**COMMENTS of SAN DIEGO AIRPORT PARKING CO.**

**Introduction and Background**

**Please state your name and business address.**

My name is Lisa McGhee. My business address is 2771 Kurtz St., San Diego, CA. 92110

**By whom are you employed and in what capacity?**

I am the Operations Manager and Regulatory Manager of Transportation and Environmental affairs for San Diego Airport Parking Company. In my current role, I advise and make recommended decisions for the company on the fleet procurement as well as participate in regulatory agencies associated with transportation in order to oversee the decisions and issues that affect transportation operations. My team of employees include the Commercial Drivers who are the shuttle drivers. Commercial Motor carriers have a high duty of care for safety while operating the bus and thereby are responsible for safety of the passengers and for the safe performance and operation of the bus and must be fit to do the job. I am responsible for Motor carrier safety in our operation. I handle the end to end use with new projects that are being developed for the company in order to meet existing regulations, updates and new changing future regulations ---all with the goal of staying current, legal, safe and efficient with a reliable useful life period that the procured assets and capital equipment can maintain without risk over-time, in other words, the equipment we operate can do the job and is durable for the duty cycle that we operate 24/7 and 365 days per year. Our vehicles

1 are the company's assets and the transportation department makes up 40% of all expenses in the  
2 operation with the entire service being at no cost but yet a high duty for care and safety. As such, I  
3 am responsible for procurement decisions that I recommend that are based on an analysis of best  
4 cost and best benefit that I believe will support the operation for the useful life that is budgeted and  
5 forecasted. My main focus since 2010 has been to establish a fleet operation to support the climate  
6 goals and in 2015 SDAP introduced Electrification Transportation into its fleet which required  
7 procuring 3 Electric shuttle buses and installing 3 EV Level-2 commercial charging infrastructure  
8 supply equipment (EVSE), the EVSE output is at 14kW of power level. SDAP's experience on  
9 transportation began in 1991 and fueling had only been with conventional and low NOx fuels until  
10 SDAP procured Electric buses. SDAP had always been on a Small business commercial utility  
11 SDG&E price plan since 1991 and has never been subject to demand kW fees. In 2015, SDAP was  
12 subject to demand fees for its TE fleet; thereby SDAP participated in SDG&E's last rate case  
13 proceeding 15-04-012.  
14  
15

16  
17 **Please describe your background, experience and expertise.**

18  
19 I have been working in the fleet procurement process since 2010. I myself hold a commercial  
20 passenger driver license and originally got my class A commercial drivers doubles and triples  
21 license back in 2000. SDAP was required by a MOU between the AG office and its relationship  
22 with the SAN Airport to move into Low NOx vehicle fleet procurement. I've been deeply involved  
23 with the climate goals ever since that time. It was in 2015 when I made the recommendation for  
24 SDAP to procure 50% of its fleet to EV's and since that time, I've been involved in the evolution of  
25 standards and policies around EV's and infrastructure. Prior to joining SDAP, I've provided  
26

1 consulting services for Expo Propane, an auto gas propane company. I was operations manager for  
2 a fitness facility for 8 years. I'm very familiar with making large capital equipment decisions to  
3 support the operations of a company and that will affect its future.  
4

5 **On whose behalf are making these comments and why?**

6  
7 I am making comments on behalf of San Diego Airport Parking Company and to support other  
8 small commercial MHD fleets that would face the same cost and challenges when displacing its  
9 fleet to TE.

10 **What is the purpose of your interest to share comments?**

11  
12 The purpose of my interest is to discuss the TE MHD funding that is generated from SB350, the  
13 ARFVTP, the HVIP rebates and the AQUIP --- billions of \$\$ that have been supporting the  
14 technology since it began. I will discuss the reasons that SDAP in general supports TE. I will also  
15 identify areas in which there is a lack of sufficient policies, testing, standards and managed charging  
16 solutions to achieve best cost and best benefits. TE could be supported by non-grid charging or  
17 infrastructure solutions that do not need to be fully 100% wired grid charging. I will provide  
18 specific recommendations to facilitate and incorporate an example of a solution that could be  
19 enabled. I will briefly address "lessons learned" and the need for an EV commercial rate that  
20 mitigates the impact of demand charges on customers providing EV fast charging services and how  
21 fleets are negatively impacted by demand fees. The demand fees in California across the corridor  
22 from South to North can be over 100% more expensive in Southern California, such as in the  
23 SDG&E service territory. I will also identify SDAP's own Fleet Use Case which identifies  
24 limitations to mitigate demand fees and or to schedule charging or to shift charging when 100% on  
25  
26

1 the grid. There is a lack of advanced managed charging equipment and renewables charging  
2 infrastructure being integrated for commercial TE. The opportunities enable commercial fleets to  
3 reduce cost on ratepayers, reduce demand rates, shift kilowatt hour rates and create emergency  
4 response hubs that could support other local ratepayers --- all while reducing emissions and  
5 reducing installation cost. I will provide a specific Fleet Use Case for recommendation that  
6 incorporates the “lessons learned” from SDAP’s own implementation of an EV Fleet program. I  
7 will address the need for an EV Commercial rate to support early adopters for both large and small  
8 customer classes in the *MHD transportation* sector. And I will share facts on how far we have  
9 progressed in the MHD sector according to procurement sales of MHD EV’s in California after  
10 spending billions of tax payer’s money. SDAP alone makes up 30% of the TE commercial MHD  
11 fleets in San Diego as San Diego has a total of 11 HVIP sales since 2009 and SDAP has 3 of these  
12 sales. (See <https://www.californiahvip.org/tools-results/#mapping-tool>)  
13

14  
15  
16 **Please describe SDAP’s interest in TE and the merit review.**

17 SDAP is an experienced MHD fleet. SDAP is an experienced MD TE fleet. SDAP has experienced  
18 benefits and negative cost associated with its procurement into TE. SDAP is concerned with  
19 maintaining reliable TE equipment for robust stakeholders in the MHD space. As a Medium Duty  
20 (MD) fleet provider of Shuttle Services for SAN Airport Operations in San Diego, we are open 24/7  
21 since 1991 and we average 20,000 miles per month in our fleet averaging 650 vehicle miles traveled  
22 (VMT) per day. We want to ensure that these programs enable all classes of commercial fleets and  
23 sizes of fleet operations that are best suited for electrification and that are currently facing a  
24 measure to adopt Zero Emission transportation. SDAP sees many benefits in the technology and is  
25  
26

