1.0 Introduction

This Mariposa Energy Project (MEP) Annual Compliance Report (ACR) #07 is being submitted to the California Energy Commission (CEC) as required in "Compliance-7" of the CEC Final Decision (MEP 09-AFC-3C). The ACR covers the ongoing operational, safety, environmental and compliance activities occurring on a routine basis. As approved by the CEC Compliance Project Manager (CPM), all ACR's shall be delivered by email exclusively.

2.0 Current Project Status – 2019

MEP is currently operated as a "peaking" facility operating under a Power Purchase Agreement (PPA) with Pacific Gas & Electric (PG&E). MEP is primarily marketed to offset bulk electric system (BES) instability to the electrical grid by providing 10-minute start-up capability by each of its four (4) GE LM6000 Gas Turbine units and has a station nominal 200 mw output rating. MEP has operated without major safety or environmental incidents in the 2019 calendar year, (January 01-December 31). Furthermore, MEP has operated without any major safety or environmental incidents since the Commercial Operation Date (COD) of October 01, 2012.

3.0 Specific Condition Activities - 2016

This section includes a description of the documents by specific CEC Conditions to be submitted as part of the ACR. (Note: CEC Conditions which have been verified by the CPM and submitted in prior ACR's are not in current or future ACR's.)

Exhibit 1, Summary of Major Equipment Failures during report period: There were no major equipment failures in the 2019 calendar year. A Letter of Attestation (LOA) has been added to the exhibit.

Exhibit 2, Exclusionary Fencing Report, BIO-10: 2019 quarterly inspection records have been added to the exhibit.

Exhibit 3 Hazardous Materials List, HAZ-1: 2019 Hazardous Materials List from the Alameda County of Environmental Health (ACDEH) California Environmental Reporting Systems (CERS) has been added to the exhibit.

Exhibit 4, Cattle Trough Inspections, LAND-2: 2019 quarterly inspection records have been added to the exhibit.

Exhibit 5, Annual Water Usage, S & W-4d: A copy of the MEP CEC-1304 (3-A Pg1) "Recordable Monthly and Annual Station Water Usage (gals) has been added to the exhibit.

Exhibit 6, Right-of-Way, TLSN-3: Since Commercial Operation Date (COD) of October 01, 2012, MEP has provided evidence that "no fire prevention activities" have occurred at MEP. A Letter of Attestation (LOA) has been added to the exhibit.

"During the first 5 years of plant operation, MEP shall provide a summary of inspection results and "if applicable" any fire prevention activities carried out along the right-of-way in the exhibit."

Exhibit 7, Surface Treatment Report, VIS-1: MEP has no new status to report regarding surface treatment maintenance. The condition of the surfaces on all MEP structures and buildings for 2019 was in "good" condition. There was no scheduled major surface treatment activities in 2019. A Letter of Attestation (LOA) has been added to the exhibit.

Exhibit 8, Waste Management Plan, WASTE-6: MEP maintains records of all Hazardous Waste Manifests and monitors waste output totals. Copies of the 2019 Hazardous Waste Manifests have been added to the exhibit.

Exhibit 9, WEAP Training Sign-In Sheets: Copies of the 2019 Worker Environmental Awareness Program (WEAP) records have been added to the exhibit.

Exhibit 10, Monthly Safety Inspection Sheets: Copies of the 2019 Monthly Plant Safety Inspections have been added to the exhibit.

Exhibit 11, Regulatory On-Site Inspections: Copies of 2019 Regulatory On-Site Inspections have been added to the exhibit.

Exhibit 12, Major Permits approved or submitted during ACR period: The Mariposa Risk Management Plan (RMP) and Spill Prevention, Control and Countermeasure Plan (SPCC) were update, submitted and approved in 2019. A Letter of Attestation (LOA) has been added to the exhibit.

4.0 Post-Certification Changes Approved - 2019

No post-certification changes were approved during calendar year 2019.

5.0 Submittal Deadlines Missed - 2019

No permit required submittal condition deadlines were missed during calendar year 2019.

6.0 Listing of Permits, Filings Submitted - 2019

The Risk Management Plan (RMP) and Spill Prevention, Control and Countermeasure Plan (SPCC) were update, submitted and approved in 2019.

7.0 Projected Compliance Activities - 2019

- RATA/Source Test/Biennial Source Test February/March 2019
- PTO Renewals Sources 1-4 and Source 6

8.0 Additions to Onsite Compliance File - 2019

All documentation regarding MEP regulatory, operational, safety, environmental and NERC/WECC including complaints, violations, warnings and citations are warehoused and maintained at the site. All exhibits to the ACRs are added to the onsite compliance files.

9.0 Contingency Plan – Unplanned Facility Closure - 2019

Mariposa Energy has no updates to Conditions 12 and 13 of the May, 2011 Mariposa Energy Project (MEP) FINAL "Commission Decision" (09-AFC-3).

10.0 Complaints, Violations, Warnings, Citations - 2019

No complaints, violations, warnings, or citations were noted for Mariposa during the 2019 year.

Exhibit 1 Summary of Major Equip Failures during report period

January 10, 2020

Mariposa Energy, LLC (09-AFC-3C) did not have any major equipment breakdowns during the 2019 calendar year (January 01 - December 31).

