moving off natural gas

Climate change poses an existential threat to humanity. All possible steps must be taken to prevent the worst climate scenario from materializing.

Homes and buildings are one of the largest sources of climate pollution in California. The fracked gas that powers our water heaters, furnaces, clothes dryers and stoves only harms the climate, and poses major air quality risks to our families and communities.

Let's waste no time in establishing the exclusive use of climate-friendly energy sources in California as soon as possible.