1 also very concerned that the programs to date have not fairly included a diverse program that is the  
 2 Medium Duty Class. Specifically, today, the program has zero Class 2B vehicles in inventory, it  
 3 has two Class 3 vehicles (the second OEM was just listed one month ago); therefore, there is only  
 4 one Class 3 vehicle with any sales today. I also am concerned with the lack of support toward small  
 5 commercial business that makes up 90% of all transportation fleets. For example, in San Diego ---  
 6 SDGE's small class commercial customers make up 87% of all commercial customers and in San  
 7 Diego on average all industries are 95% small business operations. SDAP wants to see the  
 8 programs and funding to support the small business and the light MD sector. The light MD sector is  
 9 the most popular commercially registered vehicle; thereby this is great opportunity for scalability.  
 10

11 Per ARB as of May 2018, the Class 2B/Class 3 population is in the table below. (See ARB Vehicle  
 12 population Statistics, page 10, from the May 2018 Clean Truck Working Group:  
 13

14 <https://www.arb.ca.gov/msprog/actruck/mtg/180531presentation.pdf>)

Industry	Respondent Vehicle Population			Statistics			
	2B to 3	4 to 7	8	Daily Mileage	Annual Mileage	Years in Fleet	Overnight return to base
California State Fleet	15,915	3,960	3,180	-	6,400	-	-
Gov't/Public	1,172	585	325	30	10,000	11	100%
Utility	656	784	214	50	10,000	12	67%
Construction	25	50	1,270	100	18,000	10	90%
Equipment Rental/Dismantler	0	118	85	115	28,500	10	100%
Retail	590	888	117	150	36,000	9	100%
Total Vehicles by Class	18,358	6,385	5,191

23 This technology is nimble and nascent; moreover, fleets deserve to have a seat at the table to share  
 24 the fleet procurement objective requirements, the performance, reliability and useful life standards  
 25 expected. Fleets are very savvy at vehicle procurement --- can you imagine driving your vehicle  
 26

1 for 4,000 miles per month or for 8 hours or more per day? Fleets are keen to knowing what they  
2 want, need, expect, will pay, residual value, total cost of ownership (TCO). We live and breathe  
3 this with each vehicle that is on the road daily for over 8 hours per day. How many of you know  
4 what it is like to drive and wait in traffic every single day for 8 hours and more per day and what if  
5 you have a vehicle with a malfunction. What would happen to you if your car did not run? How  
6 would this affect your commuting? Now apply this to maintaining a reliable and successful  
7 operation to keep your customers happy and meet the demand required to maintain the relationship.  
8 Now imagine....in addition to being down....what if the equipment is 100% proprietary with no  
9 local garage services available? Your programs require diversity and should include all classes of  
10 vehicles and all sizes of fleet operations as it currently lacks a target toward support for small  
11 business, small fleets and the most popular MD vehicles.  
12

13  
14 **Please describe reliable and managed charging for fleets:**  
15

16  
17 The TE MHD space has NO standards for either an EVSE or it's connectors, and the same for the  
18 Vehicles, there currently is no testing standards as CARB and EPA only regulate the fuels and  
19 emissions from the tailpipe. The vehicle Reliability, performance and efficiency are currently not  
20 regulated and thereby the future winning standards are unknown, and this includes the efficiency of  
21 the vehicles on how many kilowatt hours per mile. The answer is the cost of a mile when displaced  
22 from fossil fuels. There is no standard on the SOC or the battery efficiency as such, the loss factor  
23 will cost the fleet more kWh when dispensing even though you cannot use these kWh in the vehicle.  
24 EV tariff rates are not well designed for commercial transportation and are very complex and can  
25  
26

1 change daily. Rates need to be a benefit, the make-ready needs to be available on a property  
2 however, many properties share a transformer and may not have the 3 phase, and when fleets with  
3 multiple vehicles charge, there needs to be 3 phase power and there should be a requirement for  
4 fleets to have equipment to support effective load management strategies and there should be a rate  
5 to provide rewards and incentives when shifting. As a supporter of SB 350's goal of promoting cost  
6 effective investments, SDAP understands the need for utility participation in programs aimed at  
7 expanding the Make Ready for the EVSE infrastructure throughout California and the Utilities  
8 seems well designed to meet that need. But it will be more important to effectively implement and  
9 introduce renewable charging infrastructure in order to ensure the success of integrating the most  
10 advanced EV equipment that is currently available and is quickly becoming a part of the standards  
11 for the future of MHD EV Charging. Specifically, this will be required for fleet success and is the  
12 simplest way to manage charging with these other more suitable options verses only via Time of  
13 Use (TOU).  
14  
15

16  
17 **What are the EV NEEDS?**

18  
19 The TE Fleet business model NEEDS to incorporate renewables and managed charging solutions  
20 with storage equipment in order to enable shifting of higher kilowatt hour rates and reduced CI and  
21 GHG time of use charging periods --- as this enables capturing the over generated renewable  
22 electricity that might otherwise be wasted / curtailed. This would allow promoting the integration  
23 of renewable power and ZEV related loads to be managed and to help make these vehicles truly  
24 Zero emission both upstream and downstream and to promote the expansion of managed charging  
25 for commercial fleet customers that will not be able to directly shift their time of use as the TE  
26

1 fleets coupled with the number of miles and available hours to charge will not support “scheduled”  
2 charging and cannot take advantage of a super off peak period. Smart integration with EV  
3 infrastructure management control solutions that support reduced peak time on the grid – will limit  
4 demand fees at peak time and non-coincidental, reduces higher kWh use at peak time, prioritizing  
5 energy storage mixes in fleet TE deployment has many benefits that will reduce installation costs of  
6 trenching, wires and transformers. This execution is very possible when the number of vehicles  
7 adopted to TE fleets at the early stages and lessons learned from the first time adopters proves the  
8 adoption process is slow and low; thereby, all dispensing for the fleet at peak time can enable off  
9 grid charging and will result in no power load on the grid – thereby the fleet can dispense as fast as  
10 the equipment enables without the added upgrades or transformers, reduces loading from the grid,  
11 and curtailing and rate management promotes for best kWh pricing and encourages an attraction to  
12 beat diesel fuel prices. See below for which is the SDAP use case which is a small Fleet. The issues  
13 are immediate in this current Use Case due the lower power level charging is too slow for  
14 commercial use. The use is MD EV vehicles with power level capacity at 14 kilowatts, this 14 KW  
15 will be the output for each charging event; thereby this use case requires one EVSE for every single  
16 EV Bus and when 100% tied to the grid. See SDAP Exhibit for EV Miles and Cost of EV  
17 comparison.