Wayne Forsyth

Wayne Forsyth Program Manager – EHS & Regulatory Mariposa Energy, LLC 633 West Fifth Street, Suite 2700 Los Angeles, CA 90071 (213) 473-0093 w.forsyth@dgc-us.com

Comments:

Transmitter Model #:

**All deviations are between 'Expected mA Output' and 'Actual mA Output' (as measured with DMM in series).

Sitrans MAG6000 HART

This flowmeter communicates to the PLC via HART protocol, and therefore is not scaled from 4-20mA. Measurements were only able to be obtained from the local OIT. The scaling at the OIT matched the scaling at the transmitter.

Matt Boyer

### Alameda County Dept. Environmental Health (ACDEH) Triennial Power Plant Inspection Mariposa Energy Facility April 16, 2019

### Agenda

- 10:15 am ACDEH arrived and signed in (2 persons)
- 10:20 am Arrival and Inspection Participants
  - ACDEH-Sukla De, Corinne Lowe
  - MEP-Wayne Forsyth, Kevin Kringle, Dan Colombo

### 10:30 am Visit "Purpose and Scope"

- Triennial ACDEH visit
- Review SPCC, HMBP, RMP, HAZWOPER, DOT
  - o Training
  - o Inspections
  - o Tests
  - o SDS
  - Manifests
- 10:40 am Prep for site inspection and required PPE

#### 10:45 am Site Inspection

- Inspected power plant; security perimeter fencing; water treatment, chemical storage, hazardous waste/universal waste streams, waste water discharge streams, product storage, detention basin, storm water management system and fire system.
- 12:45 pm Lunch break

1:25 pm Reviewed Programs and documents:

- Employee Training; DOT, SPCC, HMBP, RMP, HAZWOPER
- Hazardous/Non-Hazardous/Universal Waste Manifests
- SPCC, HMBP, RMP Inspections/Testing (Weekly, Monthly, Quarterly, etc)
- Weekly Hazardous Waste Inspections
- Spill response plan
- Emergency Action Plan
- CERS HMBP Map

- 3:10 pm Findings -
  - No "Immediate" actions required
  - Actions to be taken –

Ö

- Provide copy of 8-14-17 Generator Manifest form
  - Explain 4-10-16 Soil/Jet Oil Manifest
    - Before Stipulation Letter (Reporting)
- Submit RMP 5-Year Review (Yorke)
  - With updated OCA and revision history log
- Update HMBP/SPCC/RMP
  - Director
  - Plant Manager
- o Submit Chemical Inventory Letter to Landowner
  - ACDEH to provide rule/template
- Procure Sodium Bi-Carbonate (PDC Batteries)
  - Add to CERS Inventory/Map
- Replace NH3 offloading "Tank Fill" label
- Maintain Sodium Hypochlorite at 110 gals. (remove empties)
- Add to CERS Map
  - Emergency Fire Pp fuel loading area
  - Compressed Gas Cylinder storage/usage areas
  - Increase CERS Mega-Floc to 250 gals (tote)
  - Add hydrogen cylinders to Flammable gas storage
  - Add DOT Placards to New Product Oil Storage(s)
  - Add spill prevention cable to Universal Waste Shelving
  - Keep Universal Waste containers closed (fluorescent tubes)
  - Maintain SPCC, RMP, HMBP Revision History Logs
  - Add (2) "Mini Air Respirators" at NH3 offloading site
    - ACDEH to send CalOSHA exemption rule (wait)
    - Add to CERS Map
- 3:15 pm Comments and Observations
  - ACDEH says, "We will maintain Program Level 1 as long as topography of "receptors" stays current." – Poly Balls not considered "passive mitigation." (as per Sukla De)
  - RMP has drop-box for uploads <u>DEHCalARP@acgov.org</u>
     RMP/SPCC/HMBP data requests by ACDEH
  - ACDEH says, "If you exceed Small Quantity Generator (SQG) for 1 month, you "default to a Large Quantity Generator (LQG) for remainder of year." Confirm with Yorke (Mike Dudasko)
- 3:15 pm ACDEH signed out and exited site

# Oil Spill Prevention, Control, and Countermeasure Plan Certification

#### Management Responsibility

In accordance with Title 40 of the Code of Federal Regulations (CFR), Part 112 (40 CFR 112), the responsibility for oil spill, prevention, control, and countermeasures at the Mariposa Energy Project in unincorporated Alameda County, California, has been assigned to the Plant Manager.

The management of Diamond Generating Corporation and Mariposa Energy, LLC is committed to providing the staff, equipment, facilities, and materials required to establish precautionary measures and to expeditiously control and remove any harmful quantity of oil discharged from the Mariposa Energy Project.

"I certify that I have reviewed and approve this Oil Spill Prevention, Control, and Countermeasure (SPCC) Plan."

#### 1.0 Introduction

This Oil Spill Prevention, Control and Countermeasure (SPCC) Plan has been developed to address the storage and management of oil and oil products at Mariposa Energy, LLC (MEP or facility), owned by Mariposa Energy, LLC (Mariposa Energy) and operated by DGC Operations, LLC, (DGC Ops) in unincorporated Alameda County, California. The facility street address is 4887 Bruns Road, Byron, CA, 94514. MEP is a natural gas-fired, simple cycle peaking facility with a generating capacity of 200 megawatts (MW). A site map is provided as Figure 1 and a facility diagram as Figure 2.

