Keep Nuclear in CA!

It's critical to keep a balanced source of electricity in California. It's the lack of green house gas production provided by the nuclear process that should be recognized and promoted. Use every method available to produce electricity that doesn't involve combustion. And especially consider that if we in California make choices that gives power generation to another state that then increases its production of green house gas, we shouldn't feel good about our conversion to non-nuclear. It really is a one world goal we should be seeking.