21 **1. SDAP EV Fleet: Productivity / Behavior (non-managed charging)**

22 **a. Driving Productivity = Vehicles Miles Traveled (Short Duty Cycle)**

- 23 **i. Open 24/7**
- 24 **ii. 650 miles per day for fleet**
- 25 **iii. 10-hour driver shifts**
- 26 **iv. 125 vehicle miles traveled per shift by each driver**
- 26 **v. EV range = 100 miles**

- vi. 2 drivers at 4am to 2pm = 125 miles
- vii. 2 drivers at 2pm to Midnight = 125 miles
- viii. 1 driver at 10pm to 8am = 125 miles

**b. Charging Behavior = power level 2 at 14 kW and 3 EVSE's on property**

- i. 4 hours to fill = 100 miles
  - 1. Done at OFF Peak Nightly
- ii. 2 hours of EV charging = 50 miles of range
  - 1. 12 fills per shift at 10 mins each = 2 hours and 50 miles of range
    - a. Done at Shift 1
- iii. 3 hours of EV charging = 75 miles of range
  - 1. 12 fills per shift at 15 mins each = 3 hours and 75 miles of range
    - a. Done at Shift 2 and at Graveyard

**c. Driver Behavior**

- i. Fill up 10 mins each time back at base
- ii. 12 fills per day
- iii. = 2 hours of charging
- iv. = 50 miles of range generated
- v. 2pm, Shift #1 ends
  - 1. 25 miles of range remaining
- vi. Shift # 2 starts with 25 miles of range at 2pm
  - 1. 12 fills x 15 minutes
    - i. = 180 mins at 3 hours
    - ii. = 75 miles of range replenished
- vii. Shift #2 ends at Midnight
  - 1. Driver #2 is empty at end of shift and he is short 25 miles of range.

**d. All day long this demonstrates that the business demand does not allot for "scheduled" charging or managed charging with Time of Use.**

**e. Charging Plan and Storage Capacity of 100-mile range in vehicle:**

1                                   **Use Case: 4 shuttles, 2 drivers per shift = 650 miles daily.**

2  
3                   **i. Midnight to 4am = Full Charge = 100 miles**

4                       **1. 3 buses charging at same time**

5                           **a. = 12 hours daily charging Midnight to 4am (= 300 miles)**

6                   **ii. 4am to 2pm = 2 hours of charging = 50 miles**

7                       **1. Short 10 mins intervals, 12 per shift by each driver**

8                           **a. 2 buses in this shift**

**b. = 4 hours daily charging at 4am to 2pm (= 100 miles)**

9                   **iii. 2pm to Midnight = 3 hours of charging = 75 miles**

10                       **1. Short 15 mins intervals, 12 per shift by each driver**

11                           **a. 2 buses in this shift**

**b. = 6 hours daily charging at 2pm to Midnight. (= 150 miles)**

12                   **iv. 10pm to 8am = 3 hours of charging = 75 miles**

13                       **1. Short 15 min intervals, 12 per shift by the driver**

14                           **a. 1 bus on this shift**

**b. = 3 hours daily charging at 10pm to 8am (= 75 miles)**

15                   **v. Total Hours of daily Charging = 25 hours per day (= 625 miles)**

16                   **f. RESULTS**

17                       **i. This use case cannot be accomplished --- due to the amount of**  
18                           **time between trips is not possible in order to serve the customer**  
19                           **needs --- we do not have 15 mins; therefore, we experience range**  
20                           **anxiety in shift 2.**

21                       **ii. Electricity Usage Annually = 237,000 Vehicle Fleet Miles**

22                           **1. = 1,000% increase in my usage due to EV transportation**

23                           **2. = \$43,000 removed of 12,000 gallons of diesel fossil fuel to**  
24                           **165,000 kwh per year**

25                   **2. Electric BEV Fleet Cost per Mile with SDGE Rates**

26                       **a. Use Case = 20,000 miles per month with 4 EV Bus Fleet**

27                       **b. 650 miles per day = 450 kWh per day**

28                           **i. 26% current on-peak, changed from 19% peak**

- ii. 31% current off-peak, changed from 23% mid-peak
- iii. 43% current super-off-peak, changed from 58% off-peak

Current Time of USE hours changed Jan 2018 in SDGE territory, number of higher kWh hours increased by 36% overall when compared to previous TOU hours and number of hours in each time period. Thereby not only has kWh rates increased, fleets that cannot schedule charging will also be impacted by rates + TOU hours.

**c. Demand Use = 100 kW of Demand**

i. Max Demand = 100 kW

ii. Non-Coincident Demand = 100 kW

- 1. 17 kW is generated from the business operation which increases the overall cost for TE.

**d. SDGE current Commercial Rates for TE, current comparison**

Rates are averaged annually for both Summer and Winter Seasons

i. TOU AP Current = 27 cents per kWh, 0% Demand

- 1. SEE SDGE temporary waiver per Advise letter 3115E

ii. AL TOU Current = 38 cents per kWh, 71% Demand, per kW = \$37.46 ea.

iii. ML/CI, Year 1= 38 cents per kWh, 68% Demand, per kW = \$35.81 ea.

iv. A-TOU, Current = 21 cents per kWh, 5% Demand, per kW = \$1.48 ea. (100kW, not eligible as max kW is 40 kW on this rate)

**e. Diesel Fuel**

i. Propel Diesel = 19 cents/mile, \$3.80 per gallon, 20 MPG (No Zero emission)

The above illustrations are the out the door kWh pricing that includes all fees and discounts applied to billing. This factor was important to determine the actual price for kWh in order to compare it to fossil fuels. The price per gallon at the retail pump for fossil fuels will already include all taxes, see below table for fuel tax paid for each gallon of fuel.

1 **Taxes: in the price of fossil fuels:**

2 (See: [http://www.trucking.org/News\\_and\\_Information\\_Reports\\_Industry\\_Data.aspx?](http://www.trucking.org/News_and_Information_Reports_Industry_Data.aspx?))