The SPCC Plan is designed to fulfill the requirements of; Code of Federal Regulations (CFR) Title 40, Part 112, U.S. Environmental Protection Agency (EPA) Oil Pollution Prevention Regulations and the California Aboveground Petroleum Storage Act (California Health and Safety Code, Division 20, Section 25270). The SPCC Plan describes the practices, procedures, structures, and equipment used at the facility to prevent spills and to mitigate or preclude adverse impacts to the environment.

A complete, signed copy of the SPCC Plan is maintained on file at MEP and is available to responsible individuals. The SPCC Plan will be reviewed every 5 years or within 6 months of any change in the facility design, construction, operation, or maintenance that affects the potential for an oil discharge.

#### 2.0 General Applicability - Section 112.1

The United States Environmental Protection Agency (EPA), in response to the "Regulations on Oil Pollution Prevention" included in the Federal Water Pollution Control Act (FWPCA), has established rules for the prevention of water pollution by oil discharged from "non-transportation related onshore and offshore facilities." These regulations were originally promulgated on December 11, 1973, and are set forth in Title 40, CFR, Part 112 (40 CFR 112). The current regulations originally became effective on July 17, 2002; however, SPCC implementation requirements were subsequently extended to November 10, 2011. The current regulations are applicable to MEP according to the criteria set forth in paragraphs 112.1(b) and 112.1(d) (2).

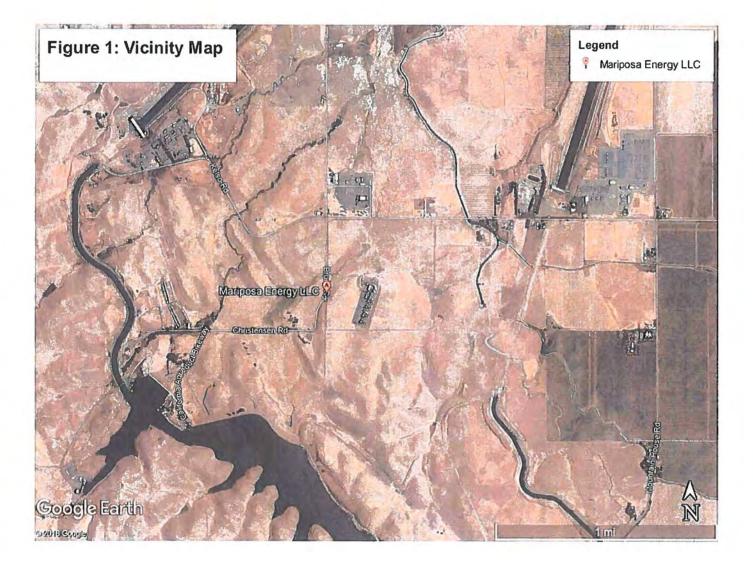

2.1 Prevent Discharge of Oil - 112.1(a)

The SPCC Plan was prepared in accordance with the procedures, methods, equipment, and other requirements established in this part to prevent the discharge of oil and oil products from the facility into navigable waters of the United States.

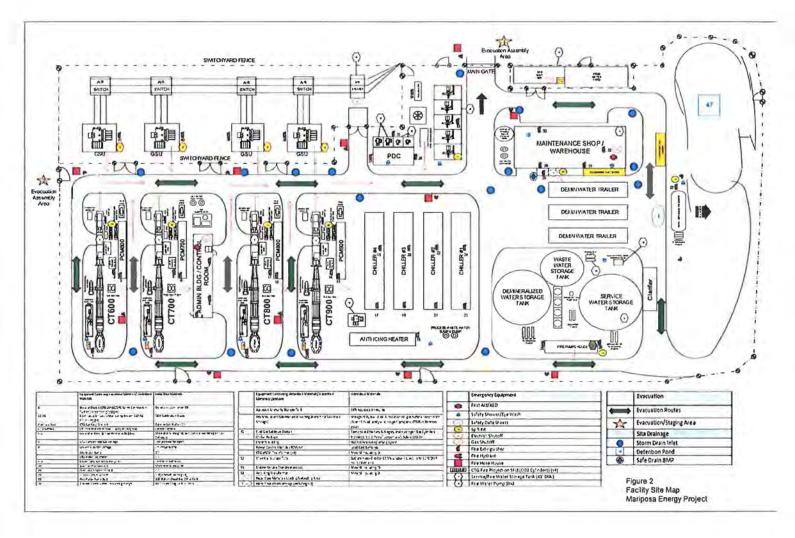

2.2 Plan Applicability - 112.1(b)

Owners or operators of non-transportation-related onshore or offshore facilities engaged in drilling, producing, gathering, storing, processing, refining, transferring, distributing, and using or consuming oil and oil products, at which

