dirt on surfaces, and the properties of the feathers structure (Quintiere 1974, Osorio 2002, Bass 1995).

c) Optical transmissivity = 0 (assumes incident flux does not pass through without being blocked and absorbed)

d) Optical absorption depth = 0.5 (Assume incident flux is absorbed in first half of thickness)

e) Mass density of solid keratin = 1.3e3 kg/m^3 Ref: (Munn 2009)

f) Void density (to account for the open keratin structure of feathers) (assumed to be 50% of volume). Note that the density characteristics affect transient effects (the timing) of the heating effects, but not the steady-state temperatures used for this risk assessment.

g) Mass density per unit area of plumage = half that of solid keratin to account for void volume of feather structure (See note above on effect of void density).

h) Thermal conductivity of keratin = 0.05 W/m-K Ref: (Dawson 1999), (Baxter 1946),(Martinez 2012)

i) Thermal conductivity of plumage = 0.074 W/m-K Ref: (Walsberg 1988)

j) Moisture level delays heating by adding water mass to the plumage that must be heated to 100 °C. Heating beyond 100 °C, is further delayed as the water consumes and carries away heat during its evaporation. This effect is minor (on the order of 2-3 seconds) for the flight paths modeled.

4) Set initial conditions:

a) Tsurf = Tambient (Assume initial surface temperature is at the ambient air temperature.)

b) Qin = 0 (Solar radiation arriving at the top of the wing surface directly from the sun, is not considered in this analysis).

c) t = 0

5) Start clock (intervals of dt). Repeat the following steps for each clock tick interval, until all way across the heliostat field. Output and graph are stored in viewable files. See Hidden Hills **Appendix BIO1 Figures 1** thorough **4** and **Appendix BIO1 Tables 2** and **5** for examples:

a) Calculate new time (t) from clock ticks by adding dt (the time interval)

b) Calculate position along path
X = V * t where t = elapsed time, V = flight speed

c) Calculate flux Level from position by interpolation between flux contours (from applicant)

d) Calculate solar energy received in from Flux Level, emissivity, view factor, transmissivity
Qin = 1000 * (SunsIn+1) * emissivity * viewFactor * (1 - transmissivity)
Ref: MERM 2001, p. 37-2, eqtn. 37.8

e) Calculate hot-side convective energy losses
Qv = h * (Tsurf - Tambient) Ref: MERM 2001, p. 36-3, eqtn. 36.14

f) Calculate hot-side re-radiative losses energy losses
Qrad = SBsigma * emissivity * ($Tsurf^4$ - $Tambient^4$) Ref: MERM 2001 p. 37-4, eqtn 37.14

g) If backside of plumage is uncovered (i.e. feather is solely protruding without being covered on front or back side by either plumage or flesh), calculate conductive-convective combination losses as:

Qcomb = (Tsurf-Tamb) / (thkPlumage * (1-abDepth) / kPlumage + 1/h) going through the feather with heat going out to the air flowing over the backside of the feather (Holman 1976 p. 29); (this option not used for the conservative general case of this analysis) if backside of feather is covered by other feathers or the bird's body, set Qcomb = 0. (option used in this analysis)

h) Calculate energy change during interval as Qnet = Qin – Qv – Qcomb – Qrad

i) Calculate change in surface temperature during interval
dT = Qnet * dt / (CpPlumage * mDryfeather + CpWater * mWater)
ref: MERM 2001, p. 34.15

Note: Possible moisture in the feather is accounted for by making the incoming flux warm its mass as well as the feather's, until 100 °C. At 100 °C, temperature rise is stalled until the water has been vaporized from the liquid state, then is assumed to be released to the atmosphere. A moisture level of constituting 15 percent of the mass of the dry feather is assumed.

j) Calculate new surface temperature Tsurf = Tsurf + dT

k) Repeat the loop until path has traversed the solar field.

1. OBJECTIVES OF THIS APPENDIX

The Palen Solar Power Project (Project or Proposed Project) is a proposed energy plant that will use solar arrays to focus sunlight and generate electricity through steam turbines (Solar Millennium 2009a). The array and associated infrastructure will be built in the Chuckwalla Valley of the Mojave Desert. This area supports a series of sand dune habitats that are reliant on the delivery of fine sand from wind (aeolian) and water (fluvial) sources. The objectives of this Appendix are as follows:

1. Provide a brief description of the Project area's sand dunes and a discussion of the sand transport processes that created and now maintain the existing dunes.

2. Provide a discussion of potential direct and indirect impacts of the Proposed Project and its two alternatives (attached) on the existing sand dune system and the processes that support them.

3. Describe mitigation for those impacts, or a well-supported conclusion that those impacts cannot be mitigated.

Note on this Appendix Version

This appendix has been modified and consolidated from several earlier PWA reports to reflect a new sand transport model that we have used to analyze alternatives, as well as new Project alternatives. This is the version that will form the basis of Dr. Andrew Collison's expert testimony in the CEC Hearing for Palen Solar Power Plant. The earlier versions are as follows:

Collison, A. 2010a Appendix A (Soil & Water Report) Geomorphic Assessment of Genesis Solar Project Site.
Collison, A., Nilsen, C., and Gregory, J. 2010 Revised wind shadow calculations for Palen Solar Energy Project, June 2nd 2010

2. SUMMARY OF KEY FINDINGS

The Proposed Project area covers several different land units including (from southwest to northeast) a currently stable coarse gravel alluvial fan surface with some relict sand dunes that have largely deflated (blown away), a more active wind-blown sand area with relatively shallow sand deposits, and an area of deeper and more active vegetated sand dunes that is Mojave Fringe Toed Lizard (MFTL) habitat. The northeastern portion of the Project site lies within the Chuckwalla sand transport corridor, a regionally-significant geomorphic feature that provides sand necessary to support sand dune habitat including MFTL habitat both on and off site. The sand corridor stretches down the Chuckwalla Valley to Blythe and the Colorado River. The Project site is crossed by a series of small distributary alluvial fan channels, and two large wash complexes formed by concentrated drainage under I-10.

The Applicant's Proposed Project as described in their Application for Certification (Solar Millennium 2009a) intrudes into the Chuckwalla sand transport corridor by more than a mile, cutting its width in half, and would create a "sand shadow" downwind. **Sand shadows are areas where the upwind supply of sand is cut off by wind fences and other infrastructure, but where existing sand can be eroded downwind, resulting in the loss of the fine sand upon which dune habitats are dependent.** Previous studies have shown that such sand shadows result in dune deflation, substrate coarsening and complete loss of MFTL habitat within a few years (4-17 years) (Griffith et al. 2002; Turner et al. 1984). If fully implemented the Proposed Project would create a total of 970 acres of direct impact to dune areas within the sand transport corridor and 1,113 acres of indirect (sand shadow) impacts downwind of the Project where we would expect to see deflation and dune loss within the life of the Project. This is considered to be a regionally-significant impact to sand transport processes that support sand dunes downwind in the Chuckwalla Valley.

As described in the Staff Assessment/Draft Environmental Impact Statement (SA/DEIS) (CEC-BLM 2010) staff analyzed two alternatives to the Proposed Project, a 2,987-acre Reconfigured Alternative developed by the Applicant and a 2,106-acre Reduced Acreage Alternative developed by staff. Impacts to sand dunes and the sand transport corridor were actually increased with the Reconfigured Alternative 1 (1,150 acres of indirect impact and 1,120 acres of direct impact to the sand transport corridor/MFTL habitat) and while staff's Reduced Acreage Alternative minimized impacts to sand dunes and the sand transport corridor (292 acres of indirect and 299 acres of direct impact to the sand transport corridor) it also reduced the output of the Project to 375 MW rather than 500 MW. Note that the staff Reduced Acreage Alternative does not include a disturbance area around the solar arrays as the other alternatives do, so the direct impact is likely somewhat higher than this number and the indirect impact is somewhat lower, but the total impact is correct.

Subsequent to publication of the SA/DEIS the Applicant developed two new reconfigured alternatives, Reconfigured Alternative 2 and Reconfigured Alternative 3 (Solar Millennium 2010l) to reduce the degree of Project intrusion into the most active part of the sand transport corridor. This report analyzes and compares the impacts of these two new reconfigured Project alternatives with the Proposed Project, the original Reconfigured Alternative and the staff Reduced Acreage Alternative. The Applicant's Reconfigured Alternative 2 has 144 acres of indirect impact and 680 acres of direct impact to the sand transport corridor if both phases are implemented. The Applicant's Reconfigured Alternative 3 has less indirect impact that Alternative 2 (94 acres) but more direct impact (790 acres) in the sand transport corridor if both phases are implemented. The impacts of the different alternatives are shown graphically in Figure 29, page 37.

The Proposed Project and the original Reconfigured Alternative 1 would have extremely high impacts to the sand transport corridor and Mojave fringe-toed lizard habitat that was judged to be significant and non-mitigable in the SA/DEIS. The staff Reduced Acreage Alternative and the

Reconfigured Alternatives 2 and 3 are superior to the Proposed Project in terms of direct and indirect impacts to sand transport and to sand dune habitat. The staff Reduced Acreage Alternative has the lowest total impacts, but with a lower power generating capacity. Selecting between the two Applicant Reconfigured Alternatives is also difficult from a sand transport and dune impact perspective since Alternative 2 offers the lowest direct impact but the highest indirect impact, whereas Alternative 3 offers a lower indirect impact and a higher direct impact. All three alternatives, the staff Reduced Acreage Alternative, and the Reconfigured Alternatives 2 and 3, reduce the impacts to sand transport and sand dunes to less than half of the Proposed Project.

Conceptual approaches have been put forwards by the applicant to mitigate for off-site sand shadow impacts by collecting and trucking sand around the Project and releasing it into the area downwind. However, the applicant has not been able to point to examples of such approaches working in other desert areas and at present the plan appears experimental rather than grounded in established practice. While such a plan has the potential to work more information would need to be provided to assess its potential for success.

3. RELATIONSHIP BETWEEN HYDRO-GEOMORPHIC PROCESSES AND BIOLOGICAL RESOURCES

This Appendix focuses on several hydro-geomorphic processes that play a significant role in the health of the ecosystem of the Project site and its surroundings. These processes are wind transportation of sand relative to the creation, preservation and destruction of sand dunes, and water transport of sediment through the alluvial fan drainage system.

Sand dune fauna such as MFTL rely on a regular supply of fine wind blown sand for their habitat (Figure 1). Active sand dunes (dunes that have an active layer of mobile sand) exist in a state of dynamic equilibrium: they are continuously losing sand downwind due to erosion and transport, but that is offset by supplies of new sand from upwind (see Figure 2). If the sand supply is cut off the dunes *deflate*; that is to say they lose sand downwind and shrink in size and depth (see Figure 3 for an example). The finest sand (which is most easily transported) is lost first with coarser sand and gravel being left behind to form an armor or lag. This combination of lag and thin sand deposits does not support many dune-dependent species. For example, Turner et al (1984) conducted experiments on paired plots of sand dunes up and downwind of wind barriers to look at abundance of MFTL. They showed that downwind sand dunes experienced deflation within 4-17 years of the erection of a relatively small wind barrier (a single line of tamarisk trees) and that while MFTL were abundant upwind of the barriers they were virtually absent downwind. Thus barriers pose a direct threat to sand transport and habitat.

Maintaining MFTL habitat requires the regular addition of wind-blown sand from a reliable source. Most of the sand dune habitat in the Mojave Desert follows discrete pathways referred to as sand transport corridors. These have been approximately mapped by Muhs et al. (2003) and are shown relative to the Project site in Figures 4 and 5. The presence and location of sand transport corridors are controlled by the availability of sand that can be eroded and transported by wind, the prevailing wind direction, and topography (especially the presence of fault-controlled troughs). Most sand corridors trend approximately northwest to southeast along troughs. Additional sand is added to corridors from local wind corridors that can be thought of as ‘sand corridor tributaries’ and by fluvial sources. Alluvial fan channels transport sand from the mountain fronts to the troughs. With increasing distance away from the mountain front the sand is preferentially sorted[1] and reduced in size by abrasion. At a sufficient distance down fan sediment becomes fine enough to be picked up and transported by wind action. This both creates local dune habitat around ephemeral channels and supplies material downwind to accumulate in larger sand corridors.

---

1 “Preferential sorting”. Alluvial fans are made up of distributary drainage systems that spread water into increasing numbers of smaller channels as water moves downstream (the opposite of most temperate drainage networks). As water spreads out down fan the channels lose sediment transport capacity and the coarsest particles are deposited first, with successively smaller particles being passed downstream.

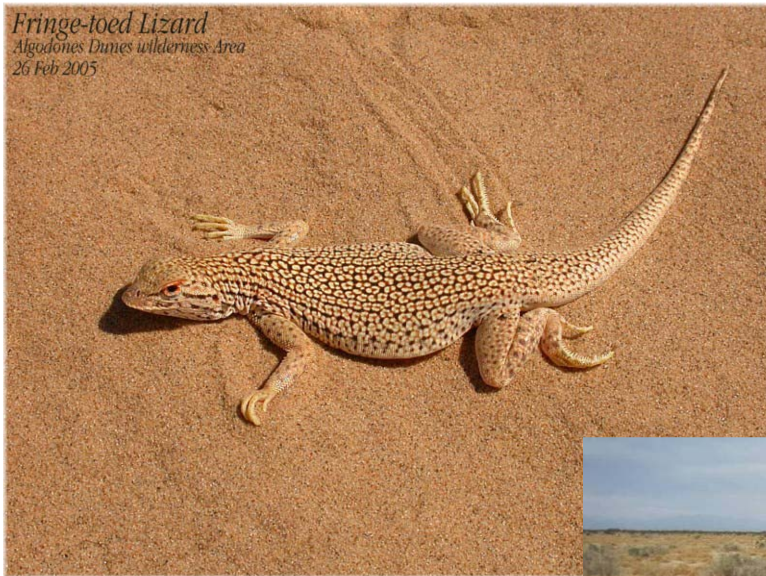

Figure 1. Mojave Fringe Toed Lizard showing its preferred habitat of fine, loose sand. Source: Southwest Images.

Figure 2. Good MFTL habitat showing 'plump', vegetated dunes connected by relatively deep, loose sand sheets.

Figure 3. Deflated former vegetated dune showing remnants of eroding dune under creosote bushes surrounded by an armored lag of coarse gravel and shallow, compacted sand. This habitat does not support MFTL.

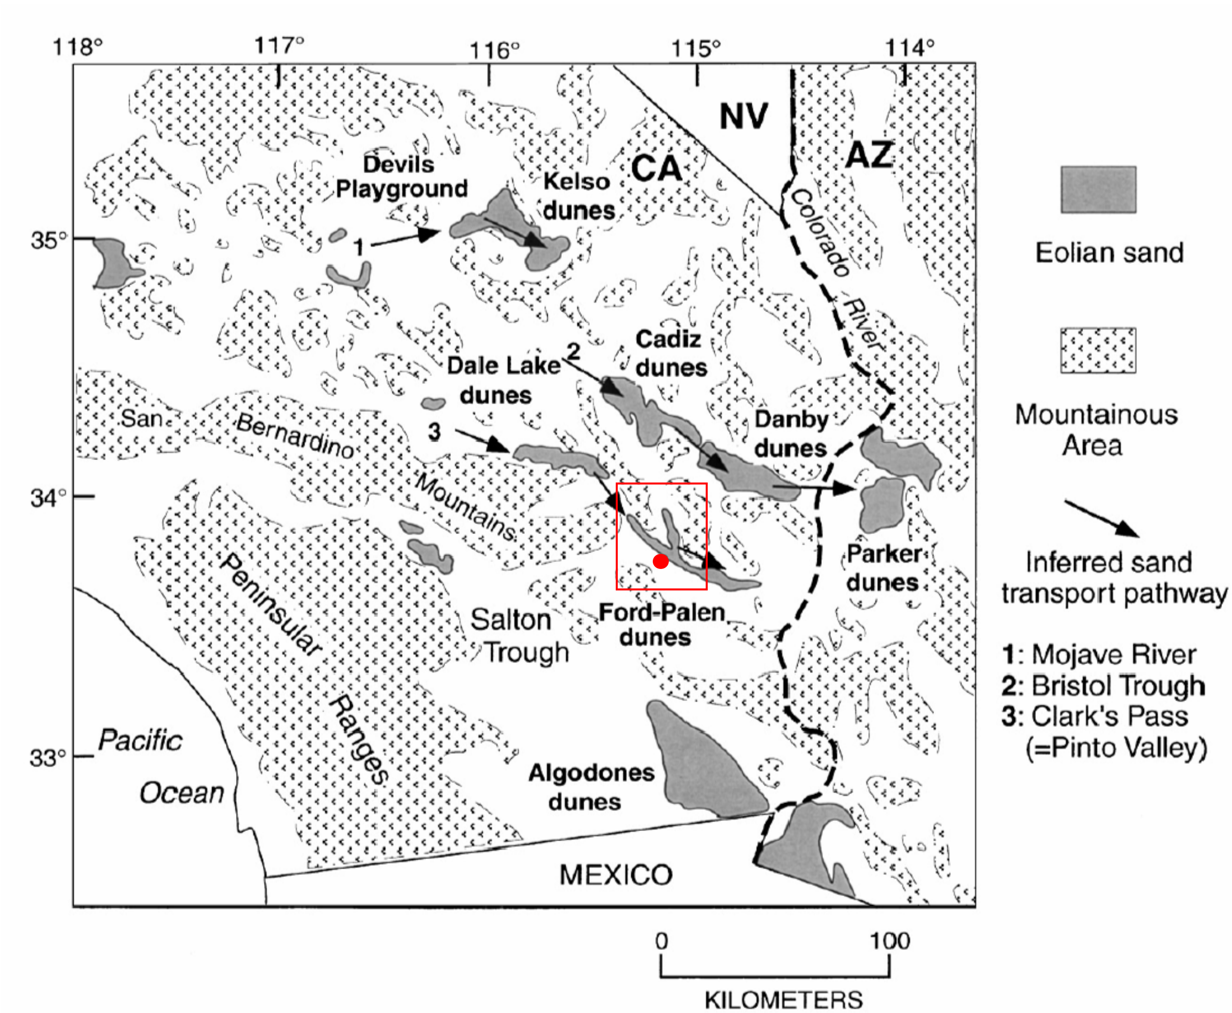

Figure 4. Eolian sand transport corridors of southern California (original figure from Muhs et. al., 2003). Approximate Project location shown by red dot. Area shown in Figure 5 illustrated by red box.

CEC Palen

Overview of the project site showing the sand transport corridor

PWA Ref# - 2006.02

PWA

The activity and location of sand transport corridors is not fixed in time or space. Fluvial delivery of sediment from mountain fronts to the alluvial fans, troughs and playas tends to occur in wet winters associated with El Niño events that occur on average every 3-5 years. Due to the wet conditions wind transport may be less active during these years, so sediment may be temporarily stored in downstream channel areas or playas. During La Niña events (also approximately every 3-5 years) winters tend to be drier, promoting wind transport and aeolian processes. Fluvially-delivered sand deposited in channels or playas during an El Niño event can be transported by the wind during a subsequent La Niña event. In an analogous manner, sand corridors can expand, contract or migrate with changing weather and climate. Wetter than average conditions may allow vegetation to encroach on the edges of a sand transport corridor, thinning it. Dryer or windier condition may add more sand to the corridor and bury vegetation, widening the corridor. Changes in prevailing wind direction or strength may change the location or intensity of sand transport.

The Proposed Project is located close to or inside of a major sand transport corridor identified by Muhs et. al. (2003), referred to as the Chuckwalla sand corridor. Muhs et al. also show a smaller ‘tributary’ sand corridor immediately east of the Project site. The sand corridors are prominent in aerial photos (see Figures 6 and 7). Sand delivered from upwind passes through dune areas including MFTL habitat and is deposited, replenishing sand that has been lost downwind. In addition to the obvious biological impact of constructing a project in a dune area (direct loss of habitat), construction activities have two potential offsite impacts on sand transport corridors. Firstly, if the project footprint is constructed in a dune area it will cut off a supply of sand that would otherwise have been transported downwind to other dune areas. Dunes downwind of a constructed site will deflate over time as sand output is not matched by sand input. Secondly, new sand that would have been transported across the project footprint from upwind will potentially be cut off by drainage ditches, wind fences and above ground infrastructure. Thus, if a project is built into a wind corridor it will create a ‘sand shadow’ area where dune deflation occurs over time.

4. DESCRIPTION OF THE PALEN PROJECT SITE

I visited the Project site for a day on February 5th 2010, following a reconnaissance visit on January 12th 2010. I made a third field visit on April 29th 2010. Conditions on January 12th were warm and dry, with no recent rain. The February 5th visit was conducted the morning following a rainstorm, while the April 29th visit was conducted immediately after a sand storm. On the February 5th visit I drove the western boundary of the property along the BLM dirt road up to the northwest corner making stops at points of interest, and hiked a loop of approximately 6 miles along the northern Project boundary to the northeast corner of the proposed impact area, returning westwards along a more southerly alignment. After this I drove the BLM road from the northwest corner southeast to the southern site boundary near I10. Finally I visited a large ephemeral wash that passed under I-10 to assess the effects of concentrating several small washes into a single channel. During the visit I logged my position on an aerial photo using a GPS linked to Google Earth, made field observations and took photos.

The site is located on an alluvial fan that drains from southwest to northeast towards Palen Dry Lake. The average slope across the site is 2 percent. There is a gradient of three major desert surfaces progressing from southwest to northeast that I detected on foot and confirmed by aerial photo. The boundaries between these areas are somewhat interwoven and gradual, but can be seen on aerial photos and in the field. There is broad agreement between the major units I mapped and the units as delineated by Dr. Kenney (Kenney 2010a, 2010b) for the Project applicant, as can be seen in our respective figures. The main area of disagreement is over the eastern boundary of Zone 1, and the degree of difference in sand transport activity between Zones 1 and 2. In addition to mapping the major units I mapped a series of smaller land units related to fluvial drainage features.

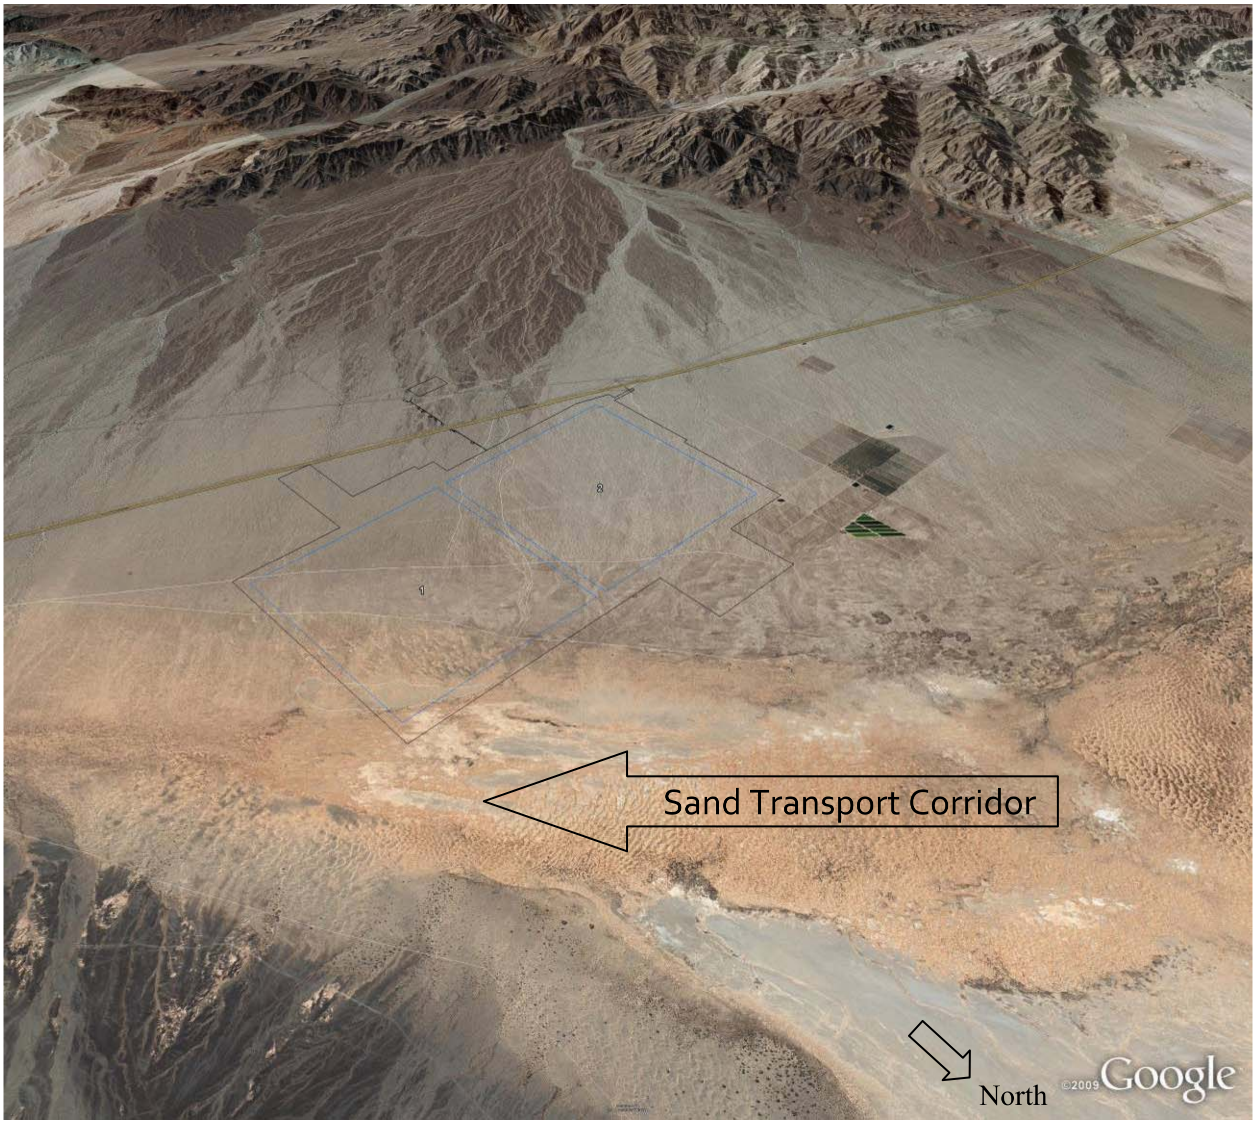

Figure 6. Setting of the Palen Project site showing the major topographic units. Project boundary shown in gray, proposed solar arrays shown in blue, pale lines are the authors land unit boundaries. The intrusion of the eastern array into the sand transport corridor (red dunes and surrounding grey dunes) can clearly be seen.

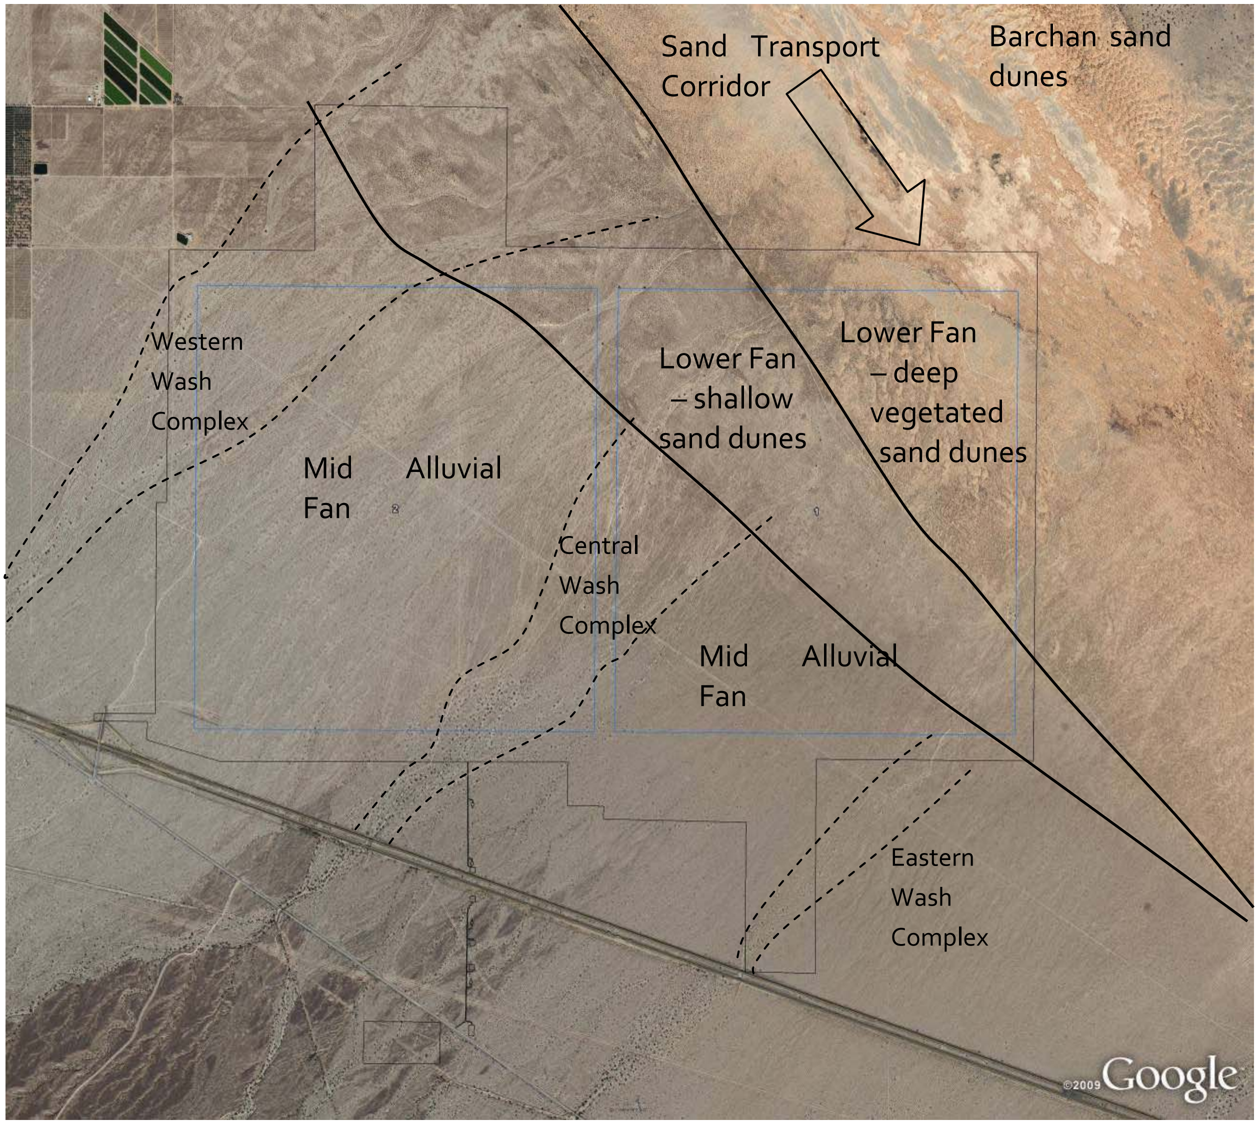

Figure 7. Distribution of major and minor land units on the Palen site. Proposed Project Alternative boundary shown in gray, proposed solar arrays shown in blue.

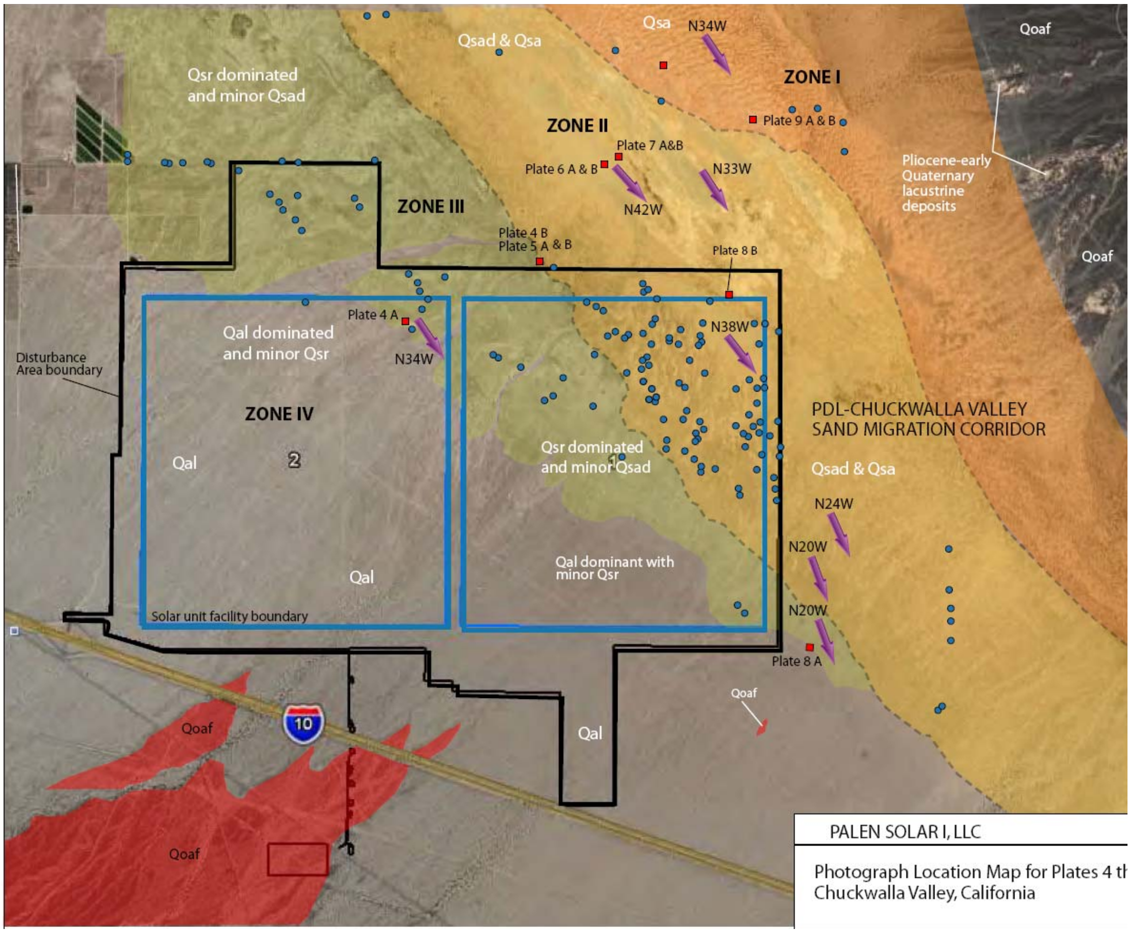

Figure 8. Sand Migration Corridor Zones and the association with MFTL observations (blue dots), from Kenney, Plate 3, 2010a.

4.1 MAJOR LAND UNITS

4.1.1 Mid Alluvial Fan Area – Degraded Vegetated Dunes with Coarse Alluvial Surfaces (corresponds to Zone 4 of Figure 8)

(Note that the Project is relatively low on the alluvial fan, and that the mid fan is the highest part of the alluvial fan occupied by the Project site. The High Alluvial Fan area is found southwest of I-10.)

In the southern and western sector of the Project site the surface is a mixture of degraded vegetated dunes with thin coarse sand, and patches of alluvial gravel and desert varnish. This surface has been formed primarily by deposition of sand and gravel from alluvial fans (fluvial action) over hundreds of thousands of years, overlain with patches of vegetated sand dunes that formed from wind action during periods of greater sand availability. The sand dunes on the mid fan have subsequently degraded due to wind erosion and deflation (sand is being removed by the wind but not replaced). Deflation of the relict dunes is leaving behind the more resistant alluvial deposits as a protective lag of gravel[2]. In many places the lag has formed desert varnish (a black coloration on the exposed surface of gravel particles). The presence of desert varnish suggests that parts of this surface have been stable and exposed in its current condition for many hundreds to thousands of years. There is little available fine loose sand for either transport to dunes down wind or to support MFTL habitat. What sand is present is coarse (1-2 mm) and there is abundant fine gravel (2 mm and larger). The vegetation cover is largely sparse creosote bushes and degraded dunes, with ironwood trees in the larger washes. This surface has a relatively stable current condition and is likely to have fewer off-site impacts compared with other parts of the site. A potential exception to this is wind erosion of the freshly exposed soil once the coarser material is removed during grading, though standard dust abatement techniques should be able to mitigate for this.

---

2 An alternative explanation for the formation of gravel pavements is that particles rise to the surface of alluvial fans as fine sand and dust are deposited around them and washed below them by rainfall. While the formation mechanisms are different it is widely agreed that areas mapped as Quaternary alluvial fans are geomorphically old features formed primarily from water-borne alluvium that have changed little in the last few thousand years.

Figure 9. Typical degraded dune and coarse gravel lag on the mid fan surface. View is from the west looking across the proposed western solar array site to Palen Dry Lake.

Figure 10. Close up of dune and lag mixture

Figure 11. Stable mid fan area with gravel lag

4.1.2 Lower Alluvial Fan – Shallow Vegetated Sand Dunes and Sand Transport Corridor (Zone 3 of Figure 8)

Moving north and east the fan surface has sandier conditions and transitions from creosote bushes to grasses. This area has shallow vegetated sand dunes and sand sheets that are less degraded and that have more abundant sand than the dunes in the mid fan. The dunes appear to be in relative equilibrium – losses of sand due to wind erosion are matched by deposition of sand from upwind. The sand is finer than in the mid fan area, with some areas that appear suited to MFTL habitat (confirmed by the presence of MFTL as shown in the Applicant's figure (Figure 8, and Kenney 2010a, Plate 3). There are abundant large rodent holes in the sand, unlike in the Mid Fan, implying that there is sufficient depth of sand for burrows. There is evidence of moderate levels of wind-borne sand transport, and this surface appears to form the outer zone of the sand transport corridor (as shown in Kenney, 2010a, reproduced here in Figure 8). Its southwest boundary appears to coincide with the southwest boundary of the Chuckwalla sand transportation corridor drawn by Dr. Miles Kenney in his assessment of sand transport and deposition in the Chuckwalla Valley. (Note that while the western boundary of the sand transport corridor coincides with the boundary between the Mid and Lower Alluvial Fan, the wind transport corridor extends east into the Lower Fan – Deep Vegetated Sand Dunes and Dry Lake areas as well, and is not confined to the Lower Alluvial Fan.) The boundary was mapped in the field in two locations which appear on the aerial photo to trace a line of different vegetation and topography. This surface is less stable than the mid fan, appears to have a higher potential habitat value for MFTL, and appears less well suited for development of infrastructure.

Figure 12. Vegetated dunes in the shallow vegetated sand dune and sand transport corridor area

Figure 13. Sandier conditions showing rodent burrows and fine surface sand. View is from center of proposed eastern solar array looking east towards Palen Lake.

4.1.3 Lower Alluvial Fan – Deeper Vegetated Sand Dunes and Sand Transport Corridor (Zone 2 of Figure 8)

Moving north and east the vegetated dunes become deeper and the sand more abundant. This area has hummocky vegetated dunes with greater topographic expression than the zone to the west, implying that they are more actively supplied by sand. This area appears very well suited for MFTL habitat, and coincides with observed MFTL activity (see Figure 8). This zone of the sand transport corridor is more active than the Shallow Vegetated Sand Dunes, though less active than the area of unvegetated barchan[3] dunes to the east (off the Project area).

Figure 14. Conditions in the Lower Fan – deeper vegetated sand dune surface showing potential Fringe Toed Lizard habitat. View is from center of proposed eastern solar array looking north.

---

[3] Barchans are very large, active, crescent shaped sand dunes without vegetation

Figure 15. More abundant sand showing in the side of the dirt road.

5. ASSESSING THE IMPACTS OF THE PROJECT ON SAND TRANSPORT TO DUNE HABITAT

5.1 BACKGROUND AND DEFINITION OF SAND SHADOWS

The applicant has assumed that all areas within the Project boundary are directly impacted, so this Appendix has focused primarily on off-site indirect impacts. The primary off-site impact is disruption of sand transport to the sand transport corridor. The Project has the potential to disrupt the Chuckwalla wind transport corridor because it includes a perimeter sand fence that is 30 feet high and that is designed to stop sand from entering the solar array. Most sand transport (as opposed to dust transport) occurs close to the ground through the processes of rolling and saltation (bouncing of sand particles). For example, Bagnold (1941) found that the mean elevation of saltating sand grains with a diameter of 0.25 mm was less than 1 cm off the ground, and more recent research has found that 90% of sand transport occurs within 30 cm of the ground surface. We would therefore expect the sand fence to pose an effective barrier to sand transport, and create a sand shadow downwind.

A sand shadow is an area downwind of a sand barrier where the wind is able to remove fine sand but there is no replacement by sand from upwind. Over time existing sand dunes in a shadow area will be deflated – they will shrink and become thinner and coarser as the fine sand is blown away by the wind. Deflated dunes have little or no habitat value for MFTL and other fine sand dependent species.

5.2 DESCRIPTION OF THE PWA SAND TRANSPORT MODEL

In order to quantitatively assess the area of sand shadow associated with different Project alternatives PWA developed a numerical model of sand transport. The model predicts areas of sand shadow in response to inputs of prevailing wind direction, distribution of wind around that mean, and the location of sand barriers.

5.2.1 Model Theory

Sand transport occurs when wind speed exceeds a threshold velocity that varies with material size but is often assumed to be around 14 mph. Sand is transported in whatever direction the wind is traveling once it exceeds the threshold velocity. Over time a prevailing direction emerges, and sand dunes reflect that prevailing direction (for example, coppice[4] dunes develop tails that are oriented away from the prevailing wind that transports sand). However, the prevailing wind is the resultant vector of numerous wind events with different orientations. This is illustrated in Figure 16, which shows the distribution of wind with differing speeds and the resulting prevailing wind transport direction for Blythe. Because of the variations in wind direction over a year sand transport can be thought of as two processes: primary sand migration that follows the prevailing wind direction, and sand diffusion on either side around that main direction. Sand diffusion means that the edge of a wind shadow will not be sharply defined into zones of complete sand transport and zones of zero transport; it will have a gradation from areas where there is a complete loss of sand to areas where there will be no reduction in sand.

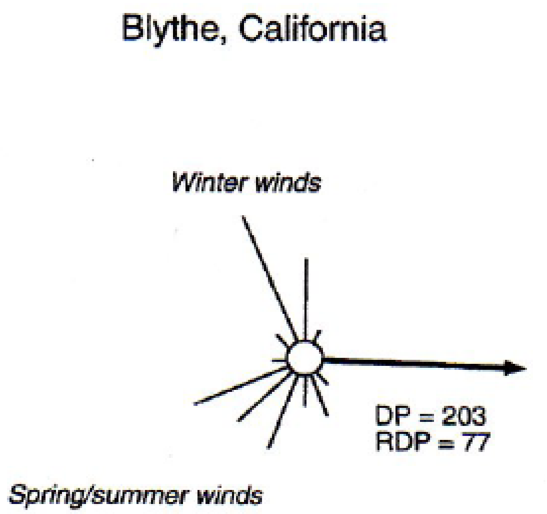

Figure 16. Example wind vectors for Blythe airport. Dominant winds (lines without arrows) are mostly from the northwest in winter and the southwest in summer, but the resulting prevailing wind for sand transport (bold arrow) is to the east. Source: Muhs et. al. (2003). DP stands for "Drift Potential", the sum of winds from a given direction that exceed the threshold velocity. RDP stands for "Resultant Drift Potential" which is the vector (direction and magnitude) that results from summing all the DPs.

5.2.2 Computational Framework for the Sand Transport Model

We have developed a sand transport model for the Palen site to simulate this combination of downwind transport and lateral diffusion. The model superimposes a 200 x 200 cell framework over the Project site and its surroundings and calculates the percentage of sand that will move from each cell to its neighbors based on the distribution of effective wind directions (Figure 17).

[4] Coppice dunes are small dunes that form around vegetation with a 'teardrop' shape that is oriented with the blunt end facing into the prevailing wind. They indicate the prevailing direction of wind transport.

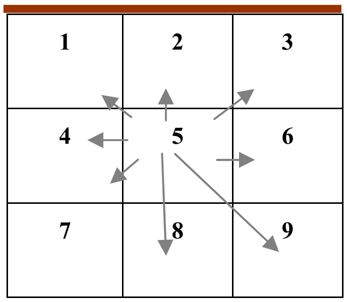

Figure 17. Calculation matrix for sand transport model. Length of arrows indicates proportion of sand moving to each cell from cell 5. In the example shown wind transport is mostly from the north and the northwest, but some diffusion occurs in other directions to represent occasional winds in these directions. The calculation is carried out for each cell in turn traveling downwind (north to south). The brown line is the upwind boundary condition.

