2018 Integrated Energy Policy Report Update Volume II

I think the above titled report fails to objectively evaluate the obstacles to achieving the desired outcome. I suggest investigating water pipes that generate electricity (<http://lucidenergy.com/how-it-works/>) as an alternative energy option. Have you researched ocean wave generated electricity as a renewable energy source? It has been reported that over 1000 terawatt-hours/yr of electricity can be generated (<https://www.boem.gov/Ocean-Wave-Energy/>). "2018 Integrated Energy Policy Report Update Volume II" mentions new technology and technological developments more than a few times. Please investigate.

I wish the report addressed the carbon sequestration of sustainable/regenerative agriculture and the amount of methane produced by livestock, particularly dairy cattle to a greater extent. I urge you to champion building/remodeling buildings that achieve net zero emissions so that all buildings achieve net zero emissions by 2050 in spite of all else that I've written here.

Thank you for reading my comments.