			rtation-related onshore facility that stores, uses, and products in excess of 1,320 gallons and, therefore, is required lan.	
	2.3	Government Facilities	<u>s-112.1(c)</u>	
		The facility is not a go	overnment owned or operated facility.	
	2.4	Plan Exemption - 112	2.1(d)	
		products stored in abo storage capacity of oil	otal capacity of approximately 41,069 gallons of oil and oil veground containers. Because the appropriate aboveground and oil products stored at MEP exceeds 1,320 gallons, the from the regulation and an SPCC Plan is required.	
	2.5	Plan Requirements -	<u>112.1(e)</u>	
		MEP understands the and implementation o	following requirements are established for the preparation f an SPCC Plan:	
		standards, pol	an will comply with existing laws, regulations, rules, icies, and procedures pertaining to safety standards, fire ad pollution prevention rules.	
			an will form a comprehensive federal and state compliant on program that minimizes the potential for discharges.	
			an will address relevant spill, prevention, control, and res necessary at the facility.	
	2.6	Exempted Facilities -	<u>112.1(f)</u>	
		MEP is not exempt fro	om SPCC Plan requirements.	
3.0	Defi	nitions - Section 112.2		
	The	following definitions are	applicable to this SPCC Plan.	
			container involving cutting, burning, welding, or heating e physical dimensions or configuration of the container.	
	<ul> <li>Bulk Storage Container – Any container (55-gallon or greater) used to store oil. These containers are used for purposes including, but not limited to, the storage of oil prior to use, while being used, or prior to further distribution in commerce. Oil-filled electrical operating, or manufacturing equipment is not a bulk storage container.</li> </ul>

Owner or Operator – Any person owning or operating an onshore or offshore facility. In the case of an abandoned offshore facility, the person who owned, operated, or maintained the facility immediately prior to such abandonment.

Person - An individual, firm, corporation, association, or partnership.

- Petroleum Oil Petroleum in any form, including but not limited to crude oil, fuel oil, mineral oil, sludge, oil, refuse, and refined products.
- Regional Administrator The Regional Administrator of the EPA, in and for the Region in which the subject facility is located.

Repair – Any work necessary to maintain or restore a container to a condition suitable for safe operation, other than that necessary for ordinary, day-to-day maintenance to maintain the functional integrity of the container and that does not weaken the container.

Storage Capacity - The shell capacity of the container.

Technical Amendments – A change in the facility design, construction, operation or maintenance that materially affects its potential for a discharge.

#### 4.0 Requirement to Prepare and Implement a SPCC Plan - Section 112.3

The requirements to prepare and implement an SPCC Plan are outlined in paragraphs (a) through (f) of 40 CFR 112.3.

4.1 Operational Before August 16, 2002 - 112.3(a)

MEP was not in operation prior to August 16, 2002; therefore, this section of the regulation is not applicable.

4.2 Operational After November 10, 2011 - 112.3(b)

MEP began operations in mid-2012. This SPCC Plan was prepared and implemented prior to commencement of operations.

4.3 Mobile Facilities - 112.3(c)

MEP is not an onshore or offshore mobile facility; therefore, this section of the regulation is not applicable.

4.4 Certification - 112.3(d)

This paragraph of the regulations states that the SPCC Plan and subsequent amendments or revisions must be reviewed and certified by a Registered Professional Engineer. The certification for this SPCC Plan is provided on the certification page of this document.

General MEP facility information is provided below:

Business Name:	Mariposa Energy, LLC
Facility Name:	Mariposa Energy Project
Facility Street Address:	4887 Bruns Road, Byron, CA 94514
Facility Mailing Address:	4887 Bruns Road, Byron, CA 94514
24-Hour Facility Phone Number:	(209) 833-3878
Nearest Surface Water Body:	Jurisdictional Drainage D-1
Approximate Distance:	Runs across northeastern portion of the 158-acre parcel
Owner Name:	Mariposa Energy, LLC
Owner Address:	633 W. Fifty Street, #2700, Los Angeles, CA 90071

This SPCC Plan is organized in accordance with the sequence presented in 40 CFR 112.7 and meets the applicable requirements specified in the regulations.

