Clean Power Generation in CA

If you are truly interested in combatting climate change, California cannot afford to lose its largest, most reliable source of clean green energy. Closing Diablo Canyon will only result in a rise in emissions just like we saw after SONG was shut down. You cannot replace constant baseload power with intermittent renewables. The energy demands of the state are only going to rise as we strive to electrify our transportation sector. If California as a state is truly concerned about climate change it will advocate to keep Diablo Canyon open, anything less is empty rhetoric. There are only 8 developed economies in the world with low greenhouse gas emissions and they accomplish this from hydroelectric, nuclear, or a combination of the two. We know how and what needs to happen to combat climate change and closing Diablo Canyon 40 years early is not the answer.