3 \$41.3 billion paid by commercial trucks in federal and state highway-user taxes in 2015.

4 Commercial trucks make up 12.8% of all registered vehicles, and paid \$18.7 billion in federal highway-user taxes and \$22.6 billion in state highway-user taxes, in 2015.

5 24.4¢ in federal fuel tax paid for each gallon of diesel fuel as of January, 2017.

6 18.4¢ in federal fuel tax paid for each gallon of gasoline as of January, 2017.

7 27.4¢ paid on average in state fuel tax for each gallon of diesel fuel as of 2016.

8 23.2¢ paid on average in state fuel tax for each gallon of gasoline as of 2016.

9 **What technology requirements should be considered for TE?**

10 The commercial vehicles should support managed charging for fleets by integrating strategies that  
11 support robust off the grid equipment for fleet transportation stakeholders. Vehicle power level  
12 capacity should incorporate 3-phase in order to keep up with the future technology and power  
13 levels.

14 Microgrids and battery storage planning will support best cost and best fit when introducing a fleet  
15 to TE. Moreover, fleets will not, within the near term, move forward at 100% TE. Integration of  
16 battery storage provides immediate managed charging solutions and avoids installation cost of wires  
17 and transformers and produces a benefit to the fleet and the ratepayers.

18  
19 **What are the Stats on number of vehicles adopted by early TE fleets?**

20 We can refer to the experienced TE fleets and review their adoption process to determine this fact.

21 *Foothill Transit* adoption: out of a 390 vehicle fleet, in 2010 and 2012, they adopted 15 EV buses.

22 (See: [https://en.wikipedia.org/wiki/Foothill\\_Transit](https://en.wikipedia.org/wiki/Foothill_Transit)). This equates to 4% of the total fleet. Foothill

23 Transit will be moving into more procurement for more EV's in the coming year. All other buses in  
24 their fleet are CNG (low NOx fuel buses). *San Joaquin Regional Transit* adopted 2 EV buses in

25 2013. (See: <http://www.recordnet.com/news/20170818/electrifying-moment-for-city-buses>).

1 This equated to less than 1% of their fleet as they have over 500 fleet vehicles. All other vehicles in  
2 fleet are Hybrid Diesel Electric. SDAP points this out as it is important to use caution on the build  
3 out of these programs and SDAP recommends a higher number of smaller sites should be supported  
4 at 2-4 vehicles for small fleets that are under 50 vehicles and up to 5-10 vehicles for larger fleets, as  
5 the commercial sector will not be scalable for a fleet to be 100% electric without risks and huge  
6 costs; moreover, there is not one fleet that has done this to date--- not one MHD fleet has adopted at  
7 100% toward Electric.

8 **How many Sales for MHD have occurred in California and How many in SDGE territory?**

9 Per the HVIP Mapping tools: ZEV's in San Diego County = 11

10 See: <https://www.californiahvip.org/tools-results/#mapping-tool>

1 Per the HVIP Stats on the Eligible EV Technologies, the following MHD vehicles sales and results  
 2 are current as of 8-1-18 and encompass the history since 2009 when the HVIP began. The  
 3 following table below demonstrates a stark fact that the MHD space and the EV technology has  
 4 very few sales. There has been a total of 573 sales since 2009 and 63% or 365 vehicles out of the  
 5 573 are currently from Vehicle Manufacturers that are out of business; thereby the HVIP currently  
 6 has a total of 208 EV sales from the existing OEM's in California. Since 2013 and thru to date the  
 7 HVIP sales have averaged 53 sales per year.

8 The MD vehicles sales make up 122 or 58% of the 208 current HVIP sales and 86  
 9 sales make up the HD.

HVIP Data updated last on 8-1-2018 <https://www.californiahvip.org/eligible-technologies/>

1 **What are the Efficiency in the EV transportation MHD Vehicles?**

2

3

Class 2B-3	Class 4-7	Class 8
<p>4 <b>Class 2B-3</b> 8,501-14,000 lb. GVWR</p> <p>5 </p>	<p>4 <b>Class 4-7</b> 14,001-33,000 lb. GVWR</p> <p>5 </p>	<p>4 <b>Class 8</b> 33,001+ lb. GVWR</p> <p>5 </p>

6

7

8 **Average kWh per mile for each class:**

14 **How can the plans support Widespread ZEV adoption and reduce dependence on Petroleum**

15 **and greenhouse gas emissions? What can be improved to accomplish this reasonably?**

16

17 The plans are designed to reduce pollutions but there should be a target towards

18 diesel fuel vehicles and fleets and not toward fleets that already have a low NOx solution fuel and

19 or fleet technology; as such, the displacement from Low NOx to ZEV is not as beneficial to our air

20 quality as Diesel to ZEV; thereby a metric to prioritize and aggressively target diesels should be

21 required. It is important to understand the historical context of California’s transportation energy

22 consumption and which fuels dominate. California’s historical demand for transportation fuels

23 reflects a significant dependence on gasoline, diesel, and jet fuel, as shown in the table below. The

24 transportation sector in California consumed more than 23.2 billion gasoline gallon equivalents

25 (GGEs) of energy in 2015, of which 21.8 billion (or 94 percent) were fossil fuels. However, since

26 the 2012 economic growth and declining crude oil prices, this has led to an increase in overall fuel

1 consumption in transportation. (See CEC report for following tables:

2 [TN223241\\_20180419T132415\\_Revised\\_Transportation\\_Energy\\_Demand\\_Forecast\\_20182030.pdf](#))

18 Source: California Energy Commission analysis of data from the Petroleum Industry Information Reporting Act, industry sales reports and the California Department of Tax and Fee Administration (<http://www.cdtfa.ca.gov/taxes-and-fees/spfrpts.htm>), adjusted to better estimate total fuel consumption rather than taxable use of fuels. "MTBE" is methyl tertiary butyl ether, an additive that was banned by the California Legislature in 2003. "Ethanol" includes ethanol used as an octane booster to gasoline as well as E85. "Other Fuels" includes aviation gasoline, biodiesel, electricity, hydrogen, natural gas, and propane.