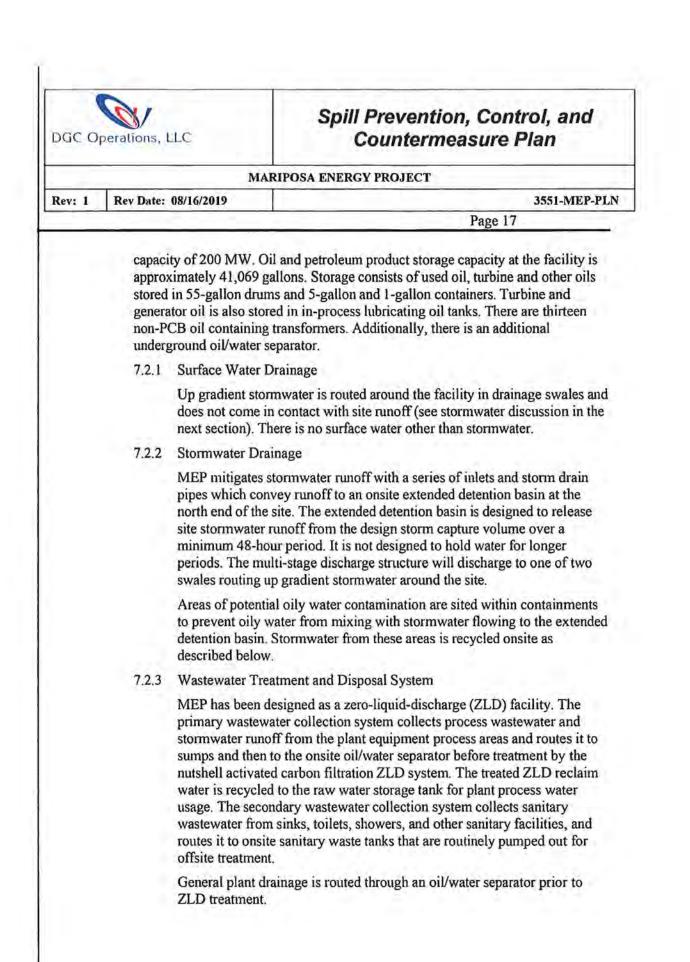

7.1 Plan Deviations - 112.7(a)(2)

The SPCC Plan may deviate from the requirements in paragraphs (g), (h)(2) and (3), and (i) of this section and the requirements in subparts B and C of this part, except the secondary containment requirements in paragraphs (c) and (h)(1) of this section, and  $\S112.8(c)(2)$ , 112.8(c)(11), 112.9(c)(2), 112.9(d)(3), 112.10(c), 112.12(c)(2), and 112.12(c)(11), where applicable to a specific facility, if equivalent environmental protection by some other means of spill prevention, control, or countermeasure is provided.

7.2 Facility Description - 112.7(a)(3)

MEP is located on a 10-acre portion of a 158-acre parcel in northeastern Alameda County, approximately 7 miles northwest of Tracy, 7 miles east of Livermore, and 6 miles south of Byron. MEP is approximately 0.5 miles north of Bethany Reservoir (part of the California Aqueduct system) and approximately 0.5 miles west of the Delta-Mendota Canal. A site map is provided as Figure 1 and a facility diagram showing onsite structures is provided as Figure 2.

MEP is a natural-gas-fired, simple-cycle electrical generating facility consisting of four (4) General Electric LM6000 turbines rated at a nominal aggregate generating

MARIPOSA ENERGY PROJECT         Rev 1       Rev Date: 08/16/2019       3551-MEP-PI         Page 18         7.3       Oil and Oil Product Storage - 112.7(a)(3)(i)         The oil and oil products at MEP include transformer insulating oil, diesel fuel, hydraulic oil, lubricating oil, and waste oil. Table 7-1 lists the inventory of oil containers that are subject to SPCC regulations and that were stored at MEP on June 20, 2019 the date MEP was inspected. Mineral Insulating Oil	Anti-icing Transformer	1	863	>863 gallons Integrated into pad design	Concrete berm, leak detection device

*These quantities are based on plant records. The exact number and contents of mobile containers (i.e. drums) may fluctuate but contents, overall quantity, and storage would be similar.

AST - aboveground storage tank

DOT - Department of Transportation

The locations of the oil containers listed in Tables 7-1 are shown in Figure 2. The facility drainage is directed to the north towards the oil water separator that acts as an additional spill protection device.

#### 7.4 Discharge Prevention Measures - 112.7(a)(3)(ii)

The facility has developed procedures and training for employees who use oilbased materials to prevent discharge of oil and oil products. Preventative equipment and secondary containment are discussed in Sections 8.0 and 9.0 of this SPCC Plan. MEP personnel will receive spill response refresher training annually, as described in Section 11.0.

Tank truck loading and unloading procedures meet the minimum requirements of the U.S. Department of Transportation.

The delivery and loading of petroleum products is monitored by the truck driver and an MEP employee, who are required to be present during these activities. Absorbent materials, including absorbent pigs and spill containment equipment,

MARIPOSA ENERGY PROJECT

3551-MEP-PLN

Page 29

## 9.0 <u>Containment and Diversion Structures and Oil Spill Contingency Plan and</u> <u>Manpower - 112.7(c)-112.7(d)</u>

The following preventive systems are used at the site to prevent a discharge of oil and oil products from reaching navigable waters.

9.1 Onshore Facilities - 112.7(c)(1)

Table 7-1 presents the secondary containment features and preventative controls for the ASTs, drums, equipment, transformers, and generators located within MEP. Additionally, mobile spill kits are located throughout the facility to be utilized in the event of a spill.

The oil drums are stored in covered bins to minimize the exposure to rainwater. The oil-filled transformer locations have secondary containment and these areas are uncovered. Some secondary containment basins are equipped with drain valves which are normally in a closed position to contain rainwater and any potential releases of oil or oil products.

No drainage from secondary containment areas is released offsite. Before rain water is removed from a secondary containment, a visual inspection for signs of oil releases, (film, sheen, or discoloration) is conducted. Once visual inspection ensures a significant release has not occurred, rain water from the secondary containments is routed to an oil/water separator prior to being recycled for process use in the ZLD system. If an oil film, sheen, or discoloration is present, but observations confirm a material release has not occurred from the oil-filled equipment, the accumulated rainwater can be released to the oil/water separator and ZLD system to be recycled. However, if a major oil contamination is released into a secondary containment system is observed, the contaminated rain water and/or released oil will not be released to the oil/water separator system. The material would either be pumped into drums or temporary tanks for proper offsite disposal or managed by a spill response contractor.

A secondary containment drainage report form to document all visual inspections prior to drainage releases is included in Attachment 4.