Sand is added to the cells at the upwind boundary (brown line in Figure 17). Sand is transported from each cell in turn to each of its eight surrounding cells based on the intensity and duration of winds >14 mph in each direction. For example, if 50% of the effective wind energy is from the northwest, 50% of the sand in cell 5 will be transferred to cell 9 in the example above.

5.2.3 Assigning primary and secondary sand transport directions to the model

There is no weather station at the Palen site to parameterize the model, but we have conducted simulations that combine the Applicant's field evidence on the primary sand transport directions (Kenney 2010a) with a distribution of secondary wind directions based on the data for Blythe airport Muhs et. al. (2003). We assigned two primary wind directions to the model to reflect conditions at the Palen site, with sand primarily coming from the northwest and the north. Thus the primary sand transport is to the south and southeast (from cell 5 to cells 8 and 9 for the example in Figure 17). We analyzed the Blythe airport weather station wind drift potential data to estimate a diffusion function to account for wind transport in other directions. We measured all the drift potential[5] vectors and calculated the percentage that were in the two primary wind directions and the percentages that were in all other directions. For Blythe airport the split is 69% from the two primary directions (northwest and southwest in the case of Blythe) with 29% of the drift potential being made up of wind from other directions. Blythe and Palen have different prevailing wind directions due to topographic influences from their respective valleys, but we assumed the same approximate split between the duration and intensity of primary wind transport and secondary transport. We adopted these proportions to the cells in the Palen model so that approximately 70% of sand is transported to the two cells representing the two primary wind directions with approximately 30% going to the surrounding 6 cells – see Figure 18.

---

[5] Drift potential is the duration of wind transport multiplied by the velocity for times when the velocity exceeds 14 mph (the typical transport threshold of sand).

5%	**5%**	**5%**
5%	**0%**	**10%**
5%	**16%**	**49%**

Figure 18. Example calculation matrix for the sand transport model showing sand proportions transported in each direction. The black arrow shows the resultant transport vector of 114 degrees (N38W) representing conditions at the north end of the Project site.

By changing the sediment split between cells the model can simulate any prevailing sand transport direction (see examples in Figure 18 and 19) while maintaining a sediment diffusion process around that mean to account for sand transport on days when the wind comes from a different direction.

5%	**5%**	**5%**
5%	**0%**	**5%**
8%	**27%**	**39%**

Figure 19. Example calculation matrix with resultant vector of 160 degrees (N20W) representing conditions at the south end of the Project site.

The prevailing wind direction in the sand transport corridor appears to bend around the site in response to topographic effects from the Palen Mountains to the east and the Chuckwalla Mountains to the southwest, being a mixture of northerly and northwesterly winds at the northern part of the site, becoming more dominated by northerly winds in the south part of the site, and picking up westerly winds again south of the Project site as the sand corridor bends east towards Blythe. Rather than assume a single average prevailing wind direction across the entire site we divided it onto five sectors from north to south, each with a different prevailing wind direction. The prevailing sand transport direction was estimated by taking the nearest indicator from the Worley Parsons report (based on the orientation of sand dunes). Where there was more than one indicator in a sector we took the average direction of all the nearby indicators, and between groups of indicators we interpolated the average of the neighboring groups. The prevailing sand transport directions for each sector are shown in Figures 20a and 20b along with the data on which they are based (Kenney, 2010a). For each sector we assigned matrix weights based on the approach shown in Figures 18 and 19 above, calculating the mixture of east, southeast and south sediment transport values that resulted in the observed prevailing transport direction and assigning values of approximately 5% to all other cells (some individual cells were set up to 10% to achieve the desired resultant vector).

The sand transport values used in the model are as follows:

Sector	Prevailing direction	Evidence for prevailing direction (all data from Kenney, 2010a)	Primary sand directions in model (% of sand traveling in each direction)[‡]
Sector 1	N38W	Mean of three closest indicators (N38W, N33W and N42W)	49% SE 16% S 10% E
Sector 2	N31W	Mean of two closest values (N38W and N24W)	51% SE 19% S
Sector 3	N24W	Single closest indicator N24W	43% SE 24% S 7% SW
Sector 4	N20W	Two adjacent indicators (both N20W)	39% SE 27% S 8% SW
Sector 5	N46W	Closest adjacent indicator (N46W)	43% SE 19% E 13% S

Table 1. Prevailing sand transport directions assumed in the model

[‡] sand is sent evenly to the remaining cells (not shown in the table) so that the total adds up to 100%

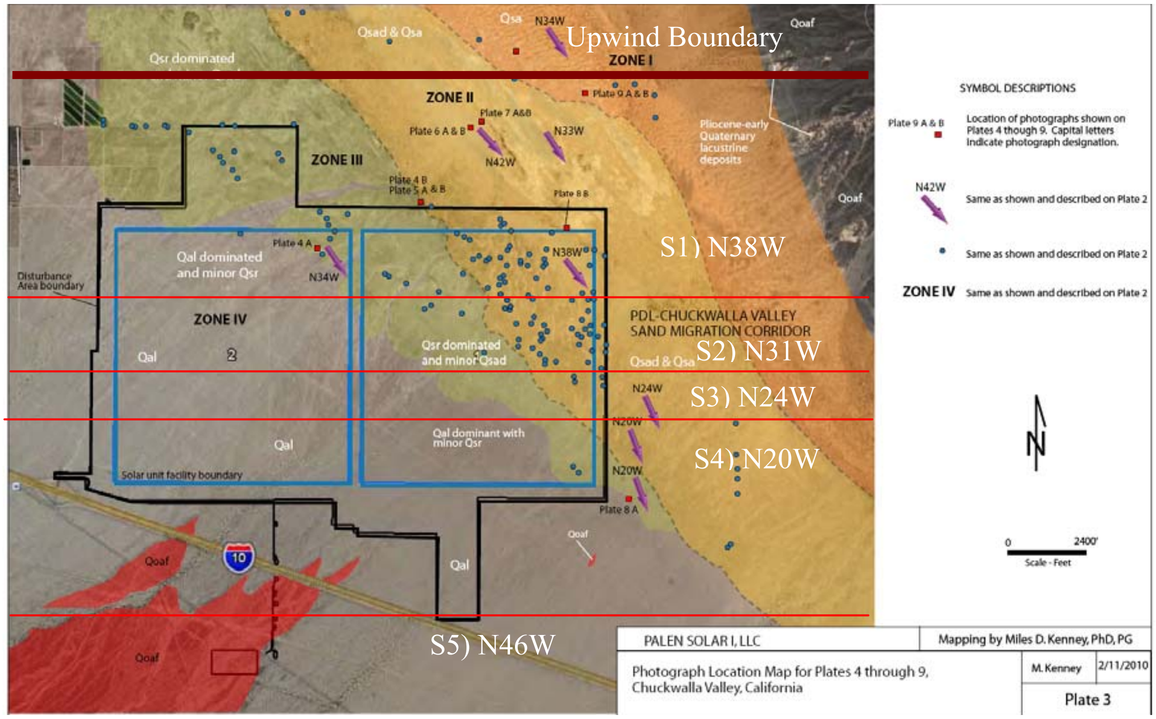

Figure 20a. Sand transport corridor and wind direction indicators (Kenney, 2010a, Plate 3). Lines in red show sectors used in the wind transport model to define different prevailing wind directions, and values in white show assumed dominant wind direction for each sector (S1-S5). Note: some vector indicators are shown in Kenney, 2010a, Plate 1, (Figure 20b of this report).

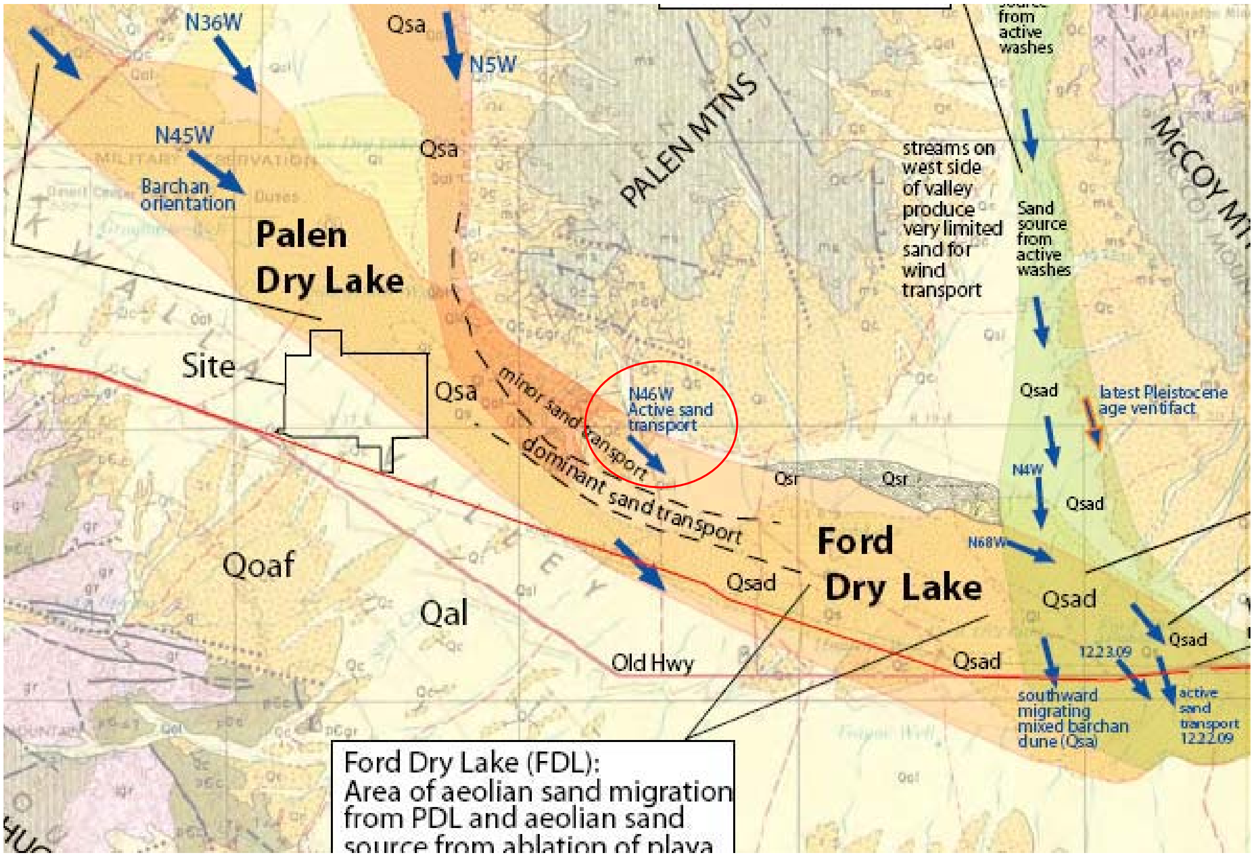

Figure 20b. Sand transport corridor and wind direction indicators (Kenney, 2010a, Plate 1). Vectors shown in red were used in the model.

5.2.4 Upwind boundary condition

We simulated a uniform input of sand across the northern (upwind) edge of the model to assess the percentage reduction in sand once the wind encountered an obstacle. Although the actual volume of sand will vary across the boundary, this simulation is concerned with the *percentage* reduction downwind, not the actual volume of sand. We assume that in the pre-project condition sand is transported across the site without obstruction, to establish a base condition.

5.3 SIMULATION OF PROJECT ALTERNATIVES

We simulated five Project alternatives: the Proposed Project, the original Reconfigured Alternative and staff's Reduced Acreage Alternative, as well as the two new alternatives developed by the applicant, Reconfigured Alternative 2 and Reconfigured Alternative 3. The latter two reconfigured alternatives as well as the staff Reduced Acreage Alternative were developed to reduce both the direct and indirect impacts of the project on biological resources including the sand dunes and Mohave fringe-toed lizard habitat. The Proposed Project and Reconfigured Alternatives 2 and 3 were further assessed in two phases. For all scenarios we imported the Project footprint into the model in GIS. The wind fences at the project boundaries were assumed to be a complete barrier to sand transport, with zero sand being transported across a project cell. We assumed no movement of sand along a fence oblique to wind movement. Direct impacts are considered to be impacts from the project footprint, or sand shadows from the wind fences that lie within the project disturbance boundary. Indirect impacts are considered to be sand shadows that extend beyond the project disturbance boundary. In all cases the model predicted a sand transport shadow downwind of the Project based on the prevailing wind directions, with diffusion gradually transporting sand into the shadow (due to variations around the prevailing wind direction). At a certain point downwind the shadow disappears because diffusion is able to bring sediment back into the area downwind of the obstruction. We calculated the percentage of sand reduction between pre-project and post-project conditions. By overlying the percent sand reduction on the Sand Transport Zones map (Kenney, 2010a) we are able to calculate both an area of impact and a percentage of impact for each alternative. This is shown in detail in Table 2. We further subdivided the MFTL habitat based on the sand transport zones devised by Dr. Miles Kenney (shown in Figure 8) where Zone 1 has the greatest rate of sand transport and Zone 3 the lowest rate. We did not consider Zone 4 in the analysis since both Energy Commission staff and the Applicant concur that wind transport is not a significant process in this zone, and MFTL habitat does not appear to be found in this zone. The greatest abundance of MFTL has been observed in Zone 2 due to the combination of active wind transport and vegetation cover, with fewer MFTL in Zones 1 (abundant sand but little vegetation) and 3 (plentiful vegetation but less active sand transport). We also excluded from the analysis areas where the reduction in sand delivery was less than 25%. We included the direct impact to the sand dunes associated with each Project footprint. It should be noted that in some alternatives the indirect impact in Zone 3 increases compared with the proposed project. This is because the alternatives generally pulled the project footprint out of Zone 2 and into Zones 3 and 4. Thus some reductions in direct impact to Zone 2 were partially offset by increases in indirect impacts in Zone 3. It should also be noted that in the two phase alternatives that we analyzed, some portion of the indirectly impacted area in Phase 1 is often subsequently occupied and directly impacted in Phase 2. The different alternatives and their predicted sand shadows are shown visually in Figures 21-28.

	Percentage reduction of sand input	Impact Area (acres)			
		Zone I	Zone II	Zone III	Sum of Impacts
Proposed Project Alternative Phase 1	25 - 50%	-	-	64	191

Summary of Alternatives' Impacts on Sand Transport Corridor

PWA Ref# 2006.02

PWA

5.4 DISCUSSION OF RESULTS

Table 2 provides a detailed break down of the direct and indirect impacts of the project alternatives. Note that comparing the Staff Reduced Acreage Alternative with the other alternatives is challenging because it only includes the solar arrays and does not include a disturbance area between the arrays and the property line, as the Proposed Project and the Applicant's Reconfigured Alternatives 2 and 3 do.

The proposed project was analyzed in two phases. Phase 1 (Figure 21) directly impacts 51 acres of sand corridor and indirectly impacts 191 acres. Phase 2 of the Proposed Project (Figure 22) has the highest indirect and direct impacts of any complete project in Zones 2-3, with a total of 970 acres of direct impact and 1,113 acres of indirect (sand shadow) impacts. Most of the indirect impacts are in the most sensitive Zone 2 (where the greatest population of MFTL is found).

The Staff Reduced Acreage Alternative (Figure 23) has the lowest direct or indirect impact on the sand transport corridor of any of the alternatives, with 292 acres of indirect and 299 acres of direct impact. Most of the indirect impacts are focused in the less sensitive Zone 3. Note that if the Staff Reduced Acreage Alternative was assessed with a disturbance area around the solar arrays (as the Proposed Project and the Applicants Reconfigured Alternatives 2 and 3 have been) the direct impact area would increase slightly and the indirect impact area would decrease (because some areas shown in our assessment as indirect impact would lie within the disturbance boundary). The total impact area would be the same.

The Applicant's Reconfigured Alternative 1 (Figure 24) has lower impacts than the Proposed Project, but retains high direct (1,120 acres) and indirect impacts (1,150 acres). Most of the indirect (sand shadow) impacts are in the more sensitive Zone 2 with the direct impacts split almost evenly between Zones 2 and 3.

In response to Staff feedback on the proposed project the Applicant developed two further Reconfigured Alternatives. These alternatives were assessed in two phases. Though not as low in impacts as the Staff Reduced Acreage Alternative, both applicant alternatives represent a substantial improvement over the proposed project, with greatly reduced direct and indirect impacts to the sand transport corridors. Phase 1 of the Applicant's Reconfigured Alternative 2 (Figure 25) has 117 acres of indirect impact and 84 acres of direct impact to the sand transport corridor, with Phase 2 (Figure 26) bringing this to 144 acres of indirect impact and 680 acres of direct impact. Most of the indirect impact is in the more sensitive Zone 2. Most of the direct impact is in the less sensitive Zone 3.

Phase 1 of the Applicant's Reconfigured Alternative 3 directly impacts 51 acres of the sand transport corridor and indirectly impacts 280 acres (Figure 27). Adding Phase 2 lowers the indirect impact to 94 acres but raises the direct impact to 790 acres (Figure 28). The shift between direct and indirect impact between Phases 1 and 2 is because much of the indirectly impacted area in Phase 1 is subsequently built on (directly impacted) in Phase 2. Most of the indirect impact is in Zone 2, but most of the direct impact is in Zone 3.

The alternatives are summarized in Figure 29 which shows impact by Zone of the sand transport corridor. The Proposed Project and the Applicant's Reconfigured Alternative 1 have extremely high impacts that have been judged to be significant and non-mitigable in the Draft Staff Assessment. The Reduced Acreage, Reconfigured Alternative 2 and Reconfigured Alternative 3 are all superior to the proposed project in terms of direct and indirect impacts. The Reduced Acreage Alternative has the lowest impacts and is the superior alternative based purely on impacts to dune habitat. There is little difference between the two applicant reconfigured alternatives from a sand transport and dune impact perspective since Alternative 2 offers the lowest total impact but the highest impact in the most sensitive Zone 2, whereas Alternative 3 offers a lower total impact but a higher impact to Zone 2.

5.5 COMPARISON OF THE STAFF-CALCULATED INDIRECT IMPACT AREAS AND THE APPLICANT'S INDIRECT IMPACT AREAS

In response to a data request from CEC dated July 9th 2010 the applicant submitted their own estimate of indirect impacts from wind transport (Kenney, July 20th 2010b, "Geomorphic evaluation of aeolian sand mitigation for reconfigured alternatives 2 and 3"). The resulting sand shadows are shown in Figure 30 and 31 and are somewhat smaller than the areas calculated in this report. Dr. Kenney's analysis used the same prevailing wind data that this report relies upon (his own data), but is different from our analysis in several ways. Firstly it sets the bar for impact much lower than our analysis. Figures 32 and 33 show the wind shadows estimated by Dr. Kenney superimposed on the sand reduction calculations we produced. This shows that Dr. Kenney's threshold for a shadow registering as an impact is approximately an 85% sand reduction or greater, whereas we consider an area impacted if it experiences a reduction in sand of 25% or more. Secondly, measuring the orientation of Dr. Kenney's sand shadows relative to the closest wind vectors (Figure 34) shows that in many cases he used orientations that are more northerly (making the shadow smaller) than the orientation of his field data.

Applicant's wind shadows showing underlying data

PWA Ref# 2006.02

In several submissions (e.g. Galati & Blek 2010j) and at staff workshops the Applicant has contested the wind shadow area estimates produced by PWA. The Applicant has asserted that PWA overestimated the area for two reasons: assuming a single prevailing wind direction that was from a more westerly direction that actually occurs, and ignoring the greater concentration of sand coming down Zone 1. The first claim is incorrect, as explained in the model description above. The model assumes the same prevailing wind direction as recorded by the applicant, primarily with a north and northwesterly direction. Furthermore, Figures 5 and 35 show that the dominant sand corridor is approaching the site from the northwest rather than the north as the Applicant claims. Regarding the second reason, neither the applicant nor staff have measured sand transport rates across the field site so the applicant's assertion that 80-90% of sand transport occurs in Zone 1 is speculative and impossible to verify. However, analysis of aerial photos from different years suggests that the boundary between Zones 1 and 2 is variable and that the width and the activity level of the sand transport corridor is more variable than the Applicant has considered. For example, Figures 5 and 35 show more sand activity in Zone 2 than is apparent on current images in Google Earth, and suggests that the eastern edge of Zone 1 was further west than conditions when mapped by the applicant (Kenney, 2010a). The differences in the apparent sand activity rate and location may reflect changes in the sand transport corridor in response to El Nino and La Nina events. It is erroneous to assume that the wind corridor as observed by the applicant in Winter 2010 (an El Nino winter with wetter conditions than average and therefore less wind activity) will have the same width and level of sand transport in a drier than average La Nina. Within the lifetime of the project there are likely to be five or six wetting and drying cycles of this nature, with associated expansion and contraction of the corridor. Finally, the distribution of levels of sand activity across the different zones is not the issue, since MFTL habitat is not correlated to increasing sand transport rates. MFTL favor a mixture of vegetation (to provide food and cover) and sand dunes. This mixture is most prevalent in Zone 2 (Zone 2B of Kenney 2010b). Dr. Kenney presumably believes that the combination of much greater sand concentrations in Zone 1 with stronger winds from the north would push more sand from Zone 1 into Zone 2, offsetting the losses sand from the project. However, if large volumes of sand were being pushed from Zone 1 to Zone 2 the boundary, and indeed the whole corridor, would bulge further south than it does. As can be seen in Figure 35, the corridor trends approximately northwest to southeast across the project site and then curves more to the east at the southern project boundary.

PWA

5.6 POTENTIAL MITIGATION OF INDIRECT IMPACTS TO THE CHUCKWALLA WIND TRANSPORT CORRIDOR

The Applicant has proposed in staff workshops and elsewhere (Galati & Blek 2910j) mitigating the indirect impacts to sand transport by collecting sand on the upwind (northern) sand fence and transporting it to a location where it can be entrained near the downwind (eastern) sand fence. Staff requested specific information about any proposed sand management activities such as clearing accumulated sand from the base of wind fencing (CEC 2010a) but has not yet received information on this subject from the Applicant. In descriptions of the proposed sand replenishment programs (Galati & Blek 2010j) the Applicant has not provided specific examples of sand replenishment schemes in the Mojave Desert or similar environments that are considered successful (or unsuccessful examples from which we can learn lessons) so assessing the likelihood of such a scheme working is difficult. We are conscious from talking to biologists with experience of sand mitigation projects that there are many practical issues that would need to be resolved before implementing such an experimental program (e.g. preventing vegetation from stabilizing sand piles, weed management, direct impacts to Mojave fringe-toed lizards and other dune-dependent species). If the Applicant were to propose such a program staff would need additional information to assess potential impacts to biological resources, including an estimate of the anticipated frequency and volume of sand removal, the location proposed for receipt of the accumulated sand, and descriptions of measures that would be taken to protect surrounding biological resources from impacts associated with such a sand removal program.

6. IMPACTS TO DRAINAGE FEATURES

Overlain on the major landscape units of the project site are a series of drainage lines that cross the site from southwest to northeast. I-10 is an important local control on drainage across the project site since it intercepts a large number of ephemeral washes draining southwest towards the site from the upper alluvial fan. These channels are captured by a series of berms and interceptor channels that run parallel with I-10, periodically funneling the collected water under I-10 at bridges and creating larger washes that pass onto the mid-fan. Thus the site has two types of wash: 'undersized' minor washes whose headwaters have been captured by the I-10 interceptor drains and that only drain a small area of their former drainages between I-10 and the project boundary, and two major wash complexes that have been 'oversized' by capturing additional flow from all the small drainages upslope of I-10 and that pass under the freeway and onto the Project site.

6.1 MINOR EPHEMERAL WASHES

Approximately a hundred minor washes cross the site from southwest to northeast, draining the area down-fan of I-10 towards Palen Dry Lake (many channels do not reach the lake but dissipate out on the vegetated sand dune surface). These channels are typically very subtle, with a width of 2-10 feet and a depth of 3-9 inches. They are found approximately every 100 feet when traversing along a contour on the mid-fan surface. There are sinuous and braided channels, with many channels showing evidence of recent flow on February 5th. Evidence of flow and small amounts of sediment transport included dampness, washed out dirt roads where they crossed channels, fresh veneers of sediment deposits, and small knickpoints and scour features of a few inches depth indicating local erosion. Based on the position of the damp ground flow was probably in the order of 1-2 inches deep through the small channels.

Figure 36. Minor ephemeral wash

6.2 MAJOR EPHEMERAL WASHES

There are 2 major ephemeral wash complexes that cross the site from southwest to northeast, draining the area down-fan of I-10 towards Palen Dry Lake. A third wash complex lies just to the southeast. Both major washes were traced from the western project boundary to Palen Dry Lake. The major washes are found as complexes of 10-20 braided channels, with each channel being approximately 10-50 feet wide. The wash complexes widen out from their constriction at I-10 and are approximately 1,500 feet wide after a mile, after which they become very dispersed, lose definition and resemble minor washes. Within a mile of I-10 the major washes have created sandy zones approximately 1,500 feet wide overlain on the less sandy alluvial gravel or thin sand sheets. These areas appear to be potential MFTL habitat, with vegetated dunes. The washes appear to be a local, smaller version of the regional wind-borne sand transport corridors discussed earlier, supplying sand to a narrow surrounding zone. The northern wash travels further between its construction on I-10 and the project site (1.4 miles) and is more dispersed than the central wash, which crossed into the proposed solar array blocks within 0.7 mile from I-10. Thus the central wash carries more sand and has created a wider sand corridor around it in the project area than the northern wash.

Figure 37. One of the main channels in the northern major wash complex. Photo is from close to the western project boundary looking east across the project site towards Palen Dry Lake.

Figure 38. The same major wash as Figure 37 in the middle of the proposed western solar array, showing the channel losing capacity as it flows towards Palen Dry Lake.

Figure 39. The central major wash complex in the center of the site has generated a corridor of sandy dune conditions around it, and supports trees.

6.3 PROJECT IMPACTS TO THE ALLUVIAL DRAINAGES

The minor washes on the project site have already likely been degraded compared with their original condition by the loss of headwater area when I-10 was constructed. They presumably transport water and sediment in smaller volumes and at lower frequencies than before, reducing the habitat quality for organisms that rely on water and fine sediment and favoring more drought tolerant species. On the other hand flow concentration into a smaller number of larger channels has likely improved conditions for water and fine sediment-loving species in the major wash complexes, which have probably become wetter and more sediment rich since I-10 was constructed (see Figure 39). This combination of 'winning' and 'losing' habitat patterns is likely to be somewhat repeated with the proposed project, with the drainage plan capturing the minor drainages, passing them through or around the solar arrays, and dissipating the concentrated flow on the alluvial fan downslope. In the immediate area downslope of the project site it is likely that there will be some disruption to the drainage plan and sediment supply, with flow being initially more concentrated near the dissipaters until it has a chance to spread out and resume a more natural drainage pattern. There is also the potential for sediment to be trapped in the channels or dissipaters where they pass round sharp corners. However, if properly executed and maintained the drainage plan should restore pre-project water and sediment delivery patterns to levels below a significant impact within a few hundred feet of the dissipaters. For most of the project site this distance lies within the disturbance limits and should not be a significant impact to habitat off-site.

FINAL STAFF ASSESSMENT – Part B

HAZARDOUS MATERIALS MANAGEMENT

Testimony of Alvin Greenberg, Ph.D.

SUMMARY OF CONCLUSIONS

California Energy Commission staff (staff) evaluated the proposed Palen Solar Electric Generating System (PSEGS) modified project (amendment dated December 17, 2012) in terms of hazardous materials use. Staff's Final Staff Assessment (FSA) indicates that with the implementation of staff's proposed mitigation measures, hazardous materials use at the modified project site would not present a potential for significant impact to the public. Staff proposes Hazardous Materials Management Conditions of Certification to address the safe handling of hazardous materials and site security. With adoption of the proposed conditions of certification, the PSEGS project will comply with all applicable laws, ordinances, regulations, and standards and will not result in any unmitigated significant adverse impacts.

The proposed Hazardous Materials Management Conditions of Certification are slightly modified from the existing conditions of certification to account for the discontinuation of the project's use of heat transfer fluid (HTF) and propane, and the addition of natural gas and a gas pipeline.

INTRODUCTION

The purpose of this hazardous materials management analysis is to determine if the PSEGS has the potential to cause significant impacts to the public as a result of the use, handling, storage, or transportation of hazardous materials at the proposed site. If significant adverse impacts to the public are identified, staff must also evaluate the potential for facility design alternatives and additional mitigation measures to reduce those impacts to the extent feasible.

This analysis does not address the potential exposure of workers to hazardous materials used at the proposed facility. Employers must inform employees of hazards associated with their work and provide them with special protective equipment and training to reduce the potential for health impacts associated with the handling of hazardous materials. The **WORKER SAFETY AND FIRE PROTECTION** section of this document describes applicable requirements for the protection of workers from these risks.

In this analysis, staff examines plausible potential loss of containment incidents (spills) for the hazardous materials to be used at the proposed facility. The worst case plausible event, regardless of cause, is considered and analyzed to see whether the risk to local populations would be significant. Hazardous material handling and usage procedures are designed to reduce the likelihood of a spill, to reduce its potential size, and to prevent or reduce the potential for impacts of accidental releases off-site. These measures also address the potential for spills to mix with runoff water and be carried offsite. Generally, staff seeks to confirm that the project owner has proposed secondary containment basins for containing liquids, and that volatile chemicals would have restricted movement into the atmosphere after containment.

Various hazardous materials including mineral and lubricating oils, cleaning detergents, water treatment chemicals, welding gasses, and natural gas will be transported to, and will be present at, the proposed PSEGS project site. This document addresses all potential impacts associated with the transportation, use and handling of hazardous materials.

METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

Staff reviewed and assessed the potential for the transportation, handling, and use of hazardous materials to impact the surrounding community. All chemicals were evaluated. Staff's analysis addresses the potential impacts on all members of the population including the young, the elderly, and people with existing medical conditions that may make them more sensitive to the adverse effects of hazardous materials. To accomplish this goal, staff utilizes exposure criteria (both acute and chronic) that are protective of the public.

In order to assess the potential for released hazardous materials to travel off-site and affect the public, staff analyzed several aspects of the proposed use of these materials at the facility. Staff recognizes that some hazardous materials must be used at power plants. Therefore, staff conducted its analysis by examining the choice and amount of chemicals to be used, the manner in which the project owner will use the chemicals, the manner by which they will be transported to the facility and transferred to facility storage tanks, and the way the project owner plans to store the materials on-site.

Staff reviewed the project owner's proposed engineering and administrative controls concerning hazardous materials usage. Engineering controls are the physical or mechanical systems, such as storage tanks or automatic shut-off valves, that can prevent the spill of hazardous material from occurring, or which can either limit the spill to a small amount or confine it to a small area. Administrative controls are procedures that will serve to prevent accidents and reduce the potential for impact if they do occur. Both engineering and administrative controls can act to prevent or minimize the need for emergency response actions.

Staff reviewed and evaluated the project owner's proposed use of hazardous materials as described by the project owner in its Petition to Amend (Palen 2012a, Section 5.6). Staff's assessment followed the five steps listed below:

- Step 1: Staff reviewed the chemicals and the amounts proposed for on-site use as listed in Table 5.6-3 of the Petition to Amend (Palen 2012a) and determined the need and appropriateness of their use.
- Step 2: Those chemicals proposed for use in small amounts or whose physical state is such that there is virtually no chance that a spill would migrate off-site and impact the public were removed from further assessment.
- Step 3: Measures proposed by the project owner to prevent spills were reviewed and evaluated. These included engineering controls such as automatic shut-off valves and different-sized transfer-hose couplings and administrative controls such as worker training and safety management programs.

- Step 4: Measures proposed by the project owner to respond to accidents were reviewed and evaluated. These measures also included engineering controls such as catchment basins and methods to keep vapors from spreading and administrative controls such as training emergency response crews.
- Step 5: Staff analyzed the theoretical impacts on the public of a worst-case spill of hazardous materials, as reduced by the mitigation measures proposed by the project owner. When mitigation methods proposed by the project owner are sufficient, no further mitigation is recommended. If the proposed mitigation is not sufficient to reduce the potential for adverse impacts to an insignificant level, staff will propose additional prevention and response controls until the potential for causing harm to the public is reduced to an insignificant level. It is only at this point that staff can recommend that the facility be allowed to use hazardous materials.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

The following federal, state, and local laws and policies apply to the protection of public health and hazardous materials management. Staff's analysis examines the project's compliance with these requirements.

Hazardous Materials Management Table 1
Laws, Ordinances, Regulations, and Standards

Applicable LORS	Description
Federal	
The Superfund Amendments and Reauthorization Act of 1986 (42 USC §9601 et seq.)	Contains the Emergency Planning and Community Right To Know Act (also known as SARA Title III).
The Clean Air Act (CAA) of 1990 (42 USC 7401 et seq. as amended)	Established a nationwide emergency planning and response program and imposed reporting requirements for businesses that store, handle, or produce significant quantities of extremely hazardous materials.
The CAA section on risk management plans (42 USC §112(r)	Requires states to implement a comprehensive system informing local agencies and the public when a significant quantity of such materials is stored or handled at a facility. The requirements of both SARA Title III and the CAA are reflected in the California Health and Safety Code, section 25531, et seq.
49 CFR 172.800	The U.S. Department of Transportation (DOT) requirement that suppliers of hazardous materials prepare and implement security plans.
49 CFR Part 1572, Subparts A and B	Requires suppliers of hazardous materials to ensure that all their hazardous materials drivers are in compliance with personnel background security checks.
The Clean Water Act (CWA) (40 CFR 112)	Aims to prevent the discharge or threat of discharge of oil into navigable waters or adjoining shorelines. Requires a written spill prevention, control, and countermeasures (SPCC) plan to be prepared for facilities that store oil that could leak into navigable waters.
Federal Register (6 CFR Part 27) interim final rule	A regulation of the U.S. Department of Homeland Security that requires facilities that use or store certain hazardous materials to submit information to the department so that a vulnerability assessment can be conducted to determine what certain specified security measures shall be implemented.

Applicable LORS	Description
State	
Title 8, California Code of Regulations, section 5189	Requires facility owners to develop and implement effective safety management plans that ensure that large quantities of hazardous materials are handled safely. While such requirements primarily provide for the protection of workers, they also indirectly improve public safety and are coordinated with the Risk Management Plan (RMP) process.
California Health and Safety Code, section 41700	Requires that "No person shall discharge from any source whatsoever such quantities of air contaminants or other material which causes injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health, or safety of any such persons or the public, or which cause, or have a natural tendency to cause injury or damage to business or property."
California Safe Drinking Water and Toxic Enforcement Act (Proposition 65)	Prevents certain chemicals that cause cancer and reproductive toxicity from being discharged into sources of drinking water.
Hazardous Material Business Plan, Cal HSC Sections 25500 to 25541; 19 CCR Sections 2720 to 2734	Requires the submittal of a chemical inventory and planning and reporting for management of hazardous materials.
Hazardous Substance Information and Training Act, 8 CCR Section 339; Section 3200 et seq., 5139 et seq., and 5160 et seq.	Requires listing and implementation of specified control measures for management of hazardous substances.
California HSC Sections 25270 through 25270.13	Requires the preparation of a Spill Prevention, Control, and Countermeasures (SPCC) Plan if 10,000 gallons or more of petroleum is stored on-site. The above regulations would also require the immediate reporting of a spill or release of 42 gallons or more to the California Office of Emergency Services and the Certified Unified Program Authority (CUPA).
NFPA 56 (adopted 2012)	NFPA 56 is the Standard for Fire and Explosion Prevention During Cleaning and Purging of Flammable Gas Piping Systems.
Local	
Riverside County Fire Code, Riverside County Code Chapter 8.32: Ordinance No. 787	Adopts the California Fire Code, 2007 Edition, with some of its appendices, into Riverside County regulations.
Disclosure of Hazardous Materials and the Formulation of Business Emergency Plans: Riverside County Ordinance 651	Requires disclosure where businesses handle hazardous materials and requires the development of response plans; designates Riverside County Department of Environmental Health as responsible for administration and enforcement of local codes.

The Certified Unified Program Authority (CUPA) with the responsibility to review the Hazardous Materials Business Plan (HMBP) is the Riverside County Environmental Health Department (RCEHD). With regard to seismic safety issues, the site is located in a Seismic Zone 4. Construction and design of buildings and vessels storing hazardous materials will meet the appropriate seismic requirements of the 2010 California Building Code (Palen 2012a, Section 5.6.3.3).

PROPOSED MODIFIED PROJECT

On December 17, 2012, Palen Solar Holdings, LLC (PSH) filed a petition with the Energy Commission requesting to modify the Palen Solar Power Project (PSPP), now called PSEGS. The major modification is replacing the parabolic trough solar collection system using heat transfer fluid with Bright Source's solar tower technology. Heliostats—elevated mirrors guided by a tracking system mounted on a pylon—focus the sun's rays on a solar receiver steam generator located atop a 750-foot tower near the center of each solar field to create steam to drive a turbine that provides electricity.

Two adjacent solar fields producing 250 MW each are proposed for a combined nominal output of approximately 500 MW. Each of the 250 MW solar fields would have a dedicated tower, solar field/heliostat array of approximately 85,000 heliostats, and a dedicated steam turbine generator/power block. Both solar fields would share common facilities, including a common area containing an administration building, warehouse, evaporation ponds, maintenance complex, a meter/valve station for incoming natural gas service to the site, an onsite switchyard, and a 10-mile single-circuit 230-kV generation tie-line. Other onsite facilities would include access and maintenance roads (either dirt, gravel, or paved), perimeter fencing, tortoise fencing, and other ancillary security facilities.

SETTING AND EXISTING CONDITIONS

Several factors associated with the area in which a project is to be located affect the potential for an accidental release of a hazardous material that could cause public health impacts. These include:

- local meteorology;
- terrain characteristics; and,
- location of population centers and sensitive receptors relative to the project.

METEOROLOGICAL CONDITIONS

Meteorological conditions, including wind speed, wind direction, and air temperature, affect both the extent to which accidentally released hazardous materials would be dispersed into the air and the direction in which they would be transported. This affects the potential magnitude and extent of public exposure to such materials, as well as their associated health risks. When wind speeds are low and the atmosphere stable, dispersion is severely reduced, but can lead to increased localized public exposure.

Recorded wind speeds and ambient air temperatures are described in the **AIR QUALITY** section (5.2.2.2) and Appendix E.1 of the Application for Certification (Solar Millennium 2009a).

TERRAIN CHARACTERISTICS

The location of elevated terrain is often an important factor in assessing potential exposure. An emission plume resulting from an accidental release may impact high elevations before impacting lower elevations. The topography of the site is mostly flat (ranges between 130 and 200 feet above sea level), with elevated terrain beginning to the northeast and southwest within 3-4 miles of the site (Solar Millennium 2009a, Section 2.4.1).

LOCATION OF EXPOSED POPULATIONS AND SENSITIVE RECEPTORS

The general population includes many sensitive subgroups that may be at greater risk from exposure to emitted pollutants. These sensitive subgroups include the very young, the elderly, and those with existing illnesses. In addition, the location of the population in the area surrounding a project site may have a major bearing on health risk. There are no sensitive receptors within a 3-mile radius of the project site. The nearest sensitive receptor is the Eagle Mountain Elementary School located about 10 miles west of the project site. There are two residences (which may or may not be occupied) within one mile of the project site, located about 25 feet and 3,500 feet northwest of the project fence line, respectively (Solar Millennium 2009a, Section 5.10.2 and Figure 5.10-2). In order to ensure a level of protection consistent with Energy Commission policies, staff assumes that these two residences either are occupied or can be occupied in the future.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

SMALL QUANTITY HAZARDOUS MATERIALS

In conducting the analysis, staff determined in Steps 1 and 2 that some hazardous materials, although present at the proposed facility, pose a minimal potential for off-site impacts since they will be stored in a solid form or in smaller quantities, have low mobility, or have low levels of toxicity. These hazardous materials, which were eliminated from further consideration, are briefly discussed below.

During the construction phase of the project, hazardous materials proposed for use include the same type and amount as in the approved PSPP project. These include paint, solvents, gasoline, diesel fuel, motor oil, lubricants, and welding gases (CEC 2010f and Palen 2012a page 4.3-1). No acutely toxic hazardous materials will be used on-site during construction, and none of these materials pose significant potential for off-site impacts as a result of the quantities on-site, their relative toxicity, their physical state, and/or their environmental mobility. Any impact of spills or other releases of these materials will be limited to the site because of the small quantities involved, their infrequent use (and therefore reduced chances of release), and/or the temporary containment berms used by contractors. Petroleum hydrocarbon-based motor fuels, mineral oil, lube oil, and diesel fuel are all very low volatility and represent limited off-site hazards even in larger quantities.

During operations, hazardous chemicals such as cleaning agents, water treatment chemicals, welding gasses, oils, and other various chemicals (see **HAZARDOUS MATERIALS APPENDIX B** for a list of chemicals proposed to be used and stored at PSEGS during operations) would be used and stored in relatively small amounts and represent limited off-site hazards because of their small quantities, low volatility, and/or low toxicity. The modified project will be limited to using, storing, and transporting only those hazardous materials listed in **HAZARDOUS MATERIALS APPENDIX B** of this section as per staff's proposed Condition of Certification **HAZ-1**. The quantities listed in

HAZARDOUS MATERIALS APPENDIX B are the amount that would be present on the entire site and would be equally divided between the two power blocks.

After removing from consideration those chemicals that pose no risk of off-site impact in Steps 1 and 2, staff continued with Steps 3, 4, and 5 to review the remaining hazardous materials: sulfuric acid, sodium hydroxide, natural gas and aqueous ammonia.

LARGE QUANTITY HAZARDOUS MATERIALS

Sulfuric Acid and Sodium Hydroxide

Because of their very low vapor pressures, these hazardous materials can pose a risk to the off-site public and on-site workers only through direct contact. Because they will be delivered in self-contained "totes" (see discussion below regarding totes) and will not be stored at any one location in a quantity greater than 400 gallons, staff concludes that the risk of impact to the off-site public is less than significant.

Natural Gas

Natural gas poses a fire and/or possible explosion risk because of its flammability. Natural gas is composed of mostly methane, but also contains ethane, propane, nitrogen, butane, isobutene, and isopentane. It is colorless, odorless, tasteless, and lighter than air. Natural gas can cause asphyxiation when methane is 90 percent in concentration. Methane is flammable when mixed in air at concentrations of 5-14 percent, which is also the detonation range. Natural gas, therefore, poses a risk of fire and/or possible explosion if a release occurs under certain specific conditions. However, it should be noted that, due to its tendency to disperse rapidly, natural gas is less likely to cause explosions than many other fuel gases such as propane or liquefied petroleum gas, but can explode under certain confined conditions (as demonstrated by the natural gas detonation in Belgium in July 2004 and in San Bruno, California in September 2010).

While natural gas will be used in significant quantities, it will not be stored on-site. It will be delivered by the Southern California Gas Company (SoCal Gas) via a new pipeline that will extend southward from the site and interconnect with an existing SoCal Gas transmission pipeline located just south of I-10. The new gas pipeline will be approximately 8-inches in diameter and be approximately 2,956 feet long and will be constructed within a previously-surveyed corridor as shown on Figure 2.1-6, dated and docketed on March 15, 2013 (Palen 2013e). SoCal Gas will construct, own, and operate the new gas pipeline as part of its extensive gas supply system.

The risk of a fire and/or explosion on-site can be reduced to insignificant levels through adherence to applicable codes and the development and implementation of effective safety management practices. The National Fire Protection Association (NFPA) code 85A requires both the use of double-block and bleed valves for gas shut off and automated combustion controls. These measures will significantly reduce the likelihood of an explosion in gas-fired equipment. Additionally, start-up procedures would require air purging of the gas turbines prior to start up, thereby precluding the presence of an explosive mixture. The safety management plan proposed by the project owner would address the handling and use of natural gas, and would significantly reduce the potential for equipment failure because of either improper maintenance or human error.

Staff concludes that since the natural gas pipeline will be owned and operated by SoCal Gas, existing LORS are sufficient to ensure minimal risks of pipeline failure.