19

20

21 An over-view of the Transportation sector that provides the amount of electricity

22 consumed in California's transportation sector is on the table below. Through 2011, the clear

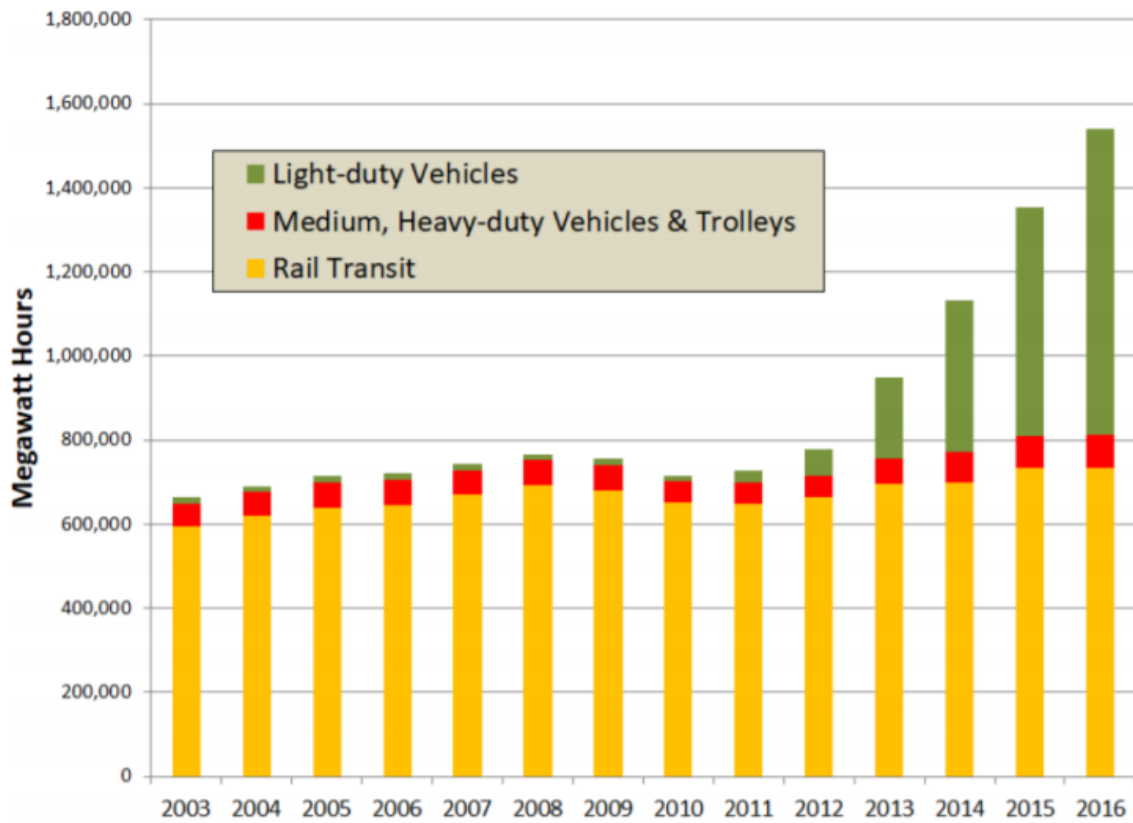

23 majority of electricity had been used for rail transit and trolley buses. However, since 2011,

24 increasing sales of light-duty PEVs have led to a rapid growth in the amount of electricity used in

25 the transportation sector and the MHD sector has not made much progress.

California Transportation Electricity Consumption (2003-2016)

Source: California Energy Commission

Many fleets like Foot hill Transit and San Joaquin Transit are primarily already reducing emissions and pollutants thereby these projects need to also create a target on fuels displacement that result in the best benefit. The current program should target for best benefits. If the vehicle fleets are aged out and the vocation falls under a measure --- there should be a plan to prioritize sites under a measure to adopt ZEV's. This includes Transit buses, Airport Shuttles, Government Fleets and Port Trucks for Last mile delivery.

1                    **Solutions to Manage Charging and that aligns with integrated Resource Action plans.**

2  
3 Power levels should be considered based on the vehicle procurement and daily VMT and the  
4 direction of the industry. Battery power levels are increasing and the MHD commercial vehicles  
5 today are not what the future will be, See CEC vehicle merit review from 8-6-18 by Proterra and  
6 Transpower.

7 [TN224418\\_20180806T163030\\_Proterra\\_Revolutionizing\\_Transit%20\(1\).pdf](#)

8 [TN224417\\_20180806T162552\\_Medium\\_and\\_Heavy\\_Duty\\_EVs\\_TransPower\\_Progress\\_and\\_Pers](#)  
9 [pectives%20\(6\).pdf](#)

10 The equipment and vehicle technology should require a minimum of 3-phase power level and the  
11 make ready to support it. As the future of all EV's and specifically the MHD vehicles that will go  
12 thru the reserve daily --- will not be able to manage charging via TOU and will require 3-phase  
13 power level to keep the vehicle on the road daily and or to have the flexibility to charge in shorter  
14 periods of time --- while enabling the vehicle to stay on the road.

15 See below for Delta Electronics battery storage solution for SDAP use case of 600 EV miles per day  
16 and by incorporating 50 kW of power level, SDAP can manage charging and avoid additional wires  
17 and other upgrades, can avoid 20 kW and maintain an output of 30 kW on the grid when battery  
18 storage is installed.

19 Battery storage solution:

20 **SDAP's fleet energy cost over 10 years with ESS saves \$75,000. 600 miles per day. 6 miles round trip.**  
21 **100 trips per day.**

2.1 Million Miles in 10 years (assuming 1 mile per kWh and is average for Medium Duty EV Bus)

22 **System objective:** Enable 50KW Fast DC charging at 20-30kW distribution transformer with no  
23 grid upgrade, and maintain fleet demand use effectively all-day long. Allow Power Conditioning  
24 Systems (PCS) "system" to operate for 4 hours per day without power from grid. The PCS will be  
25 stored in the Energy Storage System Cabinet (ESS) which eliminates the need for any trenching  
26 installation cost or other prohibitive factors on the premises with regard to location or transformer  
upgrades, the PCS is a Bi-directional Inverter providing DC to AC and backwards and meets all  
standards and certifications that are required.