The combustion turbine/generator (package) lube oil reservoirs have separate secondary containment storage areas within each unit. The package oil-filled equipment process drains go directly to the oil/water separator drainage system. These process drains are routed to either (1) oil/water sumps, which are pumped to the oil/water separator, or (2) directly to the oil/water separator. The oil/water separator has an oil-collection volume of 500 gallons. Any potential release from the package would be contained within the package secondary containment or the oil/water separator, and would not drain offsite.

		this Plan to identify problems before a spill occurs. The fied designee will perform the inspections at MEP.
	Tanks found to be leaking	ng or to have been exposed to fire or other physical

fire or other physical damage shall be taken out of service and properly repaired or inspected prior to returning to service. Qualified tank inspectors certified by the Steel Tank Institute (STI) or the American Petroleum Institute (API) should perform and certify tank inspections.

3551-MEP-PLN

#### 10.2 **Routine Inspections**

Drums, containers, aboveground in-process tanks, pumps, and connected aboveground piping shall be visually inspected for the following items on a weekly basis (also, see Attachment 5 of this Plan), as follows:

- All aboveground in-process tank connections checked for leakage and 1. appropriate capping;
- 2. All aboveground piping, valves, and fittings checked for leakage, damage to supports and pipe; and
- 3. All pumps checked for evidence of leakage and damage.

#### 10.3 **Periodic Inspections**

In addition to routine inspections, other periodic inspections are included in other written plans or procedures and be conducted. All aboveground in-process tanks and storage areas containing oil or hazardous substances shall be periodically examined visually for condition and the need for maintenance. Such examination will include aboveground foundation and tank structural supports. The outside of the tanks will be inspected for signs of deterioration, leaks from seams and gaskets, and accumulation of oil or hazardous substances inside secondary containment structures.

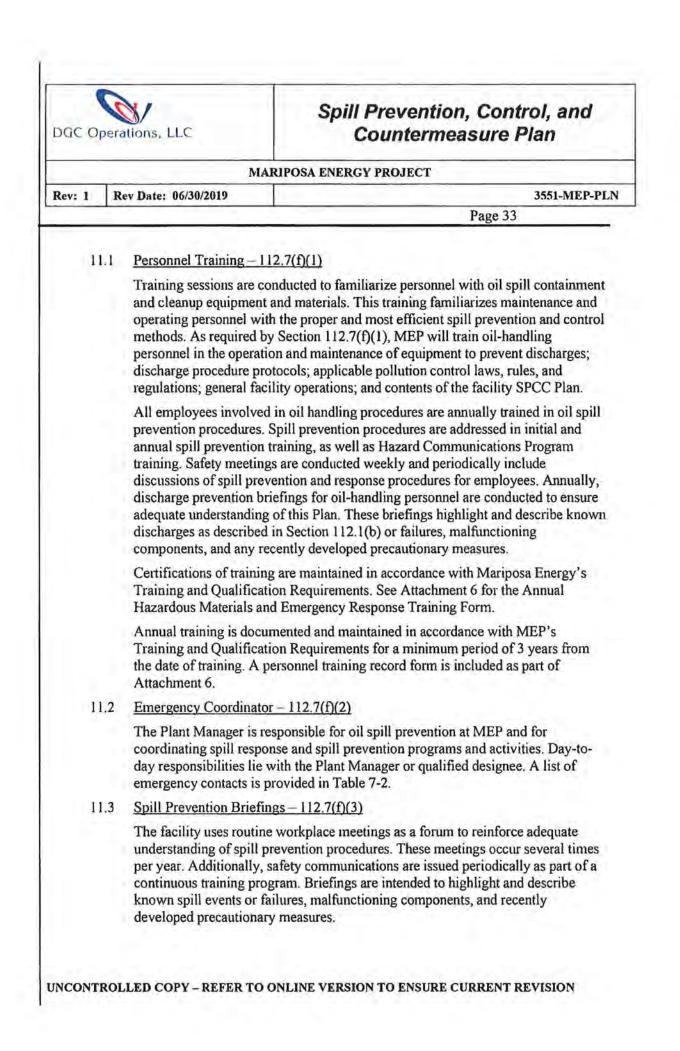

All aboveground in-process tanks will be subjected to integrity testing every 10 years, using such techniques as tightness testing or a system of nondestructive shell thickness testing.

All aboveground valves and piping shall be examined on a scheduled periodic basis for general condition of items such as supports, flange joints, expansion joints, valve glands and pipe attachments, and drip pans. Periodic pressure or other nondestructive integrity testing may be warranted for piping where facility drainage is such that a failure might lead to a spill event.

# Spill Prevention, Control, and Countermeasure Plan

#### MARIPOSA ENERGY PROJECT

3551-MEP-PLN

Page 34

#### 12.0 Security - 112.7(g)

Unauthorized access to MEP is prevented by a permanent 8-foot high chain-link fence with barbed wire surrounding the site. The facility has one primary entrance at the northwest side of the plant, through which employees gain access using access key cards. Visitors are required to call the Control Room to gain entry. MEP is manned 24 hours per day, 365 days a year. Sufficient lighting is provided throughout the facility to allow for safe nighttime operation and spill detection.

ASTs with master flow valves, allowing direct outward flow of the contents of a tank, are maintained in the closed position when not in operation. During operation, plant personnel keep sight of the flow drains and valves. There are no existing pipelines onsite that are not in service or closed permanently. However, if piping were taken out of service or permanently closed, the piping would be blank-flanged and marked as such.