On June 28, 2010, the United States Chemical Safety and Hazard Board (CSB) issued Urgent Recommendations to the United States Occupational Safety and Health Administration (OSHA), the NFPA, the American Society of Mechanical Engineers (ASME), and major gas turbine manufacturers to make changes to their respective regulations, codes, and guidance to require the use of inherently safer alternatives to natural gas blows for the purposes of pipe cleaning. Recommendations were also made to the fifty states to enact legislation applicable to power plants that prohibits flammable gas blows for the purposes of pipe cleaning. In accordance with those recommendations, staff proposes new Condition of Certification **HAZ-4** which prohibits the use of flammable gas blow for pipe cleaning at the facility either during construction or after the start of operations. All fuel gas pipe purging activities shall vent any gases to a safe location outdoors, away from workers and sources of ignition. Fuel gas pipe cleaning and purging shall adhere to the provisions of NFPA 56, the Standard for Fire and Explosion Prevention During Cleaning and Purging of Flammable Gas Piping Systems, with special emphasis on sections 4.3.1 (written procedures for pipe cleaning and purging) and 6.111 (prohibition on the use of flammable gas for cleaning or purging at any time).

Aqueous Ammonia

Aqueous ammonia will be used to control the emission of oxides of nitrogen (NO_x) from the combustion of natural gas at the PSEGS. The accidental release of aqueous ammonia without proper mitigation can result in significant down-wind concentrations of ammonia gas. The modified project would have 19-percent aqueous ammonia solution in two stationary 400 gallon above-ground storage totes at each power block for a total maximum volume on-site of 1,600 gallons (Palen 2012a, page 4.3-2).

The use of aqueous ammonia can result in the formation and release of toxic gases in the event of a spill even without interaction with other chemicals. This is a result of its moderate vapor pressure and the volume of aqueous ammonia that will be used and stored on-site. However, the use of aqueous ammonia poses far less risk than the use of the far more hazardous anhydrous ammonia (ammonia that is not diluted with water).

To assess the potential impacts associated with an accidental release of aqueous ammonia, staff uses four bench mark exposure levels of ammonia gas occurring offsite. These include:

- the lowest concentration posing a risk of lethality of 2,000 ppm;
- the immediately dangerous to life and health level of 300 ppm;
- the emergency response planning guideline level 2 of 150 ppm, which is also the RMP level 1 criterion used by United States Environmental Protection Agency (US EPA) and California; and,

- the level considered by the Energy Commission staff to be without serious adverse effects on the public for a one-time exposure of 75 ppm (considered by staff to be a level of significance – see **HAZARDOUS MATERIALS APPENDIX A**).

If the potential exposure associated with a potential release exceeds 75 ppm at any public receptor, staff assumes that the potential release poses a risk of significant impact. Staff also assessed the probability of occurrence of the release and/or the nature of the potentially exposed population in determining whether the likelihood and extent of potential exposure are sufficient to support a finding of potentially significant impact.

At this site, several factors influenced staff's conclusion that the risk of off-site impacts of a release of aqueous ammonia would be extremely low and thus air dispersion modeling would not be required:

1. The maximum of each tote is 400 gallons and totes are self-contained units that do not involve the transfer of aqueous ammonia from a tanker truck to a large storage tank. They are delivered already containing the aqueous ammonia.

2. Each tote will have secondary spill containment to limit the spread of any spilled aqueous ammonia, thus limiting the size of the pool of ammonia available for evaporation and dispersion.

3. Previous modeling at other power plants by staff of far greater amounts of aqueous ammonia spilling into secondary containment areas show very limited dispersion of ammonia and the distance to a level less than 75 ppm is usually only a few hundred feet from the source.

4. Totes have an excellent safety record of structural integrity and minimal spills and the chance that more than one would fail at the same time is extremely remote.

5. The nearest off-site public receptors are two homes located about 25 feet and 3,500 feet northwest of the project fence line. These are respectively approximately one mile (5,280 ft.) and one and two-thirds miles (8,720 ft.) from the nearest tote of aqueous ammonia at a power block. Also, a vehicle traveling on I-10 would get no closer than three quarters of a mile (4,000 ft) from the nearest ammonia tote at a power block (Palen 2012a, Figure 2 and Appendix A page 10).

Therefore, staff concludes that any spill of aqueous ammonia from any one of the four totes on the site would not result in an airborne concentration of 75 ppm or greater ammonia at any off-site location and thus would pose a less than significant risk to the public.

MITIGATION

Staff believes that this project's use of hazardous materials poses a less than significant risk, but only if mitigation measures are used. The potential for accidents resulting in the release of hazardous materials is greatly reduced by the implementation of a Safety Management Program that includes both engineering and administrative controls. Elements of facility controls and the safety management plan are summarized below.

Engineering Controls

Engineering controls help to prevent accidents and releases (spills) from moving off-site and affecting communities by incorporating engineering safety design criteria in the design of the project. The engineered safety features proposed by the project owner for use at the PSEGS project include:

- Storage of small quantity hazardous materials in original, properly labeled containers ("totes");
- construction of secondary containment areas surrounding each of the bulk hazardous materials storage areas or totes designed to contain accidental releases that might happen during storage or delivery plus the volume of rainfall associated with a 25-year, 24-hour storm;
- physical separation of stored chemicals in isolated containment areas in order to prevent accidental mixing of incompatible materials, which could result in the evolution and release of toxic gases or fumes; and,
- installation of a fire protection system for hazardous materials storage areas.

Administrative Controls

Administrative controls also help prevent accidents and releases (spills) from moving off-site and affecting neighboring communities by establishing worker training programs, process safety management programs, and complying with all applicable health and safety laws, ordinances, and standards.

A worker health and safety program will be prepared by the project owner and include (but not be limited to) the following elements (see the **WORKER SAFETY AND FIRE PROTECTION** section for specific regulatory requirements):

- worker training regarding chemical hazards, health and safety issues, and hazard communication;
- procedures to ensure the proper use of personal protective equipment;
- safety operating procedures for the operation and maintenance of systems utilizing hazardous materials;
- fire safety and prevention; and,
- emergency response actions including facility evacuation, hazardous material spill clean-up, and fire prevention including the preparation of a Spill Prevention, Control, and Countermeasure (SPCC) Plan.

At the facility, the project owner will be required to designate an individual with the responsibility and authority to ensure a safe and healthful work place. The project health and safety official will oversee the health and safety program and have the authority to halt any action or modify any work practice to protect the workers, facility, and the surrounding community in the event of a violation of the health and safety program.

Existing Condition of Certification **HAZ-1** ensures that no hazardous material would be used at the facility except as listed on pages 4.3-2 through 4.3-5 of the Petition to Amend (Palen 2012a)), which have been reviewed by staff to determine the need and appropriateness of their use. Condition of Certification **HAZ-1** also requires changes to the allowed list of hazardous materials and their maximum amounts to be approved by the Energy Commission Compliance Project Manager (CPM). Only those that are needed and appropriate would be allowed to be used. If staff feels that a safer alternative chemical can be used, staff would recommend or require its use, depending upon the impacts posed.

Additional administrative controls are required by revised Condition of Certification **HAZ-2** (preparation of a HMBP and a SPCC Plan) and existing Condition of Certification **HAZ-3** (development of a Safety Management Plan).

On-Site Spill Response

In order to address the issue of spill response, the facility will prepare and implement an emergency response plan that includes information on hazardous materials contingency and emergency response procedures, spill containment and prevention systems, personnel training, spill notification, on-site spill containment, and prevention equipment and capabilities, as well as other elements. Emergency procedures will be established which include evacuation, spill cleanup, hazard prevention, and emergency response. The presence of oil in a quantity greater than 1,320 gallons might invoke a requirement to prepare an SPCC Plan. The quantity of oil contained in any one of the planned 230/500 kV transformers would be in excess of the minimum quantity that requires such a plan. In addition, pursuant to California HSC Sections 25270 through 25270.13, the PSEGS would be required to prepare an SPCC because it will store 10,000 gallons or more of petroleum on-site. The above regulations would also require the immediate reporting of a spill or release of 42 gallons or more to the California Office of Emergency Services and the CUPA.

Plant personnel will be trained as a hazardous materials response team which would be the first responder to hazardous materials incidents. In the event of a large incident involving hazardous materials, backup support would be provided by the Riverside County Fire Department which has a hazmat response unit capable of handling any incident at the proposed PSEGS, but would respond in an inadequate time of about 1.5-2 hours (Solar Millennium 2009a, Section 5.6.4.2 and RCFD 2010).

TRANSPORTATION OF HAZARDOUS MATERIALS

Various containerized and bulk hazardous materials would be transported to the facility via the truck. While many types of hazardous materials will be transported to the site, staff believes that transport of aqueous ammonia poses the predominant risk associated with hazardous materials transport. It should be noted that previous modeling of spills involving much larger quantities of aqueous ammonia than will be used, stored and transported to the proposed PSEGS has demonstrated that significant airborne concentrations would occur only at short distances from the spill.

Staff believes it is appropriate to rely upon the extensive regulatory program that applies to the shipment of hazardous materials on California highways to ensure safe handling in general transportation (see Federal Hazardous Materials Transportation Law 49 USC §5101 et seq, DOT regulations 49 CFR subpart H, §172–700, and California Department of Motor Vehicles (DMV) regulations on hazardous cargo). These regulations also address the issue of driver competence.

Based on the environmental mobility, toxicity, the quantities at the site, and the use of totes, staff concludes that the risk associated with the transportation of hazardous materials to the proposed modified project is less than significant.

SEISMIC ISSUES

It is possible that an earthquake could cause the failure of hazardous materials storage tanks. An earthquake could also cause failure of the secondary containment system (berms and dikes), as well as the failure of electrically controlled valves and pumps. The failure of all of these preventive control measures might then result in leaks of chemicals or of natural gas that may cause fires or impact the environment.

Information obtained after the January 1994 Northridge earthquake showed that some damage was caused both to several large storage tanks and to smaller tanks associated with the water treatment system of a cogeneration facility. The tanks with the greatest damage, including seam leakage, were older tanks, while the newer tanks only sustained displacements and failures of attached lines. Staff reviewed the impacts of the February 2001 Nisqually earthquake near Olympia, Washington, a state with similar seismic design codes as California. No hazardous materials storage tanks failed as a result of that earthquake. Staff has also reviewed the impacts of the recent earthquakes in Haiti (January 12, 2010; magnitude 7.0) and Chili (February 27, 2010; magnitude 8.8). The building standards in Haiti are extremely lax while those in Chile are as stringent and modern as California seismic building codes. Yet, the preliminary reports show a lack of impact on hazardous materials storage and pipelines infrastructure in both countries. For Haiti, this most likely reflects a lack of industrial storage tanks and gas pipelines; for Chili, this most likely reflects the use of strong safety codes.

Staff also conducted an analysis of the codes and standards which should be followed when designing and building storage tanks and containment areas to withstand a large earthquake. Staff notes that the previously approved project (PSPP) would have been designed and constructed to the standards of the 2010 California Building Code for Seismic Risk Zone 4 (Solar Millennium 2009a, Section 5.6.3.3) and the modified project (PSEGS) will also meet these seismic design criteria.

Therefore, on the basis of what occurred in Northridge (with older tanks) and the lack of failures during the Nisqually earthquake (with newer tanks) and in the 2010 Chilean earthquake (with rigorous seismic building codes), and given that the construction of PSEGS would comply with stringent California Building Codes, staff determines that tank failures during seismic events are not probable and do not represent a significant risk to the public.

SITE SECURITY

The North American Electric Reliability Corporation (NERC) published *Security Guidelines for the Electricity Sector* in 2002 (NERC 2002) as well as issued a Critical Infrastructure Protection standard for cyber security (NERC 2009), and the U.S. Department of Energy published a draft *Vulnerability Assessment Methodology for Electric Power Infrastructure* in 2002 (DOE 2002). The energy generation sector is one of 14 areas of critical Infrastructure listed by the U.S. Department of Homeland Security (DHS). On April 9, 2007, the U.S Department of Homeland Security published, in the Federal Register (6 CFR Part 27), an Interim Final Rule (Chemical Facility Anti-Terrorism Standards or CFATS) requiring facilities that use or store certain hazardous materials to conduct vulnerability assessments and implement certain specified security measures. This rule was implemented with the publication of Appendix A, the list of chemicals on November 2, 2007, and the PSEGS is not proposing to use any material on the list in an amount which would trigger the need for compliance with the CFATS regulation.

However, even though the CFATS regulation does not apply, staff believes that all power plants under the jurisdiction of the California Energy Commission should implement a minimum level of security consistent with the guidelines listed here.

In order to ensure that this facility (or a shipment of hazardous material) is not the target of unauthorized access, staff's existing Condition of Certification **HAZ-5** and revised Condition of Certification **HAZ-6** address both construction security and operations security plans. These plans would require the implementation of site security measures that are consistent with both the above-referenced documents and California Energy Commission guidelines.

The goal of these conditions of certification is to provide the minimum level of security for power plants needed to protect California's electrical infrastructure from malicious mischief, vandalism, or domestic/foreign terrorist attacks. The level of security needed for this power plant is dependent upon the threat imposed, the likelihood of an adversarial attack, the likelihood of success in causing a catastrophic event, and the severity of consequences of that event.

In order to determine the level of security, staff used an internal vulnerability assessment decision matrix modeled after the U.S. Department of Justice Chemical Vulnerability Assessment Methodology (July 2002), the NERC 2002 guidelines, the U.S. Department of Energy VAM-CF model, and U.S. Department of Homeland Security regulations published in the Federal Register (Interim Final Rule 6 CFR Part 27). Staff concluded that the PSEGS would fall into the "low vulnerability" category, so staff proposes that certain security measures be implemented but does not propose that the project owner conduct its own vulnerability assessment.

These security measures include perimeter fencing and/or breach detectors, possibly guards, alarms, site access procedures for employees and vendors, site personnel background checks, and law enforcement contact in the event of a security breach. The requirement for the standard security measure of topping the 8-foot high perimeter fence with barbed wire has been removed at the request of the applicant and Energy Commission staff biologists in order to reduce the risk to birds in the area flying into the barbed wire or kit foxes climbing the fences. The project owner would have three choices to implement additional perimeter security:

1. on-site breach detectors to be located inside the perimeter;

2. CCTV capable of viewing the entire length of the perimeter fence; and

3. Routine and random guard patrols on a road inside and along the perimeter fence.

Site access for vendors would be strictly controlled. Consistent with current state and federal regulations governing the transport of hazardous materials, hazardous materials vendors would have to maintain their transport vehicle fleets and employ only drivers who are properly licensed and trained. The project owner would be required, through its contractual language with vendors, to ensure that vendors, if required by law, supplying hazardous materials strictly adhere to the U.S. Department of Transportation requirements that hazardous materials vendors prepare and implement security plans per 49 CFR 172.802 and ensure that all hazardous materials drivers are in compliance with personnel background security checks per 49 CFR Part 1572, Subparts A and B. The compliance project manager (CPM) may authorize modifications to these measures, or may require additional measures in response to additional guidance provided by the U.S. Department of Homeland Security, the U.S. Department of Energy, or NERC, after consultation with appropriate law enforcement agencies and the project owner.

NON-OPERATION AND FACILITY CLOSURE IMPACTS AND MITIGATION

Closure of the proposed PSEGS (temporary or permanent) would follow a facility closure plan approved for the original PSPP project. The facility closure plan is designed to minimize public health and environmental impacts. Non-operation and facility closure procedures would be consistent with all applicable LORS and would include monitoring of hazardous materials storage vessels, safe cessation of processes which use hazardous materials, disposal of hazardous materials and hazardous wastes, and documentation of practices and inventory (Solar Millennium 2009a, Section 5.6.3.4). Staff expects that impacts from non-operation and facility closure process would represent a fraction of the impacts associated with the construction or operation of the proposed PSEGS. Therefore, based on staff's analysis for the construction and operation phases of this project, staff concludes that hazardous materials-related impacts from non-operations and facility closure would be insignificant.

RED BLUFF SUBSTATION

Environmental Setting

The SCE Red Bluff Substation, expected to be completed in December 2013, is located in eastern Riverside County, California on undeveloped BLM desert, adjacent to the existing DPV1 500 kV transmission line and the proposed DPV 2 500 kV transmission line. Expansive, primarily undeveloped desert and mountainous areas characterize this portion of the Colorado Desert. Interstate 10 and SR 177 (Rice Road) are the primary highways providing vehicular access throughout this region.

A number of hazardous chemicals are being used during construction of the SCE Red Bluff Substation in small quantities. The existing safeguards and measures imposed on construction greatly reduce the opportunity for, or the extent of, exposure to hazardous materials or other hazards. To date, no incidents of releases have been reported.

Exposed Populations and Sensitive Receptors

The general population in the area of the Red Bluff Substation includes many sensitive subgroups that may be at a greater health risk from exposure to emitted pollutants. These sensitive subgroups include the very young, the elderly, and those with existing illnesses. In addition, the location of the population in the area surrounding a project site may have a large bearing on health risk. There are no sensitive receptors within 1,000 feet of the SCE Red Bluff Substation site. The nearest residences are located north of the I-10.

Environmental Impacts

A hazardous material is generally described as any substance or mixture of substances that have properties that are capable of having an adverse effect on human health and the environment. Hazardous materials handling is regulated at the federal, state, and local level. Regulations cover the transportation, labeling, handling, storage, disposal, and accidental releases of hazardous materials. Included within these regulations are reporting requirements for hazardous materials storage and usage, worker exposure protection, and reporting and spill response requirements. Hazardous material handling also covers response to incidental discovery of buried or unknown hazardous materials present in the subsurface environment.

Construction activities for the Red Bluff Substation include the handling and use of hazardous materials associated with general construction activities, such as heavy equipment operations. Hazardous materials including fuels, oils, and other vehicle and equipment maintenance fluids may be used during the on-going construction phase of the project and are stored at the project substation sites and construction staging areas. Improperly maintained vehicles and equipment could leak fluids during the on-going construction activities and while parked. There is a potential for incidents involving release of gasoline, diesel fuel, oil, hydraulic fluid, and/or lubricants from vehicles or other equipment at the staging areas and/or the project sites. Spills and leaks of hazardous materials during construction activities could potentially result in soil or groundwater contamination and improper handling of hazardous materials could expose project workers or the nearby public to hazards. To date, no reported leaks or spills occurred.

Conclusion

Implementing mitigation measures avoided potential significant hazard impacts from work associated with the SCE Red Bluff Substation.

CUMULATIVE IMPACT ANALYSIS

The **Executive Summary** provides detailed information on the potential cumulative solar and other development projects in the project area. Together, these projects comprise the cumulative scenario which forms the basis of the cumulative impact analysis for the proposed modified project. In summary, these projects are placed into three categories:

- Existing energy projects on BLM, State, and private lands: Four projects are identified in the **Executive Summary Attachment A – Table 1**.
- Foreseeable future energy projects in the immediate area and in the desert region: Thirty-eight foreseeable projects are identified in the **Executive Summary Attachment A – Table 2**.
- Existing and foreseeable non-energy projects on BLM, State, and private lands **Executive Summary Attachment A – Tables 1 and 2**: One hundred and nine projects are identified in the **EXECUTIVE SUMMARY**.

All of the above projects are defined within a geographic area that has been identified by the Energy Commission as covering an area large enough to provide a reasonable basis for evaluating cumulative impacts for all resource elements or environmental parameters. Most of these projects have, are, or will be required to undergo their own independent environmental review under the California Environmental Quality Act (CEQA). Even if the cumulative projects described in the **EXECUTIVE SUMMARY** have not yet completed the required environmental processes, they were considered in the cumulative impacts analyses in this section.

EFFECTS OF PAST AND PRESENT PROJECTS

For this analysis, staff notes that many – if not all - of these projects or developments in the area or region have, or will use, store, and/or transport, small quantities of hazardous materials. However, for the reasons stated below, staff has found that when combined with the proposed PSEGS, none would have a cumulative impact on the region. The use of hazardous materials in large quantities is neither frequent nor concentrated in this area and the distances between the projects are very great. Operating, under construction, or proposed power plants in the region that store, use, and/or transport hazardous materials in the area have had any direct hazardous materials management impacts mitigated to a level of less than significance.

Staff has analyzed the potential for hazardous materials cumulative impacts at many other power plant projects located in California and in the region of the proposed PSEGS. A significant cumulative hazardous materials impact is defined as the simultaneous uncontrolled release of hazardous materials from multiple locations in a form (gas or liquid) that could cause a significant impact where the release of one hazardous material alone would not cause a significant impact. Existing locations that use or store gaseous or liquid hazardous materials, or locations where such facilities might likely be built, were both considered. Staff believes that while cumulative impacts are theoretically possible, they are not probable because of the many safeguards implemented to both prevent and control an uncontrolled release. The chances of one uncontrolled release occurring are remote. The chance of two or more occurring simultaneously, with resulting airborne plumes mingling to create a significant impact, are even more remote. Staff believes the risk to the public is insignificant.

The project owner will develop and implement a hazardous materials handling program for the PSEGS independent of any other projects considered for potential cumulative impacts. Staff believes that the facility, as proposed by the project owner and with the additional mitigation measures proposed by staff, poses a minimal risk of accidental release that could result in off-site impacts. It is unlikely that an accidental release that has very low probability of occurrence (about one in one million per year) would independently occur at this site and another facility at the same time. Therefore, staff concludes that the facility would not contribute to a significant hazardous materials-related cumulative impact.

Contribution of the Palen Solar Electric Generating System to Cumulative Impacts

Construction: The construction of PSEGS is not expected to result in short term adverse impacts related to hazardous materials use during construction activities. It is expected that some of the cumulative projects described above which are not yet built may be under construction the same time as the PSEGS, however, short term impacts related to Hazardous Materials Management during construction of those cumulative projects are not expected to occur.

Operation: The operation of the PSEGS is not expected to result in long term adverse impacts during operation of the project related to Hazardous Materials Management even though it is expected that some of the cumulative projects described above may be operational at the same time as the PSEGS.

Facility Closure: Closing the PSEGS facility is not expected to result in adverse impacts related to Hazardous Materials Management similar to construction impacts. It is unlikely that the construction or facility closure of any of the cumulative projects would occur concurrently with the facility closure of this project, because the facility closure is not expected to occur for approximately 40 years. As a result, it is not expected that significant impacts related to Hazardous Materials Management during closure of the PSEGS generated by the cumulative projects will occur.

OVERALL CONCLUSIONS

The potential for off-site impacts resulting from hazardous materials use at the PSEGS is less than significant due to the nature of the materials used and the engineering and administrative controls that would be implemented to prevent and control accidental releases of hazardous materials. Because of this determination, and the additional fact that there are no existing or future foreseeable facilities in the immediate proximity (less than 1 mile) using large amounts of hazardous chemicals, there is little (if any) possibility that vapor plumes would mingle (combine) to produce an airborne concentration that would present a significant risk should an accidental release occur.

COMPLIANCE WITH LORS

Staff concludes that construction and operation of the PSEGS project would be in compliance with all applicable laws, ordinances, regulations, and standards (LORS) regarding long-term and short-term project impacts in the area of hazardous materials management.

NOTEWORTHY PUBLIC BENEFITS

The construction and operation of a solar power plant such as the proposed PSEGS, requires, in general, smaller quantities of hazardous materials and materials that are less dangerous to the public than a natural-gas fired power plant. Building solar power plants to supply the required energy in California therefore benefits the public by reducing the risks otherwise associated with the use and transport of very large quantities of aqueous ammonia or more hazardous materials such as anhydrous ammonia. Furthermore, the proposed modified project would use less hazardous materials than the approved project in that solar tower technology avoids the use of extremely large amounts of heat transfer fluid and two very large propane storage tanks, thus eliminating risks to the public posed by the potential for fire and explosion.

RESPONSE TO COMMENTS

PSA WORKSHOP, JULY 17, 2013:

Comment: At the PSA workshop on July 17, 2013, a comment made on Hazardous Materials Management by Deputy Chief Cooley of the Riverside County Fire Department. Chief Cooley supported staff's proposal to prohibit gas blows and require adherence to NFPA 56. This comment was reiterated in writing when the County of Riverside provided comments on Worker Safety/Fire Protection (CR 2013c).

Response: Staff agrees and has proposed a revision to new Condition of Certification **HAZ-4**.

Comment: A second comment was made by the County (CR 2013c) regarding a request that Condition of Certification **HAZ-2** be revised to make clear that the project owner is to not only provide the Hazardous Materials Business Plan and Spill Prevention, Control, and Countermeasure Plan to Riverside County Department of Environmental Health and to the Riverside County Fire Department, but that the project owner shall also pay the usual and customary fee for review of those plans, and the usual and customary fee for any necessary and required inspections regarding same.

Response: Staff agrees and has proposed that these requirements be included in Condition of Certification **HAZ-2**.

GALATI BLEK LLP, MARIE FLEMING/PALEN SOLAR HOLDINGS LLC, FINAL COMMENTS ON THE PSA, TN # 200077, JULY 29, 2013:

HAZ-2: PSH proposed modifications to this condition to ensure that recommendations from Riverside County are only incorporated into the plans if they are required by LORS in order to avoid disputes over the content of plans that are within the ultimate jurisdiction of the CPM.

Response: Staff concurs and has proposed a modification of Condition of Certification **HAZ-2**.

HAZ-4: Staff explained at the Workshops that it would be modifying Condition of Certification **HAZ-4** to reference compliance with NFPA 56 relating to the cleaning of the gas pipeline. PSH does not object to complying with NFPA 56.

Response: Staff appreciates the petitioner's support.

HAZ-6: PSH proposed two modifications. The first is to remove the requirement for barbed wire fencing in order to avoid take of migratory birds. At the Workshops, Staff agreed to this modification but will propose additional security measures to replace the barbed wire, and will include these options in the FSA. The second modification proposed by PSH was to remove the requirement for 100 percent camera coverage around the perimeter fence as the project will not have a fence around the power block. Staff stated that the additional security measures discussed above will also address the security camera coverage.

Response: Staff has removed the requirement that security fencing be topped with barbed wire in Condition of Certification **HAZ-6** and has proposed different options for the project owner to implement for enhanced perimeter security. Staff has also revised the wording of **HAZ-6** to reflect the other revisions requested by the petitioner.

CONCLUSIONS

Staff's evaluation of the proposed modified project (with proposed additions and revisions to the mitigation measures) indicates that hazardous material use, storage, and transportation would not pose a significant impact on the public. Staff's analysis also shows that there would be no significant cumulative impact. With adoption of the proposed Hazard Materials Management Conditions of Certification, the PSEGS would comply with all applicable LORS. Other proposed Conditions of Certification address the issues of site security matters.

Staff recommends that the Energy Commission impose the proposed Hazard Materials Management Conditions of Certification to ensure that the PSEGS is designed, constructed, and operated in compliance with applicable LORS, and would protect the public from significant risk of exposure to an accidental release of hazardous materials. If all mitigation proposed by the project owner and by staff are implemented, the use, storage, and transportation of hazardous materials would pose a less than significant risk to the public.

Staff concludes that there is insignificant potential for hazardous materials release to have an impact beyond the facility boundary, and therefore concludes there is also insignificant potential for significant impacts to the environment. For any other potential impacts upon the environment, including vegetation, wildlife, air, soils, and water resulting from hazardous materials usage and disposal at the proposed facility, the reader is referred to the **BIOLOGY**, the **AIR QUALITY**, the **SOIL AND WATER**, and the **WASTE MANAGEMENT** sections of this FSA.

Staff proposes six Hazard Materials Management Conditions of Certification. Existing Condition of Certification **HAZ-1** ensures that no hazardous material would be used at the facility except as listed in **APPENDIX A** of this section, unless there is prior approval by the Energy Commission Compliance Project Manager. Revised Condition of Certification **HAZ-2** ensures that local emergency response services are notified of the amounts and locations of hazardous materials at the facility and safety plans. Existing Condition of Certification **HAZ-3** requires the development of a Safety Management Plan that addresses the delivery of all liquid hazardous materials during the construction, commissioning, and operation of the project would further reduce the risk of any accidental release not specifically addressed by the proposed spill prevention mitigation measures, and further prevent the mixing of incompatible materials that could result in the generation of toxic vapors. Revised new Condition of Certification **HAZ-4** addresses the use of natural gas and prohibits its use to clear pipes. Site security during both the construction and operation phases is addressed in existing Condition of Certification **HAZ-5** and revised Condition of Certification **HAZ-6.**

PROPOSED CONDITIONS OF CERTIFICATION

Staff has proposed modifications to the **Hazardous Materials Management** Conditions of Certification as shown below. (**Note:** Deleted text is in ~~strikethrough~~; new text is **<u>bold and underlined</u>**)

HAZ-1 The project owner shall not use any hazardous material not listed in **Appendix ~~A~~<u>B</u>**, below, or in greater quantities or strengths than those identified by chemical name in **Appendix ~~A~~<u>B</u>**, below, unless approved in advance by the Compliance Project Manager (CPM).

<u>Verification:</u> The project owner shall provide to the CPM, in the Annual Compliance Report, a list of hazardous materials contained at the facility.

HAZ-2 The project owner shall concurrently provide a Hazardous Materials Business Plan (HMBP)~~,~~ and **<u>a</u>** Spill Prevention, Control, and Countermeasure Plan (SPCC), ~~and a Process Safety Management Plan (PSMP)~~ to the Riverside County Department of Environmental Health (RCDEH), the Riverside County Fire Department (RCFD), and the CPM for review. After receiving comments from the RCDEH, RCFD, and the CPM, the project owner shall ~~reflect~~ <u>include in the final documents</u> all recommendations that ensure LORS compliance ~~in the final documents~~. Copies of the final HMBP~~,~~ **<u>and</u>** SPCC Plan~~, and PSMP~~ shall then be provided to the RCDEH and RCFD for information and to the CPM for approval. **<u>The project owner shall also pay the usual and customary fee for RCDEH and RCFD review of those plans, and the</u>**

<u>usual and customary fee for any necessary and required inspections regarding same.</u>

<u>Verification:</u> At least 30 days prior to receiving any hazardous material on the site for commissioning or operations, the project owner shall provide a copy of a final Hazardous Materials Business Plan, Spill Prevention, Control, and Countermeasures Plan, ~~and the Process Safety Management Plan~~ to the CPM for approval.

<u>The project owner shall also provide proof that the plans were submitted to the RCDEH and RCFD for review and that the usual and customary fees for those reviews have been paid.</u>

<u>The project owner shall also provide proof in the Annual compliance Report that the usual and customary fee for any necessary and required inspections by the RCEHD and the RCFD have been paid.</u>

HAZ-3 The project owner shall develop and implement a Safety Management Plan for the delivery and handling of liquid and gaseous hazardous materials. The plan shall include procedures, protective equipment requirements, training, and a checklist. It shall also include a section describing all measures to be implemented to prevent mixing of incompatible hazardous materials. This plan shall be applicable during construction, commissioning, and operation of the power plant.

<u>Verification:</u> At least 30 days prior to the delivery of any liquid or gaseous hazardous material to the facility, the project owner shall provide a Safety Management Plan as described above to the CPM for review and approval.

~~**HAZ-4** The project owner shall place an adequate number of isolation valves in the Heat Transfer Fluid (HTF) pipe loops so as to be able to isolate a solar panel loop in the event of a leak of fluid such that the volume of a total loss of HTF from that isolated loop will not exceed 1,250 gallons. These valves shall be actuated manually, remotely, or automatically. The engineering design drawings showing the number, location, and type of isolation valves shall be provided to the CPM for review and approval prior to the commencement of the solar array piping construction.~~

~~**Verification:** At least 30 days prior to the commencement of solar array piping construction, the project owner shall provide the design drawings as described above to the CPM for review and approval.~~

<u>HAZ-4: The project owner shall not allow any fuel gas pipe cleaning activities on-site, either before placing the pipe into service or at any time during the lifetime of the facility, that involves "flammable gas blows" where natural (or flammable) gas is used to blow out debris from piping and then vented to atmosphere. Instead, an inherently safer method involving a non-flammable gas (e.g. air, nitrogen, steam) or mechanical pigging shall be used as per NFPA 56. A written procedure shall be developed and implemented as per NFPA 56, section 4.3.1</u>

Verification: At least 30 days before any fuel gas pipe cleaning activities begin, the project owner shall submit a copy of the Fuel Gas Pipe Cleaning Work Plan (as described in NFPA 56, section 4.3.1) which shall indicate the method of cleaning to be used, what gas will be used, the source of pressurization, and whether a mechanical PIG will be used, to the CBO for information and to the CPM for review and approval.

HAZ-5 Prior to commencing construction, a site-specific Construction Site Security Plan for the construction phase shall be prepared and made available to the CPM for review and approval. The Construction Security Plan shall include the following:

1. perimeter security consisting of fencing enclosing the construction area;
2. security guards;
3. site access control consisting of a check-in procedure or tag system for construction personnel and visitors;
4. written standard procedures for employees, contractors and vendors when encountering suspicious objects or packages on-site or off-site;
5. protocol for contacting law enforcement and the CPM in the event of suspicious activity or emergency; and
6. evacuation procedures.

Verification: At least 30 days prior to commencing construction, the project owner shall notify the CPM that a site-specific Construction Security Plan is available for review and approval.

HAZ-6 The project owner shall also prepare a site-specific **Operations** security plan for the ~~commissioning and~~ operational phase~~s~~ that ~~will~~**shall** be **made** available to the CPM for review and approval. The project owner shall implement site security measures that address physical site security and hazardous materials storage. The level of security to be implemented shall not be less than that described below (as per NERC 2002).

The Operation Security Plan shall include the following:

1. permanent full perimeter fence or wall, at least eight feet high; ~~and topped with barbed wire or the equivalent;~~
2. main entrance security gate, either hand operated or motorized;
3. evacuation procedures;
4. protocol for contacting law enforcement and the CPM in the event of suspicious activity or emergency;
5. written standard procedures for employees, contractors, and vendors when encountering suspicious objects or packages on-site or off-site;

6.

   A. a statement (refer to sample, **ATTACHMENT A**), signed by the project owner certifying that background investigations have been conducted on all project personnel. Background investigations shall be restricted to determine the accuracy of employee identity and employment history and shall be conducted in accordance with state and federal laws regarding security and privacy;

   ~~1.~~ B. a statement(s) (refer to sample, **ATTACHMENT B**), signed by the contractor or authorized representative(s) for any permanent contractors or other technical contractors (as determined by the CPM after consultation with the project owner), that are present at any time on the site to repair, maintain, investigate, or conduct any other technical duties involving critical components (as determined by the CPM after consultation with the project owner) certifying that background investigations have been conducted on contractors who visit the project site. **Background investigations shall be restricted to determine the accuracy of employee identity and employment history and shall be conducted in accordance with state and federal laws regarding security and privacy.**;

7. site access controls for employees, contractors, vendors, and visitors;

8. a statement(s), **if required,** (refer to sample, **ATTACHMENT C**), signed by the owners or authorized representative of ~~propane~~ **hazardous materials** transport vendors, certifying that they have prepared and implemented security plans in compliance with 49 CFR 172.802, and that they have conducted employee background investigations in accordance with 49 CFR Part 1572, subparts A and B;

9. closed circuit TV (CCTV) monitoring system, recordable, and viewable in the power plant control room and security station (if separate from the control room) with cameras able to pan, tilt, and zoom, have low-light capability, and are able to view the outside entrance to the control room, ~~the propane/LPG tank,~~ ~~and~~ the front gate, and key areas of the power block areas; and

10. additional measures to ensure adequate perimeter security consisting of either:

    A. security guard(s) present 24 hours per day, 7 days per week and conducting both routine and random patrols; **or**

    B. perimeter breach detectors; ~~power plant personnel on-site 24 hours per day, 7 days per week~~; or

    C. CCTV able to view 100% of the perimeter fence.

~~perimeter breach detectors the CCTV able to view 100% of the entrance gates and the power block areas.~~

The project owner shall fully implement the security plans and obtain CPM approval of any substantive modifications to those security plans. The CPM may authorize modifications to these measures, or may require additional measures, **<u>such as protective barriers for critical power plant components (e.g. transformers, gas lines, compressors, etc.)</u>** or cyber security depending upon circumstances unique to the facility or in response to industry-related standards, security concerns, or additional guidance provided by the U.S. Department of Homeland Security, the U.S. Department of Energy, or the North American Electrical Reliability Council, after consultation with both appropriate law enforcement agencies and the project owner.

<u>Verification:</u> At least 30 days prior to the initial receipt of ~~HTF or propane/LPG~~ **<u>hazardous materials</u>** on-site **<u>for commissioning or operations</u>**, the project owner shall notify the CPM that a site-specific Operations Site Security Plan is available for review and approval. In the annual compliance report, the project owner shall include a statement that all current project employee and appropriate contractor background investigations have been performed, and that updated certification statements have been appended to the operations security plan. In the annual compliance report, the project owner shall include a statement that the operations security plan includes all current hazardous materials transport vendor certifications for security plans and employee background investigations.

HAZARDOUS MATERIALS Appendix A Table-1
Acute Ammonia Exposure Guidelines

Guideline	Responsible Authority	Applicable Exposed Group	Allowable Exposure Level	Allowable* Duration of Exposures	Potential Toxicity at Guideline Level/Intended Purpose of Guideline
IDLH[2]	NIOSH	Workplace standard used to identify appropriate respiratory protection.	300 ppm	30 minutes	Exposure above this level requires the use of "highly reliable" respiratory protection and poses the risk of death, serious irreversible injury, or impairment of the ability to escape.
IDLH/10[1]	EPA, NIOSH	Work place standard adjusted for general population factor of 10 for variation in sensitivity	30 ppm	30 minutes	Protects nearly all segments of general population from irreversible effects.
STEL[2]	NIOSH	Adult healthy male workers	35 ppm	15 minutes, 4 times per 8-hour day	No toxicity, including avoidance of irritation.
EEGL[3]	NRC	Adult healthy workers, military personnel	100 ppm	Generally less than 60 minutes	Significant irritation, but no impact on personnel in performance of emergency work; no irreversible health effects in healthy adults. Emergency conditions one-time exposure.
STPEL[4]	NRC	Most members of general population	50 ppm 75 ppm 100 ppm	60 minutes 30 minutes 10 minutes	Significant irritation, but protects nearly all segments of general population from irreversible acute or late effects. One-time accidental exposure.
TWA[2]	NIOSH	Adult healthy male workers	25 ppm	8 hours	No toxicity or irritation on continuous exposure for repeated 8-hour work shifts.
ERPG-2[5]	AIHA	Applicable only to emergency response planning for the general population (evacuation) (not intended as exposure criteria) (see preface attached)	200 ppm	60 minutes	Exposures above this level entail** unacceptable risk of irreversible effects in healthy adult members of the general population (no safety margin).

1) (EPA 1987) 2) (NIOSH 1994) 3) (NRC 1985) 4) (NRC 1972) 5) (AIHA 1989)

* The (NRC 1979), (WHO 1986), and (Henderson and Haggard 1943) all conclude that available data confirm the direct relationship to increases in effect with both increased exposure and increased exposure duration.

** The (NRC 1979) describes a study involving young animals, which suggests greater sensitivity to acute exposure in young animals. The WHO (1986) warned that the young, elderly, asthmatics, those with bronchitis, and those that exercise should also be considered at increased risk based on their demonstrated greater susceptibility to other non-specific irritants.

APPENDIX B

Hazardous Materials Proposed for Use at the PSEGS

(Total Amounts to be Located on the Entire Site)

Hazardous Materials Management
Appendix B
Hazardous Materials at the PSEGS
(Based on Title 22 Hazard Characterization)

Material	Hazard Characteristics	Purpose	Storage Location	Maximum Stored	Storage Type
Nalco Elimin-OX (Oxygen scavenger)	Ignitability	Oxygen scavenger for boiler chemistry	Power Block: Containers near power tower	1,600 gal[1]	400 gallon totes
Aqueous Ammonia (19% concentration)	Reactivity, toxicity	pH control for boiler chemistry	Power Block: Containers near power tower	1,600 gal[1]	400 gallon totes
Sulfuric Acid 93% (66° Baumé)	Corrosivity, reactivity, toxicity	pH control	Power Block and Common Area: Containers located in Water Treatment Building	2,400 gal[1]	400 gallon totes
Sulfuric Acid (Batteries)	Corrosivity, reactivity, toxicity	Electrical power	Power Block: Contained within the main electrical room and the power tower Common Area: Contained within main electrical room	12,000 gal	Batteries
Sodium Hydroxide (50% concentration)	Corrosivity, reactivity, toxicity	pH control	Power Block and Common Area: Containers located in Water Treatment Building	2,400 gal[1]	400 gallon totes
Diesel Fuel (No. 2)	Ignitability	Emergency generator	Power Block: Near fire pump, beneath emergency diesel generator, and adjacent to the mirror wash machines water filling station Common Area: beneath emergency diesel generator and near fire pump	40,000 gal	Aboveground storage tanks and in equipment
Paint, solvents, adhesives, cleaners, sealants, lubricants	Toxicity	Equipment Maintenance,	Power Block: Maintenance Shop	500 gal	1 gal and 5 gal containers

Note 1: Assumes 2 totes at each power block

Hazardous Materials Usage and Storage During Operation Based on Material Properties					
Material	**Hazard Characteristics**	**Purpose**	**Storage Location**	**Maximum Stored**	**Storage Type**
Cleaning Chemicals and Detergents	Toxicity, irritant	Periodic cleaning of steam turbine	Power Block: Maintenance shop	3,000 gal	Misc. Manufacturer's containers
Nalco 5200M (Anti- scalant	Irritant, mildly toxic	Wastewater treatment anti-scalant	Power Block: Containers near WWTS Common Area: Containers in Water Treatment Building (storage)	1,500 gal	300 gal totes
Nalco 3DT-187 (Corrosion Inhibitor)	Irritant, mildly toxic	Wet-Surface Air Cooler (WSAC) Corrosion inhibitor	Power Block: Containers near WSAC Common Area: Containers in Water Treatment Building (storage)	2,100 gal	300 gallon totes
Nalco 73801WR (Dispersant)	Irritant, mildly toxic	WSAC Dispersant	Power Block: Containers near WSAC Common Area: Containers in Water Treatment Building (storage)	2,100 gal	300 gallon tote
Nalco TRAC107 (Corrosion Inhibitor)	Irritant, mildly toxic	Closed cooling water Corrosion Inhibitor	Power Block: Contained within CCW system Common Area: Containers in water treatment building (storage)	500 gal	55 drums
Avista Vitec (Scale Inhibitor)	Irritant, mildly toxic	Reverse osmosis scale inhibitor	Power Block and Common Area: Containers in Water Treatment Building	900 gal	300 gallon totes
Sodium Bisulfite	Irritant, mildly toxic	Dechlorination	Power Block and Common Area: Containers in Water Treatment Building	900 gal	300 gallon totes

Hazardous Materials Usage and Storage During Operation Based on Material Properties					
Material	**Hazard Characteristics**	**Purpose**	**Storage Location**	**Maximum Stored**	**Storage Type**
Nalco 7468 (Anti- foaming agent)	Irritant, mildly toxic	Wastewater treatment system anti-foaming agent	Power Block: Containers near WWTS Common Area: Containers in Water Treatment Building (storage)	1,500 gal	300 gallon totes

Hazardous Materials Usage and Storage During Operation Based on Material Properties					
Material	**Hazard Characteristics**	**Purpose**	**Storage Location**	**Maximum Stored**	**Storage Type**
Lubricating Oil	Mildly toxic	Miscellaneous equipment lubrication	Power Block: Contained within equipment, drums during replacement Common Area: Contained within equipment, spare capacity stored in Maintenance shop	30,000 gal	Contained within equipment and misc. drums during replacement
Mineral Transformer Insulating Oil	Mildly toxic	Provides overheating and insulation protection for transformers	Power Block: Contained within transformers Common Area: Contained within transformers	112,000 gal	Transformers
Hydraulic Oil	Mildly toxic	Miscellaneous equipment control oil	Power Block: Contained within equipment, drums during replacement Common Area: Contained within equipment, spare capacity stored in Warehouse	6,000 gal	Contained within equipment and misc. drums during replacement
Sodium Hypochlorite 12% (trade) solution	Irritant, Corrosivity, reactivity	Biocide	Power Block: Containers in water treatment building Common Area: Potable water treatment area	2,400 gal	300 gal totes

LAND USE

Testimony of James Adams

SUMMARY OF CONCLUSIONS

The proposed Palen Solar Electric Generating System (PSEGS) would be located on 3,794 acres of public land administered by the U.S. Bureau of Land Management (BLM), within the federal California Desert Conservation Area (CDCA) Plan area. The acreage for the PSEGS would be 572 acres less than the original footprint of the Palen Solar Power Project (PSPP or approved project). The project area is in the “Multiple-Use Class M” land use category. The Class M land use category may allow electrical generation plants in accordance with federal, state, and local laws subject to approval of a CDCA Plan amendment by the BLM.