1  
2 **Theory of operation:** System is configured to provide DCDC fast charge of 4.17 kWh in 5-minute  
3 charge cycles every 10-15 minutes. Accordingly, this design meets the needs of a use case for 600  
4 miles per day with driving patterns that will require day time short incremental charging as the daily  
5 fleet vehicle miles traveled will go beyond the range of the vehicle plus the fleet has limited  
6 availability to night time charge. This will provide up to 6 times per hour, or 108 times in the  
7 busiest 18-hour period. It is expected that full charge/discharge cycles will occur between 18 hours  
8 of 6:00am and 12:00 midnight. The vehicles can be topped off at night at less frequent intervals  
9 whenever most cost-effective to avoid additional loads on the grid when multiple buses are charging  
10 at the same time.

11 System will draw a maximum of 20-30kW from the grid at any time, and the battery will buffer  
12 energy to provide additional power between charges to support the 50kW EV charge requirement.  
13 This system will supply enough energy to maintain the fleet demand while supporting its daily  
14 vehicles miles traveled (VMT) including simultaneous night charging. The system is sized as  
15 shown below to sustain discharging capacity for 4 hours daily on battery power alone in order for  
16 the utility or the fleet to curtail power during peak demand, or if the grid is having a circuit or  
17 system event and thereby the grid is overloaded or the grid or charging is not available; nonetheless  
18 the PCS will act as an emergency hub for the Transportation Electrification Fleet.

### 12 Lifetime of Cycles

- 13 1. 105 kwh x 4,000 = 420,000 kwh
- 14 2. 4,000 cycles
- 15 3. 4% cycles at 4 kWh x 100 times per day = up to 400 daily cycles
- 16 4. Depending on how many "Full" cycles of 100 kWh are used daily will determine the amount  
17 in years for the full lifetime.

### 17 Budget

- 18 1. \$150,000 installed

### 18 Warranty

- 19 1. System: 10 years.
- 20 2. Battery Guaranteed for 400,000 kWh: 8 % onetime fee or \$4,000

### 21 System advantages

- 22 1. Enables 50kW DC fast charging on 20 or 30kW distribution transformer
- 23 2. Eliminates transformer upgrades
- 24 3. Small battery can maintain capacity needed for 600-daily VMT fleet with charging capacity  
25 speeds at 50 kW
- 26 4. Eliminates demand spikes to grid
- 27 5. Grid power can be curtailed at any time for 4 hours
- 28 6. Manages Charging based on 'Demand of Use'
7. Fleet can stay on the road beyond the short range of the vehicle

- 1 8. Energy can be supplied modularly in 100kWh and 500kWh increments
- 2 9. Single PCS can support 2 simultaneous 50KW charges
- 3 10. Power can be increased in 125kWh increments
- 4 11. PV Solar can be added to eliminate daytime power draw from grid
- 5 12. Skidded solution can be provided to ease installation and relocation
- 6 13. System can be configured to support multiple chargers discharges simultaneously
- 7 14. Can enable more DCDC fast chargers and Level 2 chargers if needed.
- 8 15. System can be reconfigured if assumptions change, or system needs to be optimized for larger fleet consumption.