#### 13.0 Tank Alterations - 112.7(i)

MEP does not have any field constructed aboveground containers, thus this section does not apply.

#### 14.0 State and Local Spill Prevention Rules - 112.7(i)

This SPCC Plan is intended to provide appropriate guidance for response to spills of oil and oil products. However, it may not address all compliance issues for spills covered by regulations mandated by laws other than the Clean Water Act (e.g., Resource Conservation and Recovery Act [RCRA]; Comprehensive Environmental Response, Compensation and Liability Act [CERCLA]; or state requirements). These guidelines should be followed to the extent applicable and practical. The MEP Emergency Response Plan does cover spills and spill responses under RCRA and CERCLA, plus all applicable state laws.

14.1 Qualified Oil-Filled Operational Equipment - 112.7(k)

> MEP has qualified oil-filled equipment that meets the requirements of Section 112.7(k)(3). The oil-filled operation equipment is listed in Table 7-1.

14.2 Reportable Discharge History - 112.7(k)(1)

> MEP has had no discharges from oil-filled operational equipment that meet the requirements under Section 112.7(k)(1).

14.3 Alternative Requirements to Secondary Containment - 112.7(k)(2)

All oil-filled operational equipment that is subject to this SPCC Plan has secondary containment for the most credible release. Mariposa Energy is not requesting any alternative requirements to secondary containment for these pieces of equipment.

SPCC Subpar	Plan R t B of 4 e faciliti	MARIPOSA ENERGY PROJECT 06/30/2019 Page 35 equirements for Onshore Facilities – 112.8 0 CFR 112 provides additional requirements for owners and operators of ies. 40 CFR 112.8(a) through 112.8(d) are addressed below.

Subpart	t B of 4 e faciliti	0 CFR 112 provides additional requirements for owners and operators of
		tes. 40 CFR 112.8(a) through 112.8(d) are addressed below.
5.1	Genera	일부가 하는 것 같아요. 것은 것 같아? 엄마, 말 다 만들는 것은 아니는 것이 같아.
	This CI	al SPCC Plan Requirements - 112.8(a)
22 -	by the	PCC Plan meets the requirements of 40 CFR 112.7, which is supplemented discharge prevention and containment procedures of this section.
5.2	100000	<u>y Drainage – 112.8(b)</u>
	Stormy corner	contains no natural ponds, streams, or significant drainage channels. water at the MEP flows into the detention basin located at the northeast of the property. Surface drainage from process and chemical storage areas introlled by the ZLD system.
	15.2.1	Valves and Pumps on Diked Areas - 112.8(b)(1-2)
		The diked areas have drain valves associated with them. When rain water must be removed from a diked area, the water is visually inspected for film, sheen, or discoloration due to the presence of oil. Accumulated rain water is drained to the ZLD system once visual inspection ensures compliance with applicable water quality standards and that a harmful discharge defined in 40 CFR Part 110 will not be caused. If a film, sheen, or discoloration is present, the accumulated rain water is tested for oil and fuel and only clean runoff is released to the storm drain.
	15.2.2	Plant Drainage from Undiked Areas – 112.8(b)(3)
		Plant drainage from undiked process areas flows into the ZLD system. General site stormwater runoff flows into the detention basin at the northeast corner of the property.
	15.2.3	Drainage Diversion System - 112.8(b)(4)
		MEP has adequate drainage structures from areas where petroleum products are stored outside to prevent stormwater discharges contaminated with petroleum products from migrating off the property. Therefore, this section is not applicable.
	15.2.4	Facility Drainage Systems - 112.8(b)(5)
		Drainage waters collected from secondary containment systems with an oily sheen are tested for oil and fuel before any runoff is released. If test results are positive for oil and fuel, the drainage water is collected and disposed of in accordance with federal, state, and local requirements.

I

# Spill Prevention, Control, and Countermeasure Plan

MARIPOSA ENERGY PROJECT Rev: 1 Rev Date: 06/30/2019 3551-MEP-PLN Page 37 Smaller containers (e.g., 55-gallon drums, totes) used by MEP are expected to have minimal risk of internal corrosion and failure. These containers are inspected at least monthly and stored so all sides are visible (i.e., the container has no contact with the ground). If the container starts to degrade (e.g., begins to rust, or oxidize if a poly drum), the contents of the container will be transferred to a new drum that is constructed of a material that is compatible with the stored material. These controls are expected to provide environmental protection equivalent to integrity testing. All tanks are visually inspected on a regular basis to assess tank integrity. Inspections are performed as described in Section 9.0. 15.3.7 Internal Heating Coils - 112.8(c)(7) Internal heating coils are not associated with the ASTs at MEP. 15.3.8 Fail-Safe Engineering - 112.7(c)(8) The possibility of a significant discharge is reduced by the following. equipment/ procedures: Manual control (and physical presence by trained plant employees) over all movements of oil products Regular inspections of tanks, respective liquid levels, and auxiliary equipment All tanks located within close view of the daily operations conducted at MEP Secondary containment of storage containers of oil and oil products Compatible tank gauges for the respective contents of the tanks 15.3.9 Effluents into Navigable Waters - 112.8(c)(9) MEP produces no effluents for discharge to navigable waters or tributaries thereof. 15.3.10 Correction of Tank Discharges - 112.8(c)(10) If it is determined the integrity of the tanks or auxiliary equipment has been compromised, the system will immediately be taken out of service, the problem evaluated, and appropriate steps taken to correct all deficiencies. Any oil accumulation in diked areas will be removed and properly disposed. 15.3.11 Mobile/Portable Oil Tank - 112.8(c)(11) There are no mobile/portable tanks containing oil products at MEP.