The proposed power plant and overhead transmission line to serve the project require the BLM’s approval of a right-of-way (ROW) grant and two CDCA Plan amendments; one amendment for the solar facility and one to allow the project’s electric transmission line to be constructed outside a designated corridor. With the BLM’s approval of the ROW grant and plan amendments, the PSEGS and the portion of the transmission line outside of the designated corridor would be consistent with the CDCA Plan. The project owner filed a revised plan of development with the BLM on February 13, 2013. Staff proposes Conditions of Certification BIO-9 through BIO-11 to mitigate the loss of desert tortoise habitat and ensure that the PSEGS is compatible with the Northern and Eastern Colorado Desert Coordinated Management Plan (NECO) area.

Unlike the approved project, the PSEGS does not involve the use of private land. Therefore, land use related state and local laws, ordinances, regulations, and standards (LORS) identified for the PSPP are not applicable to the PSEGS, and only federal LORS would apply. As conditioned, the PSEGS would comply with applicable land use-related LORS.

Staff concludes the PSEGS would not disrupt or divide an established community, or convert farmland to non-agricultural use or forest land to non-forest use. The PSEGS is not within a habitat conservation plan approved by the U.S. Fish and Wildlife Service (USFWS), or a natural community conservation plan approved by the California Department of Fish and Wildlife. The PSEGS would either not contribute to cumulative impacts or its incremental impacts would be less than cumulatively considerable.

The Visual Resources staff concludes that the PSEGS would result in significant unmitigable direct and cumulative impacts to existing scenic resource values as seen from several viewing areas in the project vicinity and Chuckwalla Valley area (approximately 30 mile radius from the PSEGS), including: Interstate 10 (I-10), State Route 177 (SR-177), Corn Springs Road, Joshua Tree National Park, Palen McCoy Wilderness, and Chuckwalla Mountains Wilderness. Staff concludes the PSEGS would create a land use incompatibility because of significant and unavoidable visual impacts to recreational users of park and wilderness areas.

According to 2010 census data, there are no occupied residences and no minority or below poverty level populations' living within the six-mile buffer of the PSEGS site. Therefore there is no environmental justice population as defined by *Environmental Justice: Guidance Under the National Environmental Policy Act* that would trigger further scrutiny for purposes of an environmental justice analysis.

INTRODUCTION

In this section, staff discusses if the PSEGS would result in substantial adverse impacts under the California Environmental Quality Act, and if the project would be inconsistent with applicable laws, ordinances, regulations, and standards (LORS) pertaining to land use, agriculture, and forest resources.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS (LORS)

Land Use Table 1 lists the land use LORS applicable to the proposed project. The proposed project's consistency with these LORS is analyzed under "Assessment of Impacts and Discussion of Mitigation" in **Land Use Table 2**. The same federal LORS applicable to the PSPP would be applicable to the PSEGS. Because the PSEGS does not involve the use of private land and would be located entirely on BLM land, the State Subdivision Map Act and Riverside County Land Use LORS are not applicable to the PSEGS Land Use Table 1

Land Use Table 1
Laws, Ordinances, Regulations and Standards (LORS)

Applicable LORS	Description
Federal	
Federal Land Policy and Management Act (FLPMA), 1976 – 43 CFR 1600, Sec. 501. [43 U.S.C. 1761]	Establishes public land policy; guidelines for administration; and provides for the management, protection, development, and enhancement of public lands. In particular, the FLPMA's relevance to the proposed project is that Title V; Section 501 establishes BLM's authority to grant rights-of-way for generation, transmission, and distribution of electrical energy (FLPMA 2001).
Bureau of Land Management -California Desert Conservation Area (CDCA) Plan, 1980 as Amended (BLM 1980)	The 25 million-acre CDCA contains over 12 million acres of public lands spread within the area known as the California Desert, which includes the following three deserts: the Mojave, the Sonoran, and a small portion of the Great Basin. The 12 million acres of public lands administered by the BLM are half of the CDCA. The CDCA Plan is a comprehensive, long-range plan with goals and specific actions for the management, use, development, and protection of the resources and public lands within the CDCA, and it is based on the concepts of multiple use, sustained yield, and maintenance of environmental quality. The plan's goals and actions for each resource are established in its 12 elements. Each of the plan elements provides both a desert-wide perspective of the planning decisions for one major resource or issue of public concern as well as more specific interpretation of multiple-use class guidelines for a given resource and its associated activities.
Northern and Eastern Colorado Desert (NEC0) Coordinated	The NECO plan is a landscape-scale planning effort for most of the California portion of the Sonoran Desert ecosystem. The planning area encompasses over five million acres. The NECO Plan amended the CDCA plan in 2002 The CDCA Plan/NECO is related to the BLM/U.S. Department of Energy

Applicable LORS	Description
Management Plan	(DOE).Final Programmatic Environmental Impact Statement for Solar Energy Development in Six Southwestern States, which was published in July 2012. It gives guidance as to how and where solar projects can be built on BLM lands.

PROPOSED MODIFIED PROJECT

The PSEGS proposal includes replacing the parabolic trough solar collection system with solar tower technology. Access to the site would use the same primary access road as the approved project. The project would continue to interconnect to the regional transmission grid at Southern California Edison's (SCE) Red Bluff Substation, which is currently under construction. The PSEGS would be comprised of two adjacent solar fields and associated facilities with a total combined nominal output of approximately 500 MW. Palen Solar Holdings (PSH) proposes to develop the PSEGS in two operational units, each consisting of one solar field, one tower, and a power block capable of producing approximately 250 MW of electricity.

SETTING

The PSEGS is to be constructed on a relatively flat, largely undeveloped portion of the Colorado Desert (a subdivision of the Sonoran Desert) in the Chuckwalla Valley between the Palen Mountains and U.S. Interstate 10 (I-10) (Corn Springs Road exit) in Riverside County, California.

The project site is dominated by sand, Sonoran creosote brush scrub, and has several desert dry wash and unvegetated ephemeral dry wash areas. High voltage electric transmission lines cross the area.

The project owner has requested a right of way grant on approximately 5,200 acres of land administered by the U.S. Bureau of Land Management (BLM). The construction and operation of the PSEGS would involve approximately 3,794 acres. As noted earlier, the BLM and the Department of Energy (DOE) published a Final Programmatic Environmental Impact Statement for Solar Energy Development in Six Southwestern States in July 2012. The small town of Desert Center is located at the far southwestern edge of the Riverside East Solar Energy Zone (SEZ), along Interstate (I-10), which runs east-west along the southern boundary of the Riverside East SEZ (USBLM/US DOE 2012). The PSEGS would be located within this SEZ.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

Energy Commission staff has analyzed the information provided in the Application for Certification (AFC) and the Petition to Amend as well as information from other sources to determine consistency of the proposed PSEGS project with applicable land use LORS and the PSEGS potential to have significant adverse land use-related impacts.

METHODS AND THRESHOLDS FOR DETERMINING SIGNIFICANCE

Significance criteria used in this document are based on Appendix G of the CEQA Guidelines and performance standards or thresholds identified by Energy Commission staff, as well as applicable LORS utilized by other governmental regulatory agencies.

An impact may be considered significant if the proposed project results in:

- Conversion of Farmland or Forest Land;
  - Conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance (Farmland) as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use.[1]
  - Conflict with existing zoning for agricultural use, or a Williamson Act contract.
  - Conflict with existing zoning for, or cause rezoning of, forest land [as defined in Pub. Resources Code §12220 (g)), timberland (as defined by Pub. Resources Code §4526), or timberland zoned Timberland Production [as defined by Gov. Code §51104(g)].
  - The loss of forest land or conversion of forest land to non-forest use.
  - Other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use[2] or conversion of forest land to non-forest use.
- physical disruption or division of an established community;
- conflict with any applicable habitat conservation plan, natural community conservation plan, or biological opinion;
- conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction, or that would normally have jurisdiction, over the project adopted for the purpose of avoiding or mitigating environmental effects. This includes, but is not limited to, a General Plan, redevelopment plan, or zoning ordinance; or
- incremental impacts that, although individually limited, are cumulatively considerable when viewed in connection with other project-related effects or the effects of past projects, other current projects, and probable future projects.[3]

---

[1] FMMP defines "land committed to non-agricultural use" as land that is permanently committed by local elected officials to non-agricultural development by virtue of decisions which cannot be reversed simply by a majority vote of a city council or county board of supervisors.

[2] A non-agricultural use in this context refers to land where agriculture (the production of food and fiber) does not constitute a substantial commercial use.

[3] Cumulative impacts refer to two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts. The individual effects may be changes resulting from a single project or a number of separate projects and can result from individually minor, but collectively significant actions taking place over a period of time (CEQA Guidelines §15355; 40 CFR 1508.7)

In general, a power plant and its related facilities may also be incompatible with existing or planned land uses, resulting in potentially significant impacts, if they create unmitigated noise, dust, or a public health or safety hazard or nuisance; result in adverse traffic or visual impacts; or preclude, interfere with, or unduly restrict existing or future uses.

DIRECT/INDIRECT IMPACTS AND MITIGATION

This section discusses the applicable potential project impacts and associated methods and thresholds of significance referenced above.

Agriculture and Forest

A. Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use?

The PSEGS would not convert farmland. The project site and vicinity are characterized largely as undeveloped desert. Figure 2.1-3 in the Petition to Amend shows adjacent parcels to the north and west of the project site that are being farmed (Palen 2102a). The PSEGS would not convert farmland and would not result in a significant adverse impact under this CEQA criterion.

The BLM's Master Title Plats[4] showing Township 5 South Range 17 East, and Township 6 South Range 17 East of the San Bernardino Meridian, California, which includes the project area, provide notations that the townships are not suitable for agriculture. However, more recent land use shows parcels are being farmed near the PSEGS site.

B. Would the project conflict with existing zoning for agricultural use, or a Williamson Act contract?

The PSEGS would not convert prime farmland, conflict with existing county zoning for agricultural use or a Williamson Act contract, or result in the conversion of farmland to a non-agricultural use. The PSEGS would not conflict with this CEQA criterion and would not result in a significant impact. The PSEGS would be constructed entirely on BLM land and county zoning would not apply. Also, there are no Williamson Act contracts on BLM lands.

[4] The BLM's Master Title Plats are the foundation of their land records. It is a drawing of the most recent survey or protraction (unsurveyed lands) by township. It is a graphic plat illustrating current federal ownership, agency jurisdiction, and rights reserved to the Federal government on private land within a township (USDOI2010).

C. Would the project conflict with existing zoning for, or cause rezoning of, forest land [as defined in Public Resources Code section 12220(g)], timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production [as defined by Government Code section 51104(g)]?

The PSEGS would not conflict with zoning for, or cause rezoning of forest land, timberland or timberland zoned Timberland Production. The project area and vicinity are characterized as undeveloped desert though there are some agricultural activities near the PSEGS site.

The project area is located on BLM administered land designated "Multiple-Use Class M." This class provides for energy and utility development in accordance with federal, state and local law. The project's proposed use on this acreage is a use that would be consistent with uses permitted in Multiple-Use Class M and would not conflict with the CDCA Plan with the approval of an amendment by the BLM. With the BLM's approval, the PSEGS would not be in conflict with this CEQA criterion and would not result in a significant adverse impact.

D. Would the project result in the loss of forest land or conversion of forest land to non-forest use?

The PSEGS would not result in the loss of forest land or conversion of forest land to non-forest use.[5] The project area and vicinity are characterized as undeveloped desert. The PSEGS would not create a loss or conversion of forest land and would not result in a significant adverse impact under this CEQA criterion.

E. Would the project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

The PSEGS would be constructed on an undeveloped portion of the Colorado Desert in the eastern Chuckwalla Valley. The project area consists of relatively undisturbed, unimproved desert dominated by sand and Sonoran creosote brush scrub. The area also has desert dry wash woodland, unvegetated ephemeral dry wash areas, and stabilized and partially stabilized desert dunes, and transmission power lines. The PSEGS would not involve other changes in the existing environment creating a conversion of farmland or forest land and would not result in a significant impact under this CEQA criterion.

[5] In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board (CCR2010).

Physical Disruption Or Division Of An Established Community

The PSEGS would not physically divide an established community. The project site is in an undeveloped portion of the Colorado Desert in eastern Chuckwalla Valley. The unincorporated community of Desert Center (population 150) is the closest community to the project. Desert Center is approximately 10 miles west of the project site. The PSEGS would not conflict with this CEQA criterion and would not create a significant impact.

Conflict With Any Applicable Habitat Conservation Plan Or Natural Community Conservation Plan

The 3,794 acre PSEGS site is not within an approved U.S. Fish and Wildlife Service habitat conservation plan under section 10 of the Endangered Species Act, or within an approved California Department of Fish and Wildlife natural community conservation plan under section 2800 of the Natural Communities Conservation Act. The PSEGS would not conflict with this CEQA criterion and would not result in a significant impact.

Conflict With Any Applicable Land Use Plan, Policy Or Regulation

California Desert Conservation Area

In 1976, Congress passed the Federal Land Policy Management Act (FLPMA). In the FLPMA, Congress required the preparation of a comprehensive long-range plan for the California Desert Conservation Area (FLPMA section 601).

The CDCA Plan is a comprehensive, long-range plan with goals and specific actions for the management, use, development, and protection of the resources and public lands within the CDCA, and it is based on the concepts of multiple use, sustained yield, and maintenance of environmental quality. The plan's goals and actions for each resource are established in its 12 elements.

The CDCA Plan area totals 25 million acres of which 12 million acres are administered by the BLM. The project site is located within the CDCA Plan "Multiple-Use Class M (Moderate Use)" land use category. This class may provide for electrical generation plants in accordance with state, federal, and local laws. New gas, electric, and water transmission facilities and cables for interstate communication may be allowed only within designated corridors. The Class M category is also designed to conserve desert resources and to mitigate damage to those resources that permitted uses may cause. (USDOI1980, pg. 13 and pg. 15) [See **Land Use Figure 1**– Current BLM Multiple Use Classes].

Although the site is classified as Multiple-Use Class M, a land use amendment to the CDCA would be required because the proposed use, a solar thermal electric generating facility, is not identified in the current CDCA Plan. The BLM's approval of a ROW grant and plan amendments for the power plant and the transmission line would make the project conform to the CDCA Plan. With the BLM's approval of the ROW grant and plan amendments, the PSEGS and transmission line would not result in a conflict with the CDCA Plan under this CEQA criterion and would not result in a significant adverse impact.

Northern and Eastern Colorado Desert Coordinated Management Plan

The PSEGS area is within the Northern and Eastern Colorado Desert Coordinated Management Plan (NECO) area. The NECO is an amendment to the CDCA Plan to make it compatible with desert tortoise conservation and recovery. The NECO is a landscape-scale planning effort for most of the California portion of the Sonoran Desert ecosystem that promotes desert tortoise conservation and recovery. The project area is within the Desert Tortoise Eastern Colorado Recovery Unit.

In 1990, the desert tortoise was listed as a threatened species under the federal Endangered Species Act. By law, land managing agencies are required to review their current land use plans, adjust them as necessary, and consult on their adequacy with the U.S. Fish and Wildlife Service (USFWS) [USDOI2002, pg. 1-1].

The NECO designates a portion of the PSEGS area as a Multiple-species Wildlife Habitat Management Area (WHMA). The WHMA was established to provide long-term conservation of various species of special concern. The entire PSEGS site is within a multi-species WHMA. The BLM designates portions of land under its control as Desert Wildlife Management Areas (DWMA). Approximately 1,400 feet of the proposed generation tie-line is within the Chuckwalla DWMA. The southwestern portion of the project site, natural gas line corridor, and proposed generation tie-line corridor overlaps with 226 acres of the Chuckwalla Desert Tortoise Critical Habitat Unit.

As indicated in the **BIOLOGICAL RESOURCES** section, without mitigation the PSEGS could contribute to the cumulatively significant loss of biological resources within the Chuckwalla Valley and the NECO area. The **Biological Resources** analysis proposes Conditions of Certification **BIO-9** through **BIO-11** to mitigate the loss of desert tortoise habitat. Condition of Certification **BIO-7** would require the project owner to prepare and implement a Biological Resources Mitigation Implementation and Monitoring Plan (BRMIMP). The BRMIMP comprehensively describes avoidance, minimization, and mitigation measures. Staff concludes that with the proposed conditions of certification the PSEGS would be compatible with the NECO PSEGS.

Land Use Compatibility

A power plant and its related facilities may also be incompatible with existing or planned land uses, resulting in potentially significant impacts, if they create unmitigated noise, dust, or a public health or safety hazard or nuisance; result in adverse traffic or visual impacts; or preclude, interfere with, or unduly restrict existing or future uses. Staff has conferred with staff in the following technical areas: **Noise and Vibration**, **Public Health**, **Hazardous Materials Management**, **Traffic and Transportation**, and **Visual Resources** and concludes that the PSEGS would have no significant direct or cumulative impacts in any of these technical areas except **Visual Resources,** and perhaps **Traffic and Transportation.** The **Traffic and Transportation** analysis notes that traffic impacts are undetermined and will be addressed in the Final Staff Assessment.

The **Visual Resources** staff concludes that the PSEGS would result in significant unmitigable direct and cumulative impacts to existing scenic resource values as seen from several viewing areas in the project vicinity and Chuckwalla Valley area (approximately 30 mile radius from the PSEGS), including: Interstate 10 (I-10), State Route 177 (SR-177), Corn Springs Road, Joshua Tree National Park, Palen McCoy Wilderness, and Chuckwalla Mountains Wilderness. Staff concludes the PSEGS would be an incompatible land use for recreationists using these park and wilderness areas.

CUMULATIVE IMPACTS

Under CEQA Guidelines, "a cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the EIR [environmental impact report] together with other projects causing related impacts" [Cal. Code Regs., tit. 14, §15130(a)(1)]. Cumulative impacts of the project must be discussed if the incremental effect of a project, combined with the effects of other projects is "cumulatively considerable" [Cal. Code Regs., tit. 14, §15130(a)]. Such incremental effects are to be viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects" [Cal. Code Regs., tit. 14, §15164(b)(1)]. Together, these projects comprise the cumulative scenario which forms the basis of the cumulative impact analysis.

The discussion of cumulative impacts shall reflect the severity of impacts and their likelihood of occurrence, but the discussion need not provide as great detail as is provided for the effects attributable to the project alone. The discussion of cumulative impacts shall be guided by standards of practicality and reasonableness, and should focus on the cumulative impact to which the identified other projects contribute rather than the attributes of other projects which do not contribute to the cumulative impact [Cal. Code Regs., tit. 14, §15130(b)].

Geographic Scope of Analysis

Executive Summary Attachment A – Tables 1, 2, and 3, identifies existing projects, foreseeable projects in the project area, and projects submitted and on hold, respectively. The projects discussed below are contained in the **Executive Summary Attachment A – Tables 1, 2,** and **3**. The cumulative land use analysis considers past, current and probable future projects that are relatively near the proposed project that would contribute to cumulative impacts by impacting agricultural or forest lands, disrupting or dividing an established community, conflicting with applicable land use plans, policy or regulation, or conflicting with an applicable habitat conservation plan or natural community conservation plan.

Existing Projects

The eastern Chuckwalla Valley is characterized by undisturbed desert open space and wilderness, distinctive flora such as creosote bush scrub and Joshua tree, sand dunes, and mountainous terrain with large rock outcroppings. Urban and suburban development is absent and infrastructure other than energy transmission infrastructure is very limited. Farming is limited and primarily dedicated to jojoba and palm tree production. Much of the land has been identified as desert tortoise habitat by the U.S.

Fish and Wildlife Service. Land south of I-10 is within the NECO desert tortoise southern recovery unit (*Eastern Colorado Recovery Unit*).

Desert Center, population 150, is a focused specialty center primarily serving the commercial needs of highway travelers on I-10 and State Highway 177. It is an aggregation of highway service commercial-related uses clustered around the Desert Center-Rice Road interchange. The community also includes two mobile home parks, industrial/storage facilities, and a Caltrans equipment yard.

The Chuckwalla Valley State Prison is located on 1,720 acres on Wiley's Well Road in Blythe. The state prison provides for long-term housing and services for male felons classified as medium and low-medium inmates. It is located about 20 miles east of the PSEGS site.

The Devers-Palo Verde No.1 (DPV1) is an existing 500 kilovolt (kV) transmission line that parallels I-10. The transmission line is within a developed transmission line right of way within a federally approved utility corridor[6] The DPV1 was approved by the California Public Utilities Commission (CPUC) in 1979 and constructed in 1982. It is located about two miles south of the PSEGS site.

The Blythe 230 kV Transmission Line is two 230 kV transmission lines that span approximately 70 miles between the Julian Hinds Substation and the Bucks Substation. The transmission line was completed in June 2010. The transmission line was constructed within the existing federally approved utility corridor along I-10 about two miles south of the PSEGS site.

The Blythe Energy Project is a 520 MW combined-cycle natural gas-fired electricity generating facility located north of I-10 and seven miles west of the California/Arizona border. It is connected to the Bucks Substation and is located about 31 miles east of the PSEGS site.

A Section 368 Energy Corridor[7] parallels I-10 and includes the existing federal utility corridor designated in the CDCA Plan. The no default corridor width shown for the Chuckwalla Valley segment of the Section 368 Corridor is 10,560 feet (USDOI2009, Table A).

---

[6] The utility corridor is one of 16 utility corridors designated in the California Desert Conservation Area Plan of 1980, as amended.

[7] Section 368 of the Energy Policy Act of 2005 (the Act), Public Law 109-58 (H.R. 6), enacted August 8, 2005, directs the Secretaries of Agriculture, Commerce, Defense, Energy, and the Interior (the Agencies) to designate under their respective authorities corridors on federal land in 11 western states (Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming) for oil, gas, and hydrogen pipelines and electricity transmission and distribution facilities (energy corridors). Section 368 requires the Agencies to conduct any "environmental reviews" necessary to complete the designation of Section 368 energy corridors. The evaluation of future project-related environmental impacts must await site-specific proposals and the required site-specific environmental review (WECPEIS2010).

Foreseeable Projects in the Project Area

The U.S.DOE, Office of Energy Efficiency and Renewable Energy and the BLM, in response to direction from Congress under Title II, Section 211 of the Energy Policy Act of 2005, as well as Executive Order 13212, Actions to Expedite Energy-Related Projects (May 18, 2001), has published a Programmatic Environmental Impact Statement that evaluates utility-scale solar energy development; to develop and implement agency-specific programs that would establish environmental policies and mitigation strategies for solar energy projects; and to amend relevant BLM land use plans with the consideration of establishing a new BLM solar energy development program (SEDPEISIC2010).

On March 11, 2009, Secretary of Interior Salazar announced Secretarial Order No. 3285, a policy goal of identifying and prioritizing specific locations best suited for large-scale production of solar energy on tracts of BLM-administered land. The BLM identified a 202,295-acre area in eastern Riverside County as "Riverside East." Riverside East includes the Chuckwalla Valley and lands on the north side of I-10 and west of the city of Blythe.

The Devers-Palo Verde 2 Transmission Line Project, approved by the CPUC in January 2007, involves the construction of two 500 kilovolt electric transmission lines. The route for the Devers-Palo Verde 2 (DPV2) Transmission Line parallels the existing DPV1 transmission line route along I-10. Construction began in June 2011. The new line would be about two miles south of the PSEGS site.

The Red Bluff Substation is located in the Desert Center area near I-10 within the Devers-Palo Verde transmission line corridor and will be operational in December 2013. The substation is about six miles west of the PSEGS site and will be owned and operated by SCE. The 230/500 kV substation would allow electricity to be carried by the Devers-Palo Verde 2 transmission line. The substation also would allow interconnection of the proposed PSEGS project and other proposed renewable energy projects in the Desert Center area.

The proposed Desert Southwest Transmission Line project consists of construction of an approximate 118-mile 500 kV transmission line and a new substation/switching station. The BLM Palm Springs-South Coast Field Office approved a ROW grant for the transmission line to cross public land between Blythe and the western end of the Coachella Valley about 24 miles east of the PSEGS site.

The proposed Chuckwalla Solar 1, a 200 MW solar photovoltaic generating project, is to be constructed one mile north of Desert Center. The project is to be constructed on 4,083 acres of federal land administered by the BLM. A plan for development (POD) has been submitted to the BLM for their approval. The proposed PSEGS site is approximately six miles east of the project.

The proposed Desert Lily Soleil Project, a 100 MW photovoltaic generating project on 1,216 acres, is to be located six miles north of Desert Center. The project includes a five to eight mile transmission line to the proposed SCE Red Bluff Substation. A POD has been submitted to the BLM for their approval. The PSEGS is approximately seven miles east of the project.

The proposed Desert Sunlight Solar Farm, a 550 MW solar photovoltaic generating project, is to be located approximately five miles north of Desert Center. The project is to be constructed on 4,410 acres of BLM administered land. A record of decision and a CDCA Plan amendment have been approved by the BLM. The PSEGS site is approximately 13.5 miles east of the project.

The proposed Genesis Solar Energy Project, a 250 MW solar parabolic trough generating project, is located north of the Ford Dry Lake exit on I-10. The project's facility footprint would be 1,800 acres. The project was approved by the Energy Commission on October 12, 2010 and is under construction. The PSEGS site is approximately 12.5 miles west of the Genesis project site.

Blythe Energy Project ll is a 520 MW combined-cycle power plant that would be located within the Blythe Energy Project site boundary located on 30 acres of a 76 acre site. It was approved by the Energy Commission on September 23, 2010. The project would be about 31 miles east of the PSEGS site.

Projects Submitted and on Hold

Staff has identified a few projects where documents have been submitted to the BLM but the projects are on hold. The Eagle Mountain Landfill Project would be developed on a 4,000-acre portion of the Kaiser Eagle Mountain Mine about 17 miles north of the PSEGS site. It is currently before the U.S. Court of Appeals. Graham Pass Wind Project is a proposed 175 MW facility that would be located 15 miles south of the PSEGS site. Mule Mountain III would be a 200 MW solar photovoltaic project that would be located 22 miles southeast of the PSEGS site. Both projects are pending before the BLM.

CUMULATIVE IMPACTS ANALYSIS

The potential for the PSEGS to cause significant cumulative impacts has been considered using the following criteria from the CEQA Guidelines.

Agriculture and Forest Resources

A. Would the incremental effect of the project, combined with the effects of the other projects within the geographic scope convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use?

The PSEGS would have no direct impact on farmland and it would not contribute to cumulative impacts on this resource.

B. Would the incremental effect of the project, combined with the effects of the other projects within the geographic scope conflict with existing zoning for agricultural use, or a Williamson Act contract?

The PSEGS would not conflict with existing zoning for agricultural use and there are no Williamson Act contracts on BLM land. The PSEGS would not contribute to cumulative impacts on agricultural uses.

C. Would the incremental effect of the project, combined with the effects of the other projects within the geographic scope conflict with existing zoning for, or cause rezoning of, forest land [as defined in Public Resources Code section 12220(g)], timberland [as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g)]?

The PSEGS would not conflict with existing zoning for or cause rezoning of forest land or timberland and would not contribute to cumulative impacts on these resources.

D. Would the incremental effect of the project, combined with the effects of the other projects within the geographic scope result in the loss of forest land or conversion of forest land to non-forest use?

The PSEGS would not result in the loss or conversion of forest land and would not contribute to cumulative impacts on this resource.

E. Would the incremental effect of the project, combined with the effects of the other projects within the geographic scope involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

The PSEGS would not involve changes in the environment that would result in the conversion of farmland or forest land and would not contribute to cumulative impacts on these resources.

Physical Disruption or Division Of An Established Community

Would the incremental effect of the project, combined with the effects of the other projects within the geographic scope physically divides an established community?

The PSEGS would not physically divide an established community and would not contribute to cumulative impacts under this criterion.

Conflict With Any Applicable Habitat or Natural Community Conservation Plan

Would the incremental effect of the project, combined with the effects of the other projects within the geographic scope conflict with any applicable habitat conservation plan or natural community conservation plan?

The 3,794-acre PSEGS site is not within an approved U.S. Fish and Wildlife Service habitat conservation plan under section 10 of the Endangered Species Act, or within an approved California Department of Fish and Wildlife natural community conservation plan under section 2800 of the Natural Communities Conservation Act and would not contribute to cumulative impacts under this criterion.

Conflict With Any Applicable Land Use Plan, Policy or Regulation

Would the incremental effect of the project, combined with the effects of the other projects within the geographic scope conflict with any applicable land use plan, policy or regulation of an agency with jurisdiction over the project adopted for the purpose of avoiding or mitigating an environmental effect?

As noted earlier, the PSEGS is in the NECO Management Plan area. The NECO is an update to the CDCA Plan to make it compatible with desert tortoise conservation and recovery. The southwestern portion of the PSEGS site, natural gas line corridor, and proposed generation tie-line corridor overlap with 226 acres of the Chuckwalla Desert Tortoise Critical Habitat Unit. The **Biological Resources** analysis proposes Conditions of Certification **BIO-9** through **BIO-11** to mitigate for loss of desert tortoise habitat. With the three identified conditions of certification, staff concludes that the PSEGS would be consistent with the NECO and its impacts under this criterion would not be cumulatively considerable.

CUMULATIVE IMPACTS CONCLUSION

The PSEGS would not divide an established community, convert farmland or forest land, is not within a habitat conservation plan or a natural community conservation plan, and would not contribute to cumulative impacts to these resources. The **Biological Resources** analysis proposes Conditions of Certification **BIO-9** through **BIO-11** to mitigate for loss of desert tortoise habitat. With the three identified conditions of certification, the PSEGS would be consistent with the NECO and its impacts under this criterion would not be cumulatively considerable.

COMPLIANCE WITH LORS

Land Use Table 2 provides an analysis of the PSEGS's consistency with applicable land use-related LORS.

Land Use Table 2
PSEGS's Consistency with Applicable Land Use LORS

LORS		Consistency Determination	Basis for Consistency or Inconsistency	Proposed Condition of Certification
Source	**Policy and Strategy Descriptions**			
Federal				
Federal Land Policy and Management Act 1976 The California Desert Conservation Area Plan 1980 as amended	In 1976 Congress passed the Federal Land Policy Management Act - a law to direct the management of the public lands of the United States. In section 601, Congress required the preparation of a comprehensive long-range plan for the California Desert Conservation Area (CDCA). The purpose of this plan was to establish guidance for the management of the public lands in the California Desert administered by the U.S. Bureau of Land Management.			
Chapter 2 Multiple-Use Classes: - Multiple-Use Class M (Moderate Use)	Multiple-Use Class M (Moderate Use) is based upon a controlled balance between higher intensity use and protection of public lands. This class provides for a wide variety of present and future uses such as mining, livestock grazing, recreation, energy, and utility development. Class M management is also designed to conserve desert resources and to mitigate damage to those resources which permitted uses may cause. All types of electrical generation plants may be allowed in accordance with state, federal, and local laws. New gas, electric, and water transmission facilities and cables for interstate communication may be allowed only within designated corridors. Existing facilities within designated corridors may be maintained and upgraded or improved in accordance with existing rights of way grants or by amendments to right of way grants. Existing facilities outside designated corridors	The PSEGS would be consistent if the BLM approves two project-specific CDCA Plan amendments.	The PSEGS is to be constructed on federal land administered by the BLM. Sites associated with power generation or transmission not identified in the CDCA Plan is considered through the CDCA Plan amendment process (USDOI1980). All requests for amendments must be submitted to the District Manager of the California Desert District (USDOI1980). The project owner has submitted an application to the BLM requesting a project-specific CDCA Plan	Condition of Certification LAND-1

LORS		Consistency Determination	Basis for Consistency or Inconsistency	Proposed Condition of Certification
Source	Policy and Strategy Descriptions			
	may only be maintained but not upgraded or improved.		amendment and right of way grant	
Chapter 3 Plan Elements - Energy Production And Utility Corridors Element	Sites associated with power generation or transmission not identified in the Plan will be considered through the CDCA Plan Amendment process. Utility needs which do not conform to an adopted corridor system will be processed by means of a Plan Amendment in conjunction with necessary permit hearings required by other agencies. The scope of the CDCA allows the designation of corridors which address the following types of utility facilities: • New electrical transmission towers and cables of 161 kV (kilovolt) or above; and • All pipelines with diameters greater than 12 inches. The following criteria are used in determining decisions contained in this element. These criteria also will be used when evaluating future applications: (1) Minimize the number of separate rights of way by utilizing existing rights of way as a basis for planning corridors; (2) Encourage joint use of corridors for transmission lines, canals, pipelines, and cables; (3) Provide alternative corridors to be considered during processing of applications; (4) Avoid sensitive resources wherever possible; (5) Conform to local plans whenever possible; (6) Consider wilderness values and be consistent with final wilderness recommendations;	The project would be consistent if the BLM approves a project-specific CDCA Plan amendment.	The route for the transmission line between the PSEGS and the SCE Red Bluff Substation has been identified and the substation will be operational by December 2013. Sites associated with power generation or transmission not identified in the CDCA Plan are considered through the CDCA Plan amendment process (USDOI1980). All requests for amendment must be submitted to the District Manager of the California Desert District (USDOI1980).	Condition of Certification LAND-1

	(7) Complete the delivery-systems network; (8) Consider ongoing projects for which decisions have been made, for example, the Intermountain Power Project; and (9) Consider corridor networks which take into account power needs and alternative fuel resources.			

NOTEWORTHY PUBLIC BENEFITS

Staff has not identified any noteworthy public benefits related to land use.

FACILITY CLOSURE

At some point in the future, the proposed facility would cease operation and close down. At that time, it would be necessary to ensure that closure occurs in such a way that public health and safety and the environment are protected from adverse impacts.

The planned lifetime of the project is estimated at 30 years. **Three years prior to initiating a permanent facility closure, the project owner must submit for CPM review and approval, a Final Closure Plan, which includes any long-term, post-closure site maintenance and monitoring**. This review and approval process would be public and allow participation by interested parties and other regulatory agencies. At the time of closure, all applicable land use related LORS would be identified and the closure plan would discuss conformance of dismantling and demolition, restoration, and remediation activities with these LORS. All of these activities would fall under the authority of the Energy Commission. For more information on facility closure, please see the General Conditions provided in this Final Staff Assessment.

RESPONSE TO COMMENTS

VEENA DOIJODE, E-MAIL COMMENT LETTER, TN # 70449, APRIL 22, 2013:

Comment: The commenter would like the Energy Commission to assess the impact to their parcel close to the project as they intend to grow palm dates on this land.

Response: Staff has reviewed an aerial image of the project area that shows the commenter's property is about five miles southeast of the PSEGS site. The PSEGS would be constructed on undeveloped desert land administered by the BLM and would not convert farmland or conflict with existing zoning for agricultural use. The solar technology would not affect agricultural activities. Staff concludes that the construction and operation of the PSEGS would not prevent local landowners from growing palm dates or other agricultural products.

COUNTY OF RIVERSIDE, JOHN J. BENOIT, COMMENTS ON THE PRELIMINARY STAFF ASSESSMENT FOR THE PROPOSED PSEGS, TN # 200094, JULY 30, 2013:

Comment: The county has identified General Plan Land Use Element Policies LU 2.1.c and LU 7.1 regarding biological resources and LU 8.1, 13.1, 13.3, 20.1, 20.2, and 20.4 regarding visual resources.

Response: Staff has addressed these policies in the **BIOLOGICAL RESOURCES** and **VISUAL RESOURCES** analyses in this FSA.

CONCLUSIONS

This analysis focused on whether the PSEGS would result in substantial adverse impacts under the California Environmental Quality Act, and if the project would be inconsistent with applicable land use laws, ordinances, regulations, and standards. Staff concludes the following:

1. The PSEGS would be located on public land (federal land) administered by the U.S. Bureau of Land Management (BLM)

2. The approximately 3,794 acre PSEGS site is within the federal California Desert Conservation Area (CDCA) Plan area. The project area is in the “Multiple-Use Class M” land use category. The Class M land use category allows electrical generation plants in accordance with federal, state, and local laws subject to the approval of a CDCA Plan amendment by the BLM.

3. Staff concludes that with implementation of Conditions of Certification **BIO-9** through **BIO-11** the PSEGS would be compatible with the NECO.

4. The proposed power plant and the overhead transmission line to serve the project each require the BLM’s approval of a ROW grant and two CDCA Plan amendments. With the BLM’s approval of the ROW grant and plan amendments, the PSEGS and transmission line would be consistent with the CDCA Plan.

5. The PSEGS does not divide or disrupt the physical arrangement of an established community.

6. The PSEGS is not located within a habitat conservation plan approved by the U.S. Fish and Wildlife Service, or a natural community conservation plan approved by the California Department of Fish and Wildlife.

7. The PSEGS does not convert prime farmland, conflict with existing county zoning for agricultural use or a Williamson Act contract, or result in the conversion of farmland to a non-agricultural use.

8. The PSEGS does not conflict with zoning for or cause rezoning of forest land, timberland or timberland zoned Timberland Production. The project does not result in the loss of forest land or conversion of forest land to non-forest use.

The **Visual Resources** staff concludes that the PSEGS would result in significant unmitigable direct and cumulative impacts to existing scenic resource values as seen from several viewing areas in the project vicinity and Chuckwalla Valley area (approximately 30 mile radius from the PSEGS), including: Interstate 10 (I-10), State Route 177 (SR-177), Corn Springs Road, Joshua Tree National Park, Palen McCoy Wilderness, and Chuckwalla Mountains Wilderness. Staff concludes the PSEGS would create a land use incompatibility because of significant and unavoidable visual impacts to recreational users of park and wilderness areas.

PROPOSED CONDITION OF CERTIFICATION

Staff has made minor edits to the one existing land use condition of certification from the Commission Decision for the Palen Solar Power Project should the Commission approve the project amendment. (Note: Deleted text is in ~~strikethrough~~; new text is **bold** and **underlined**.)

LAND-1 Prior to the start of construction, the ~~Applicant~~ **project owner** shall provide to the Compliance Project Manager (CPM) documentation of the U.S. Bureau of Land Management (BLM) Right-of-Way grant and the BLM-approved project-specific amendment to the California Desert Conservation Area Plan (CDCA) permitting the construction/operation of the proposed Palen Solar ~~Power Project~~ **Electric Generating System**.

Verification: Prior to the start of construction, the ~~Applicant~~ **project owner** shall submit to the CPM a copy of the BLM approved **Right-of-Way grant and** project specific amendment to the CDCA Plan permitting the Palen Solar ~~Power Project~~ **Electric Generating System**.

NOISE AND VIBRATION

Testimony of Shahab Khoshmashrab

SUMMARY OF CONCLUSIONS

Because construction and operational noise would be the same or lower than the approved project, the modified Palen Solar Electric Generating System (PSEGS), if built and operated in conformance with the existing conditions of certification, would comply with all applicable noise and vibration laws, ordinances, regulations and standards, and would produce no significant adverse noise impacts on people within the affected area, directly, indirectly, or cumulatively. The existing conditions of certification provide appropriate mitigation, in the form of good design practice and selection of appropriate project equipment that would avoid any significant adverse impacts.

INTRODUCTION

The construction and operation of any power plant creates noise or unwanted sound. The character and loudness of this noise, the times of day or night that it is produced, and the proximity of the facility to sensitive receptors all combine to determine whether the facility would meet applicable noise control laws and ordinances and whether it would cause significant adverse environmental impacts. In some cases, vibration may be produced as a result of power plant construction practices such as blasting or pile driving. The ground-borne energy of vibration has the potential to cause structural damage and annoyance.

The purpose of this analysis is to identify and examine the likely noise and vibration impacts from the construction and operation of the proposed modified project, and to recommend procedures to ensure that the resulting noise and vibration impacts would be adequately mitigated to comply with applicable laws, ordinances, regulations and standards (LORS). For an explanation of technical terms used in this section, please refer to **Noise Appendix A** immediately following.

METHODS AND THRESHOLDS FOR DETERMINING SIGNIFICANCE

CALIFORNIA ENVIRONMENTAL QUALITY ACT

The California Environmental Quality Act (CEQA) requires that significant environmental impacts be identified and either eliminated or mitigated to the extent feasible. Section XI of Appendix G of CEQA's guidelines (Cal. Code Regs., tit. 14, App. G) describes some characteristics that could signify a potentially significant impact. Specifically, a significant effect from noise may exist if a project would result in:

1. exposure of persons to, or generation of, noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;

2. exposure of persons to or generation of excessive ground borne vibration or ground borne noise levels;

3. substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project; or,

4. substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.

The Energy Commission staff, in applying Item 3, above, to the analysis of this and other projects, has concluded that a potential for a significant noise impact exists where the noise of the project plus the background exceeds the background by more than 5 dBA at the nearest sensitive receptor.

Staff has concluded that an increase in background noise levels up to and including 5 dBA in a residential setting is insignificant; an increase of more than 10 dBA, however, is clearly significant. An increase of between 5 and 10 dBA should be considered adverse, but could be either significant or insignificant, depending upon the particular circumstances of a particular case.

Factors to be considered in determining the significance of an adverse impact as defined above include:

1. the resulting noise level;

2. the duration and frequency of the noise;

3. the number of people affected; and,

4. the land use designation of the affected receptor sites.

Noise due to construction activities is usually considered to be insignificant in terms of CEQA compliance if:

- the construction activity is temporary; and,
- the use of heavy equipment and noisy[1] activities is limited to daytime hours.

Staff uses the above method and threshold to protect the most sensitive populations.

[1] Noise that draws a legitimate complaint. For the definition of “legitimate complaint”, please see Condition of Certification **NOISE-4**.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS (LORS)

Noise and Vibration Table 1
Laws, Ordinances, Regulations and Standards (LORS)

Applicable LORS	Description
Federal	
Occupational Safety & Health Act (OSHA): 29 U.S.C. § 651 et seq.	Protects workers from the effects of occupational noise exposure
U.S. Environmental Protection Agency (USEPA)	Assists state and local government entities in development of state and local LORS for noise
State	
California Occupational Safety & Health Act (Cal-OSHA): 29 U.S.C. § 651 et seq., Cal. Code Regs., tit. 8, §§ 5095-5099	Protects workers from the effects of occupational noise exposure
Local	
Riverside County General Plan, Noise Element	Establishes goals, objectives, and procedures to protect the public from noise intrusion.
Riverside County Noise Ordinance, Ordinance 847 (Regulating Noise)	Specifies sound level limits. Limits hours of construction

FEDERAL

Under the Occupational Safety and Health Act of 1970 (OSHA) (29 U.S.C. § 651 et seq.), the Department of Labor, Occupational Safety and Health Administration, (OSHA) adopted regulations (29 C.F.R. § 1910.95) designed to protect workers against the effects of occupational noise exposure. These regulations list permissible noise exposure levels as a function of the amount of time during which the worker is exposed (see **Noise Appendix A, Table A4**, immediately following this section). The regulations further specify a hearing conservation program that involves monitoring the noise to which workers are exposed, assuring that workers are made aware of overexposure to noise, and periodically testing the workers' hearing to detect any degradation.

Guidelines are available from the U.S. Environmental Protection Agency (USEPA) to assist state and local government entities in developing state and local LORS for noise. Because there are existing local LORS that apply to this project, the USEPA guidelines are not applicable.

There are no federal laws governing off-site (community) noise.

The Federal Transit Administration (FTA) has published guidelines for assessing the impacts of ground-borne vibration associated with construction of rail projects, which have been applied by other jurisdictions to other types of projects. The FTA-recommended vibration standards are expressed in terms of the "vibration level," which is calculated from the peak particle velocity measured from ground-borne vibration. The FTA measure of the threshold of perception is 65 vibrational decibel (VdB), which correlates to a peak particle velocity of about 0.002 inches per second (in/sec). The FTA measure of the threshold of architectural damage for conventional sensitive structures is 100 VdB, which correlates to a peak particle velocity of about 0.2 in/sec.

STATE

California Government Code Section 65302(f) encourages each local governmental entity to perform noise studies and implement a noise element as part of its general plan. In addition, the California Office of Planning and Research has published guidelines for preparing noise elements, which include recommendations for evaluating the compatibility of various land uses as a function of community noise exposure.

The State of California, Office of Noise Control, prepared the Model Community Noise Control Ordinance, which provides guidance for acceptable noise levels in the absence of local noise standards. This model also defines a simple tone, or “pure tone,” as one-third octave band sound pressure levels that can be used to determine whether a noise source contains annoying tonal components. The Model Community Noise Control Ordinance further recommends that, when a pure tone is present, the applicable noise standard should be lowered (made more stringent) by 5 A-weighted decibels (dBA).