8 **Considerations not included:**

9 Property demand kW use is not included, and Taxes are not included under the analysis  
10 No increases in rates.

11 **Further reduction in cost:**

12 Time Shifting could be accomplished at peak time hours and thereby do not charge anything at peak time hours.

13 **Proposed system configuration**

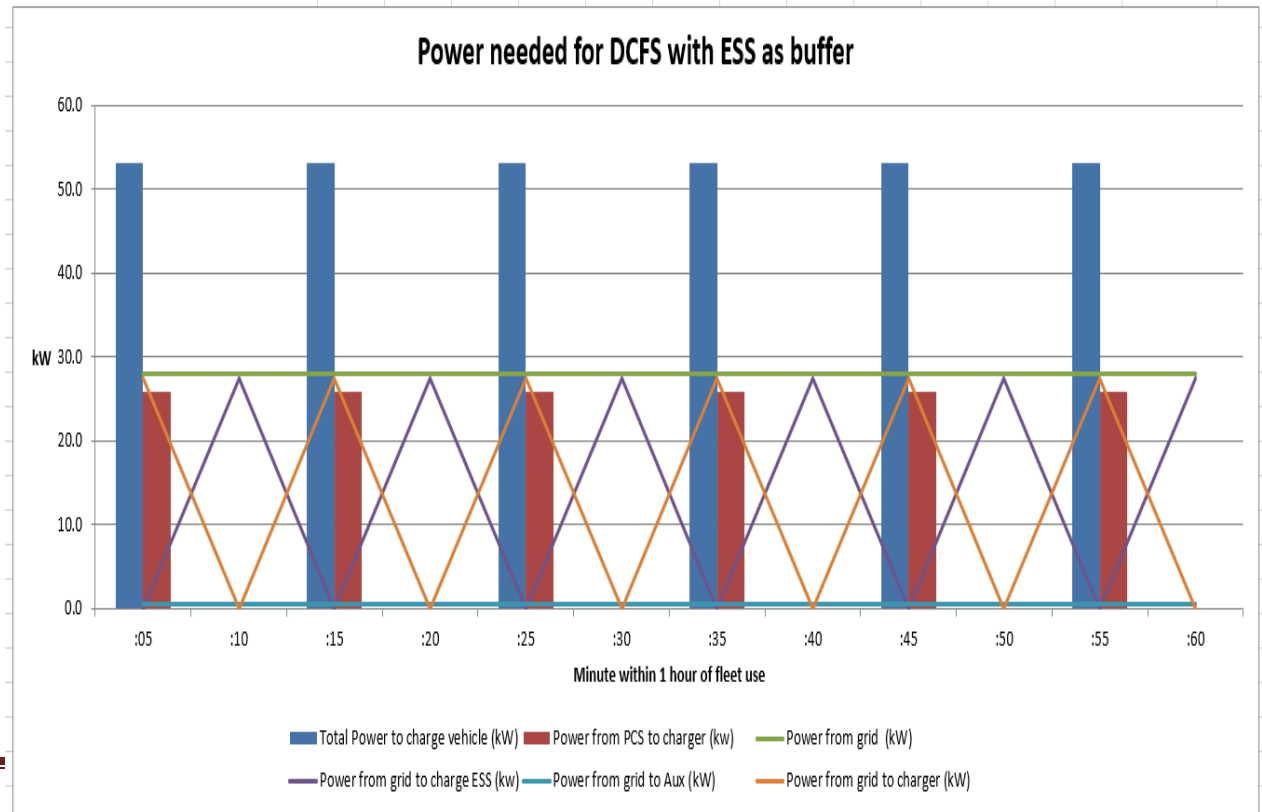

- 1 125kW PCS
- 1 100kWh ESS cabinet
- 1 50kW DCDC fast charger

24 System is modular and can be expanded to add power, energy, and the quantity of charging stations.

25 System can be provided on skid.

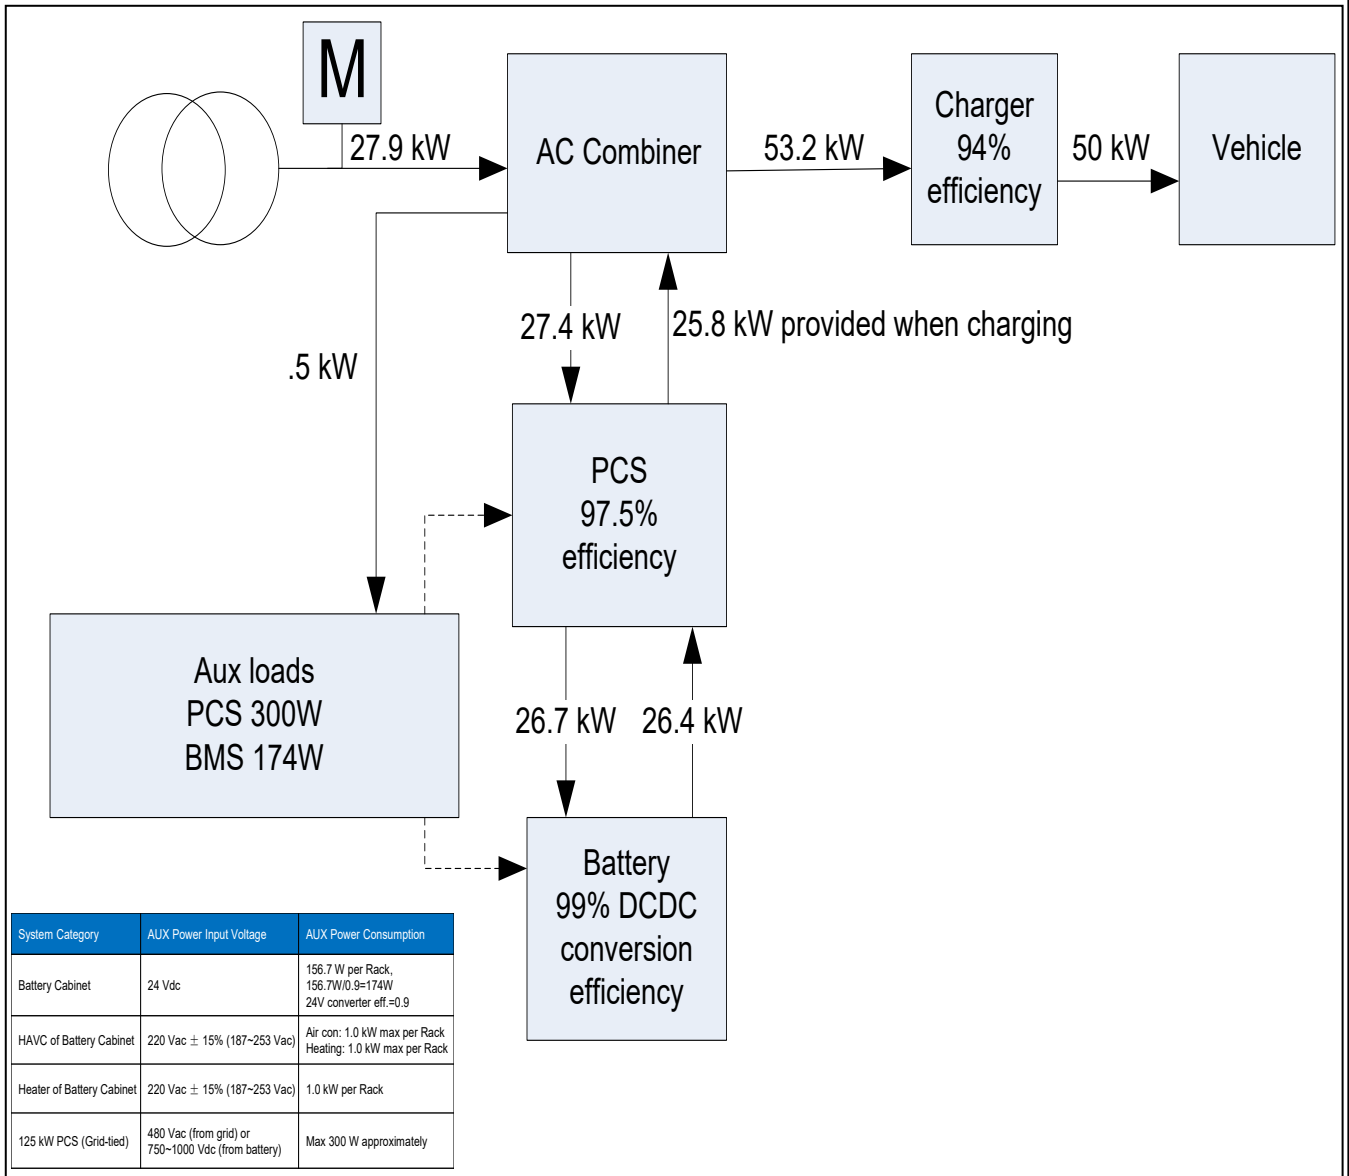

**Proposed ESS management**

**Vehicle Demonstration with Scalability and Barriers to overcome:**

The light MD Class 2b and Class 3 vehicles have had no programs and this class has had limited inventory selection that is limited with a power level that does meet the needs of the commercial sector until the most recent addition of the Lightning Systems product with DCFC. LS was added to the inventory recently. Additionally, another challenge for this class has been the pricing, the EV vehicles in this class are more expensive today than in 2015 and the HVIP plus ups have gone away ---which also has negatively impacted this class. The vehicles have design barriers to overcome due to the battery weight and sizes; moreover, these vehicles are 5 feet shorter and 2 feet narrower and highly efficient as diesel. However, also in TE they achieve .50 kWh per mile. Keeping in line with efficiency standards and reducing VMT, the fact is that a highly efficient EV vehicle reduces emissions. This vehicle deserves a demonstration for manufacturers to over-come the barriers they face with integrating the battery packs on this size of a vehicle. This is a very scalable project and it deserves the opportunity that it has not been provided to date. The mere fact that you only have “2” vehicles in a Class 3 and “0” in the Class 2b for EV inventory, further supports this case.

