18-MISC-03 and REAP Draft Guidelines

Solar or wind projects should be sized to what the future of the project will use and not the prior years. It is easy to use ET and pump efficiency reports to determine what the project will be using when in full production. It seems that new orchards/vineyards are excluded do to the low usage in the first few years; however that is not looking at the bigger long term picture.

I feel that it is important to consider allowing one to install solar on a new shade structure or shop as in many cases those are the only logical places. Some existing structures however need to be reinforced structurally.