The California Occupational Safety and Health Administration (Cal-OSHA) has promulgated occupational noise exposure regulations (Cal. Code Regs., tit. 8, §§ 5095-5099) that set employee noise exposure limits. These standards are equivalent to federal OSHA standards (see **NOISE APPENDIX A, TABLE A4**).

LOCAL

The project is located within Riverside County. The Noise Element of the Riverside County General Plan (Riverside County 2007) and the Riverside County Noise Ordinance (Riverside County 2008) apply to this project.

Riverside County Noise Element

The County Noise/Land Use Compatibility Guidelines, provided in the Noise Element, are used to evaluate potential noise impacts and provide criteria for environmental impact findings and conditions for project approval. Land use compatibility defines the acceptability of a land use in a specified noise environment. For residential land uses, these guidelines categorize noise levels of up to 60 dBA day/night average sound level (Ldn) or CNEL as “normally acceptable” and up to 70 dBA Ldn or CNEL as “conditionally acceptable”.

Riverside County Noise Ordinance

The Noise Ordinance allows for different levels of acceptable noise depending upon land use. Section 4 of Ordinance No. 847 (Regulating Noise) limits noise on any property that causes the exterior noise level on any other occupied property to 55 dBA during the daytime hours and 45 dBA during the nighttime hours, for noise-sensitive receptors[2] within a very low density rural area, such as the area surrounding the project site.

[2] A sensitive noise receptor, also referred to as a noise-sensitive receptor, is a receptor at which there is a reasonable degree of sensitivity to noise (such as residences, schools, hospitals, elder care facilities, libraries, cemeteries, and places of worship).

This Noise Ordinance also limits the hours of construction activities to the hours of 6:00 a.m. to 7:00 p.m., June through September, 6:00 a.m. to 6:00 p.m., October through May, Mondays through Fridays, and to 9:00 a.m. to 5:00 p.m. on Saturdays.

PROPOSED MODIFIED PROJECT

The modifications proposed in the petition include replacing the parabolic trough solar collection system, steam turbine generator, and associated heat transfer fluid with BrightSource's solar tower technology. Heliostats—elevated mirrors guided by a tracking system mounted on a pylon—focus the sun's rays on a solar receiver steam generator (SRSG) located atop a 750-foot-tall tower near the center of each solar field to create steam to drive a turbine that generates electricity.

The modified project includes two power blocks similar in size and types of equipment as the approved project. However, the farthest power block to the nearest noise-sensitive receptor (LT1, a residence described in more detail below) would be located farther away from this receptor than the farthest power block for the approved project. The nearest power block to this receptor would be located approximately at the same distance to this receptor as the nearest block for the approved project. For this reason, project noise would be slightly lower at LT1 for the modified project as compared to the approved project.

The only notable difference between the tower technology and the parabolic trough technology is that one of the major sources of noise for the tower technology, the SRSG, would be located atop a 750-foot-tall tower. This may cause a different sound dispersion profile than the approved project (due to the height of the source) within a couple of thousands of feet. However, due to the long distance of LT1 to the nearest tower, approximately 6,000 feet, the project's overall noise would be heard much the same as the approved project at this receptor.

Construction noise impact from the modified project is expected to be the same as the approved project.

SETTING AND EXISTING CONDITIONS

The PSEGS site is located in Riverside County, approximately 0.5 mile north of Interstate 10 (I-10) near the Corn Springs Road intersection. The site is in a remote area of primarily undeveloped land, with open space and some land developed as a nursery. The small community of Desert Center is located approximately 10 miles west of the site, along I-10.The predominant noise source in proximity to the project site is vehicular traffic on I-10.

The land use of the PSEGS site is undeveloped open space, and the surrounding land uses include undeveloped land and some agricultural land to the west of the project site.

There is one residence, LT1, located approximately 25 feet from the northwest corner of the project right-of-way boundary, but over 1 mile from the nearest power block. The power block would be the major source of the power plant's noise during the facility's operation. Another residence is located approximately 3,500 feet northwest of the site boundary and well over a mile from the nearest power block (Solar Millennium 2009a, AFC § 5.8.2.3; **Project Description Figure 4**).

Ambient Noise Monitoring

In order to establish a baseline for the comparison of predicted project noise with existing ambient noise, the project owner presented the results of an ambient noise survey in 2009 (Solar Millennium 2009a, AFC § 5.8.2.4; Tables 5.8-5, 5.8-6). Because the noise environment is still the same, a new ambient noise survey is not necessary, and staff uses the 2009 survey to evaluate the noise and vibration impacts of the modified project at the project's noise-sensitive receptors.

Ambient noise levels were measured near the western boundary of the PSEGS site, near the two residences to the northwest of the project site, from May 18 to May 19, 2009. One long-term measurement was taken near the two residences over a 25-hour period between 6:51 p.m., May 18, and 7:51 p.m., May 19, 2009. The survey was performed using acceptable equipment and techniques. The noise survey monitored existing noise levels near the nearest sensitive receptors, shown in **Noise Figure 1**:

1. Location LT1: closest residence to the project site. This is a residence located approximately 25 feet from the northwest corner of the project right-of-way boundary, but over 1 mile from the nearest power block. A location near this residence (LT, as shown in **Noise Figure 1**) was monitored continuously between 6:51 p.m., May 18, and 7:51 p.m., May 19, 2009.

2. Location LT2: the second closest residence to the project site. This is a residence located approximately 3,500 feet northwest of the site boundary and well over a mile from the nearest power block. A location near this residence (LT, as shown in **Noise Figure 1**) was monitored continuously between 6:51 p.m., May 18, and 7:51 p.m., May 19, 2009.

Because of the similarity of the noise environments between these residences and the long-term survey location, staff finds it reasonable to use the results of this survey as the baseline for the existing ambient noise levels at these noise-sensitive receptors.

Noise Table 2 summarizes the ambient noise measurements (Solar Millennium 2009a, AFC § 5.8.2.4; Table 5.8-6).

Noise Table 2
Summary of Measured Noise Levels

Measurement Sites	Measured Noise Levels, dBA	
	Average During Daytime Hours L_{eq}	Average During Nighttime Hours L_{eq}
LT1, Nearest Residence	43[1]	34[2]
LT2, Second Nearest Residence	43[1]	34[2]

2 - Staff calculations of average of the nighttime hours

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

DIRECT IMPACTS AND MITIGATION

Noise impacts associated with the project can be created by short-term construction activities and normal long-term operation of the project.

Construction Impacts and Mitigation

Construction noise is usually a temporary phenomenon. Construction of the PSEGS project is expected to be typical of similar projects in terms of equipment used and other types of activities (Solar Millennium 2009a, AFC § 5.8.3.2; Palen 2012a, § 6.4.2).

Construction of an industrial facility such as a power plant is typically noisier than permissible under usual noise ordinances. In order to allow the construction of new facilities, construction noise during certain hours of the day is commonly exempt from enforcement by local ordinances.

Construction noise from the modified project is expected to be the same as the approved project. There are no new pieces of equipment or methods of construction that were not analyzed previously for the approved project. Therefore, in this FSA, staff uses the same data and analysis as those described for the approved project, to evaluate the project’s impacts at the nearest noise-sensitive receptors.

In the AFC, the project owner predicted a construction noise level of 59 dBA at the nearest residential receptor, LT1. It is shown here in **Noise Table 3**.

Noise Table 3
Predicted Construction Noise Level

Receptor	Highest Construction Noise Level L_{eq} (dBA)[1]	Measured Existing Ambient, Average Daytime L_{eq} (dBA)[2]	Cumulative, Using Highest Noise Level of 48 dBA	Change
LT1	59	43	59	+16
LT2	46	43	48	+5

Sources:
1 - Solar Millennium 2009a, AFC § 5.8.3.1, and staff's calculations
2 - **Noise Table 2**, above

The applicable local noise LORS do not limit the loudness of construction noise, but staff compares the projected noise levels with ambient levels

The project owner commits to performing noisy construction work during the times specified in the Riverside County Noise Ordinance, to the hours of 6:00 a.m. to 7:00 p.m., June through September, and 6:00 a.m. to 6:00 p.m., October through May, Mondays through Fridays, and 9:00 a.m. to 5:00 p.m. on Saturdays, with no construction allowed on Sundays and Federal holidays (Solar Millennium 2009a, AFC § 5.8.3.1; Palen 2012a, § 6.4.3). To ensure that these hours are, in fact, enforced, staff proposes Condition of Certification **NOISE-6**.

Therefore, the noise impacts of the PSEGS project construction activities would comply with the noise LORS.

Since construction noise typically varies with time, it is most appropriately measured by, and compared with, the L_{eq} (energy average) metric. Even though project construction would likely last 33 months (Palen 2012a, § 6.3.2), the construction activities within an area that would potentially considerably impact the nearest residential receptor would not last more than several months. The nearest location to the nearest residence (LT1) where there would be more than minimal activities is the northwestern extent of the solar arrays of Unit #2, near the residence. Construction noise from site grading and array installation would not exceed 59 dBA L_{eq} at the residence, temporarily resulting in a 16 dBA increase in the ambient noise level at LT1 (see **Noise Table 3** above); this is a considerable increase. However, this impact would be only for the short time that construction activities occur in that portion of the site. Noise levels would decrease the farther away construction activities occur from the residence.

The second nearest residence (LT2) is also located northwest of the project site, but it is further away from the site than LT1 is. The above activities in the northwestern extent of the solar arrays of Unit #2 would likely generate a noise level of 46 dBA L_{eq} at the LT2. This will result in a temporary increase in the ambient noise level at LT2 of 5 dBA (see **Noise Table 3** above). Staff considers an increase of 5 dBA to be less than significant.

Therefore, because of the temporary nature of these activities and because construction would be limited to the daytime hours, the noise effects of plant construction are considered to be less than significant at the above receptors.

To ensure the project construction would create less than significant adverse impacts at the most noise-sensitive receptors, in addition to Condition of Certification **NOISE-6**, staff proposes Conditions of Certification **NOISE-1** and **NOISE-2**, which would establish a public notification and noise complaint process to resolve any complaints regarding construction noise.

In light of the following proposed conditions of certification, the noise impacts of the PSEGS project construction activities would be less than significant.

Steam Blows

Typically, the loudest noise encountered during construction, inherent in building any project incorporating a steam turbine, is created by the steam blows. After erection and assembly of the feed water and steam systems, the piping and tubing that comprise the steam path have accumulated dirt, rust, scale, and construction debris such as weld spatter, dropped welding rods, and the like. If the plant were started up without thoroughly cleaning out these systems, all this debris would find its way into the steam turbine, quickly destroying the machine.

In order to prevent this, before the steam system is connected to the turbine, the steam line is temporarily routed to the atmosphere. Traditionally, high pressure steam is then raised in the boiler or a temporary boiler and allowed to escape to the atmosphere through the steam piping. This flushing action, referred to as a *high pressure steam blow*, is quite effective at cleaning out the steam system. A series of short steam blows, lasting 2 or 3 minutes each, are performed several times daily over a period of 2 or 3 weeks. At the end of this procedure, the steam lines are connected to the steam turbine, which is then ready for operation. Alternatively, high pressure compressed air can be substituted for steam.

High pressure steam blows, if unsilenced, can typically produce noise levels as high as 129 dBA at a distance of 50 feet; this would amount to roughly 88 dBA at LT1 and 84 at LT2. Unsilenced steam blows could be disturbing at the nearest noise-sensitive receptors, depending on the frequency, duration, and noise intensity of venting. With a silencer installed on the steam blow piping, noise levels are commonly attenuated to 89 dBA at 50 feet.

A quieter steam blow process, referred to as *low pressure steam blow* and marketed under names such as QuietBlow™ or Silentsteam™, has become popular. This method utilizes lower pressure steam over a continuous period of about 36 hours. Resulting noise levels reach about 86 dBA at 50 feet.

To minimize the impact of steam blows, staff has proposed Condition of Certification **NOISE-7**, which limits steam blow noise to 89 dBA measured at a distance of 100 feet. A noise level of 89 dBA at 100 feet results in about 53 dBA at LT1, which is tolerable. This condition of certification also limits steam blows to between 8:00 a.m. and 5:00 p.m.

Linear Facilities

Construction of linear facilities typically moves along at a rapid pace, thus not subjecting any one receptor to noise impacts for more than 2 or 3 days. Further, construction activities would be limited to daytime hours. To ensure that these hours are, in fact, adhered to in compliance with the LORS, staff proposes Condition of Certification **NOISE-6**.

Vibration

The only construction operation likely to produce vibration that could be perceived off site would be pile driving. The project owner anticipates that pile driving would not be required for construction of the PSEGS project (Solar Millennium 2009a, AFC § 5.8.3.2; Palen 2012a, § 6.4.2). Therefore, no vibration impacts are expected.

Worker Effects

The project owner has acknowledged the need to protect construction workers from noise hazards and has recognized applicable LORS that would protect construction workers (Solar Millennium 2009a, AFC §§ 5.8.1, 5.8.4). To ensure that construction workers are, in fact, adequately protected, staff has proposed Condition of Certification **NOISE-3**.

Operation Impacts and Mitigation

The primary noise source of the PSEGS plants would be the power blocks, where the steam turbine generators, the air-cooled condensers, electric transformers, and various pumps and fans would be located. The modified project's major noise sources are similar to those for the approved project, and thus, the noise modeling used for the approved project is still applicable. Staff uses the results of that modeling for this analysis. The project's two power blocks (one for each 250 MW unit) would be centrally located in the middle of each solar unit; these blocks would be surrounded by the solar reflector fields. The overall noise generated by these various noise sources would be based on the configuration of the sources, the number and power rating of the equipment, and any noise-reducing measures incorporated. Staff compares the projected project noise with applicable LORS, in this case the Riverside County noise LORS. In addition, staff evaluates any increase in noise levels at sensitive receptors due to the project in order to identify any significant adverse impacts.

The project would avoid the creation of annoying tonal (pure-tone) noises by balancing the noise emissions of various power plant features during plant design (Condition of Certification **NOISE-4**).

For the approved project, the project owner performed noise modeling to determine the project's noise impacts on sensitive receptors (Solar Millennium 2009a, AFC § 5.8.3.3). Based on that modeling, the project owner predicted the operational noise levels at the nearest sensitive receptors; they are shown in **Noise Table 4** below. As explained above, the modified project's major noise sources are similar to those for the approved project, and thus, the noise modeling used for the approved project is still applicable. Staff uses the results of that modeling for this analysis (**Noise Table 4**).

The Noise Ordinance allows for different levels of acceptable noise depending upon land use. Section 4 of Ordinance No. 847 (Regulating Noise) limits noise on any property that causes the exterior noise level on any other occupied property to 55 dBA during the daytime hours and 45 dBA during the nighttime hours, for noise-sensitive receptors within a very low density rural area, such as the area surrounding the project site. The project owner predicts the project's operational noise level at receptor LT1, the nearest receptor, to be 42 dBA L_{eq} (Solar Millennium 2009a, AFC § 5.8.3.3). This level is less than the above LORS requirements.

The above predicted operational noise level also complies with the Riverside County's guideline that considers a noise level of up to 60 dBA day/night average (Ldn) or CNEL (Community Noise Equivalent Level) to be normally acceptable.

To ensure compliance, staff proposes Condition of Certification **NOISE-4**. Also to ensure compliance, staff proposes Conditions of Certification **NOISE-1** and **NOISE-2**, which would establish a public notification and noise complaint process requiring the project owner to resolve any problems caused by operational noise.

With the implementation of the following conditions of certification, noise due to the operation of the PSEGS project would be in compliance with applicable LORS.

As explained, the PSEGS project would operate during the daylight hours. Thus, staff compares the project's noise levels to the existing daytime ambient noise levels at the project's noise-sensitive receptor. (Please see below for limited nighttime activities.)

Typically, daytime ambient noise consists of both intermittent and constant noises. The noise that stands out during this time is therefore best represented by the average noise level, referred to as L_{eq}. Staff's evaluation of the above noise surveys shows that the daytime noise environment in the project area consists of both intermittent and constant noises. Thus, staff compares the project's noise levels to the daytime ambient L_{eq} levels at the project's noise-sensitive receptors.

The project owner has predicted the operational noise level at LT1; it is shown here in **Noise Table 4**.

Noise Table 4
Predicted Operational Noise Levels at the Identified Sensitive Residential Receptors

Receptor	Project Alone Operational Noise Level (dBA)[1]	Measured Existing Ambient, Daytime L_{eq} (dBA)[2]	Cumulative L_{eq} (dBA)	Increase in Existing Ambient (dBA)
LT1	42	43	46	+3
LT2	33[3]	43	43	0

Sources:
1 - Solar Millennium 2009a, AFC § 5.8.3.2
2 - **Noise Table 2**, above
3 - Staff's calculations based on the noise modeling in the AFC.

Combining the ambient noise level of 43 dBA L_{eq} (**Noise Table 4**, above) with the project noise level of 42 dBA at LT1 would result in 46 dBA L_{eq}, 3 dBA above the ambient. As described above (in **METHODS AND THRESHOLDS FOR DETERMINING SIGNIFICANCE**), staff regards an increase of up to 5 dBA as a less-than-significant impact. Therefore, staff considers the above noise impact at LT1 to be less than significant.

Combining the ambient noise level of 43 dBA L_{eq} (**Noise Table 4**, above) with the project noise level of 33 dBA at LT2 would result in 43 dBA L_{eq}; the project would not cause an increase in the ambient noise level. Therefore, there would be no impact at this location.

Adverse impacts on residential receptors can also be identified by comparing predicted power plant noise levels with the nighttime ambient background noise levels at the nearest sensitive residential receptors. The project would have limited nighttime activities related to maintenance. The project owner's projection of the noise level from these activities at LT1 is 22 dBA (Solar Millennium 2009a, AFC § 5.8.3.3). This is significantly lower than the average nighttime ambient noise level of 34 at LT1 (**Noise Table 2**, above), and thus, the project's nighttime activities would have a less than significant impact on the project's most noise-sensitive receptor. Subsequently, these activities would likely have no impact on LT2, due to its further distance from the project site than LT1.

Staff proposes Condition of Certification **NOISE-4** to ensure that the noise level due to project operation would not exceed the above level (in **Noise Table 4**, second column).

Tonal Noises

One possible source of annoyance could be strong tonal noises. Tonal noises are individual sounds (such as pure tones) which, while not louder than permissible levels, stand out in sound quality. To ensure that tonal noises do not cause public annoyance, staff proposes Condition of Certification **NOISE-4**, which would require mitigation measures, if necessary, to ensure the project would not create tonal noises.

Linear Facilities

All water pipes and gas pipes would be underground and therefore silent during plant operation. Noise effects from electrical interconnection lines typically do not extend beyond the lines' right-of-way easements and would be inaudible to receptors.

Vibration

Vibration from an operating power plant could be transmitted through two primary means: ground (ground-borne vibration), and air (airborne vibration).

The operating components of the PSEGS plant would consist of high-speed steam turbine generators and various pumps and fans. All of these pieces of equipment would be carefully balanced in order to operate; permanent vibration sensors would be attached to the turbines and generators. Based on experience with numerous previous projects employing similar equipment, staff agrees with the project owner that ground-borne vibration from the PSEGS project would be undetectable by any likely receptor.

Airborne vibration (low frequency noise) can rattle windows and objects on shelves and can rattle the walls of lightweight structures. However, none of the project equipment is likely to produce noticeable low frequency noise beyond the project site boundaries. This makes it highly unlikely that the PSEGS would cause perceptible airborne vibration effects at any offsite noise-sensitive receptor.

Worker Effects

The project owner acknowledges the need to protect plant operating and maintenance workers from noise hazards and commits to compliance with all applicable LORS (Solar Millennium 2009a, AFC § 5.8.4; Palen 2012a, § 6.4.3). Signs would be posted in areas of the plant with noise levels exceeding 85 dBA (the level that OSHA recognizes as a threat to workers' hearing), and hearing protection would be required and provided. To ensure that plant operation and maintenance workers are adequately protected, Energy Commission staff has proposed Condition of Certification **NOISE-5**. For further discussion of proposed worker safety conditions of certification, please see **WORKER SAFETY AND FIRE PROTECTION** section of this document.

Facility Closure

All operational noise from the project would cease when the PSEGS project closes, and no further adverse noise impact from its operation would be possible. The remaining potential temporary noise source would be the dismantling of the project structures and equipment, as well as any site restoration work that may be performed. Since this noise would be similar to that caused by the original construction, it could be similarly treated – that is, noisy work would be performed during daytime hours with machinery and equipment that are properly equipped with mufflers. Any noise LORS in existence at that time would apply. Unless modified, applicable conditions of certification included in the Energy Commission decision would also apply.

CUMULATIVE IMPACTS

Since the original project was approved, there are no new projects or new "reasonably foreseeable probable future projects" within a distance that would cause cumulative noise and vibration impacts when combined with the modified project.

Furthermore, the change in technology (from parabolic trough to solar tower) will not result in cumulative impacts that were not analyzed in the original project.

NOTEWORTHY PUBLIC BENEFITS

The proposed modified project would affect the daytime ambient noise levels in the project area. While this change would be barely noticeable at the project's most noise-sensitive receptor, and thus not significant, development of the proposed modified project would not result in any noteworthy public benefits.

RESPONSE TO COMMENTS

Staff received no comments relating to **Noise and Vibration**.

CONCLUSIONS

Staff concludes that the PSEGS project, if built and operated in conformance with the existing conditions of certification, would comply with all applicable noise and vibration LORS and would produce no significant direct or cumulative adverse noise impacts on people within the project area, directly or indirectly.

EXISTING CONDITIONS OF CERTIFICATION

All the **Noise and Vibration** conditions of certification remain unchanged (see below).

PUBLIC NOTIFICATION PROCESS

NOISE-1 At least 15 days prior to the start of ground disturbance, the project owner shall notify all residents within one mile of the project site and the linear facilities, by mail or by other effective means, of the commencement of project construction. At the same time, the project owner shall establish a telephone number for use by the public to report any undesirable noise conditions associated with the construction and operation of the project. If the telephone is not staffed 24 hours a day, the project owner shall include an automatic answering feature, with date and time stamp recording, to answer calls when the phone is unattended. This telephone number shall be posted at the project site during construction where it is visible to passersby. This telephone number shall be maintained until the project has been operational for at least one year.

Verification: Prior to ground disturbance, the project owner shall transmit to the compliance project manager (CPM) a statement, signed by the project owner's project manager, stating that the above notification has been performed and describing the method of that notification. This communication shall also verify that the telephone number has been established and posted at the site, and shall provide that telephone number.

NOISE COMPLAINT PROCESS

NOISE-2 Throughout the construction and operation of the project, the project owner shall document, investigate, evaluate, and attempt to resolve all project-related noise complaints. The project owner or authorized agent shall:

- use the Noise Complaint Resolution Form (below), or a functionally equivalent procedure acceptable to the CPM, to document and respond to each noise complaint;
- attempt to contact the person(s) making the noise complaint within 24 hours;
- conduct an investigation to determine the source of noise in the complaint;
- if the noise is project related, take all feasible measures to reduce the source of the noise; and
- submit a report documenting the complaint and actions taken. The report shall include: a complaint summary, including the final results of noise

reduction efforts and, if obtainable, a signed statement by the complainant stating that the noise problem has been resolved to the complainant's satisfaction.

Verification: Within five days of receiving a noise complaint, the project owner shall file a Noise Complaint Resolution Form, shown below, with both the local jurisdiction and the CPM that documents the resolution of the complaint. If mitigation is required to resolve the complaint and the complaint is not resolved within a three-day period, the project owner shall submit an updated Noise Complaint Resolution Form when the mitigation is performed and complete.

EMPLOYEE NOISE CONTROL PROGRAM

NOISE-3 The project owner shall submit to the CPM for review and approval a noise control program. The noise control program shall be used to reduce employee exposure to high (above permissible) noise levels during construction in accordance to the applicable OSHA and Cal-OSHA standards.

Verification: At least 30 days prior to the start of ground disturbance, the project owner shall submit the noise control program to the CPM. The project owner shall make the program available to Cal-OSHA upon request.

NOISE RESTRICTIONS

NOISE-4 The project design and implementation shall include appropriate noise mitigation measures adequate to ensure that the operation of the project will not cause the noise levels due to plant operation alone, during the daytime hours of 7 a.m. to 10 p.m., to exceed an average of 48 dBA L_{eq} measured at or near monitoring location LT1.

No new pure-tone components shall be caused by the project. No single piece of equipment shall be allowed to stand out as a source of noise that draws legitimate complaints[3].

A. When the project first achieves a sustained output of 85 percent or greater of rated capacity, the project owner shall conduct a 25-hour community noise survey at monitoring location LT1, or at a closer location acceptable to the CPM. This survey shall also include measurement of one-third octave band sound pressure levels to ensure that no new pure-tone noise components have been caused by the project.

[3] A legitimate complaint refers to a complaint about noise that is caused by the PSEGS project as opposed to another source (as verified by the CPM). A legitimate complaint constitutes a violation by the project of any noise condition of certification (as confirmed by the CPM), which is documented by an individual or entity affected by such noise.

The measurement of power plant noise for the purposes of demonstrating compliance with this Condition of Certification may alternatively be made at a location, acceptable to the CPM, closer to the plant (e.g., 400 feet from the plant boundary) and this measured level then mathematically extrapolated to determine the plant noise contribution at the affected residence. The character of the plant noise shall be evaluated at the affected receptor locations to determine the presence of pure tones or other dominant sources of plant noise.

B. If the results from the noise survey indicate that the power plant noise at the affected receptor site exceeds the above value during the above time period, mitigation measures shall be implemented to reduce noise to a level of compliance with this limit.

C. If the results from the noise survey indicate that pure tones are present, mitigation measures shall be implemented to eliminate the pure tones.

Verification: The survey shall take place within 30 days of the project first achieving a sustained output of 85 percent or greater of rated capacity. Within 15 days after completing the survey, the project owner shall submit a summary report of the survey to the CPM. Included in the survey report shall be a description of any additional mitigation measures necessary to achieve compliance with the above listed noise limit and a schedule, subject to CPM approval, for implementing these measures. When these measures are in place, the project owner shall repeat the noise survey.

Within 15 days of completion of the new survey, the project owner shall submit to the CPM a summary report of the new noise survey, performed as described above and showing compliance with this condition.

OCCUPATIONAL NOISE SURVEY

NOISE-5 Following the project’s attainment of a sustained output of 85 percent or greater of its rated capacity, the project owner shall conduct an occupational noise survey to identify any noise hazardous areas in the facility.

The survey shall be conducted by a qualified person in accordance with the provisions of Title 8, California Code of Regulations, sections 5095-5099 (Article 105) and Title 29, Code of Federal Regulations, section 1910.95. The survey results shall be used to determine the magnitude of employee noise exposure.

The project owner shall prepare a report of the survey results and, if necessary, identify mitigation measures to be employed in order to comply with the applicable California and federal regulations.

Verification: Within 30 days after completing the survey, the project owner shall submit the noise survey report to the CPM. The project owner shall make the report available to OSHA and Cal-OSHA upon request.

CONSTRUCTION RESTRICTIONS

NOISE-6 Heavy equipment operation and noisy construction work relating to any project features within one-quarter of a mile of an existing residence shall be restricted to the times delineated below, unless a special permit has been issued by the County of Riverside:

Mondays through Fridays:

June through September:	6 a.m. to 7 p.m.
October through May:	6 a.m. to 6 p.m.

Saturdays:

9 a.m. to 5 p.m.

Sundays and Federal holidays:

No Construction Allowed

Haul trucks and other engine-powered equipment shall be equipped with adequate mufflers. Haul trucks shall be operated in accordance with posted speed limits. Truck engine exhaust brake use shall be limited to emergencies.

Verification: Prior to ground disturbance, the project owner shall transmit to the CPM a statement acknowledging that the above restrictions will be observed throughout the construction of the project.

NOISE-7 If a traditional high-pressure steam blow process is used, the project owner shall equip steam blow piping with a temporary silencer that quiets the noise of steam blows to no greater than 89 dBA measured at a distance of 100 feet. The steam blows shall be conducted between 8:00 a.m. and 5:00 p.m. unless arranged with the CPM such that off-site impacts will not cause annoyance to receptors. If a low-pressure continuous steam blow process is used, the project owner shall submit to the CPM a description of the process, with expected noise levels and planned hours of steam blow operation.

Verification: At least 15 days prior to the first steam blow, the project owner shall notify all residents or business owners within one mile of the project site boundary. The notification may be in the form of letters, phone calls, fliers, or other effective means as approved by the CPM. The notification shall include a description of the purpose and nature of the steam blow(s), the planned schedule, expected sound levels, and explanation that it is a one-time activity and not part of normal plant operation.

NOISE APPENDIX A –
FUNDAMENTAL CONCEPTS OF COMMUNITY NOISE

To describe noise environments and to assess impacts on noise sensitive area, a frequency weighting measure, which simulates human perception, is customarily used. It has been found that A-weighting of sound intensities best reflects the human ear's reduced sensitivity to low frequencies and correlates well with human perceptions of the annoying aspects of noise. The A-weighted decibel scale (dBA) is cited in most noise criteria. Decibels are logarithmic units that conveniently compare the wide range of sound intensities to which the human ear is sensitive. **Noise Table A1** provides a description of technical terms related to noise.

Noise environments and consequences of human activities are usually well represented by an equivalent A-weighted sound level over a given time period (L_{eq}), or by average day and night A-weighted sound levels with a nighttime weighting of 10 dBA (L_{dn}). Noise levels are generally considered low when ambient levels are below 45 dBA, moderate in the 45 to 60 dBA range, and high above 60 dBA. Outdoor day-night sound levels vary over 50 dBA depending on the specific type of land use. Typical L_{dn} values might be 35 dBA for a wilderness area, 50 dBA for a small town or wooded residential area, 65 to 75 dBA for a major metropolis downtown (e.g., San Francisco), and 80 to 85 dBA near a freeway or airport. Although people often accept the higher levels associated with very noisy urban residential and residential-commercial zones, they nevertheless are considered to be levels of noise adverse to public health.

Various environments can be characterized by noise levels that are generally considered acceptable or unacceptable. Lower levels are expected in rural or suburban areas than what would be expected for commercial or industrial zones. Nighttime ambient levels in urban environments are about 7 decibels lower than the corresponding average daytime levels. The day-to-night difference in rural areas away from roads and other human activity can be considerably less. Areas with full-time human occupation that are subject to nighttime noise, which does not decrease relative to daytime levels, are often considered objectionable. Noise levels above 45 dBA at night can result in the onset of sleep interference effects. At 70 dBA, sleep interference effects become considerable (Effects of Noise on People, U.S. Environmental Protection Agency, December 31, 1971).

In order to help the reader understand the concept of noise in decibels (dBA), **Noise Table A2** has been provided to illustrate common noises and their associated sound levels, in dBA.

Noise Table A1 –
Definition of Some Technical Terms Related to Noise

Terms	Definitions
Decibel, dB	A unit describing the amplitude of sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure, which is 20 micropascals (20 micronewtons per square meter).
Frequency, Hz	The number of complete pressure fluctuations per second above and below atmospheric pressure.
A-Weighted Sound Level, dBA	The sound pressure level in decibels as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise. All sound levels in this testimony are A-weighted.
L_{10}, L_{50}, & L_{90}	The A-weighted noise levels that are exceeded 10%, 50%, and 90% of the time, respectively, during the measurement period. L_{90} is generally taken as the background noise level.
Equivalent Noise Level, L_{eq}	The energy average A-weighted noise level during the noise level measurement period.
Community Noise Equivalent Level, CNEL	The average A-weighted noise level during a 24-hour day, obtained after addition of 4.8 decibels to levels in the evening from 7 p.m. to 10 p.m., and after addition of 10 decibels to sound levels in the night between 10 p.m. and 7 a.m.
Day-Night Level, L_{dn} or DNL	The Average A-weighted noise level during a 24-hour day, obtained after addition of 10 decibels to levels measured in the night between 10 p.m. and 7 a.m.
Ambient Noise Level	The composite of noise from all sources, near and far. The normal or existing level of environmental noise at a given location.
Intrusive Noise	That noise that intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, and time of occurrence and tonal or informational content as well as the prevailing ambient noise level.
Pure Tone	A pure tone is defined by the Model Community Noise Control Ordinance as existing if the one-third octave band sound pressure level in the band with the tone exceeds the arithmetic average of the two contiguous bands by 5 decibels (dB) for center frequencies of 500 Hz and above, or by 8 dB for center frequencies between 160 Hz and 400 Hz, or by 15 dB for center frequencies less than or equal to 125 Hz.

Noise Table A2 –
Typical Environmental and Industry Sound Levels

Noise Source (at distance)	A-Weighted Sound Level in Decibels (dBA)	Noise Environment	Subjective Impression
Civil Defense Siren (100')	140-130		Pain Threshold
Jet Takeoff (200')	120		Very Loud
Very Loud Music	110	Rock Music Concert	
Pile Driver (50')	100		
Ambulance Siren (100')	90	Boiler Room	
Freight Cars (50')	85		
Pneumatic Drill (50')	80	Printing Press Kitchen with Garbage Disposal Running	Loud
Freeway (100')	70		Moderately Loud
Vacuum Cleaner (100')	60	Data Processing Center Department Store/Office	
Light Traffic (100')	50	Private Business Office	
Large Transformer (200')	40		Quiet
Soft Whisper (5')	30	Quiet Bedroom	
	20	Recording Studio	
	10		Threshold of Hearing

SUBJECTIVE RESPONSE TO NOISE

The adverse effects of noise on people can be classified into three general categories:

- Subjective effects of annoyance, nuisance, dissatisfaction.
- Interference with activities such as speech, sleep, and learning.
- Physiological effects such as anxiety or hearing loss.

The sound levels associated with environmental noise, in almost every case, produce effects only in the first two categories. Workers in industrial plants can experience noise effects in the last category. There is no completely satisfactory way to measure the subjective effects of noise, or of the corresponding reactions of annoyance and dissatisfaction, primarily because of the wide variation in individual tolerance of noise.

One way to determine a person's subjective reaction to a new noise is to compare the level of the existing (background) noise, to which one has become accustomed, with the level of the new noise. In general, the more the level or the tonal variations of a new noise exceed the previously existing ambient noise level or tonal quality, the less acceptable the new noise will be, as judged by the exposed individual.

With regard to increases in A-weighted noise levels, knowledge of the following relationships can be helpful in understanding the significance of human exposure to noise.

1. Except under special conditions, a change in sound level of one dB cannot be perceived.

2. Outside of the laboratory, a 3 dB change is considered a barely noticeable difference.

3. A change in level of at least 5 dB is required before any noticeable change in community response would be expected.

4. A 10 dB change is subjectively heard as an approximate doubling in loudness and almost always causes an adverse community response. (Kryter, Karl D., The Effects of Noise on Man, 1970).

COMBINATION OF SOUND LEVELS

People perceive both the level and frequency of sound in a non-linear way. A doubling of sound energy (for instance, from two identical automobiles passing simultaneously) creates a 3 dB increase (i.e., the resultant sound level is the sound level from a single passing automobile plus 3 dB). The rules for decibel addition used in community noise prediction are:

Noise Table A3 –
Addition of Decibel Values

When two decibel values differ by:	Add the following amount to the larger value
0 to 1 dB	3 dB
2 to 3 dB	2 dB
4 to 9 dB	1 dB
10 dB or more	0
Figures in this table are accurate to ± 1 dB.	

Source: Architectural Acoustics, M. David Egan, 1988.

SOUND AND DISTANCE

Doubling the distance from a noise source reduces the sound pressure level by 6 dB.

Increasing the distance from a noise source 10 times reduces the sound pressure level by 20 dB.

WORKER PROTECTION

OSHA noise regulations are designed to protect workers against the effects of noise exposure, and list permissible noise level exposure as a function of the amount of time to which the worker is exposed:

**Noise Table A4 –
OSHA Worker Noise Exposure Standards**

Duration of Noise (Hrs/day)	A-Weighted Noise Level (dBA)
8.0	90
6.0	92
4.0	95
3.0	97
2.0	100
1.5	102
1.0	105
0.5	110
0.25	115

PUBLIC HEALTH

Testimony of Huei-An (Ann) Chu, Ph.D.

SUMMARY OF CONCLUSIONS

California Energy Commission (Energy Commission) staff (staff) analyzed potential public health risks associated with construction and operation of the modified Palen Solar Electric Generating System (PSEGS) and does not expect any significant adverse cancer, or short- or long-term noncancer health effects from project toxic air emissions. Staff's analysis of potential health impacts from the proposed site configuration of the PSEGS was based on a conservative health protective methodology that accounts for impacts to the most sensitive individuals in a given population, including newborns and infants. According to the results of staff's health risk assessment, emissions from PSEGS would not contribute significantly to morbidity or mortality in any age or ethnic group residing in the project area.

With the incorporation of the existing Condition of Certification **PUBLIC HEALTH-1**, the proposed facility would not present a significant health risk to the public. Staff concludes that construction and operation of the PSEGS would be in compliance with all applicable LORS regarding long-term and short-term project impacts in the area of **Public Health**.

INTRODUCTION

On December 17, 2012, Palen Solar Holdings, LLC (PSH), filed a petition with the Energy Commission requesting to modify the approved Palen Solar Power Project (PSPP) and rename the project the Palen Solar Electric Generating System. PSPP was approved as a 500-megawatt (MW) solar thermal power-generating facility utilizing parabolic trough technology. The project owner has requested to amend the approved facility by replacing the approved parabolic trough with BrightSource's solar power tower technology.

The purpose of this Final Staff Assessment (FSA) is to determine if emissions of toxic air contaminants (TACs) from the proposed PSEGS project would have the potential to cause significant adverse public health impacts or to violate standards for public health protection. If potentially significant health impacts are identified, staff would evaluate mitigation measures to reduce such impacts to insignificant levels.

In addition to the analysis contained in this **PUBLIC HEALTH** Section that focuses on potential effects to the public from emissions of toxic air contaminants, other related aspects to the assessment of potential public health and safety impacts from PSEGS are considered elsewhere in this document as listed and briefly described below:

- <u>Air Quality</u> - evaluates the expected air quality impacts from the emissions of criteria air pollutants from both the construction and operation of the PSEGS project; criteria air pollutants are defined as air contaminants for which the state and/or federal governments have established an ambient air quality standard to protect public health;

- Hazardous Materials Management - evaluates the potential impacts on public and worker health from accidental releases of hazardous materials;
- Socioeconomics and Environmental Justice - evaluates project-induced changes on community services including law enforcement and hospitals;
- Soil and Water Resources - evaluates the potential for PSEGS to cause contamination of soil and water resources, to exacerbate flooding, and to cause adverse effects to water supply in consideration of other existing users and projected needs;
- Transmission Line Safety and Nuisance - evaluates potential effects associated with proposed transmission lines accounting for both the physical presence of the lines and the physical interactions of their electric and magnetic fields; The potential effects include aviation safety, interference with radio-frequency communication, audible noise, fire hazards, hazardous shocks, nuisance shocks, and electric and magnetic field (EMF) exposure.
- Worker Safety and Fire Protection - assess the worker safety and fire protection measures proposed by the project owner including determining whether the project would have any adverse impacts on fire protection and emergency medical services that are also relied upon by the public;
- Waste Management - evaluates issues associated with wastes generated from the proposed modified project construction and operation including ensuring that wastes would be managed in an environmentally safe manner.

METHODOLOGY AND THRESHOLDS FOR DETERMINING ENVIRONMENTAL CONSEQUENCES

METHODOLOGY

The analysis of PSEGS effects must comply with the California Environmental Quality Act (CEQA) which requires that the significance of individual effects be determined by the Lead Agency, in this case the California Energy Commission.

CEQA also requires a list of criteria that are used to determine the significance of identified impacts. A significant impact is defined by CEQA as “a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project” (State CEQA Guidelines Section 15382).

Thresholds for determining significance in this section are based on Appendix G of the CEQA Guidelines (CCR 2006) and performance standards or thresholds identified by the Energy Commission staff. The analysis includes staff’s evaluation of the environmental effects of the proposed PSEGS on land uses (i.e. rural land and desert around the site).

The **PUBLIC HEALTH** section of this staff assessment discusses toxic emissions to which the public could be exposed during project construction and routine operation. Following the release of toxic contaminants into the air or water, people may come into contact with them through inhalation, dermal contact, or ingestion via contaminated food or water.

Air pollutants for which no ambient air quality standards have been established are called noncriteria pollutants. Unlike criteria pollutants such as ozone, carbon monoxide, sulfur dioxide, or nitrogen dioxide, noncriteria pollutants have no ambient (outdoor) air quality standards that specify levels considered safe for everyone.

Since noncriteria pollutants do not have such standards, a health risk assessment (HRA) is used to determine if people might be exposed to those types of pollutants at unhealthy levels. The standard approach currently used for HRA involves four steps: 1) hazard identification; 2) exposure assessment; 3) dose-response assessment; and 4) risk characterization. These four steps are briefly discussed below (OEHHA, 2003).

First, hazard identification is conducted to determine the potential health effects that could be associated with project emissions. For air toxics sources, the main purpose is to identify whether or not a hazard exists. If this hazard exists, staff evaluates the exact toxic air contaminant(s) of concern and whether a TAC is a potential human carcinogen or is associated with other types of adverse health effects.

Second, an exposure assessment is conducted to estimate the extent of public exposure to project emissions, including: (1) the worst-case concentrations of project emissions in the environment using dispersion modeling; and (2) the amounts of pollutants that people could be exposed to through inhalation, ingestion, and dermal contact. Therefore, this step involves emissions quantification, modeling of environmental transport and dispersion, evaluation of environmental fate, identification of exposure routes, identification of exposed populations and sensitive subpopulations, and estimation of short-term and long-term exposure levels.

Third, a dose-response assessment is conducted to characterize the relationship between exposure to an agent and incidence of an adverse health effect in exposed populations. The assumptions and methodologies of dose-response assessment are different between cancer and noncancer health effects. In carcinogenic risk assessment, the dose-response relationship is expressed in terms of a potency (or slope) factor that is used to calculate the probability of getting cancer associated with an estimated exposure. It is assumed in cancer risk assessments that risk is directly proportional to dose and that there is no threshold for carcinogenesis below which there is no risk. In non-carcinogenic risk assessment, dose-response data developed from animal or human studies are used to develop acute and chronic noncancer Reference Exposure Levels (RELs). The acute and chronic RELs are defined as the concentration at which no adverse noncancer health effects are anticipated. Unlike cancer health effects, noncancer acute and chronic health effects are generally assumed to have thresholds for adverse effects. In other words, acute or chronic injury from a TAC would not occur until exposure to the pollutant has reached or exceeded a certain concentration (i.e., threshold).

Finally, risk characterization is conducted to integrate the health effects and public exposure information and to provide quantitative estimates of health risks resulting from project emissions. Staff characterizes potential health risks by comparing worst-case exposure to safe standards based on known health effects.

Staff conducts its public health analysis by evaluating and then adopting the information and data provided in the petition by the project owner. Staff also relies upon the expertise of the California Environmental Protection Agency (Cal/EPA) Office of Environmental Health Hazard Assessment (OEHHA) to: (1) identify contaminants that are known to the state to cause cancer or other noncancer health effects; and (2) identify the toxicity and cancer potency factors of these contaminants. Staff relies upon the expertise of the California Air Resources Board (ARB) and the local air districts to conduct ambient air monitoring of toxic air contaminants and the California Department of Public Health to conduct epidemiological investigations into the impacts of pollutants on communities. It is not within the purview or the expertise of the Energy Commission staff to duplicate the expertise and statutory responsibility of these agencies.

Initially, a screening level risk assessment is performed using simplified assumptions that are intentionally biased toward protection of public health. That is, an analysis is designed that overestimates public health impacts from exposure to project emissions. In reality, it is likely that the actual risks from the power plant would be much lower than the risks as estimated by the screening level assessment. The risks for screening purposes are based on examining conditions that would lead to the highest, or worst-case, risks and then using those conditions in the study. Such conditions include:

- using the highest levels of pollutants that could be emitted from the plant;
- assuming weather conditions that would lead to the maximum ambient concentration of pollutants;
- using the type of air quality computer model which predicts the greatest plausible impacts;
- calculating health risks at the location where the pollutant concentrations are estimated to be the highest;
- assuming that an individual's exposure to cancer and noncancer-causing agents occurs continuously for 70 years; and
- using health-based standards designed to protect the most sensitive members of the population (i.e., the young, elderly, and those with respiratory illnesses).