**Target:** *(CEC Report 8-6-18: Docket Number: 15-MISC-04, Project Title: Fuels and Transportation Merit Review, TN Number: 224418)*

A full incremental rebate should be available for the light MD vehicles and especially for fleets that fall under the regulatory measure to adopt ZEV’s; thereby, this should also include Airport Shuttle buses. MD vehicles and HD vehicles should be targeted fairly as the MD sector is the most popular and some of these LD MD vehicles could be registered under LDV when under 10,000 GVW.

Source: California Energy Commission Analysis of DMV data

1                   **Rates Design and Demand Charges**

2                   The programs should require an opportunity to achieve off grid charging rates.

3 Fleets require rates and one territory as large as SDGE, which is the most Southern California IOU  
4 location and when their rates are over 100% more than LADWP, for example, this will influence  
5 the decisions that fleets will make; plus, fleet corridors will cross over into other territories.

6                   **Funding for EVSE and Ownership.**

7                   HVIP program already include \$30k per EVSE per vehicle. See HVIP  
8 implementation manual.

9                   EVSE ownership should not be allowed by Utility for commercial use.

10                  Higher power levels > not every EV vehicle procured requires an EVSE when the  
11 power level of DCFC charging is available from the vehicle.

12                   **Stranded Assets.**

13                  Moving slower is recommended, we have no standards in this sector.

14                   **Small business and Small Fleets**

15  
16 In the US small businesses are often recognized as the “incubator for innovation”. In San Diego,  
17 small business is essential to the region’s economy and workforce because of the significant  
18 impact in all industries. Firms with fewer than 50 employees make up 95 percent of all  
19 establishments and account for nearly one-half of the workforce in San Diego.

20 See the illustration below for the percentage of total business by sector and size of business.

### Percentage of Total Businesses by Sector and Size of Business

95% of the commercial businesses industry is made up by small business and employ over 655,000 employees today.

In 2015, small businesses (including owner-operated firms) employed approximately 568,000 workers. By 2016, total employment in small businesses is expected to grow by 15 percent, or 87,800 positions.

### Estimated Employment Projections for Small Businesses in San Diego into 2016

Business Size	Current employment	Employment in 12 months	Change	% Change
1-4 Employees	105,800	139,100	33,300	31%
5-9 Employees	83,500	96,700	13,200	16%
10-19 Employees	123,300	138,100	14,800	12%
20-75 Employees	255,300	281,800	26,500	10%
<b>Total</b>	<b>567,900</b>	<b>655,700</b>	<b>87,800</b>	<b>15%</b>

1 There are current challenges that small businesses are facing in San Diego due to the number of  
2 regulatory requirements or changes, legislative mandates, new rules, zoning requirements, labor  
3 laws, environmental regulations, and high tax. Considerations need to be established for Small  
4 Business' to be prioritized the same as the DAC and Low Income communities for the main reason  
5 that in the current Pilot Programs most of the pilot sites are being installed only in large  
6 commercial business or municipalities that are the most likely to be able to afford the investment to  
7 install EV infrastructure and purchase vehicles and are the most capable of tackling the application  
8 process and agreements that is required by programs. Small business' will be harmed by  
9 environmental regulations if there continues to be disproportionately funded pilots that favor large  
10 commercial business over small business, plus small businesses are less financially capable of  
11 having the cash resources, time, and ability to be gain the education to learn about the technology  
12 and environmental regulations. Therefore, any efforts intended to accelerate ZEV adoption must  
13 not negate the small commercial businesses that make up, for example in San Diego, 95% of the  
14 businesses. The pilot programs to date are imposing agreements or lengthy applications that  
15 require further examination by this commission as this creates additional hardships on the small  
16 private sector that cannot compete with large commercial entities or municipalities that are  
17 privileged to have many other sources and options for funding that is not available to small  
18 business or private business. The following guidelines will promote fairness in transportation:

- 22 • Ensure that the level and quality of ZEV transportation service is provided without regard to  
23 race, color, or national origin;
- 24 • Promote the full and fair participation of all affected small transportation business's in the  
25 decision making;
- 26 • Prevent the denial, reduction, or delay in benefits related to programs and activities that  
27 could benefit small business, minority or low-income populations;

- Ensure meaningful access to programs and activities by the small business sector and private sector

**How can the IOU's address the Demand rates?**

The State and Agencies should order a Transportation Commercial Rate be developed for each transportation customer class that requires EV charging. Rates need to complement each fleet application as there are small fleets, medium fleets and large fleets. See below cost affects as per size of fleet and the difference of 2 cents on the cost per mile. Most importantly depending on the daily fleet miles traveled and the power flow this will also have a big effect on cost per mile, but we do not know enough about the effects. Rates will affect choice. We look forward to seeing a proposal for choices on EV fleet rates and a program that targets the barriers for light MD vehicles.

**Cost per Mile effect on Fleets when it is MORE.**

**f. Small Commercial Fleet at 240k miles per year**

- g. 0.2 cents more per mile = \$4,800 more per year**
- h. 0.3 cents more per mile = \$7,200 more per year**
- i. 0.4 cents more per mile = \$9,600 more/year**

**j. Medium Size Commercial Fleet at 5 Million miles per year: 100 buses**

- k. 01 cents more per mile = \$50k more per year.**
- l. 0.2 cents more per mile = \$100k more per year**
- m. 0.4 cents more per mile = \$200k more per year**

**n. Large Size Commercial Fleet at 14 Million miles per year: 150+ buses**

**Transit Operation = \$5M per year in fuel and 14M miles annually**

- o. 01 cents more per mile = \$140k more per year.**
- p. 0.2 cents more per mile = \$280k more per year**
- q. 0.4 cents more per mile = \$560k more per year**

BATTERY PACK IMAGE, BYD

Contracting documents show BYD is now conceding shorter ranges. Its most recent bid for a Metro contract still boasted extended ranges but included charging stations along bus routes to top off battery packs.

Workers install batteries on top of a bus destined for UC Irvine. BYD's business began with production of cellphone batteries. (Mel Melcon / Los Angeles Times)
