Renewable Energy Solutions

Hello there,

As an Architect, I want to introduce here some new conceptual design Ideas about how to generate a Sustainable Green Power Energy from Renewable Energy Resources.

The idea is about to Recycle and Capture as much Clean Power from Natural Power Resources, like Sun and Wind, and other daily Human activities, like Highways, Open Farms and other human activities like Gym centers and HVAC Systems that already existed everywhere.

I think that all these above-mentioned power resources had not been used correctly yet, to produce a full capacity of power.

Take for example the HVAC System of any home, I can be a good source of clean Power in the Day and Night hours. It is all about how to Recycle this massive amount of Energy, and then how to Store it to be under control for any demand of power resource, like Recharging an Electrical Vehicle in the Evening Hours.

The question here is how those ideas could be seriously taken to the next steps, since all the Solicitations Terms and Conditions are blocking any individual, like my self, to be a part of this important potential Solicitations?

In other meaning, Do I have to have tons of money to be able to pay for all Subcontractors and Researchers, that I will surely need to develop any serious idea and turn it to the Reality?

I hope that the Gap between Ideas and Fund will be covered in the near future.

I do suggest that the California Energy Commission should Reorient some of its Money for Individuals and Researchers that are seriously interested in the Topics of Solicitations and Research Exchange Ideas, to help reach to the best every interested mind.

Best,
Ahmed Hashem