A screening level risk assessment would, at a minimum, include the potential health effects from inhaling hazardous substances. Some facilities may also emit certain substances that could present a health hazard from noninhalation pathways of exposure (OEHHA 2003, Tables 5.1, 6.3, 7.1). When these multi-pathway substances are present in facility emissions, the screening level analysis includes the following additional exposure pathways: soil ingestion, dermal exposure, and mother's milk (OEHHA 2003, p. 5-3).

The health risk assessment process for this project addresses three categories of health impacts: (1) acute (short-term) health effects; (2) chronic (long-term) noncancer effects; and (3) cancer risk (also long-term).

Acute Noncancer Health Effects

Acute health effects are those that result from short-term (one-hour) exposure to relatively high concentrations of pollutants. Such effects are temporary in nature and include symptoms such as irritation of the eyes, skin, and respiratory tract.

Chronic Noncancer Health Effects

Chronic noncancer health effects are those that result from long-term exposure to lower concentrations of pollutants. The exposure period is considered to be approximately from 12 percent to 100 percent of a lifetime, or from 8 to 70 years (OEHHA 2003, p. 6-5). Chronic health effects include diseases such as reduced lung function and heart disease.

The analysis for both acute and chronic noncancer health effects compares the maximum project contaminant levels to safe levels called Reference Exposure Levels, or RELs. These are amounts of toxic substances to which even sensitive people can be exposed and suffer no adverse health effects (OEHHA 2003, p. 6-2). These exposure levels are designed to protect the most sensitive individuals in the population, such as infants, the aged, and people suffering from illness or disease which makes them more sensitive to the effects of toxic substance exposure. The Reference Exposure Levels are based on the most sensitive adverse health effect reported in the medical and toxicological literature and include margins of safety. The margin of safety addresses uncertainties associated with inconclusive scientific and technical information available at the time of the analysis and is meant to provide a reasonable degree of protection against hazards that research has not yet identified. The margin of safety is designed to prevent pollution levels that have been demonstrated to be harmful, and to prevent lower pollutant levels that may pose an unacceptable risk of harm, even if the risk is not precisely identified as to nature or degree. Health protection is achieved if the estimated worst-case exposure is below the relevant reference exposure level. In such a case, an adequate margin of safety exists between the predicted exposure and the estimated threshold dose for toxicity.

Exposure to multiple toxic substances may result in health effects that are equal to, less than, or greater than effects resulting from exposure to the individual chemicals. Only a small fraction of the thousands of potential combinations of chemicals have been tested for the health effects of combined exposures. In conformity with the California Air Pollution Control Officers Association (CAPCOA) guidelines, the health risk assessment assumes that the effects of each substance are additive for a given organ system (OEHHA 2003, pp. 1-5, 8-12). Other possible mechanisms due to multiple exposures include those cases where the actions may be synergistic or antagonistic (where the effects are greater or less than the sum, respectively). For these types of substances, the health risk assessment could underestimate or overestimate the risks.

Cancer Risk and Estimation Process

For carcinogenic substances, the health assessment considers the risk of developing cancer and assumes that continuous exposure to the cancer-causing substance occurs over a 70-year lifetime. The risk that is calculated is not meant to project the actual expected incidence of cancer, but rather a theoretical upper-bound number based on worst-case assumptions.

Cancer risk is expressed in terms of chances per million of developing cancer and is a function of the maximum expected pollutant concentration, the probability that a particular pollutant would cause cancer (called *potency or slope factors* and established by OEHHA), and the length of the exposure period. Cancer risks for each carcinogen are added to yield a total cancer risk. The conservative nature of the screening assumptions used means that the actual cancer risks due to project emissions would be considerably lower than those estimated.

The screening analysis is performed to assess worst-case risks to public health associated with the proposed modified project. If the screening analysis were to predict a risk below significance levels, then no further analysis would be necessary and the source would be considered acceptable with regard to carcinogenic effects. However, if the risk were to be above the significance level, then further analysis, using more realistic site-specific assumptions, would be performed to obtain a more accurate estimate of potential public health risks.

SIGNIFICANCE CRITERIA

Energy Commission staff determines the health effects of exposure to toxic emissions based on impacts to the maximally exposed individual (MEI). This is a person hypothetically exposed to project emissions at a location where the highest project-related impacts were calculated using the worst-case assumptions as described above. Since the exposure of MEI would produce the maximum impacts possible around the source, staff uses this risk estimate as a marker for acceptability of the project's impacts.

As described earlier, noncriteria pollutants for this project are evaluated for short-term (acute) and long-term (chronic) noncancer health effects, and cancer (long-term) risk. The significance of project-related health impacts are determined separately for each of these three health effects categories.

Acute and Chronic Noncancer Health Effects

Staff assesses the significance of noncancer health effects by calculating a *hazard index (HI)*. A hazard index is a ratio comparing exposure from facility emissions to the safe exposure level (i.e. Reference Exposure Level, or REL). A ratio of less than 1.0 suggests that the worst-case exposure would be below the limit for safe levels and would thus be insignificant with regard to health effects. The hazard indices for all toxic substances with the same type of health effect are added together to yield a total hazard index for the source. The total hazard index is calculated separately for acute effects and chronic effects. A total hazard index of less than 1.0 would indicate that cumulative worst-case exposures would be less than the reference exposure levels and not lead to significant noncancer health effects. In such cases, noncancer health impacts from project emissions would be considered unlikely even for sensitive members of the population. Staff would therefore conclude that there would be no significant noncancer project-related public health impacts. This assessment approach is consistent with risk management guidelines of both California OEHHA and U.S. EPA.

Cancer Risk

Staff relies upon regulations implementing the provisions of Proposition 65, the Safe Drinking Water and Toxic Enforcement Act of 1986, (Health & Safety Code, §§25249.5 et seq.) for guidance to determine a cancer risk significance level. Title 22, California Code of Regulations section 12703(b) states that "the risk level which represents no significant risk shall be one which is calculated to result in one excess case of cancer in an exposed population of 100,000, assuming lifetime exposure." This level of risk is equivalent to a cancer risk of 10 in 1 million, which is also written as 10×10^{-6}. In other words, under state regulations, an incremental cancer risk greater than 10 in 1 million from a project should be regarded as suggesting a potentially significant carcinogenic impact on public health. The 10 in 1 million risk level is also used by the Air Toxics "Hot Spots" (AB 2588) program as the public notification threshold for air toxic emissions from existing sources.

An important distinction between staff's and the Proposition 65 risk characterization approach is that the Proposition 65 significance level applies separately to each cancer-causing substance, whereas staff determines significance based on the total risk from all cancer-causing chemicals. Thus, the manner in which the significance level is applied by staff is more conservative (health-protective) than the manner applied by Proposition 65. The significant risk level of 10 in 1 million is consistent with the level of significance adopted by the South Coast Air Quality Management District (SCAQMD) in Rule 1401 (Solar Millennium 2009a, Section 5.10.1.3).

As noted earlier, the initial risk analysis for a project is typically performed at a screening level, which is designed to overstate actual risks, so that health protection could be ensured. Staff's analysis also addresses potential impacts on all members of the population including the young, the elderly, and people with existing medical conditions that may make them more sensitive to the adverse effects of toxic air contaminants and any minority or low-income populations that are likely to be disproportionately affected by impacts. To accomplish this goal, staff uses the most current acceptable public health exposure levels (both acute and chronic) set to protect the public from the effects of air toxics being analyzed. When a screening analysis shows cancer risks to be above the significance level, refined assumptions would be applied for what would likely be a lower, more realistic risk estimate. If, after refined assumptions, the project's risk is still found to exceed the significance level of 10 in 1 million, staff would require appropriate measures to reduce the risk to less than significance levels. If, after all feasible risk reduction measures have been considered and a refined analysis still identifies a cancer risk greater than 10 in 1 million, staff would deem such risk to be significant and would not recommend project approval.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

Public Health Table 1
Laws, Ordinances, Regulations, and Standards (LORS)

Applicable LORs	Description
Federal	
Clean Air Act section 112 (Title 42, U.S. Code section 7412)	This act requires new sources that emit more than 10 tons per year of any specified Hazardous Air Pollutant (HAP) or more than 25 tons per year of any combination of HAPs to apply Maximum Achievable Control Technology.
State	
California Health and Safety Code section 25249.5 et seq. (Proposition 65)	These sections establish thresholds of exposure to carcinogenic substances above which Proposition 65 exposure warnings are required.
California Health and Safety Code section 41700	This section states that “no person shall discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health, or safety of any such persons or the public, or which cause, or have a natural tendency to cause injury or damage to business or property.”
California Health and Safety Code Sections 44300 et seq.	Air Toxics Hot Spots Program requires participation in the inventory and reporting program at the local air pollution control district level.
California Health and Safety Code Sections 44360 - 44366	Air Toxics Hot Spots Information and Assessment Act requires that based on results of an HRA conducted per ARB/OEHHA guidelines, toxic contaminants do not exceed acceptable levels.
California Public Resource Code section 25523(a); Title 20 California Code of Regulations (CCR) section 1752.5, 2300–2309 and Division 2 Chapter 5, Article 1, Appendix B, Part (1); California Clean Air Act, Health and Safety Code section 39650, et seq.	These regulations require a quantitative health risk assessment for new or modified sources, including power plants that emit one or more toxic air contaminants (TACs).
Local	
South Coast Air Quality Management District (SCAQMD) Rule 402	Prohibits the discharge of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to the public; endanger the comfort, repose, health or safety of the public; or cause injury or damage to business or property.
SCAQMD Rule 1401	Discusses new source review for air toxics; specifies limits for maximum individual cancer risk, cancer burden, and noncancer acute and chronic hazard index from new permit units, relocations, or modifications to existing permit units which emit toxic air contaminants listed in Table I of the rule.
SCAQMD Rule 1470	Establishes fuel requirements, operating requirements and emission standards for stationary diesel-fueled internal combustion engines greater than 50 brake-horsepower.

PROPOSED MODIFIED PROJECT

The modification of PSEGS includes replacing the parabolic trough solar collection system and associated heat transfer fluid (HTF) with solar tower technology. The solar tower technology would create steam to run an electricity generator by using a field of heliostats—elevated mirrors, each approximately 12 feet tall, mounted on pylons and guided by a sun-tracking system—to focus the sun's rays on a solar receiver steam generator (SRSG) on top of a 750-foot solar tower located near the center of each of two solar fields. The modified PSEGS would be comprised of two adjacent solar fields and associated facilities with a total combined nominal output of approximately 500 MW. The project owner proposes to develop the PSEGS in two operational units, each consisting of one solar field, one tower, and a power block capable of producing approximately 250 MW of electricity.

In summary, the primary modifications to the already-approved PSPP needed for PSEGS related to Public Health are as follows:

- Two 250-MW power-generating units, each consisting of a dedicated field of approximately 85,000 heliostats, a 750-foot solar tower and receiver, a power block, a natural-gas fired auxiliary boiler, a natural gas-fired night preservation boiler, a diesel-fired emergency fire pump system, a diesel-fired emergency electric generator system, and a wet surface air condenser unit;
- An approximately 15-acre common facilities area located in the southwestern corner of the site, with an administrative/warehouse building and two 2-acre evaporation ponds (reduced from four 2-acre evaporation ponds for the PSPP). Additional equipment to be installed and operated include a diesel-fired emergency fire pump system, a diesel-fired emergency electric generator system, mirror washing machines and site support vehicles.
- An approximately 203-acre temporary construction laydown area located in the southwestern portion of the site immediately north of the common facilities area.
- Re-routing of the generation tie-line near the western end of the route and around the newly constructed Red Bluff Substation; the purpose of this re-routing is to align the PSEGS generation tie-line route immediately adjacent to the NextEra Desert Sunlight generation tie-line to minimize crossings over Interstate 10 and to ensure easy entry into the Red Bluff Substation nearest the PSEGS breaker position;
- Elimination of the secondary emergency access road;
- Reduction of the project footprint from 4,366 acres to 3,794 acres;
- Reduction of the amount of grading by 4.3 million cubic yards because the heliostat technology does not require an entirely flat surface;
- An increase in NOx emissions from the use of nighttime preservation and auxiliary boilers.

SETTING AND EXISTING CONDITIONS

This section describes the environment in the vicinity of the proposed modified project site from the public health perspective. Features of the natural environment, such as meteorology and terrain, affect the project's potential for causing impacts on public health. An emissions plume from a facility may affect elevated areas before lower terrain areas, due to a reduced opportunity for atmospheric mixing. Consequently, areas of elevated terrain can often be subjected to increased pollutant impacts. Also, the types of land use near a site influence the surrounding population distribution and density, which, in turn, affects public exposure to project emissions. Additional factors affecting potential public health impacts include existing air quality, existing public health concerns, and environmental site contamination.

SITE AND VICINITY DESCRIPTION

The proposed facility would be located in the Colorado Desert portion of eastern Riverside County, approximately 10 miles east of Desert Center and about 0.5 miles north of Interstate 10. Lands in the vicinity of the project consist predominantly of open desert and agricultural lands. The topography of the site is mostly flat (ranges between 130 and 200 feet above sea level), with elevated terrain beginning to the northeast and southwest within 3-4 miles of the site (Solar Millennium 2009a, Section 2.4.1).

The general population of California includes many sensitive subgroups that may be at greater risk from exposure to emitted pollutants. These sensitive subgroups include the very young, the elderly, and those with existing illnesses. There are no sensitive receptors within a 6-mile buffer zone of the project site. Several residential and worker receptors were identified within the regional area of the project site and are listed in Table 4.1-25 of Supplement Number Two (Palen 2013d, p. 37).

METEOROLOGY

Meteorological conditions, including wind speed, wind direction, and atmospheric stability, affect the extent to which pollutants are dispersed into ambient air and the direction of pollutant transport. This, in turn, affects the level of public exposure to emitted pollutants and associated health risks. When wind speeds are low and the atmosphere is stable, for example, dispersion is reduced and localized exposure may be increased.

This region of Riverside County is characterized by a dry-hot desert climate; summers are hot and dry, winters are moderate with low precipitation, and temperature inversions are strong. The region typically experiences clear skies, two rainy seasons (in winter and late summer), and strong seasonal winds. Winds generally flow from the west and southwest across the region and tend to transport air pollutants from the Los Angeles area into the Mojave Desert Air Basin (MDAB), in which the project is located (Solar Millennium 2009a, section 5.2.2.1).

Atmospheric stability is a measure related to turbulence, or the ability of the atmosphere to disperse pollutants due to convective air movement. Mixing heights (the height above ground level through which the air is well mixed and in which pollutants can be dispersed) are lower during mornings due to temperature inversions and increase during the warmer afternoons. Staff's **AIR QUALITY** section presents more detailed meteorological data.

EXISTING AIR QUALITY

The proposed site is within the South Coast Air Quality Management District (SCAQMD), although it is part of the MDAB. By examining average toxic concentration levels from representative air monitoring sites in the project vicinity with cancer risk factors specific to each contaminant, lifetime cancer risk can be calculated to provide a background risk level for inhalation of ambient air. When examining such risk estimates, staff considers it important to note that the overall lifetime risk of developing cancer for the average female in the United States is about 1 in 3, or 333,333 in 1 million and about 1 in 2, or 500,000 in 1 million for the average male (American Cancer Society, 2011). From 2004 to 2008, the cancer incidence rates in California are 51.28 in 1 million for males and 39.69 for females. Also, for the year 2004, the American Cancer Society estimated that the death rate due to cancer was 23.1 percent, about 1 in 4. From 2004 to 2008, the cancer death rates for California are 19.74 in 1 million for males and 14.34 in 1 million for females (American Cancer Society, 2012).

There are no monitoring stations within the MDAB that measure TACs, and therefore the background cancer risk in the MDAB cannot be determined. The nearest ARB air toxics monitoring station that actively reports values is located in Calexico, approximately 70 miles south of the project site. Staff does not consider this location to be representative of air quality in the area of the proposed site because emissions of toxic substances in Calexico are much greater than emissions in the vicinity of the project. However, data from Calexico serve to show the upper-bound levels of toxic air contaminants found in the general region. In 2008, the background cancer risk calculated by ARB for the Calexico monitoring station was about 135 in 1 million (ARB 2009). The pollutants 1, 3-butadiene and benzene, emitted primarily from mobile sources, accounted together for more than half of the total risk. The risk from 1, 3-butadiene was about 43 in 1 million, while the risk from benzene was about 44 in 1 million. Formaldehyde accounted for about 13 percent of the 2008 average calculated cancer risk based on air toxics monitoring results, with a risk of about 18 in 1 million. Formaldehyde is emitted directly from vehicles and other combustion sources. The risk from hexavalent chromium was about 14 in 1 million, or ~10 percent of the total risk.

The use of reformulated gasoline, beginning in the second quarter of 1996, as well as other toxics reduction measures, have led to a decrease of ambient levels of toxics and associated cancer risk in all areas of California during the past few years. For example, in one large air district, cancer risk was 342 in 1 million based on 1992 data and in 2002, the average inhalation cancer risk decreased to 162 in 1 million (BAAQMD 2004, p. 12). Similar reductions occurred throughout the state's major metropolitan areas.

EXISTING PUBLIC HEALTH CONCERNS

When evaluating a new project, staff sometimes conducts a study and analysis of existing public health issues in the project vicinity. This analysis is prepared in order to identify the current status of respiratory diseases (including asthma), cancer, and childhood mortality rates in the population located near the proposed modified project, which provides a basis on which to evaluate the significance of any additional health impacts from the proposed modified project. Because of the very low population in the immediate vicinity of the project and the fact that no existing health concerns are identified within a 6-mile buffer zone of the project, staff has concluded that an analysis of existing public health issues was not needed.

PSEGS is proposed at a location where the fungus that causes Valley Fever[1] (*Coccidioidomycosis)* may occur naturally. It was reported by the Desert Sun newspaper in a February 23, 2011 article that Riverside County saw an increase in one year in Valley Fever cases, from 67 to 106 cases, which is a 58 percent jump in the number of Valley Fever cases in 2010. The increase might be due to heavy spring rains followed by dry summers and a windy autumn, or because of a change in state reporting in 2010[2] (The Desert Sun, 2011).

ENVIRONMENTAL SITE CONTAMINATION

Site disturbances occur during demolition of existing structures, facility construction from excavation, grading, and earth moving. Such activities have the potential to adversely affect public health through various mechanisms, such as the creation of airborne dust, material being carried off-site through soil erosion, and uncovering buried hazardous substances. The Phase I Environmental Site Assessment conducted for this site in 2009 found no “Recognized Environmental Conditions” per the American Society for Testing and Materials Standards (ASTM) definition. That is, there was no evidence or record of any use, spillage, or disposal of hazardous substances on the site, nor was there any other environmental concern that would require remedial action (Solar Millennium 2009a, Section 5.16.2.3).

To address the possibility that soil contamination would be encountered during construction of the PSEGS, existing condition **WASTE-1** and modified condition **WASTE-2** require a registered professional engineer or geologist to be available during soil excavation and grading to ensure proper handling and disposal of contaminated soil. Staff believes that adherence to current ordinances and to staff’s proposed conditions of certification mentioned above would be adequate to address any soil or groundwater contamination that may exist on this site. See the staff assessment section on **WASTE MANAGEMENT** for a more detailed analysis of this topic.

---

[1] Valley Fever is an infection that occurs when the spores of the fungus *Coccidioides immitis* enter human’s through inhalation. When people breathe in these *Coccidioides* spores, they are at risk of developing Valley Fever.

[2] Valley Fever (*Coccidioidomycosis*) became laboratory-reportable in California in 2010 (Hector el al., 2011). California Code of Regulations, Title 17, Section 2505 requires laboratories to report laboratory testing results suggestive of the disease of Valley Fever (*Coccidioidomycosis*) to the local health department. Source: http://www.cdph.ca.gov/HealthInfo/Documents/TITLE_17_SECTION_2505.pdf

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

CONSTRUCTION IMPACTS AND MITIGATION

Potential risks to public health during construction may be associated with exposure to toxic substances in contaminated soil disturbed during site preparation (discussed in the “Setting” section above), and diesel exhaust from heavy equipment operation. Criteria pollutant impacts from the operation of heavy equipment and particulate matter from earth moving are examined in staff’s **Air Quality** analysis.

The operation of construction equipment would result in air emissions from diesel-fueled engines. Diesel emissions are generated from sources such as trucks, graders, cranes, welding machines, electric generators, air compressors, and water pumps. Although diesel exhaust contains criteria pollutants such as nitrogen oxides, carbon monoxide, and sulfur oxides, it also includes a complex mixture of thousands of gases and fine particles. These particles are primarily composed of aggregates of spherical carbon particles coated with organic and inorganic substances. Diesel exhaust contains over 40 substances that are listed by the U.S. Environmental Protection Agency (U.S. EPA) as hazardous air pollutants and by the ARB as toxic air contaminants. Diesel exhaust is also characterized by ARB as “particulate matter from diesel-fueled engines.”Exposure to diesel exhaust may cause both short- and long-term adverse health effects. Short-term effects can include increased coughing, labored breathing, chest tightness, wheezing, and eye and nasal irritation. Long-term effects can include increased coughing, chronic bronchitis, reductions in lung function, and inflammation of the lung. Epidemiological studies also strongly suggest a causal relationship between occupational diesel exhaust exposure and lung cancer. Diesel exhaust is listed by the EPA as “likely to be carcinogenic to humans (US. EPA, 2003).”

Based on a number of health effects studies, the Scientific Review Panel (SRP) on Toxic Air Contaminants recommended a <u>chronic</u> REL (see REL discussion in Method of Analysis section above) for diesel exhaust particulate matter of 5 $\mu g/m^3$ and a cancer unit risk factor of $3x10^{-4}$ $(\mu g/m^3)^{-1}$ (SRP 1998, p. 6). (The SRP, established pursuant to California Health and Safety Code section 39670, evaluates the risk assessments of substances proposed for identification as Toxic Air Contaminants by ARB and the Department of Pesticide Regulation [DPR]. The SRP reviews the exposure and health assessment reports and the underlying scientific data upon which the reports are based.) The SRP did not recommend a value for an <u>acute</u> REL since available data in support of a value was deemed insufficient. On August 27, 1998, ARB listed particulate emissions from diesel-fueled engines as a toxic air contaminant and approved SRP’s recommendations regarding health effect levels (OEHHA 2009, Appendix A). In 2000, ARB developed a “Risk Reduction Plan to Reduce Particulate Matter Emissions From Diesel-Fueled Engines and Vehicles” and has been developing regulations to reduce diesel particulate matter emissions since that time.

Construction of the PSEGS, including site preparation, is anticipated to take place over a period of 33 months (Palen 2013d, Section 4.1.6). As noted earlier, assessment of chronic (long-term) health effects assumes continuous exposure to toxic substances over a significantly longer time period, typically from 8 to 70 years.

Applicant Analysis

The project owner conducted a health risk assessment for diesel exhaust from construction activities and the results are listed in the upper portion of **Public Health Table 2**. The project owner did not run the Hotspots Analysis Reporting Program (HARP) model to evaluate construction-related public health impacts, but rather took the maximum three locations from diesel PM modeling and hand calculated the results (Palen 2013p). The maximum modeled annual average concentration of diesel particulate matter at any location calculated by the project owner was 0.041 $\mu g/m^3$. The cancer unit risk value for an assumed 3-year exposure is $9.3x10^{-6}$ per $\mu g/m^3$[3]. This is lower than the cancer unit risk of $3x10^{-4}$ $(\mu g/m^3)^{-1}$ from SRP since the results from SRP are derived for longer-term exposures. The calculated cancer risk is approximately 0.38 in one million[4], which is for below the significance level of 10 in one million (Palen 2013p).

Staff Analysis

Staff also calculated the risk of diesel exhaust from construction activities by assuming an exposure for a 9-year period, which is recommended by OEHHA for short-term exposure (OEHHA, 2003). The cancer risk calculated by staff is approximately 1.58 in one million, which is still below the significance level of 10 in one million. As described above, construction of PSEGS is anticipated to take place over a period of under three years (i.e. 33 months), which is shorter than the 9-year period assumed in the staff's calculations. Therefore, staff's analysis should be regarded as conservative because of the inherently conservative exposure-related assumptions made in the modeling analysis. Staff regards the related conditions of certification in the **AIR QUALITY** section as adequate to ensure that cancer-related public health impacts of diesel exhaust emissions are mitigated during construction to a point where they are not considered significant.

The chronic hazard index for diesel exhaust during construction activities is $8.17x10^{-3}$ as calculated by staff using a chronic noncancer REL of 5 $\mu g/m^3$. This index is lower than the significance level of 1.0. It means that there would be no chronic noncancer impacts from construction activities. The potential levels of criteria pollutants from operation of construction-related equipment are discussed in staff's **AIR QUALITY** section along with mitigation measures and related conditions of certification. The pollutants of most concern in this regard are particulate matter (PM), carbon monoxide (CO), sulfur dioxide (SO_2), and nitrogen dioxide (NO_2).

---

[3] The cancer unit risk value of $9.3x10^{-6}$ per $\mu g/m^3$ was calculated by assuming an exposure of 3 years (20 hours per day, 6 days per week, 52 weeks per year). By using this exposure assumption, the lifetime exposure factor could be calculated by the following formula:

The Lifetime Exposure Factor = (3×52×6×20)/(70×52×7×24) =0.031.

The cancer unit risk value then could be calculated by the following formula:

The Cancer Unit Risk Value = The Cancer Unit Risk from SRP × The Lifetime Exposure Factor = $3x10^{-4}$ per $\mu g/m^3$ x0.031=$9.3x10^{-6}$ per $\mu g/m^3$.

[4] The risk of 0.38 in one million was calculated using the following formula:
Cancer Risk = Concentration of Diesel Exhaust × Cancer Unit Risk = 0.041 $\mu g/m^3$ × $9.3x10^{-6}$ per $\mu g/m^3$ = $0.38x10^{-6}$.

Public Health Table 2
Construction Hazard/Risk from Diesel Particulate Matters (DPMs)

	Cancer Unit Risk $(\mu g/m^3)^{-1}$	Cancer Risk (in one million)	Significance Level	Significant?
Project owner's Analysis [a]	9.3×10^{-6}	0.38	10	No
Staff's Analysis [b]	38.7×10^{-6}	1.58	10	No
	Chronic Noncancer REL $(\mu g/m^3)$	**Hazard Index (HI)**		
	5	8.17×10^{-3}	1	No

[a] Assumed for a 3-year exposure period (20 hours per day, 6 days per week, 52 weeks per year). Source: Palen 2013p.
[b] Assumed for a 9-year exposure period.

Mitigation measures are proposed by both the project owner and Air Quality staff to reduce the maximum calculated PM10 and PM2.5 concentrations. These include the use of extensive fugitive dust control measures that are assumed to result in a 50 percent reduction of fugitive dust emissions. In order to mitigate potential impacts from construction-related particulate emissions during the operation of diesel-powered construction equipment, the use of ultra low-sulfur diesel fuel is now required and the installation of an oxidation catalyst and soot filters on diesel equipment is included when possible. The catalyzed diesel particulate filters are passive, self-regenerating filters that reduce particulate matter, carbon monoxide, and hydrocarbon emissions through catalytic oxidation and filtration. The degree of particulate matter reduction is comparable for both mitigation measures in the range of approximately 85% to 92%. Such filters would reduce diesel combustion emissions during construction and further reduce the impacts associated with diesel exhaust. (See the **AIR QUALITY** section of this FSA for staff's proposal to control particulate matter.)

The project owner proposes to use a concrete batch plant during the construction phase of the project. The operation of the concrete batch plant would result in increased TAC emissions during construction as well as increased diesel exhaust and fugitive dust emissions. Emissions of volatile TACs from onsite diesel and gasoline fuel storage would also occur. Staff reviewed the estimated levels of pollutants associated with the concrete batch plant (Galati & Blek 2010i) and has determined that the increased emissions are minimal and would not add significantly to public health impacts during construction. The project owner did not include additional emissions from the concrete batch plant in the HRA. Emissions of TACs from a concrete batch plant usually result in the highest airborne concentrations being close-in. Given the isolated nature of the power plant from residences and commercial operations where the public would congregate for a period of time (as opposed to rapidly moving through the area when traveling on I-10), staff believes that the risks would not be significant to any on-site or off-site receptor.

Construction could disturb a certain percentage of approximately 5,200 acres (Palen 2013d, Section 4.1.1.1) of top soil that could harbor the *Coccidioides* spores possibly exposing humans to the risk of Valley Fever. On-site workers could be exposed from inhaling these fungal spores from wind-blown dust generated from soil excavation construction activities.

To minimize the risk of getting Valley Fever, the Center for Disease Control and Prevention (CDC) recommends the following measures for people such as onsite workers who are at risk of exposure to Valley Fever:

- wear an N95 mask if a person must be in or near a dusty environment, such as a construction zone;
- avoid activities that involve close contact to dust including yard work, gardening, and digging;
- use air quality improvement measures indoors such as HEPA filters;
- take prophylactic anti-fungal medication if deemed necessary by a person's healthcare provider; and
- clean skin injuries well with soap and water, especially if they have been exposed to soil or dust.

The California Department of Public Health (CDPH) also recommends that, "those exposed to dust during their jobs or outside activities in these areas should consider respiratory protection, such as a mask, during such activities." (CDPH, 2010)

The recommendations from CDC and CDPH are all preventive actions, but do not guarantee protection from exposure to Valley Fever. Based on CDC and CDPH's recommendations, staff recommends that project workers in the vicinity of such dust generation areas wet the soil before any excavation activities, wear protective masks and stay indoors during dust storms and close all doors to avoid dust inhalation. Staff also recommends people who live in endemic regions should try to avoid smoky and dusty environments. Staff considers the project owner's dust suppression plans adequate to minimize the risk of the public getting Valley Fever in areas where *Coccidioides* spores are found. Please refer to staff's **WORKER SAFETY AND FIRE PROTECTION** section for more information regarding exposure of the project's workers to Valley Fever.

As for the concerns of Valley Fever affecting the general population, in the **AIR QUALITY** section of this FSA staff recommends some mitigation measures, including **AQ-SC3 (Construction Fugitive Dust Control)** and **AQ-SC4 (Dust Plume Response Requirement)** for the purposes of preventing all fugitive dust plumes from leaving the project boundary. As long as the dust plumes are kept within the project boundary, there won't be any significant concern for Valley Fever adversely affecting the general population and public health.

OPERATION IMPACTS AND MITIGATION

Emissions Sources

The emissions sources at the proposed PSEGS site for both power blocks include two natural gas-fired auxiliary boilers, two natural gas-fired night preservation boilers, two wet surface air condensers (WSAC) units, two diesel-fired emergency electrical generators, two diesel-fired emergency fire pumps, mirror washing machines and site support vehicles. Additional emission sources in the common area include one fire pump engine, one emergency electrical generator, and one mirror washing machine. In summary, a total of 19 emitting units were modeled by the project owner for facility operations, including (Palen 2013d):

- 2 auxiliary boilers
- 2 night preservation boilers
- 8 wet surface air condensers (WSAC) units
- 3 emergency electric generator systems
- 3 emergency fire pump systems
- 1 onsite equipment for mirror washing

In the project owner's "Revised Supplement No. 2, Complete Air Quality & Public Health Sections", emissions of diesel particulate matter (DPM) from mirror washing activities and onsite operations support vehicles were included, and the HRA for facility operations was re-conducted. The project owner also included ammonia emissions in their revised HRA for using selective catalytic reduction (SCR) with the boilers. The following sections present the results of project owner's updated HRA and staff's revised analysis (Palen 2013ff).

As noted earlier, the first step in a health risk assessment is to identify potentially toxic compounds that may be emitted from the facility. Table 4.1-27 of the Supplement Number Two (Palen 2013d) and the revised version (Palen 2013ff) lists toxic air contaminants that may be emitted by the project. **Public Health Table 3** lists each such TAC, their exposure routes and how they would contribute to the total risk obtained from the risk analysis. Toxicity values include RELs which are used to calculate short-term and long-term noncancer health effects, and cancer unit risks, which are used to calculate the lifetime risk of developing cancer, are listed in **Public Health Table 4** (ARB 2011). Emission factors for most TACs were obtained from the U.S. EPA emission factors database (AP-42) and the California Air Toxics Emission Factors (CATEF II) database.

Emissions Levels

Once potential emissions are identified, the next step is to quantify them by conducting a “worst case” analysis. Maximum hourly emissions are required to calculate acute (one-hour) noncancer health effects, while estimates of maximum emissions on an annual basis are required to calculate cancer and chronic (long-term) noncancer health effects.

The next step in the health risk assessment process is to estimate the ambient concentrations of toxic substances that may result from the project. This is accomplished by using a screening air dispersion model and assuming conditions that result in maximum project impacts. The project owner’s screening analysis was performed using the ARB/OEHHA Hotspots Analysis and Reporting Program modeling program to model operating period public health impacts, version 1.4f (ARB, 2011). Finally, ambient concentrations were used in conjunction with RELs and cancer unit risk factors to estimate health effects which might occur from exposure to facility emissions.

Exposure pathways, or ways in which people might come into contact with toxic substances, include inhalation, dermal (through the skin) absorption, soil ingestion, consumption of locally grown plant foods, and mother's milk.

The above method of assessing health effects is consistent with OEHHA's Air Toxics Hot Spots Program Risk Assessment Guidelines (OEHHA 2003) referred to earlier, and results in the following health risk estimates. In the following sub-sections, staff reviews and summarizes the work of project owner, and evaluated the adequacy of project owner's analysis by conducting another HRA.

Applicant Analysis

The project owner's screening health risk assessment resulted in a maximum acute hazard index of 0.000276 and a maximum chronic hazard index of 0.000683 at the point of maximum impact (PMI). The worst-case cancer risk was found to be 1.08 in one million at the PMI. As **Public Health Table 5** shows, both acute and chronic hazard indices are under the significance level of 1.0, and cancer risk is below the significance level of 10 in 1 million, indicating that no short- or long-term adverse health effects are expected.

Public Health Table 5
Operation Hazard/Risk at Point of Maximum Impact

Type of Hazard/Risk	Hazard Index/Risk	Significance Level	Significant?
Acute Noncancer	0.000276	1.0	No
Chronic Noncancer	0.000683	1.0	No
Individual Cancer	1.08 in 1 million	10 in 1 million	No

Source: Table4.1-29 of project owner's Supplement Number Two – Complete Air Quality and Public Health Sections (Palen 2013ff)

Staff Analysis

To evaluate the project owner's analysis, staff conducted another analysis of cancer risks and acute and chronic hazards due to combustion-related emissions during operation from the proposed PSEGS. The analysis was conducted for the general population, sensitive receptors, nearby residences and the project's work force. The sensitive receptors, as previously noted, are subgroups that may be at greater risk from exposure to emitted pollutants, and include the very young, the elderly, and those with existing respiratory illnesses. Results are shown in **Public Health Table 6**.

Health risks potentially associated with ambient concentrations of carcinogenic pollutants were calculated in terms of excess lifetime cancer risks. The total cancer risk at any specific location is found by summing the contributions from the individual carcinogens. Health risks from noncancer health effects were calculated in terms of hazard index as a ratio of ambient concentration of TACs to RELs for that pollutant.

Cancer Risk at the Point of Maximum Impact (PMI)

The first result of HRA is the numerical cancer risk for the maximally exposed individual (MEI) which is the individual located at the point of maximum impact as well as risks to the MEI at a residence (MEIR). Human health risks associated with emissions from the proposed and similar projects by definition would not be higher at any other location than at the PMI. Therefore, if there is no significant impact associated with concentrations at the PMI location, it can be reasonably assumed that there would not be significant impacts in any other location in the project area. The cancer risk to the MEI at the PMI is referred to as the Maximum Incremental Cancer Risk (MICR). However, the PMI (and thus the MICR) is not necessarily associated with actual exposure because in many cases, the PMI is in an uninhabited area. Therefore, the MICR is generally higher than the maximum residential cancer risk. MICR is based on 24 hours per day, 365 days per year, 70 year lifetime exposure. As shown in **Public Health Table 6**, the total worst-case individual cancer risk calculated by staff is 1.41 in 1 million at the PMI. The PMI is approximately 200 feet west of the project boundary and approximately 250 ft southeast of the project common area. The difference of HRA between the project owners and staff is because the project owner used the Derived (Adjusted) Cancer Risk method to calculate cancer risk while staff used the Derived (OEHHA) Cancer Risk method[5]. As **Public Health Table 6** shows, the cancer risk value at PMI calculated by staff is still below the significance level, 10 in a million, indicating that no significant adverse cancer risk is expected.

Chronic and Acute Hazard Index (HI)

The results of staff's calculations for chronic and acute index reach the same conclusions as the project owner. The screening health risk assessment for the project including emissions from all sources resulted in a maximum chronic Hazard Index (HI) of 6.83×10^{-4} and a maximum acute HI of 8.09×10^{-4}. As **Public Health Table 6** shows, both acute and chronic hazard indices are less than 1.0, indicating that no short- or long-term adverse health effects are expected.

Project-Related Impacts at Area Residences

Several residential and worker receptors were identified by the project owner within the regional area of the project site and were listed in Table 4.1-25 of the Supplement Number Two (Palen 2013d, Section 4.1.12). Staff's specific interest in the risk to the maximally exposed individual in a residential setting (or MEIR) is because this risk most closely represents the maximum project-related lifetime cancer risk. Residential risk is presently assumed by the regulatory agencies to result from exposure lasting 24 hours per day, 365 days per year, over a 70- year lifetime. Residential risks were presented in

---

[5] The Derived (OHHHA) Cancer Risk method applies to multipathway risk assessments and is described in detail in the OEHHA Air Toxic Hot Spots Program Guidance Manual for Preparation of Health Risk Assessment (August 2003). In brief, for a multipathway cancer risk assessment, the two dominant (driving) exposure pathways use the high-end point-estimates of exposure, while the remaining exposure pathways use average point estimates listed in the OEHHA HRA Guidance Manual. The Derived (Adjusted) Cancer Risk method is identical to the method used for the Derived (OEHHA) Cancer Risk with one exception. The Derived (Adjusted) method uses the breathing rate at the 80th percentile of exposure rather than the high-end point-estimate when the inhalation pathway is one of the dominant exposure pathways. Source: http://www.arb.ca.gov/toxics/harp/rmpolicyfaq.htm#10

terms of MEIR and HI at residential receptors in **Public Health Table 6**. The cancer risk for MEI of residential receptors, or MEIR, is 0.151 per million, which is below the significance level, indicating that no significant adverse cancer risk is expected. The maximum chronic HI of MEIR is 7.58×10^{-5} and the maximum acute HI is 1.3×10^{-4}. As **Public Health Table 6** shows, both acute and chronic hazard indices are less than 1.0, indicating that no short- or long-term adverse health effects are expected. This MEIR[6] is approximately 1 mile northwest of the project Unit 1 Tower, and just about 300 ft north of the project boundary.

Risk to Workers

Cancer risk to potentially exposed workers was presented in terms of risk to the maximally exposed individual worker (MEIW) at PMI and is also summarized in **Public Health Table 6**. The staff's assessment is for potential workplace risks, due to exposure of shorter duration than for residential risks from 70 years of exposure. Workplace risk is presently assumed by the regulatory agencies to result from exposure lasting 8 hours per day, 245 days per year, over a 40-year period. As shown in **Public Health Table 6**, the cancer risk for workers at MEIW (i.e. 0.214 in 1 million) is below the significance level, indicating that no significant adverse cancer risk is expected.

Risk to Sensitive Receptors

As noted previously, there were no sensitive receptors, such as schools (both public and private), day care facilities, nursing homes, and hospitals, identified within a 6-mile buffer zone of the site (Palen 2013d, Section 4.1.12). Thus, there is no calculation for risk to sensitive receptors.

Public Health Table 6
Results of Staff Analysis: Cancer Risk and Chronic Hazard from PSEGS Operations

Receptor Location	Cancer Risk (per million)	Chronic HI[d]	Acute HI[d]	Significant?
PMI[a]	1.41	6.83×10^{-4}	8.09×10^{-4}	No
Residence MEIR[b]	0.0151	7.58×10^{-5}	1.3×10^{-4}	No
Worker MEIW[c]	0.214	-	-	No
at a Sensitive Receptor	-	-	-	No
Significance level	10	1	1	

[a] PMI = Point of Maximum Impact
[b] MEIR = MEI of residential receptors. Location of the residence of the highest risk with a 70-year residential scenario.
[c] MEIW = MEI for workers. Occupational exposure patterns assuming exposure of 8 hours/day, 245 days/year for 40 years.
[d] HI = Hazard Index

[6]According to Socioeconomics Figure 1 as of April 1, 2010, there were no people counted as part of the Decennial Census, so their residence was either vacant or the occupant did not respond to the census.

In **Public Health Table 6**, it can also be seen that the cancer and noncancer risks from the PSEGS operation would be significantly below their respective significance levels. It means that no health impacts would occur within all segments of the surrounding population. Therefore, staff concludes there is no need for conditions of certification to protect public health, except for Legionella, discussed next.

Wet Surface Air Condensers (WSAC) and Legionella

To conserve water in the site's desert environment, each plant would use an air-cooled condenser for the main steam-cycle. However, a WSAC would be used for auxiliary equipment cooling (Palen 2013d). Since the facility would mainly use dry cooling, there would be no emissions of toxic metals or volatile organic compounds from cooling tower mist or drift. In addition to being a source of potential toxic air contaminants, in particular beryllium and copper due to the project's use of groundwater that contains trace amounts of these substances (Palen 2013d, Table 4.1A-8), the possibility exists for bacterial growth to occur in the eight WSACs (four at each power block) that are part of the project. Legionella is a bacterium that is ubiquitous in natural aquatic environments and is also widely distributed in man-made water systems. It is the principal cause of Legionellosis, otherwise known as Legionnaires' Disease, which is similar to pneumonia. Transmission to people results mainly from inhalation or aspiration of aerosolized contaminated water. Untreated or inadequately treated cooling systems, such as industrial cooling towers and building heating, ventilating, and air conditioning systems, have been correlated with outbreaks of Legionellosis.

Legionella can grow symbiotically with other bacteria and can infect protozoan hosts. This provides Legionella with protection from adverse environmental conditions, including making it more resistant to water treatment with chlorine, biocides, and other disinfectants. Thus, if not properly maintained, cooling water systems and their components can amplify and disseminate aerosols containing Legionella.

The State of California regulates recycled water for use in cooling towers in Title 22, Section 60306, California Code of Regulations. This section requires that, in order to protect workers and the public who may come into contact with cooling tower mists, chlorine or another biocide must be used to treat the cooling system water to minimize the growth of Legionella and other micro-organisms. This regulation does not apply to the PSEGS project since it intends to use well water (not reclaimed water) for cooling purposes (Palen 2013d, Section 4.1.12.9); however, the potential remains for Legionella growth in cooling water at the PSEGS due to nutrients found in groundwater.

The U.S. EPA published an extensive review of Legionella in a human health criteria document (EPA 1999). The U.S. EPA noted that Legionella may propagate in biofilms (collections of microorganisms surrounded by slime they secrete, attached to either inert or living surfaces) and that aerosol-generating systems such as cooling towers can aid in the transmission of Legionella from water to air. The U.S. EPA has inadequate quantitative data on the infectivity of Legionella in humans to prepare a dose-response evaluation. Therefore, sufficient information is not available to support a quantitative characterization of the threshold infective dose of Legionella. Thus, the presence of even small numbers of Legionella bacteria presents a risk, however small, of disease in humans.

In February of 2000 the Cooling Technology Institute (CTI) issued its own report and guidelines for the best practices for control of Legionella (CTI 2000). The CTI found that 40-60 percent of industrial cooling towers tested were found to contain Legionella. More recently, staff has received a 2005 report of testing in cooling towers in Australia that found the rate of Legionella presence in cooling tower waters to be extremely low, approximately 3-6 percent. These cooling towers all had implemented aggressive water treatment and biocide application programs similar to that required by existing condition of certification **PUBLIC HEALTH-1**.

To minimize the risk from Legionella, the CTI recommended: (a) minimization of water stagnation; (b) minimization of process leads into the cooling system that provide nutrients for bacteria; (c) maintenance of overall system cleanliness; (d) application of scale and corrosion inhibitors as appropriate; (e) use of high-efficiency mist eliminators on cooling towers; and (5) the overall general control of microbiological populations.

Good preventive maintenance is very important in the efficient operation of cooling towers and other evaporative equipment (ASHRAE 1998). Preventive maintenance includes having effective drift eliminators, periodically cleaning the system if appropriate, maintaining mechanical components in good working order, and maintaining an effective water treatment program with appropriate biocide concentrations. Staff notes that most water treatment programs are designed to minimize scale, corrosion, and biofouling and not to control Legionella.

