CPUC Must Enable Rebates For Replacing Gas Appliances With Electric

Additional submitted attachment is included below.

This old gas space heater was in the guest house.

1948 gas floor furnace in living room

On April 2, 2019 we had the fossil fuel gas heat removed from our 1948 built house and guest house. Since we have a PV solar system that produces more energy than we use, and because of the existing Climate Emergency, we replaced our dirty fuel heat with a ductless electric heat pump heating and air-conditioning system. It cost us \$14,500 out of our savings but rising annual temperatures now requires air conditioning here at the beach. We deserved to get the same \$4,500 rebate for replacing existing gas furnaces with electric heat pump space heaters that SMUD customers get.

Gas floor furnace now removed

The guest house no longer uses gas heat

This is one of 4 wall units powered by our 36k condenser. Each is super energy efficient.

This wall unit in the living room replaces a dangerous gas floor furnace like so many homes have

We want to get rid of all the gas appliances at our house - the gas hot water heaters, the gas stove and the gas clothes dryer, but we don't have the money to do so.

Yet the CO2 levels in the atmosphere and current global temperatures demand that we decarbonize immediately.

We are tired of hearing the lies and propaganda from the for-profit fossil fuel gas industry who still calls their product "clean air technology" and tells us they intend to keep burning their polluting, climate-wrecking product for decades to come.

Give us the rebates we need to Turn Off The Gas. Our kid's future depends on it.