The efficacy of any biocide in ensuring that bacterial and in particular Legionella growth, is kept to a minimum is contingent upon a number of factors including, but not limited to, proper dosage amounts, appropriate application procedures and effective monitoring.

In order to ensure that Legionella growth is kept to a minimum, thereby protecting both nearby workers as well as members of the public, staff has proposed Condition of Certification **PUBLIC HEALTH-1** in previous PSA/FSA for PSPP. **PUBLIC HEALTH-1** has already been approved and already existed in the license. The condition requires the project owner to prepare and implement a biocide and anti-biofilm agent monitoring program to ensure that proper levels of biocide and other agents are maintained within the two cooling towers' water at all times, that periodic measurements of Legionella levels are conducted, and that periodic cleaning is conducted to remove bio-film buildup. Staff believes that with the use of an aggressive antibacterial program coupled with routine monitoring and biofilm removal, the chances of Legionella growing and dispersing would be reduced to insignificance. The project owner has stated that an appropriate biocide program and anti-biofilm agent monitoring program would be implemented for the cooling towers (Solar Millennium 2009a, Section 5.10.3.5). Since the condition meets the need of PSEGS, Staff concludes that there is no need to modify **PUBLIC HEALTH-1**.

NON-OPERATION AND FACILITY CLOSURE IMPACTS AND MITIGATION

Closure of the proposed PSEGS would follow a facility closure plan prepared by the project owner and designed to minimize public health and environmental impacts. Staff expects that impacts to public health from the non-operation or facility closure process would represent a fraction of the impacts associated with the construction or operation of the proposed PSEGS. Therefore, based on staff's analysis for the construction and operation phases of this project, staff concludes that public health-related impacts from non-operation or facility closure would be insignificant.

PROJECT-RELATED FUTURE ACTIONS

In order to transmit the power generated at the PSEGS to the electricity grid, a new substation is required. Southern California Edison Company (SCE) is constructing the Red Bluff Substation, which will allow the electricity to be carried by the Devers–Palo Verde No. 1 (DPV1) 500 kV transmission line.

The SCE Red Bluff Substation is expected to be operational in December 2013. Staff concludes that there won't be any overlap of construction phase of SCE Red Bluff Substation and the PSEGS. Therefore, there is no need to discuss the potential impacts of the construction of the SCE Red Bluff Substation. As for the potential impacts of the operation of the SCE Red Bluff Substation, the only health impacts in concern are exposure to electromagnetic fields (EMF) from power transmission and safety concerns for workers. EMF is discussed in the **TRANSMISSION LINE SAFETY AND NUISANCE** section of this FSA. Worker safety is discussed in the **WORKER SAFETY AND FIRE PROTECTION** section of this FSA.

CUMULATIVE IMPACT ANALYSIS

A project may result in a significant adverse cumulative impact where its effects are cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects (California Code of Regulations, Title 14, section 15130).

The geographic scope of analysis for cumulative effects to public health is a 6-mile buffer zone around the project site. This is the same six-mile buffer zone for localized significant cumulative air quality impacts described and evaluated in the **AIR QUALITY** section. Cumulative impacts of the proposed project and other projects within a 6-mile buffer zone were not quantitatively evaluated in the Supplement Number Two (Palen 2013d, Section 4.1.12.12). Staff considered the potential impacts due to construction and operation of the proposed PSEGS with new projects or new "reasonably foreseeable probable future projects" in the area since the original project was approved, and none of them fall within the 6-mile buffer zone. Therefore, staff concludes that there would not be any cumulatively significant impacts associated with public health risks.

COMPLIANCE WITH LORS

Staff has considered the minority population as identified in **Socioeconomics Figure 1** in its impact analysis and has found no potential significant adverse impacts for any receptors, including environmental justice populations. In arriving at this conclusion, staff notes that its analysis complies with all directives and guidelines from the Cal/EPA Office of Environmental Health Hazard Assessment and the ARB. Staff's assessment is biased toward the protection of public health and takes into account the most sensitive individuals in the population. Using extremely conservative (health-protective) exposure and toxicity assumptions, staff's analysis demonstrates that members of the public potentially exposed to toxic air contaminant emissions of this project—including sensitive receptors such as the elderly, infants, and people with pre-existing medical conditions—would not experience any significant chronic or cancer health risk as a result of that exposure. Staff believes that it incorporated every conservative assumption called for by state and federal agencies responsible for establishing methods for analyzing public health impacts. The results of that analysis indicate that there would be no direct or cumulative significant public health and safety impact to any population in the area. Therefore, given the absence of any significant health impacts, there are no disparate health impacts and there are no environmental justice issues associated with **Public Health**. Staff concludes that construction and operation of the PSEGS would be in compliance with all applicable LORS regarding long-term and short-term project impacts in the area of **Public Health**.

NOTEWORTHY PUBLIC BENEFITS

It is noteworthy that a solar electric generating facility such as the proposed PSEGS project would emit significantly less TACs to the environment than other energy sources available in California such as natural gas or biomass, thereby reducing the health risks that would otherwise occur with these non-renewable energy sources. At the same time, the proposed PSEGS would provide much needed electrical power to California residences and businesses, and would contribute to electricity supply. Electrical power is not only necessary to maintain a functioning society, but it also benefits many individuals who rely on powered equipment for their health (such as dialysis equipment and temperature control equipment). For example, it is documented that during heat waves in which elevated air-conditioning use causes an electrical blackout, hospitalizations and deaths due to heat stroke are increased.

Moreover, changing from trough solar collection system to solar tower technology would be more suitable for endemic areas of Valley Fever. This is because the heliostat technology does not require an entirely flat surface and would decrease the disturbance of the top soil.

RESPONSE TO COMMENTS

STATE OF CALIFORNIA, ENERGY RESOURCES CONSERVATION AND DEVELOPMENT COMMISSION/BASIN AND RANGE WATCH, LAURA CUNNINGHAM AND KEVIN EMMERICH, STATUS REPORT NO. 2, TN # 70697, MAY 8, 2013:

Comment: The Intervenor raised concerns in their May 8, 2013 status report regarding air quality and public health during the construction and operational phases of the proposed project to insure air quality impacts don't exceed significant thresholds of PM10/PM2.5 for fugitive and windblown dust.

Response: As for the concerns of Valley Fever on public health, in the **AIR QUALITY** section of this FSA, staff recommends mitigation measures, including **AQ-SC3 (Construction Fugitive Dust Control)** and **AQ-SC4 (Dust Plume Response Requirement)** for the purposes of preventing all fugitive dust plumes from leaving the project boundary. As long as the dust plumes are kept within the project boundary, there won't be any significant concern for Valley Fever adversely affecting public health.

CONCLUSIONS

Staff has analyzed potential public health risks associated with construction and operation of the amended PSEGS and does not expect any significant adverse cancer, short-term, or long-term health effects to any members of the public including low income and minority populations, from project toxic emissions. Staff also concludes that its analysis of potential health impacts from the proposed PSEGS uses a conservative health protective methodology that accounts for impacts to the most sensitive individuals in a given population, including newborns and infants. According to the results of staff's health risk assessment, emissions from the PSEGS project would not contribute significantly to morbidity or mortality in any age or ethnic group residing in the project area. With the incorporation of the existing Condition of Certification **PUBLIC HEALTH-1**, the proposed facility would not present a significant health risk to the public.

PROPOSED CONDITIONS OF CERTIFICATION

Staff recommends the following Condition of Certification for PSEGS, which is essentially identical to the single Condition of Certification recommended for the previously approved PPSP (Note: new text is <u>**bold and underlined)**</u>:

PUBLIC HEALTH-1 The project owner shall develop and implement a Cooling Water Management Plan to ensure that the potential for bacterial growth in cooling water is kept to a minimum. The Plan shall be consistent with either staff's "Cooling Water Management Program Guidelines" or with the Cooling Technology Institute's "Best Practices for Control of Legionella" guidelines but in either case, the Plan must include sampling and testing for the presence of Legionella bacteria at least every six months. After two years of power plant operations, the project owner may ask the <u>**compliance project manager (**</u>CPM<u>**)**</u> to re-evaluate and revise the Legionella bacteria testing requirement.

Verification: At least 60 days prior to the commencement of cooling tower operations, the Cooling Water Management Plan shall be provided to the CPM for review and approval.

SOCIOECONOMICS

Testimony of Lisa Worrall

SUMMARY OF CONCLUSIONS

California Energy Commission (Energy Commission) staff ("staff") has reviewed the Petition to Amend the Commission Decision for the Palen Solar Power Project (PSPP) in accordance with the requirements of the California Environmental Quality Act (CEQA). The petition proposes to eliminate the use of solar parabolic trough technology approved under the Commission Decision and replace it with BrightSource's LPT solar power tower technology. Staff's analysis considers the changes between the approved project (PSPP) and the amended project, now called the Palen Solar Electric Generating System (PSEGS).

Staff concludes that the construction and operation of the PSEGS would not cause a significant adverse direct or indirect impact on the area's housing, schools, law enforcement services, or parks. The project would not directly or indirectly induce a substantial population growth or displacement of population, or induce substantial increases in demand for housing, parks, or law enforcement services. However, when considered cumulatively with the other proposed and approved projects, temporary lodging may be constrained in the local and regional study areas, thus contributing to a cumulative impact. PSEGS operations would not create a significant adverse socioeconomic cumulative impact on the area's housing, schools, law enforcement services, or parks.

Staff concludes the population residing in the six-mile project buffer does not constitute an environmental justice population as defined by Environmental Justice: Guidance under the National Environmental Policy Act, and would not trigger further scrutiny by the thirteen technical areas for purposes of an environmental justice analysis.[1] Cultural Resources staff has identified tribal entities that use the project area, and as defined by Environmental Justice: Guidance under the National Environmental Policy Act, this environmental justice population would trigger further scrutiny by Cultural Resources staff for purposes of an environmental justice analysis. Refer to the Cultural Resources section for more information. As discussed in the subsection "Project-Specific Demographic Screening," staff notes that the Bureau of Land Management (BLM) July 2013 PSEGS Draft Supplemental Environmental Impact Statement identified an environmental justice population, where Energy Commission staff did not.

[1] The thirteen technical staff/areas are Air Quality, Hazardous Materials Management, Land Use, Noise and Vibration, Public Health, Socioeconomics, Soils and Surface Water Resources, Water Supply, Traffic and Transportation, Transmission Line Safety and Nuisance, Visual Resources, Cultural Resources, and Waste Management.

INTRODUCTION

Staff's socioeconomics impact analysis evaluates project-caused changes on existing population, housing, employment patterns, and community services. Staff analyzes the potential impacts of the construction and operation of the PSEGS on local communities, community resources, and law enforcement services, and also provides a discussion of the estimated beneficial economic impacts of the construction and operation of the proposed project.

METHODOLOGY AND THRESHOLDS FOR DETERMINING SIGNIFICANCE

CEQA requires a list of criteria to determine the significance of identified impacts. A significant impact is defined by CEQA as "a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project" (Cal. Code Regs., tit., 14 § 15382).

Thresholds serve as the benchmark for determining if a project will result in a significant adverse impact when evaluated against existing conditions (e.g., "baseline" conditions). CEQA Guideline section 15064(e) specifies that: "[e]conomic and social changes resulting from the project shall not be treated as significant effects on the environment." Section 15064(e) states that when "a physical change is caused by economic or social effects of a project, the physical change may be regarded as a significant effect in the same manner as any other physical change resulting from the project. Alternatively, economic and social effects of a physical change may be used to determine that the physical change is a significant effect on the environment. If the physical change causes adverse economic or social effects on people, those adverse effects may be used as a factor in determining whether the physical change is significant." Staff has used Appendix G of the CEQA Guidelines for this analysis, which specifies that a project may have a significant effect on population, housing, law enforcement services, schools, and parks if the project would:

- induce substantial population growth in an area, either directly or indirectly;
- displace substantial numbers of people and/or existing housing, necessitating the construction of replacement housing elsewhere; or
- adversely impact acceptable levels of service for police protection, schools, and parks and recreation.

Staff's assessment of impacts on population, housing, police protection, schools, and parks and recreation is based on professional judgments, input and data from local and state agencies, and the industry-accepted, two-hour commute range for construction workers and one-hour commute range for operational workers. Typically, long-term employment of people from regions outside the study area could potentially result in significant adverse socioeconomic impacts.

Criteria for subject areas such as utilities, fire protection, emergency medical services, water supply, and wastewater disposal are analyzed in the Reliability, Worker Safety and Fire Protection, and Soils and Water Resource sections of this document.

LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

Socioeconomics Table 1 contains socioeconomics laws, ordinances, regulations, and standards (LORS) applicable to projects proposed on non-federal land. The PSEGS is proposed on BLM land, as was the approved PSPP's administration and warehouse space, therefore the provisions of Education Code section 17620 would not apply, and no school impact fees would be collected for the PSEGS, as was the case for the approved PSPP (CEC 2010g).

Socioeconomics Table 1
Laws, Ordinances, Regulations, and Standards (LORS)

Applicable LORS	Description
State	
California Education Code, section 17620	The governing board of any school district is authorized to levy a fee, charge, dedication, or other requirement for the purpose of funding the construction or reconstruction of school facilities.
California Government Code, sections 65996-65997	Except for a fee, charge, dedication, or other requirement authorized under section 17620 of the Education Code, state and local public agencies may not impose fees, charges, or other financial requirements to offset the cost for school facilities.
California Revenue and Taxation Code, section 73	Allows property tax exclusion for certain types of solar energy systems. Assembly Bill 1451 extended the current property tax exclusion for new construction of solar energy systems to expire on January 1, 2017. If a project has started construction prior to the expiration date it would be eligible for the exclusion. After the exclusion sunsets, any solar energy system constructed remains exempt from property tax for so long as the property does not change ownership.

PROPOSED MODIFIED PROJECT

The changes from the approved PSPP to the PSEGS relevant to Socioeconomics involve the construction and operations workforce numbers (including the peak and average number of workers), duration of construction, and estimated fiscal benefits. The construction schedule for PSEGS would be 33 months rather than the approved PSPP's 39-month schedule. The construction workforce for the PSEGS would increase over the approved PSPP by 1,166 workers during peak construction, for a peak of 2,311 workers. The average number of construction workers for the PSEGS would increase by 432 workers, for an average of 998 construction workers. The changes to the fiscal benefits are presented in Socioeconomics Table 14. The PSEGS is in the same location as the approved PSPP, but reduced in acreage. Therefore, the regional and local study areas are not changed from the approved PSPP.

SETTING

Staff defines the study area related to the project's operational impacts on population, housing, and parks as the local study area, and the project's construction impacts on population, housing, and parks as the regional study area – both study areas are defined below. The study area for law enforcement is the local jurisdictional boundaries for the Riverside Sheriff's Department. The study area for impacts to schools is the Palo

Verde and Desert Center School districts. The study area for indirect and induced economic impacts is defined as Riverside County. The study area for environmental justice impacts is within a six-mile buffer of the project site.

Regional Study Area

For the purposes of assessing project impacts during construction, staff defines the regional study area as within a two-hour commute of the project. The regional study area is roughly defined by the distance construction workers are typically willing to commute daily to a project site, and includes Riverside County, California, San Bernardino County, California, and La Paz County, Arizona.

The proposed PSEGS includes the construction and operation of a solar generating facility located in the Southern California inland desert, approximately 10 miles east of the small community of Desert Center, in eastern Riverside County, California.

To characterize the population and housing profile of the regional study area, current and forecasted population trends as well as current housing trends for the study area are summarized in Socioeconomics Table 2. The regional study contains a high number of housing units, with San Bernardino and Riverside Counties contributing the largest number of vacant units in the PSEGS study area. Among all counties within the study area, La Paz County has the highest vacancy rate (43 percent).

Socioeconomics Table 2
Population and Housing Profile of the Regional Study Area

Local Study Area

Staff defines the local study area during project operation as within a one-hour commute of the project. An analysis at a local level presents a challenge because the proposed PSEGS is in a sparsely populated area, with the largest urban center being the city of Riverside, located approximately 100 miles west of the site. A reasonable study area for localized socioeconomic impacts would include the two nearest communities: the City of Blythe, California (approximately 25 miles east of the PSEGS site), and the City of Ehrenburg, Arizona (approximately 30 miles east of the PSEGS site). The most recently published population and housing data for these communities are presented below in Socioeconomics Table 3. As Desert Center is the closest community to the project site, population and housing data for Desert Center have been included in the table even though this community is sparsely populated.

Using the 2010 US Census and US Census Bureau's American Community Survey in Staff Assessments

The detailed social, economic, and housing information previously collected only in the decennial census was not collected for the 2010 Census (US Census 2011a). This information is now collected through the U.S. Census Bureau's American Community Survey (ACS). Decennial census data are from a 100 percent count collected once every ten years and represent information from a single reference point (April 1). The main function of the decennial census is to provide counts of people for the purpose of congressional apportionment and legislative redistricting. ACS estimates are collected from a sample of the population based on information compiled continually and aggregated into one, three, and five-year estimates ("period estimates") released every year. The primary purpose of the ACS is to measure the changing social and economic characteristics of the U.S. population. As a result, the ACS does not provide official counts of the population in between censuses. Instead, the Census Bureau's Population Estimates Program will continue to be the official source for annual population totals, by age, race, Hispanic origin, and sex.

ACS collects data at every geographic level from the largest level (nation) to the smallest level available [block group (BG)].2 Census Bureau staff recommends the use of data from units no smaller than the census tract level.3,4 Data from the five-year estimates are used for staff's analysis as it provides the greatest detail at the smallest geographic level. Because ACS estimates come from a sample population, a certain level of variability is associated with these estimates. This variability is expressed as a margin of error (MOE). The MOE is used to calculate the coefficient of variation (CV). CVs are a standardized indicator of the reliability of an estimate. While not a set rule, the U.S. Census Bureau considers the use of estimates with a CV of more than 15 percent a cause for caution when interpreting patterns in the data (US Census 2009). In situations where CVs for estimates are high, the reliability of an estimate improves by using estimates for a larger geographic area (e.g., city or community versus census tract), or by aggregating estimates of adjacent geographic areas, such as cities.

[2] Census Block Group - A statistical subdivision of a census tract. A BG consists of all tabulation blocks whose numbers begin with the same digit in a census tract; for example, for Census 2000, BG 3 within a census tract includes all blocks numbered between 3000 and 3999. The block group is the lowest-level geographic entity for which the Census Bureau tabulates sample data from the decennial census. http://www.census.gov/dmd/www/glossary.html.

[3] Census Tract - A small, relatively permanent statistical subdivision of a county or statistically equivalent entity, delineated for data presentation purposes by a local group of census data users or the geographic staff of a regional census center in accordance with Census Bureau guidelines. Census tracts are designed to be relatively homogeneous units with respect to population characteristics, economic status, and living conditions at the time they are established. Census tracts generally contain between 1,000 and 8,000 people, with an optimum size of 4,000 people. Census tract boundaries are delineated with the intention of being stable over many decades, so they generally follow relatively permanent visible features. http://www.census.gov/dmd/www/glossary.html.

[4] Using the American Community Survey (ACS) and The New American Factfinder (AFF). Census Workshop presented by Barbara Ferry, U.S. Census Partnership Data Services Specialist, hosted by Sacramento Area Council of Governments, May 11–12, 2011.

Project-Specific Demographic Screening

Staff's demographic screening is based on information contained in two documents: Environmental Justice: Guidance Under the National Environmental Policy Act (CEQ 1997) and Final Guidance for Incorporating Environmental Justice Concerns in EPA's Compliance Analyses (US EPA 1998). The intention is to identify potentially sensitive populations, which could be disproportionately impacted by the proposed action. Due to the changes in the data collection methods used by the U.S. Census Bureau, the screening process relies on 2010 U.S. Census data to determine the number of minority populations and data from the 2007–2011 ACS to evaluate the presence of individuals and households living below the federal poverty level.

Staff's demographic screening is designed to identify the presence of minority and below-poverty-level populations residing within a six-mile area of the proposed project site. The six-mile buffer is based on air quality modeling, which shows that project-related impacts from pollutants decrease to less than significant within six miles of the emission site. Staff uses the six-mile buffer to determine the area of potential project impacts and to obtain data to gain a better understanding of the demographic makeup of the communities potentially impacted by the project. Once Socioeconomics staff identifies the presence of an environmental justice population, staff from the thirteen affected technical areas evaluates the project for potential disproportionate impacts on the environmental justice population. When staff's screening analysis does not identify the population in the six-mile buffer as an environmental justice population, as defined by Environmental Justice: Guidance Under the National Environmental Policy Act, no further scrutiny of this population is required for purposes of an environmental justice analysis.

Staff reviewed the Bureau of Land Management (BLM) July 2013 PSEGS Draft Supplemental Environmental Impact Statement, specifically the section on Environmental Justice. Staff notes that the BLM used the 2007 – 2011 ACS Zip Code Tabulation Area (ZCTA) 92239 to determine the presence or absence of an environmental justice population, where Energy Commission staff used 2010 census data for the geographies identified in Socioeconomics Table 4. The BLM document identified an environmental justice population residing in the project area, where Energy Commission staff did not. To provide the reader a comparison of the geographies used to identify an environmental justice population, staff's Socioeconomics Figure 2 shows the different census geographies used by the BLM and staff. The BLM found no disproportionate adverse impacts from the PSEGS to the BLM-identified environmental justice population.

Minority Populations

According to Environmental Justice: Guidance Under the National Environmental Policy Act, minority individuals are defined as members of the following groups: American Indian or Alaskan Native; Asian or Pacific Islander; Black, not of Hispanic origin; or Hispanic. An environmental justice population is identified when the minority population of the potentially affected area is greater than 50 percent or meaningfully greater than the minority population in the general population or other appropriate unit of geographical analysis. Socioeconomics Figure 1 shows that, based on census data, there are no people within a six-mile buffer of the project site. Socioeconomics Table 4 presents the minority population data for the community of Desert Center, plus Riverside County, and the Chuckwalla Census County Division (CCD) for reference. The 2010 decennial census data show there is no population (minority or otherwise) in the six-mile project buffer. Therefore, there is no environmental justice population as defined by Environmental Justice: Guidance Under the National Environmental Policy Act that would trigger further scrutiny for purposes of an environmental justice analysis.

Socioeconomics Table 4
Minority Population in the Project Area

	Six-Mile Buffer Around Project Site	Desert Center CDP	Chuckwalla Valley CCD	Riverside County
Total	0	204	9,843	2,189,641
Not Hispanic or Latino: White alone	0	156	4,349	869,068
Minority	0	48	5,494	1,320,573
Percent Minority	0	24	56	60
Notes: CDP – Census Designated Place, CCD – Census County Division. Source: US Census Bureau 2010c.				

Below-Poverty-Level Populations

The poverty status of households and individuals is determined based on a set of income thresholds, set by the U.S. Census Bureau, that vary by family size and composition. If the total income of the family is less than the family's threshold, that family and every individual in it is considered in poverty. The official poverty thresholds do not vary by geography (e.g., state, county, etc.), but are updated annually to allow for changes in the cost of living. The population for whom poverty status is determined does not include institutionalized people, people in military quarters, people in college dormitories, and unrelated individuals under 15 years old.

Staff identified the below-poverty-level population in the project area using county level data from the 2007-2011 ACS Five-Year Estimates from the U.S. Census (US Census 2011b).[5] Approximately 14 percent, or 8,482 people, in Riverside County lives below the federal poverty threshold. Socioeconomics Table 5 presents poverty data for Riverside County, plus California for reference purposes. Poverty data for the Chuckwalla Valley CCD and Desert Center CDP were not included because the CV values were greater than 20, indicating that the data were unreliable and may not accurately reflect local characteristics.

[5] Staff determined that the data at the county level are the lowest level available that retain reasonable accuracy. The data represent a period estimate, meaning the numbers represent an area's characteristics for the specified time period.

Socioeconomics Table 5
Poverty Data in the Project Area

Area	Total			Income in the past 12 months below poverty level			Percent below poverty level		
	Estimate*	MOE	CV	Estimate	MOE	CV	Estimate	MOE	CV
Riverside County	2,119,466	±1,760	0.05	301,763	±8,482	1.71	14.20	±0.4	1.71
California	36,211,794	±3,530	0.01	5,211,481	±39,013	0.46	14.40	±0.1	0.42

Note: *Population for whom poverty status is determined.
Source: U.S. Census 2011b.

Additional Environmental Justice Population Considerations

Final Guidance for Incorporating Environmental Justice Concerns in EPA's Compliance Analyses (US EPA 1998) also encourages outreach to community-based organizations and tribal governments early in the screening process to identify the presence of distinct minority communities residing within, or in close proximity to, the proposed project site. It also encourages identification of minority groups that utilize or hold sacred certain natural and cultural resources that may be affected by the proposed action.

For information regarding the Energy Commission's outreach program and consultations with local Native American communities, see the **EXECUTIVE SUMMARY**, **INTRODUCTION**, and **CULTURAL RESOURCES** sections of this document. Cultural Resources staff has identified tribal entities that use the project area. Therefore, this environmental justice population, as defined by Environmental Justice: Guidance Under the National Environmental Policy Act, would trigger further scrutiny by Cultural Resources staff for purposes of an environmental justice analysis. Refer to the Cultural Resources section for more information.

ASSESSMENT OF IMPACTS AND DISCUSSION OF MITIGATION

INDUCE SUBSTANTIAL POPULATION GROWTH

For the purpose of this analysis, staff defines "induce substantial population growth" as workers moving into the project area because of project construction and operation, thereby encouraging construction of new homes or extension of roads or other infrastructure. To determine whether the project would induce population growth, staff analyzes the availability of the local workforce and the population within the region. Staff defines "local workforce" for the PSEGS project to be the Riverside/San Bernardino/Ontario Metropolitan Statistical Area (MSA),[6] which includes both Riverside and San Bernardino counties. While the City of Ehrenberg, within La Paz County, Arizona, is located within the proposed PSEGS regional study area and could contribute to the local workforce, detailed labor skill data are unavailable for this limited portion of the regional and local study area. As shown above in Socioeconomics Table 2, due to the size of the La Paz County population, presenting local workforce data for the entire state of Arizona would not be representative of the available workforce within the county. However, it should be noted that construction workforce from within this county

[6] Metropolitan Statistical Areas are geographic entities defined by the U.S. Office of Management and Budget (OMB) for use by Federal and State statistical agencies in collecting, tabulating, and publishing socioeconomic statistics.

and local communities would contribute to the local workforce, as identified in detail below. Staff has focused this analysis on the cities and communities along the Interstate-10 corridor, as this route provides the most reasonable access to the PSEGS site. Access to the site from other parts of Riverside, San Bernardino, and La Paz Counties is not as convenient.

Construction

The project owner expects that construction of the proposed PSEGS would be similar to the approved PSPP. Construction of the PSEGS would last for 33 months, while construction of the approved PSPP was 39 months. The construction workforce would increase from an average of approximately 566 daily construction workers, peaking with a daily workforce of 1,145, to an average of approximately 998 workers, with a peak workforce of 2,311 workers (Palen 2012a). This peak employment number is used to analyze worst-case construction population and employment impacts. Socioeconomics Table 6 shows Year 2010–2020 occupational employment projections for the Riverside/San Bernardino/Ontario MSA by construction labor skill. The number of construction workers by trade for the PSEGS peak month (month 22) is presented in Socioeconomics Table 6 and compared with the construction workforce needed for the approved PSPP (Solar Millennium 2009a, p. 5.11-26; Palen 2012a). The peak number of construction workers by trade is reported in parenthesis where different from the PSEGS peak construction month. Staff has updated Socioeconomics Table 6 to reflect the applicant's response to Data Request #4.

Socioeconomics Table 6
Total Labor by Skill in Riverside/San Bernardino/Ontario MSA and Construction Worker by Craft, Peak Month

Trade	Total Workers for Construction by Craft (peak month)		Riverside/ San Bernardino/ Ontario MSA	
	Approved PSPP Project	PSEGS	2010	2020
Surveyor	12	4 (16*)	440	520
Operator[1]	90	106	2,510	3,030
Laborer[2]	185	86 (122*)	11,870	13,380

Instrument Tech[10]		12	620	680

Notes:
1 - The “Operating Engineers and Other Construction Equipment Operators” category was used.
2 - The “Construction Laborers” category was used.
3 - The “Heavy and Tractor Trailer Truck Drivers” category was used.
4 - The “Construction Trades Workers” category was used.
5 - The “Structural Iron and Steel Workers” categories were used.
6 - The “Construction Mangers” category was used.
7 - The “Bookkeeping, Accounting, and Auditing Clerks” category was used.
8 – The “Other Office and Administrative Support Workers” category was used.
9 - The “First-Line Supervisors of Office and Administrative Support Workers” category was used.
10 - The “Control and Valve Installers and Repairers, except mechanical door” category was used.
*Largest number of workers by trade. Where no number is included in parenthesis, number reported is the largest number of workers for the trade and during the peak project month, month 22.
Sources: Solar Millennium 2009a, Tables 5.11-8 and 5.11-17; EDD 2012; Palen 2012a; Palen 2013mm.

As shown in Socioeconomics Table 6, there is more than adequate local availability of construction workforce within the Riverside/San Bernardino/Ontario MSA for the approved PSPP and, given the relatively small increase in total number of workers for the PSEGS, it is reasonable to assume there would be adequate local availability of workforce for the PSEGS.

The amendment did not include the project owner's estimations of the proportion of construction workers who would temporarily relocate closer to the project site versus those who would commute daily. Staff for the approved PSPP assumed that up to 15 percent of construction workers would seek local lodging during the workweek, and up to 85 percent would commute daily. Staff is using the same assumptions for the PSEGS and agrees that 15 and 85 percent are reasonable. Therefore, for the PSEGS peak construction, up to 347 workers would seek local lodging, which represents an increase of 175 workers over the approved PSPP project.

Hotel/Motel. Socioeconomics Table 7 identifies over 12,900 motel/hotel rooms within a two-hour commute of the project site in selected cities in Riverside County and the nearby communities of Ehrenberg and Quartzsite in Arizona.

Socioeconomics Table 7
Hotel/Motel Supply Within the PSEGS Regional and Local Study Areas

Housing Vacancy. As shown in Socioeconomics Table 3, the closest community to the PSEGS site, Desert Center, had a 39 percent vacancy rate with 55 vacant housing units available in 2010. The city of Blythe had a larger vacant housing supply with 960 units, for an 18 percent vacancy rate. A five percent vacancy is largely accepted as a minimum benchmark for a sufficient amount of housing available for occupancy (Virginia Tech 2006). Socioeconomics Table 8a presents a more detailed look at housing supply within a two-hour commute of the PSEGS and Socioeconomics Table 8b presents a more detailed look at the type of vacancy available. In 2010, a total of 43,559 vacancies, representing a 28 percent vacancy rate, were available in the cities and communities within the regional study area. As presented in Socioeconomics Table 8b, the vacant housing supply shows a total of 6,585 of the vacancies were available for rent, 4,007 vacancies were available for sale, and 28,536 vacancies were for seasonal, recreational or occasional use. The housing counts in the study area indicate a greater supply of available housing units than demand.

Campground/RV Parks. Socioeconomic Table 9 shows abundant RV park spaces in the Blythe, Ehrenberg, and Quartzsite areas. However, RV parks in Blythe tend to be located along the Colorado River and receive higher levels of use during the summer, thereby possibly reducing availability for construction workers.

Socioeconomics Table 9
RV Parks Near the PSEGS Site

Geographic Area	RV Spaces
Blythe, California	795
Ehrenberg, Arizona	94
Quartzsite, Arizona	1,876
Sources: BS 2011a, adapted from Table 5.10-7, pg. 5.10-17; URS 2012a.	

For the approved PSPP, staff contacted a small sample of these RV parks and learned that while they have a large number of spaces, many are occupied by year-round residents or are privately owned, and would not be available for use by construction workers (GSEP2009a, p. 5.8-6). Additional RV parks are located in Ehrenberg, Arizona, and Quartzsite, Arizona, approximately 4 miles and 20 miles east of Blythe, respectively. The town of Quartzsite web site states there are more than 70 RV parks in the vicinity of the community that are typically occupied between October and March, with visitors attracted to the gem, mineral, and swap meet shows which are popular tourist attractions in the area (GSEP2009a, p. 5.8-6).

Lodging Availability and PSEGS Workforce

To better understand the housing choices of construction workers who may relocate to the PSEGS area, staff contacted Mr. Bill Perez, Executive Secretary with the San Bernardino and Riverside counties Building and Construction Trades Council (local BCTC). Staff asked Mr. Perez to discuss the construction workforce employed at solar power plant projects in Riverside County and the construction workforce to be employed by the PSEGS (CEC 2013w). Mr. Perez commented that a good number of Craft Workers are local residents in Riverside and San Bernardino counties and carpool daily to project sites, generally three to four persons per vehicle. Mr. Perez reported that construction workers for energy projects in Riverside County are staying in Indio and Blythe in California and Ehrenberg in Arizona. Mr. Perez thought that the construction workers for PSEGS who seek lodging closer to the project would stay in Indio, Blythe and Ehrenberg, but would not necessarily go as far east as Quartzsite. Mr. Perez noted that the construction workers for the current energy projects in construction in Riverside County have not found any problems in securing lodging.

According to Mr. Perez, the seasonal vacancy rates, especially in Blythe have not posed a problem for construction workers seeking lodging for the solar power plant projects. Mr. Perez explained that there are only two times when out-of-the-area visitors would seek local lodging: in January when Quartzsite holds a rock and gem show and during dove season in September. Lodging during these times is a little more difficult, but can be found. When construction workers secure lodging for extended construction periods they are not subject to the higher seasonal room rates. Construction workers often share rooms to reduce costs and as they rent rooms for long periods, they can often negotiate room rates.

Staff inquired about the construction workforce that would be employed at the PSEGS and what service amenities workers would look for when seeking lodging. Mr. Perez explained that construction workers typically seek lodging close to a freeway with easy on-off access, and convenience stores, gas stations, and dining options. Construction workers who commute to a project site typically do not look for amenities like movie theaters or retail shopping because they return to their primary residences on the weekend. Mr. Perez stated that construction workers employed on the PSEGS would not seek lodging in Palm Springs, Palm Desert, La Quinta or Indian Wells because of the high cost of lodging. Mr. Perez explained that construction workers for the PSEGS would not seek lodging around Thermal, Mecca or other communities near the Salton Sea because these areas are too far from Interstate 10. Staff inquired about Desert Center as an option for construction workers and Mr. Perez did not think the construction workers would stay there because there is no longer a gas station in the community. Mr. Perez did mention that a potential lodging option for some construction workers could be a private recreational vehicle park off Rice Road.

Conclusion. Based on this available local study area data and discussions with Mr. Perez, staff concludes that any construction workers seeking RV and campground lodging could find limited availability during January and September. However, ample local housing (hotel/motel and housing units) would be available to any construction worker seeking to relocate during construction. Because of the availability of short-term housing in the local study area, staff concludes that construction of the PSEGS would not temporarily induce substantial growth or a concentration of population in the local study area.

Operation

The proposed PSEGS is expected to require 100 operational employees, compared with the 134 permanent operational employees that were required for the approved PSPP (Solar Millennium 2009a, p. 5.11-29; Palen 2012a). Socioeconomics Table 10 shows Year 2010-2020 occupational employment projections for the Riverside/San Bernardino/Ontario MSA by operational labor skill, and the estimated total number of operational workers needed for the PSEGS, along with the number needed for the approved PSPP. Socioeconomics Table 10 has been updated to include the applicant's responses to Data Request #4.

Total	*134*	*100*	*95,040*	*105,860*
Sources: Solar Millennium 2009a, Table 5.11-8; Palen 2012a; Palen 2013ss; EDD 2012.				

Data for the Riverside/San Bernardino/Ontario MSA indicate that in the Year 2010, the employment sectors for the trades listed in Socioeconomics Table 10 contained a total of 95,040 workers, with Year 2020 forecasts for these employment sectors estimated at a total of 105,860 employees. The applicant for the approved PSPP estimated that 75 percent of operational workers would come from within the regional study area workforce, resulting in a potential influx of approximately 34 workers in the communities in the local study areas (Solar Millennium 2009a). With the reduction of operational workers for the PSEGS, staff estimates 25 permanent workers could choose to live closer to the PSEGS site. Housing data show that the vacancy rates for the cities of Blythe, California, Ehrenberg, Arizona, and Quartzsite, Arizona, are 18, 32, and 40 percent, respectively. Even with seasonal variations in vacancy rates, 2010 Census data shows there was a total of 373 housing units available for rent and 228 housing units available for sale in Blythe, Ehrenberg, and Quartzsite combined. Given the possible addition of 25 permanent workers, ample local housing is available should these operational employees choose to relocate to the local study area. Additionally, as shown in Socioeconomics Table 2, the regional study area provides a high number of available housing opportunities. The addition of up to 25 workers for the PSEGS operations to either the local or regional study area would not induce substantial growth or concentration of population in excess of available housing or forecasted growth.

Staff concludes that inducement of substantial population growth would be a less than significant impact, under CEQA, which is consistent with the conclusion for the approved PSPP.

Displace Existing Housing and Substantial Numbers of People

The proposed PSEGS site is vacant, undeveloped land, vegetated with desert scrub throughout and includes some sand dunes in the northeast (Solar Millennium 2009a, p. 5.7-12). No housing structures exist on the property. Two residences exist west of the PSEGS site, but the residents and the homes would not be displaced by the construction or operation the project (Solar Millennium 2009a, p. 5.7-14). As such, no housing or persons would be displaced by the PSEGS.

Staff concludes that the required construction workforce for the PSEGS would be found in the regional study area, consistent with the approved PSPP. An estimated 15 percent of workers could seek local lodging during the workweek. There appears to be sufficient lodging in the local and regional study area to house the 347 (at peak month) PSEGS construction workers without triggering the need for new housing. Vacancy rates within the local study area offer the 25 PSEGS operations employees wishing to relocate sufficient available housing. Therefore, staff concludes that no significant construction or operation-related impacts are expected for the regional and local study area housing supply, availability, or demand, and the PSEGS would not displace any populations or existing housing, and it would not necessitate construction of replacement housing elsewhere.

Result in Substantial Physical Impacts to Government Facilities

Physical impacts to public services and facilities are usually associated with population in-migration and growth in an area, which can increase the demand for a particular service, leading to the need for expanded or new facilities. Public service providers serving the PSEGS site are located within Riverside County. Therefore, the study area for the public services analysis is limited to Riverside County.

As discussed under the subject headings below, the PSEGS would not cause significant impacts to service ratios, response times, or other performance objectives relating to law enforcement, schools, or parks.

Please refer to the Worker Safety and Fire Protection section of this document for a detailed discussion of fire protection and emergency medical services.

Police Protection

The PSEGS, like the approved PSPP, would be served by the Riverside County Sheriff's Department Colorado River Station at 260 North Spring Street in Blythe, California. The Colorado River Station provides service to the unincorporated area from Red Cloud Road on the west, to the Arizona state line on the east, and from county line to county line on the north and south (Solar Millennium 2009a, p. 5.11-20). Communities included in this service area are Desert Center, Eagle Mountain, East Blythe, Hayfield, Midland, Nicholls Warm Springs, Ripley, and the Colorado River. The project owner has not provided any information related to police protection, such as updated response times to the project site and proposed security measures for either construction or operations of the PSEGS.

Staff received comments on the PSEGS project in response to staff's outreach to the Riverside County Sheriff's Department at the Colorado River Station and incorporated their comments in this document (RCSD 2013a). The sheriff's department has 27 sworn officers and 10 non-sworn officers with 2 to 3 officers on duty per shift. The Colorado River Station is approximately 40 miles from the PSEGS site.

The response time to the PSEGS site for a priority call is estimated at 30 minutes or more and a non-priority call is estimated at 45 minutes or more. There is a low probability that additional law enforcement services are needed during project construction and operation. The sheriff's department estimated that there is a moderate probability that during construction the project-related traffic could affect circulation and access on roads near the project site to the extent that emergency response times might be affected. The Traffic and Transportation section of this document proposes Condition of Certification TRANS-1, which requires the preparation and implementation of a traffic control plan to address the movement of workers, vehicles, and materials, including arrival and departure schedules and designated workforce and delivery routes.

The sheriff's department requested that total perimeter fencing should be provided, including illumination of access points. In addition, gates at the project site should not be obstructed. The sheriff's department requested that a No Trespass sign with the location address posted and visible should be installed and a "No Trespassing" letter should be on file at the sheriff station during construction and operation of the project. Staff is proposing Condition of Certification SOCIO-1 to address this request.

Construction. The project owner did not provide security details for construction; however, the Hazardous Materials Management section of this document proposes Conditions of Certification HAZ-4 and HAZ-5, which require the preparation of a Construction Site Security Plan and an Operation Security Plan to ensure site security. The plans also include a protocol for contacting law enforcement and the Energy Commission Compliance Project Manager (CPM) in the event of suspicious activity or emergency. Site security would minimize the potential need for the Riverside County Sheriff's Department assistance.

During the peak construction month, up to 347 workers for the PSEGS could seek local lodging. This number is considered less than significant as these workers would most likely already live within the regional study area and would be part of the Riverside County Sheriff's Department population served. Also, the service standard for the Riverside County Sheriff's Department is one officer per 1,000 populations. If all 347 workers were to temporarily relocate within this service area, the number of workers would still be less than significant because they would not trigger a need for additional sheriff staffing or services. While the PSEGS would increase the number of individuals within the local study area during construction, the increase would not be substantial and would not necessitate new or expanded law enforcement facilities or staff levels within the PSEGS regional or local study areas.

Operation. The project owner did not provide security details for operation of the site, but as was discussed for construction, an operations security plan would be required for the PSEGS. As discussed above, the operational workforce for the PSEGS is expected to be hired from within the regional workforce. It is possible that up to 25 operational employees for the PSEGS could choose to relocate to the PSEGS local area from more distant regional study area locations. Should operational employees permanently relocate to the local study area and purchase homes, they would contribute to the local community through the payment of property taxes based on the assessed value of the home at the time of sale. As it is likely a number of these employees already reside in Riverside County, relocation to the local area would not result in an increase over the total population policed by the Riverside County Sheriff's Department. Therefore, staff concludes that operation of the proposed PSEGS would not require the need for new or expanded law enforcement facilities or staff levels within the PSEGS regional or local study areas.

Schools

The proposed PSEGS site area is served by the Palo Verde Unified School District, serving the city of Blythe and other remote areas of Riverside County, and the Desert Center Unified School District in Desert Center (Solar Millennium 2009a, pp. 5.11-22–5.11-23). Socioeconomics Table 11 identifies the schools plus the current and previous year's student enrollment data in each of the respective school districts. As shown, Palo Verde Unified School District (PVUSD), approximately 40 miles east of the PSEGS site, offers a full range of educational opportunities with three elementary schools, one middle school, one high school, and a continuation high school. Desert Center Unified School District, approximately 10 miles west of the PSEGS site, offers one elementary school.

Construction. Staff assumes the construction workforce for the PSEGS would be hired from within the available regional workforce, with up to 15 percent of workers potentially seeking temporary local housing during the workweek. This temporary local housing need would not result in substantial population in-migration occurring from PSEGS construction into the PVUSD. Staff does not expect that any construction workers seeking local temporary housing would bring school-aged children seeking enrollment within the PVUSD, as staff assumes workers would only seek local lodging during the workweek and return to their permanent homes on the weekend. Therefore, staff concludes that construction of the PSEGS would not require the need for new or expanded PVUSD school facilities or staff levels.

Operation. The PSEGS is proposed on BLM land, as was the approved PSPP's administration and warehouse space, therefore the provisions of Education Code section 17620 would not apply, and no school impact fees would be collected for the PSEGS, as was the case for the approved PSPP (CEC 2010g).

The operational workforce for the PSEGS is expected to be hired from the available regional workforce. Up to 25 operational employees for the PSEGS, a decrease from the estimated 34 employees for the approved PSPP could choose to relocate to the PSEGS local area from more distant regional study area locations. At the time the approved PSPP was under Energy Commission review, the PVUSD school district expected to have the necessary capacity to accommodate new students resulting from project operation (Solar Millennium2009a, p. 5.11-23). Based on the school data in Socioeconomics Table 11, staff concludes that any contribution of school-aged children from workers relocating for the PSEGS would account for a small increase in the overall PVUSD student body. With the decrease in the required operational PSEGS workforce from 34 to 25, staff does not anticipate the impacts to school capacity to worsen. Staff concludes that operation of the proposed PSEGS would not necessitate new or expanded school facilities or staff levels within the PSEGS regional or local study areas, which was also the conclusion for the approved PSPP project.

Parks and Recreation

The PSEGS site is currently undeveloped, is not designated for active recreational use, and does not appear to be frequented as a recreational area (Solar Millennium 2009a, p. 5.7-13). The nearest park facilities to the PSEGS site are located within the City of Blythe, approximately 40 miles east of the PSEGS site. The City of Blythe Parks Department is responsible for the maintenance and upkeep of the area's seven parks and one pocket park (City of Blythe, 2009).

Construction. Staff assumes the construction workforce for the PSEGS would be hired from within the available regional workforce, with up to 15 percent of workers potentially seeking temporary local area housing during the workweek to avoid commuting. This temporary local housing need would not result in substantial population in-migration occurring from PSEGS construction into either the local or regional study areas. As discussed above, staff concludes that camping and RV facilities would experience peak attendance from tourists during the summer and higher occupancy during the winter, thereby possibly reducing availability for construction workers seeking local area housing. Therefore, staff concludes that as a result of the PSEGS, construction employment, like the approved PSPP construction employment, would not require new or expanded recreational facilities or staff levels within the PSEGS regional or local study areas.

Operation. The operational workforce for the PSEGS is expected to come from within the available regional workforce. It is possible that up to 25 operational employees for the PSEGS could choose to relocate to the PSEGS local area from more distant regional study area locations. If any operational employees were to permanently relocate to the local study area, it is assumed that some percentage of this population would purchase homes and contribute to the local community through the payment of property taxes. Should operational employees permanently relocate to the local study area and purchase homes, they would contribute to the local community through the payment of property taxes based on the assessed value of the home at the time of sale. Staff concludes that permanent employment associated with the PSEGS, like the approved PSPP, would not necessitate new or expanded parks and recreational facilities or staff levels within the PSEGS regional or local study areas.

NON-OPERATION AND CLOSURE

As described in the **PROJECT DESCRIPTION** section of the **EXECUTIVE SUMMARY**, it is assumed the planned operational life of the PSEGS is at least 30 years from project start-up, but the facility conceivably could operate for a longer or shorter period depending on economic or other circumstances (Solar Millennium 2009a, p. 3-2). If the PSEGS remains economically viable, it could operate for more than 30 years, which would defer environmental impacts associated with closure and with the development of replacement power generating facilities. However, if the facility were to become economically non-viable before 30 years of operation, permanent closure could occur sooner. In any case, a Facility Closure Plan would be prepared three years prior to initiating a permanent facility closure and put into effect when permanent closure occurs. If the PSEGS facility ceases operation temporarily, whether by plan or due to an unplanned incident (non-operation), a Repair/Restoration Plan for conducting the activities necessary to restore the facility to availability and reliable and/or improved performance would be prepared. In general, the Facility Closure Plan would address any long-term, post-closure site maintenance and monitoring for the PSEGS and all associated facilities, including activities necessary for site restoration/revegetation. If removal of all equipment and facilities is needed, recycling of facility components, collection and disposal of hazardous wastes and resale of unused chemicals to other parties would be addressed in the Facility Closure Plan. Closure alternatives other than full site restoration, costs associated with the planned closure activities, funding sources for these activities; and conformance with applicable LORS would also be included in the Facility Closure Plan (Solar Millennium 2009a, p. 3-2).

It is assumed that the number and type of workers required for non-operation and closure activities would be similar to those described above for construction of the PSEGS. Also, staff assumes that, as for the construction of the PSEGS, 15 percent of the non-operation and closure workforce would temporarily relocate closer to the project site for non-operation and closure activities. The remaining 85 percent would be drawn from the regional and local study areas. As most workers are expected to reside within the study area, no impacts to existing population levels are expected to occur. Staff expects that, like the PSEGS construction workforce, the workforce for non-operation and closure would have no impacts on housing, population, and police services. No significant impacts to the study area population would result from proposed PSEGS non-operation and closure activities.

CUMULATIVE IMPACTS

A project may result in significant adverse cumulative impacts when its effects are "cumulatively considerable." Cumulatively considerable means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, or the effects of probable future projects (Cal. Code Regs., tit. 14, §15130). Cumulative socioeconomics impacts could occur when more than one project has an overlapping construction schedule that creates a demand for workers that cannot be met by the local labor force, resulting in an influx of non-local workers and their dependents. Operational cumulative socioeconomic impacts could occur when the development of multiple projects significantly impacts the population of an area, resulting in a housing shortage, change in local employment conditions, and an increased demand on public services.

Projects considered for the socioeconomic cumulative analysis are shown in Socioeconomics Table 12a and Socioeconomics Table 12b. Although not all of those projects are expected to complete the environmental review process, or to be funded and constructed, the list is indicative of the large number of large residential, commercial, and energy projects currently proposed in California.

The projects are defined within a geographic area that has been identified by staff as covering an area large enough to provide a reasonable basis for evaluating cumulative impacts for all resource elements. Most of these projects have, are, or would be required to undergo their own independent environmental review under CEQA and/or the National Environmental Protection Act (NEPA).

GEOGRAPHIC EXTENT OF CUMULATIVE IMPACT ANALYSIS

The area of cumulative effect for socioeconomic resources is Riverside and San Bernardino Counties, California, and La Paz County, Arizona. The analysis of cumulative effects considers a number of variables including geographic (spatial) limits, time (temporal) limits, and the characteristics of the resource being evaluated. The geographic scope of cumulative impact analysis is based on the workforce boundaries of the cumulative development projects.

EFFECTS OF PAST AND PRESENT PROJECTS

A wide variety of past and present development projects contribute to the cumulative conditions for socioeconomics. As shown in Socioeconomics Table 2, from 2000 to 2010 the populations of Riverside and San Bernardino Counties increased by 41.7 and 19.1 percent, respectively, while the population within La Paz County increased by 15.6 percent during the same time. This is an example of the steady growth rate that has occurred throughout the regional study area. As a result, past and present residential, commercial, and industrial development has contributed to the overall socioeconomic growth within the study area.

EFFECTS OF FUTURE FORESEEABLE PROJECTS

Socioeconomics would be affected by reasonably foreseeable future projects such as large electrical generation and distribution infrastructure development projects proposed along the I-10 corridor (**Executive Summary Attachment A – Figure 1**) and solar and wind applications proposed on approximately 1,000,000 acres of BLM land in the California Desert District Planning Area. Also, a large number of solar generation and distribution infrastructure development projects proposed on non-federal land in the I-10 corridor would affect socioeconomics (Socioeconomics Tables 12a and 12b).

Contribution of the Palen Solar Electric Generating System to Cumulative Impacts

Construction. Foreseeable development in the project area includes primarily renewable energy electrical generation and transmission infrastructure projects, with some residential and commercial development. Given the large number of renewable energy projects occurring within the PSEGS regional study area, it is possible that some overlap of construction phasing could occur between the PSEGS and the cumulative development projects. Socioeconomics Table 12a presents the most recently published data (Year 2010–2020 projections) on labor force characteristics for the cumulative regional study area pertaining to solar energy project construction labor skill sets and compares those to major cumulative projects located near the PSEGS along the I-10 corridor, including the Blythe Solar Power Project (BSPP), Genesis Solar Power Project (GSEP), Rice Solar Energy Project (RSEP), and the Desert Sunlight PV Project (DSPV). Socioeconomics Table 12b presents a complete list of projects considered part of the socioeconomics cumulative analysis, including the map ID/feature that correlates with **Executive Summary Attachment A – Figure 1**, which shows the location of the projects.

All cumulative projects identified in **Socioeconomics Tables 12a** and **12b** would be expected to draw on the large regional construction workforce in and around Riverside/San Bernardino/Ontario MSA. **Socioeconomics Table 12a** also identifies the labor force by skill for the MSA and the number of workers by skill to construct each project. Even in a worst-case scenario, should construction of these projects occur during overlapping peak work months, construction labor requirements would not exhaust the supply of construction labor by craft in the Riverside/San Bernardino/Ontario MSA. Other MSAs that could be a source of additional labor supply include the San Diego-Carlsbad-San Marcos MSA, El Centro MSA, and Santa Ana-Anaheim-Irvine Metropolitan Division. It is staff's opinion that there would be quite a few construction workers that would move from one project to another as their job at each project is completed. This could reduce the number of different construction workers seeking lodging closer to their project site.

Socioeconomics Table 12a
Cumulative Project Construction Employment Needs and Labor Supply

Trade	Total # of Workers for Project Construction by Craft – Peak Month						*TOTAL*	Riverside/San Bernardino/ Ontario MSA

4	Line	Devers-Palo Verde No. 2 Transmission Line Project	From the Midpoint Substation to Devers Substation	SCE	CPUC petition to modify request to construct CA-only portion approved by CPUC 11/2009	New 500 kV transmission line parallel to the existing Devers-Palo Verde Transmission Line from Midway Substation, approximately 10 miles southeast of Blythe, to the SCE Devers Substation, near Palm Springs. The ROW for the 500 kV transmission line would be adjacent to existing DPV ROW	2
3	Line	Green Energy Express Transmission Line Project	Eagle Mountain Sub to So. California	Green Energy Express	Approved	70 mile double circuit 500 kV transmission line from Eagle Mt. Sub to So. California	2
5	Line	Blythe Energy Project Transmission Line	From the Blythe Energy Project to Julian Hinds Substation	Blythe Energy, LLC	Existing	Transmission line modifications including upgrades to Buck Substation, approximately 67.4 miles of new 230 kV transmission line between Buck Substation and Julian Hinds Substation, upgrades to the Julian Hinds Substation, installation of 6.7 miles of new 230 kV transmission line between Buck Substation and SCE's DPV 500 kV transmission line	2
14	Polygon	SCE Red Bluff Substation	South of I-10 at Desert Center	SCE	Approved	A proposed new 500/220 kV substation, 2 new parallel 500 kV transmission lines of about 2,500 to 3,500 feet each	6
12	Polygon	Chuckwalla Solar I	1 mile north of Desert Center	Chuckwalla Solar I	POD in to BLM	200 MW solar PV project on 4,083 acres	6
8	Polygon	Desert Lily Soleil Project	6 miles north of Desert Center	EnXco	POD in to BLM	100 MW PV plant on 1,216 acres of BLM land	7
11	Polygon	Desert Center 50	Desert Center	US Solar Holdings	Under review	A planned 49.5 MW fixed flat panel photovoltaic solar power plant	8

ID	Feature	Project Name	Location	Ownership	Status	Project Description	Distance (MILE)
7	Polygon	Desert Harvest Solar Project	6 miles north of Desert Center	EnXco	Final document submitted on 11/7/2012	Project would be a 150-megawatt solar photovoltaic facility sited on 1,208 acres of BLM-managed lands north of the community of Desert Center in Riverside County, CA. An associated 220-kilovolt generation-intertie transmission line would be sited within a 204-acre right-of-way on BLM-managed land and 52 acres of non-BLM managed land, which would extend from the solar facility site to the planned Red Bluff Substation.	12
17	Polygon	Genesis Solar Energy Project	North of I-10, 25 miles west of Blythe, 27 miles east of Desert Center	NextEra (FPL)	Approved, under construction	250 MW solar power project on 1,950 acres north of the Ford Dry Lake. 6 mile natural gas pipeline and 5.5 mile gen-tie line to the Blythe Energy Center to Julian Hindes Transmission Line	12
3	Polygon	Desert Sunlight Project	6 miles north of Desert Center	First Solar	Approved	550 MW PV project on 4,144 acres of BLM land, requiring a 12 mile transmission to the planned Red Bluff Substation	14
26	Polygon	Graham Pass Wind Project	Riverside County	Graham Pass Inc	Pending	175 MW Wind Project	15
18	Polygon	EnXco	North of Wiley's Well Rd, east of Genesis Solar Project	EnXco	POD in to BLM	300 MW solar PV project	17
6	Point	Eagle Mountain Pumped Storage Project	Eagle Mountain iron ore mine, north of Desert Center	Eagle Crest Energy	FERC draft EIS published in 12/2010	1,300 MW pumped storage project on 2,200 acres of public and private land, designed to store off-peak energy to use during peak hours	20
25	Polygon	Mule Mountain III	Chuckwalla Valley	EnXco	Pending	200 MW Solar PV	22
6	Line	Desert Southwest Transmission Line	118 miles primarily parallel to DPV	Imperial Irrigation District	Approved	118 mile 500 kV transmission line from a new substation/switching station near the Blythe Energy Project to the existing Devers Substation located approximately 10 miles north of Palm Springs	24
13	Polygon	McCoy Solar Energy Project	North of I-10, south of McCoy Wash, east of McCoy Mountains, Riverside County	McCoy Solar, LLC	Record of Decision signed on March 13, 2013	750 megawatt (MW) photovoltaic (PV) solar energy generating facility and related infrastructure in unincorporated Riverside County, CA. About 7,700 acres of BLM land and 470 acres of private land.	25

ID	Feature	Project Name	Location	Ownership	Status	Project Description	Distance (MILE)
10	Polygon	McCoy Soleil Project	10 miles northwest of Blythe	EnXco	Plan of Development to Palm Springs BLM	300 MW solar power tower project located on 1,959 acres. Requires a 14 mile transmission line to proposed SCE Colorado Substation south of I-10	25
15	Polygon	Blythe Solar Power Project	North of I-10, north of Blythe Airport	Solar Millennium	Approved	1,000 MW solar trough facility on 7,540 acres	26
22	Polygon	Desert Quartzite	South of I-10, 8 miles southwest of Blythe	First Solar	POD in to BLM	600 MW solar PV project located on 7,724 acres, adjacent to DPV transmission line and SCE Colorado Substation	28
5	Polygon	Big Maria Vista Solar Project	North of I-10, 12 miles N/W Blythe	Bullfrog Green Energy	POD in to BLM	500 MW PV project on 2,684 acres	29
27	Polygon	Palo Verde Mesa Solar Project	N/W Of Blythe	Renewable Resources Group	NOP Filed	486 MW Solar	29
19	Polygon	Blythe Energy Project II	Near Blythe Airport	Blythe Energy	Approved	520 MW combined-cycle power plant located entirely within the Blythe Energy Project site boundary, located on 30 acres of a 76 acre site	31
20	Point	Blythe Solar Power Generation Station I	Blythe	Southwestern Solar Power	Approved	A planned 4.76 MW solar PV facility, including 69 PV panels that stand 50 feet tall and 72 feet ride	33
28	Point	Blythe Mesa Solar I	Blythe	Renewable Resources Group	Under review	A planned 485 MW solar PV project on private land in Blythe	33
1	Polygon	Rice Solar Energy Project	Rice Valley, Eastern Riverside County	Rice Solar Energy	Approved, construction date unknown at this time	150 MW solar power tower project with liquid salt storage. Project located on 1,410 acres and includes a power tower approximately 650 feet tall and 10 miles long interconnection with the WAPA Parker-Blythe transmission line	35
23	Point	Colorado River Substation Expansion	10 miles southwest of Blythe	SCE	Approved 7/2011	500/230kV substation, constructed in an area approximately 1000 ft by 1900 ft	36
22	Point	Twelve Residential Developments	Blythe	Various	Approved or under construction	12 residential development projects have been approved by the Blythe Planning Department: Vista Palo Verde, Van Weelden, Sonora South, Ranchette Estates, Irvine Assets, Chanslor Village, St. Joseph's Investments, Edgewater Lane, The Chanslor Place Phase IV, Cottonwood Meadows, Palo Verde Oasis. A total of 1,005 single family residences are proposed	36

ID	Feature	Project Name	Location	Ownership	Status	Project Description	Distance (MILE)
26	Point	Four Commercial Projects	Blythe	Various	Approved	Four commercial projects have been approved by the Blythe Planning Department, including the Agate Road Boat & RV Storage, Riverway Ranch Specific Plan, Subway Restaurant and Motel, and Agate Senior Housing Development. Dates of construction are unknown at this time	36
34	Point	Mount Signal Solar Farm #1	Calexico	82LV 8ME	EA pending	600 MW solar PV project located on 1,440 acres	51
33	Point	Travertine Point Specific Plan	St. Rte 86, between 81st Ave and Coolidge Spring Rd, Riverside and Imperial County	County of Riverside	Lead agency approved the project on 1/15/2013, and will have significant impacts	The project proposes the construction of a total of 16,665 residential units and 5,029,500 square feet of non-residential development. This includes approximately 1,410 acres of TMDCI lands of which 647 acres are in Imperial County.	52
33	Polygon	Ogilby Solar	Chocolate Mountain	Pacific Solar Investments	Revised POD 8/26/11	1,500 MW Solar Thermal Trough	53

21	Polygon	Nextlight Quartzsite	Quartzsite, AZ	Nextlight Renewable Power	Pending	50 MW CSP Trough	58
15	Point	East County Detention Center	Existing Riverside County Jail, Indio	Riverside County	EIR filed, review period ends 6/4/2013	1,273 bed expansion of existing 353 bed detention center	58
28	Polygon	La Posa Solar Thermal	Stone Cabin, AZ	Pacific Solar Investments	Pending	2,000 MW Solar	60
1	Point	La Paz Solar Tower	La Paz County, AZ	EnviroMission	Pre-construction	200 MW power station on 11.0 acres	61
30	Polygon	Wildcat Quartzsite	Quartzsite, AZ	Wildcat Quartzsite Solar	Pending	800 MW CSP Tower	62

ID	Feature	Project Name	Location	Ownership	Status	Project Description	Distance (MILE)
14	Point	Hwy 111 Beautification and Improvement Project	Hwy 111, Riverside County	California State Transportation Commission	Lead agency approved the project on 3/5/2013, and will not have significant impacts	The project will widen Highway 111 from four to six lanes for a distance of approximately 4 miles	66
Fig 1B-1	Polygon	Imperial Solar Energy Center West	El Centro	CSOLAR Development	ROW granted	250 MW solar facility located on 65 acres of BLM land	73
Fig 1B-2	Polygon	Ocotillo Sol	9 miles southwest of El Centro	SDG&E	NOI published	18 MW project on 115 acres	74
5	Point	College of the Desert West Valley Campus Facilities Master Plan & Phase I Project	Indian Canyon Drive and Tramview Road, Palm Springs	Desert Community College District	Draft EIR Submitted 3/15/2013	West Valley Campus Facilities Master Plan and Phase 1 Project. Total planned development of 650,000 sf on 119+ acres. Also includes 30 on-campus dwelling units and 10,000 sf of campus related retail. Phase 1 development of 50,000 sf.	77
Fig 1B-3	Polygon	Ocotillo Wind Energy Facility	5 miles west of Ocatillo	Ocotillo Express	ROW approved	115 MW wind facility located on 12,436 acres of BLM land	80

While there is sufficient labor supply for the PSEGS and the other cumulative projects, the large number of construction workers needed for the projects when considered cumulatively, particularly if peak construction periods overlap, could impact the amount of hotel/motel and housing units in the local and regional study area. By itself, the PSEGS would not significantly impact the availability of local lodging supply. When considered cumulatively with the other projects, temporary lodging may be constrained in the local and regional study areas, thus contributing to a cumulative impact. Mr. Perez explained construction workers preference for lodging with easy access to Interstate 10, dining options, and convenience stores. As more construction workers come to work on the various cumulative projects, lodging availability in the more ideally-located communities (e.g. Indio, Blythe, Ehrenberg), could be more difficult to find, necessitating construction workers to turn to less ideally-located communities. A less ideally-located community would include communities further away from the project, communities without easy access to Interstate 10, or communities where lodging is higher priced. Also, more construction workers could choose to commute daily from their residence instead of moving closer to their job site.

Staff reviewed Google Earth and generated a table (Appendix A) that correlates the center point of each community by distance and travel time to PSEGS. With the use of both these tools, staff identified the communities of Mesa Verde, Desert Center, Ripley, Coachella, Bermuda Dunes, Thousand Palms, Thermal, Mecca, and Quartzsite as possible areas for lodging. However, when staff researched hotels and motels in these communities, the only lodging shown was one motel in Thousand Palms, an expensive hotel in Bermuda Dunes, and numerous hotels and motels of varying prices in Indian Wells, Indio, Palm Springs, Palm Desert, and La Quinta. Housing data for these communities is provided in **Socioeconomics Tables 8a** and **8b**.

Staff concludes that added with other projects with overlapping construction schedules, the PSEGS would contribute to a shortage of local and regional lodging. Approximately 1,005 single-family residential units (from 12 projects - ID/feature 23/point) are approved for construction in the city of Blythe and three residential developments are currently under construction. Riverside County approved a large residential development project with 16,665 units along the northwestern shores of Salton Sea (ID/feature 34/point). With these two projects, 17,670 residential units would be added to the PSEGS regional study area over time. Staff does not know when these projects anticipate completion of construction, but it is reasonable to assume that at least some of the units between the two projects would have completed construction during the PSEGS construction. Staff does not anticipate that new housing would need to be created to meet the temporary lodging needs of the PSEGS and the other cumulative projects.

Even with the temporary population increase in the local and regional study area, cumulative construction activities would not necessitate new or expanded public services (police, schools, parks and recreation) in the local study area based on information from the local BCTC and the Riverside County Sheriff’s Department. Mr. Perez with the local BCTC commented that construction workers for power plant projects tend to return to their residences on the weekend and when at the project site, they work their hours and go back to their temporary lodging in the evening. The Riverside County Sheriff’s Department commented that there is a low probability that additional law enforcement services are needed during PSEGS construction and operation, so it is likely that with the addition of the other projects in the cumulative setting, new or expanded law enforcement services would not be necessary. Construction workers do not tend to bring their families with them to their jobsite so new or expanded schools are not anticipated for the PSEGS and the other projects in the cumulative setting. Staff does not anticipate that new or expanded parks and recreation services are necessary for the PSEGS and other cumulative projects. Construction workers are not likely to spend much time visiting and using these resources.

Short-term, construction-related spending activities of the PSEGS, as for the approved PSPP, are expected to have cumulative economic benefits for the study area (refer below to Socioeconomics Table 14). The cumulative benefits would increase when revenues accrued as a result of the proposed PSEGS are combined with spending and any local revenues accrued as a result of current and future reasonably foreseeable cumulative development projects.

Operation. Operation of the PSEGS is expected to result in the potential permanent relocation of up to 25 workers into the local study area, versus 34 workers estimated for the approved PSPP. Socioeconomics Table 13 presents the most recently published data (Year 2010–2020 projections) on labor force characteristics for the cumulative regional study area pertaining to solar energy project operational labor skill sets and compares those to major cumulative projects located near the PSEGS along the I-10 corridor, including the GSEP, BSPP, RSEP, and the DSPV.

Socioeconomics Table 13

Notes: — Data not available. N/A Not applicable.
[1] BSPP and PSEGS use a 25% relocation assumption in their respective AFCs. As no assumed percentage was included in the RSEP AFC or in the DSPV information provided by BLM, this table assumes 25% of operational employees would permanently relocate to the cumulative project area. The GSEP AFC specifically indicates that up to 33 workers would relocate. *Total reflects the combined total peak month numbers for the PSEGS, BSPP, GSEP, RSEP, and DSPV projects.
Source: Solar Millennium 2009a and b; GSEP 2009a; SR 2009a; BLM 2010c; NEBSEC 2013a; Palen 2012a; and Palen 2013ss.

Socioeconomics Tables 8a and 8b show there is enough housing in the local study area to house the 25 operational workers estimated to relocate closer to the project and enough housing for the other operations workers for the cumulative projects. The combined 17,600 housing units in Blythe and near the northwestern end of the Salton Sea could also be a source of housing for the operations workers for the cumulative projects. Staff does not anticipate a housing supply shortage for the operations workers for the cumulative projects. The small increase in the overall Palo Verde Unified School District student body from the PSEGS would not pose a significant cumulative impact and when added to the other cumulative projects, it is not anticipated that the increased student enrollment would necessitate the provision of new or expanded school services. The Riverside County Sheriff's Department commented that there is a low probability that additional law enforcement services are needed for project operations, so it is likely that with the addition of the other projects in the cumulative setting, new or expanded law enforcement services would not be necessary. Staff does not anticipate that the addition of the 25 PSEGS operations workers in the local study area plus the operations workers for the other cumulative projects would result in the need for new or expanded parks and recreation services, particularly when existing and planned housing (cumulative projects) would have considered these services. Also, operations workers for the PSEGS and the other cumulative projects may not all settle in the local study area, and instead settle in the regional study area, especially as operations workers are known to commute up to an hour in each direction to work on a power plant.

Closure. The closure of the PSEGS is expected to result in similar cumulative impacts related to socioeconomics as PSEGS construction impacts, as described above. It is unknown if the construction or closure of any of the cumulative projects would occur concurrently with the closure of this project, because the closure is not expected to occur until at least 30 years from project start-up. Based on the cumulative impact analysis for PSEGS construction activities, the impacts of the closure of the PSEGS would not be expected to contribute to cumulative impacts related to socioeconomics. Staff assumes that like the PSEGS, the non-operation and closure workforce would be drawn from the regional and local study areas, and at most, 15 percent of the workforce would temporarily relocate closer to the site for closure activities.

COMPLIANCE WITH LORS

CALIFORNIA REVENUE & TAXATION CODE, SECTION 73

Solar thermal projects are subject to property taxes and current law would qualify the PSEGS for the exclusion of certain parts from valuation per the Revenue and Taxation Code, section 73, if the project were under construction by January 1, 2017. However, because the PSEGS is located entirely on BLM lands and under Title 43, United States Code, section 1701, and the federal government is immune from state and local taxes, property taxes would not be collected. The federal government can provide payments to compensate states and local governments for burdens created as a result of immunity (payment in lieu of taxes, or PILT) [43 U.S.C., § 1701, subd. (a)(13)].

NOTEWORTHY PUBLIC BENEFITS

For the purpose of this analysis, staff defines noteworthy public benefits to include changes in local economic activity and local tax revenue that would result from project construction and operation. Impact estimates reflect two different scenarios representing the construction and operation phases of the project. Economic impacts associated with the construction phase include substantial expenditures on materials and labor that would occur during the 33-month construction phase.

The economic model most commonly used is the IMPLAN input-output model, developed by the Minnesota IMPLAN Group (MIG). The model relies on complex input-output tables and social accounting matrices. These are quantitative representations of the purchaser-supplier relationships between producers and intermediate and final consumers. Based on these tables, the analyst can estimate the economic activity that would result from a given expenditure, or other economic event. The resulting economic impact estimates are divided into three categories. These are the direct, indirect, and induced economic impacts. Within each of these categories, the model estimates associated changes in employment, labor income, and economic output.[7] Direct economic effects represent the employment, labor income, and spending associated with construction or operation of the project itself. Indirect economic effects represent the expenditures on intermediate goods made by suppliers who provide goods and services to the project. Induced economic effects represent household spending that occurs due to the increased wages, salaries, and proprietor’s income generated in the direct and indirect rounds.

Socioeconomics Table 14 provides a summary of economic and employment benefits of the PSEGS compared with the approved PSPP. As the PSEGS is completely on BLM land and the federal government is immune from state and local taxes, property taxes would not be collected. However, through payment in lieu of taxes the federal government can provide payments to compensate state and local governments for burdens created as a result of immunity (43 U.S.C., § 1701, subd. (a)(13)). The petition to amend has identified that an estimated $4.3 million in annual property tax would be assessed on the project if it were sited on non-BLM land. Payment in lieu of taxes would be at the discretion of the BLM.

[7] The Minnesota IMPLAN Group (2012) defines Economic Output as “the value of industry production.” In the manufacturing sector, output is equal to total sales, minus inventory changes. For the service sectors, output is equal to total sales. In the retail and wholesale trade sectors, output is equal to the gross margin (i.e., total sales, minus the cost of goods sold).

Socioeconomics Table 14
PSEGS Economic Benefits

Fiscal Benefits	**Approved PSPP Project** (2009 dollars)	**PSEGS**
Estimated annual property taxes	$200,000[1]	$0 to 4.3 million[2]
State and local sales taxes: Construction	$805,000	$7 million
State and local sales taxes: Operation	$437,500	$70 million
School Impact Fee	$0	Not applicable
Non-Fiscal Benefits		
Capital Cost	$248,700,000	$533.8 million[3]
Construction materials and supplies	$30.0 million	$71,400,000
Operations and maintenance supplies	$5.0 million	$589,600
Direct, Indirect, and Induced Benefits		
Estimated Direct Employment		
Construction	566 jobs (annual full-time equivalent over full 39-month construction phase)	840 jobs
Income	$218.7 million (total over full 39-month construction phase)	$462.4 million
Operation	134 jobs	100 jobs
Income	$5.8 million (annual)	12.3 million (annual)
Estimated Indirect Employment		
Construction	291 jobs	172 jobs
Income	$14.0 million	$11 million
Operation	40 jobs	8 jobs
Income	$3.0 million	$36,605
Estimated Induced Employment		
Construction	196 jobs	3,274 jobs
Income	$13.0 million	$159.1 million
Operation	37 jobs	69 jobs
Income	$2.0 million	$2,778,257

Notes:

1 At present, there is no property tax assessed on solar components (mirrors, solar boiler, heat exchangers) by law (section 73 of the California Taxation and Revenue Code). Components included under the exemption include storage devices, power conditioning equipment, transfer equipment, and parts. The first operational year and subsequently thereafter would generate an estimated $200,000 in annual property taxes.

2 As the PSEGS is completely on BLM land and the federal government is immune from state and local taxes, property taxes would not be collected. However, the federal government can provide payments to compensate states and local governments for burdens created as a result of immunity (43 U.S.C., § 1701, subd. (a)(13)). An estimated $4.3 million would ordinarily be assessed which the federal government could pay to Riverside County, either in full, in part, or not at all.

3 The applicant estimated the capital cost for construction as $2 million. Staff questions the applicant's estimate as the combined estimate for local materials and supply purchases and the total construction payroll (capital costs) add up to $533.8 million.

RESPONSE TO COMMENTS

Staff received the following agency and public comments related to socioeconomics for the PSEGS (summarized below). Staff's responses to the comments are provided below the list of comments and where noted in the responses, comments have been addressed in this text.

COUNTY OF RIVERSIDE, JOHN J. BENOIT, COUNTY OF RIVERSIDE COMMENTS ON THE PRELIMINARY STAFF ASSESSMENT, TN 200094, JULY 30, 2013:

Comment: If private land within the county must be permanently restricted for mitigation purposes, the economic impact resulting from the removal of those lands must be accounted for and further mitigation may be necessary to offset any identified adverse impacts to the county or the environment.

Response: The Biological Resources staff notes that acquisition lands for mitigation could be private or under the public domain, and are not limited to Riverside County, but rather, are recommended to occur within the desert tortoise's Colorado Desert Recovery Unit. Also, mitigation lands are not typically selected during the permitting phase. According to the Biological Resources staff, ownership and zoning of land are a subpart of the selection criteria; however, biological characteristics, including habitat connectivity, are also considered when evaluating a mitigation proposal from a project owner (see Condition of Certification BIO-12).

It is beyond the scope of the Socioeconomic analysis to assess the fiscal impact to Riverside County from the possible removal of private lands for purposes of environmental mitigation.

Comment: Due to the remoteness of the site, housing workers on both a short-term and long-term basis may be an issue.

Response: Staff has addressed this concern and incorporated additional information into the analysis (see the Induce Substantial Population Growth, Displace People or Housing, and Cumulative Impacts subsections).

Comment: The population projections presented in the PSA are the most recent California Department of Finance population forecasts released in January 2013, and are the most recent forecasts for the County overall. Southern California Association of Governments (SCAG) Regional Transportation Plan/Sustainable Communities Strategy growth forecasts are available at geographic levels as small as the Traffic Analysis Zone, providing for more detailed analyses. For Riverside County as a whole, the Department of Finance and SCAG forecasts are consistent. Use of the SCAG forecasts may provide a more accurate localized analysis of project impacts.

Response: Staff reviewed the SCAG data and incorporated additional information into the analysis (see Socioeconomics Tables 2 and 3).

Comment: The series of numbers in Socioeconomics Table 6 under the columns labeled "2010" and "2020" could not be deciphered.

Response: Staff has corrected the data in Socioeconomics Table 6.

Comment: The county questions the selection of cities and CDPs presented in Socioeconomics Table 8 (renumbered as Socioeconomics Table 8a) as being representative of localities in the study area most likely to be impacted and questions why the city of Coachella and the communities of Thermal, Mecca, Bermuda Dunes, and Thousand Palms have not been included. The county also questioned why the Palo Verde CDP was included as it is in Imperial County and the Riverside County communities of Mesa Verde and Ripley were not included.

Response: Staff has incorporated a classification of vacancy status for each of the cities and communities presented in the regional and local study areas (see Socioeconomics Tables 8a and 8b).

Comment: The county presented a table with vacancy data for Blythe, Cathedral City, Desert Center, Indian Wells, Indio, Palm Desert, Palm Springs and Palo Verde CDP. The county comments that the vacancy rates they presented in the table represent a comparison of the total number of vacant units to the vacant units available for rent or purchase. The table specifically presents the total housing units, occupied housing units, vacant housing units, units for rent, units for sale, and the vacancy rate. The county also calculated a vacancy rate for sale units and one for rental units. The county comments that 67 percent of the vacant units in the region are for seasonal, recreation, or occasional use so the conclusions in the PSA that there is ample housing available may be an over estimate.

Response: Staff reviewed the data presented in the county's table and agrees with the majority of the data except for the county's calculation of the vacancy rate for sale units and rental units. With the exception of "Other Vacant," the data presented in Socioeconomics Table 8b is a direct reporting of 2010 decennial Census data.

Comment: The county comments that it is inappropriate to assume that the housing units presented in Socioeconomics Table 7 (hotel and motel lodging) are in the rate categories of the income level of the typical construction worker. A number of cities listed in Socioeconomics Table 8 (renumbered as Socioeconomics Table 8a) have some of the highest real estate and rental prices in the country and it is likely that a significant percentage of the vacancies are not within reach of the average solar worker.

Response: Staff realizes that there may be lodging in some of the cities and communities in the PSEGS regional study area that is more expensive than construction workers may choose to spend. Staff has addressed this issue and incorporated additional information into the analysis (see the Induce Substantial Population Growth subsection).

Comment: The cumulative effect of construction workers temporarily relocating to sites under construction that would adversely impact low-income housing and possibly create a shortage of available housing for low- and moderate- income residents in areas such as Coachella, Chuckwalla, and Palo Verde valleys.

Response: Staff's research shows that construction workers who temporarily relocate to job sites prefer hotels/motels over apartments or single-family homes. At the July 25th PSA workshop, staff asked Riverside County to provide some evidence of displacement of low-income residents by construction workers to verify or corroborate the county's concerns. The county indicated that they did not have evidence that would support their concerns. To assume that construction workers would displace low-income residents by taking up temporary residence in low-income housing is speculative and appears to be unsupported by staff's research with Mr. Perez.

Comment: The county questions staff's use of the six-mile buffer based on urban air quality modeling methods to determine "social justice" impacts.

Response: As discussed in the Socioeconomics analysis, staff defines the study area related to project impacts on population, housing, and parks as within a one-hour commute of the project. An analysis at a local level presents a challenge because the proposed PSEGS is in a sparsely populated area, with the largest urban center being the city of Riverside, located approximately 100 miles west of the site. A reasonable study area for localized socioeconomic impacts would include the two nearest communities: the city of Blythe, California (approximately 25 miles east of the PSEGS site), and the city of Ehrenburg, Arizona (approximately 30 miles east of the PSEGS site). The study area for law enforcement is the local jurisdictional boundary for the Riverside Sheriff's Department. The study area for impacts to schools is the Palo Verde and Desert Center School districts. The study area for indirect and induced economic impacts is defined as Riverside County. For the purposes of assessing project impacts during construction, staff defines the regional study area as within a two-hour commute of the project. As Desert Center is the closest community to the project site, population and housing data for Desert Center have been included in the table even though this community is sparsely populated.

The study area for environmental justice impacts is a six-mile buffer of the project site. When an environmental justice population is present, the following technical areas include in their analyses an assessment of impacts to environmental justice communities: Air Quality, Hazardous Materials Management, Land Use, Noise and Vibration, Public Health, Socioeconomics, Soil and Water Resources, Water Quality, Traffic and Transportation, Transmission Line Safety and Nuisance, Visual Resources, Cultural Resources, and Waste.

Final Guidance for Incorporating Environmental Justice Concerns in EPA's Compliance Analyses (US EPA 1998) encourages outreach to community-based organizations and tribal governments early in the screening process to identify the presence of distinct minority communities residing both within, and in proximity to the proposed project, and to identify those minority groups who utilize or are dependent upon natural and cultural resources that could be potentially affected by the proposed action. The Public Adviser's Office is responsible for outreach to local communities affected by a project. Consultations with local Native American communities are initiated by the Cultural Resources staff. In some cases, impacts have occurred to Native American populations who use the natural and cultural resources found in the six-mile buffer but who do not live there.

Air quality staff identifies the maximum impacts of the project and compares them with the most stringent ambient air quality standards. The ambient air quality standards provide public health protection, including protecting the health of "sensitive" populations such as asthmatics, children, and the elderly. Staff always finds the maximum air quality impact occurs well within the 6-mile radius. The impact would be much less beyond the 6-mile radius. If the maximum project impact (which always occurs within 6-mile radius) is less than significant, there would be no environmental justice issue for air quality (CEC 2013x).

Comment: Adequacy of services provided by Riverside Sheriff's Department, Colorado River Station should construction workers relocate to the area for construction.

Response: Staff has addressed this concern and incorporated additional information into the analysis (see the Police Protection subsection).

Comment: The county states that staff's conclusion regarding the availability of local housing within a two-hour commute rate is flawed because the data does not accurately reflect the true vacancy rates, does not take into account the actual affordability of available housing within reach of the solar workforce, does not include the communities within the study's commute rate most likely to be impacted, and does not adequately examine the potential environmental and social justice impacts on some of the county's most vulnerable communities from workers displacing low-income renters. The assumption that adequate available housing for all types of construction workers is unproven and the potential economic impact on Riverside County's most economically fragile communities remains unexamined.

Response: Staff has addressed this concern and incorporated additional information into the analysis (see Socioeconomics Tables 8a and 8b and the Induce Substantial Population Growth subsection.

Comment: The purchase of homes by "some percentage" of the project's operational staff would only result in a net benefit to the county if the sale results in greater property tax revenue than presently received. Given the trends in real estate values over the last seven years, it remains highly likely that the sale of an existing home may actually result in a reduction of assessed value and a net loss of revenue to the county. Staff should not automatically assume that home buying by permanent operational staff will result in a net benefit to the county.

Response: Staff has updated this text to acknowledge that residential property taxes are based on the assessed value at the time of sale (see the Police Protection and Parks and Recreation subsections).

TOURISM ECONOMICS COMMISSION, PAUL SMITH AND MORONGO BASIN CONSERVATION ASSOCIATION, PAT FLANAGAN, COMMENTS ON THE PSA, TN #: 200074, JULY 29, 2013:

Comment: The assessment did not take into account the economic effects on the tourism and business in the desert from the PSEGS project alone and in conjunction with other solar projects cumulatively planned along the Interstate 10 corridor.

Response: Socioeconomics Table 14 presents an estimate of the economic benefits from the PSEGS, including the indirect and induced jobs and income from the project. Visual Resources staff states that the Palen Solar Electric Generating Systrem project would result in a substantial adverse impact to existing scenic resource values as seen from Joshua Tree National Park (see the Visual Resources section of the FSA). Quantifying the economic effect from a reduction in scenic value to the Joshua Tree National Park and Morongo Basin communities is beyond the scope of the Socioeconomics analysis.

CONCLUSIONS

No direct or indirect significant adverse socioeconomics impacts would occur as a result of the construction or operation of the proposed PSEGS, like the approved PSPP. However, when considered cumulatively with the other proposed and approved projects, temporary lodging may be constrained in the local and regional study areas, thus contributing to a cumulative impact. Staff does not anticipate that new housing would need to be created to meet the temporary lodging needs of the PSEGS and the other cumulative projects. Even with the temporary population increase in the local and regional study area, cumulative construction activities would not necessitate new or expanded public services (police, schools, parks and recreation) in the local study area.

PSEGS operations would not create a significant adverse socioeconomic cumulative impact. New or expanded law enforcement services would not be necessary and the increased student enrollment would not necessitate the provision of new or expanded school services. Staff does not anticipate that the addition of the 25 PSEGS operations workers in the local study area plus the operations workers for the other cumulative projects would result in the need for new or expanded parks and recreation services, particularly when existing and planned housing (cumulative projects) would have considered these services.

The proposed PSEGS, like the approved PSPP, would benefit the local and regional study areas in terms of an increase in local expenditures and payrolls during construction and operation of the facility, as well as a possible benefit to public finance and local economies through taxation. These activities would have a positive effect on the local and regional economy.

PROPOSED CONDITIONS OF CERTIFICATION

Staff has a new condition for Socioeconomics. There were no pervious conditions for Socioeconomics for the PSPP project. (Note: New text is **<u>bold and underlined</u>**)

<u>SOCIO-1 The project owner shall submit a “No Trespassing” letter to the satisfaction of the Colorado River Station of the Riverside County Sheriff’s Department. The “No Trespassing” letter shall remain on file throughout construction and operation of the project.</u>

<u>Verification: At least 30 days prior to the start of construction, the project owner shall provide a copy of the letter to the Colorado River Station of the Riverside County Sheriff’s Department for review and to the CPM for review and approval.</u>

SOIL AND WATER RESOURCES

Testimony of Marylou Taylor, P.E.

SUMMARY OF CONCLUSIONS

Based on the information provided, California Energy Commission (Energy Commission) staff (staff) determined that construction, operation, and closure of the proposed modified Palen Solar Electric Generating System (PSEGS) could potentially impact soil and water resources. Where these potential impacts have been identified, staff has proposed mitigation measures to reduce identified impacts to levels that are less than significant. The mitigation measures, as well as specifications for laws, ordinances, regulations and standards (LORS) conformance, are included herein as conditions of certification. The Soil and Water Resources Conditions of Certification address the California Environmental Quality Act (CEQA) requirements for the Energy Commission's analysis, and if the conditions of certification are implemented, the project would conform to all applicable LORS and state policies.

A summary of proposed modifications to the **Soil and Water Resources** Conditions of Certification is shown in **Soil & Water Resources Table 1**.

Soil & Water Resources Table 1
Summary of Proposed Modifications to Conditions of Certification

Condition of Certification	Proposed Modification(s) to Condition
SOIL&WATER-1	DRAINAGE EROSION AND SEDIMENTATION CONTROL PLAN (DESCP): Edit to items C and N.
SOIL&WATER-2	PROJECT GROUNDWATER WELLS, PRE-WELL INSTALLATION: No change.
SOIL&WATER-3	CONSTRUCTION AND OPERATION WATER USE: Reduce maximum limit of water usage and construction duration to match the project description.
SOIL&WATER-4	GROUNDWATER LEVEL MONITORING, MITIGATION AND REPORTING: No change.
SOIL&WATER-5	COMPENSATION FOR WELL IMPACTS: No change.
SOIL&WATER-6	WASTE DISCHARGE REQUIREMENTS: Delete a typo. Revise requirements specified in Appendix B, C, and D to match the modified project.
SOIL&WATER-7	SEPTIC SYSTEM AND LEACH FIELD REQUIREMENTS: No change.
SOIL&WATER-8	REVISED PROJECT DRAINAGE REPORT AND PLANS: Delete.
SOIL&WATER-9	DETAILED FLO-2D ANALYSIS: Delete.
SOIL&WATER-10	DRAINAGE CHANNEL DESIGN: Delete.
SOIL&WATER-11	CHANNEL EROSION PROTECTION: Delete.
SOIL&WATER-12	CHANNEL MAINTENANCE PROGRAM: Delete.
SOIL&WATER-13	CLOSURE PLAN: Text changed to match language in the GENERAL CONDITIONS section.
SOIL&WATER-14	MITIGATION OF IMPACTS TO THE PALO VERDE MESA GROUNDWATER BASIN: No change.
SOIL&WATER-15	GROUNDWATER PRODUCTION REPORTING: No change.

Condition of Certification	Proposed Modification(s) to Condition
SOIL&WATER-16	GROUND SUBSIDENCE MONITORING AND ACTION PLAN: Change “applicant” to “project owner”.
SOIL&WATER-17	ESTIMATION OF SURFACE WATER IMPACTS: Edit to verification.
SOIL&WATER-18	GROUNDWATER QUALITY MONITORING AND REPORTING PLAN: Change “applicant” to “project owner”.
SOIL&WATER-19	NON-TRANSIENT, NON-COMMUNITY WATER SYSTEM: No change.
SOIL&WATER-20	STORM WATER DAMAGE MONITORING AND RESPONSE PLAN: New.