Attachment 3 Certification of Substantial Harm Determination Form

# **Certification of Substantial Harm Determination Form**

 Facility Name:
 Mariposa Energy Project

 Facility Address:
 4887 Bruns Road, Byron CA

Substantial Harm Criteria	Yes	No
Does the facility transfer oil over water to or from vessels and does the facility have a total oil storage capacity greater than or equal to 42,000 gallons?		x
Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and does the facility lack secondary containment that is sufficiently large to contain the capacity of the largest aboveground oil storage tank plus sufficient freeboard to allow for precipitation within any aboveground storage tank area?		x
Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and is the facility located at a distance (as calculated using the appropriate formula in 40 CFR part 112 Appendix C, Attachment C-III or a comparable formula) such that a discharge from the facility could cause injury to fish and wildlife and sensitive environments?		х
Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and is the facility located at a distance (as calculated using the appropriate formula in 40 CFR part 112 Appendix C, Attachment C-III or a comparable formula) such that a discharge from the facility would shut down a public drinking water intake?		x
Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and has the facility experienced a reportable oil spill in an amount greater than or equal to 10,000 gallons within the last 5 years?		x

#### CERTIFICATION:

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals responsible for obtaining this information. I believe that the submitted information is true, accurate, and complete.

Attachment 6 Annual Hazardous Materials and Emergency Response Training Form

### Annual Hazardous Materials & Emergency Response Training

Date & Time Held	Location	Training Conducted by:
		Title:

Training will cover chemical hazards, emergency response, Hazwoper, spill response, and storm water pollution prevention. Additional training is provided and separately documented on Hazard Communication, Fire Fighting and Fire Prevention, Bloodborne Pathogens, Chemical Hygiene, Tagout/Lockout, Respiratory Protection, and Confined Space Entry.

From the Safety and Environmental Procedures "21XX-MEP-Personal Safety Health Wellness", "24XX-MEP-Emergency-Fire-High Risk", "33XX-MEP-Waste", "33XX-MEP-Hazmat, EPCRA, 35XX-MEP-Oil, Pollution Prevention", training will include the following Site-Specific training:

- [ ] 1. "Hazardous Materials Emergency Response"
- [ ] 2. "Safety, Isolation, and Notification"
- [ ] 3. "Hazardous Waste Identification and Management Requirements"
- [ ] 4. "Hazardous Materials Recognition and Hazard Assessment"
- [ ] 5. "Exposure Control and Respiratory Equipment"
- [ ] 6. "Environmental Protection Programs (SPCC and SWPPP)"

#### Annual Emergency Response Drill Scenario:

California Accidental Release Prevention (CalARP) Program – Registration Information

Date of Submittal: 5/31/2019

## Registration

According to the California Code of Regulations (CCR), Title 19, Chapter 4.5, Article 2, Section 2740.1, if an RMP is required under Section 2735.4(a)(2), the owner or operator shall complete the required registration information below [CCR, Section 2740.1 (d)(1) – (20)] and submit it with the RMP.

Stationary Source Name:	Mariposa Energy, LLC.
Facility Address:	4887 Bruns Rd,
	Byron, CA 94514
Mailing Address:	Same
Dun and Bradstreet Number:	039727181
Primary NAICS Number	221112
Name of Owner/Operator:	Mariposa Energy, LLC
Latitude:	37.790561 N
Longitude:	-121.600978 W
Method of Obtaining Latitude and Longitude:	Google Earth
Description of Location that Latitude and Longitude Represents:	Ammonia Tank
Name and Title of the person or position with the overall responsibility of RMP elements and implementation:	Plant Manager
Name of Emergency Contact:	Kevin Kringle
Title of Emergency Contact:	Plant Manager
Telephone Number of Emergency Contact	(209) 830-1401 x 305
24-Hour Phone	(925) 337-3859
List of Covered Process:	Aqueous Ammonia Storage Process
Name of Regulated Substance (CAS Number):	Aqueous Ammonia—19% (1336-21-6)
Maximum Quantity of regulated substance (lbs):	65,779
Program Level	1
Number of Full Time Employees:	10
Is the stationary Source Subject to Section 5189 of Title 8 of CCR?	No
Is the stationary Source subject to part 355 of Title 40 of the Code of Federal Regulations?	No
Does the Stationary Source have a CAA Title V operating permit (Permit Number)	Yes (B9730)
Date of last safety inspection of the stationary source by a federal, state or local government agency and the identity of the inspecting entity?	4/16/2019; Alameda County Department of Environmental Health (the CUPA)

### **Executive Summary**

## ES.1 Introduction

The Mariposa Energy (Mariposa) is owned by Mariposa Energy, LLC (Mariposa Energy) and operated by Diamond Generating Corporation (DGC) Operations, LLC, in an unincorporated area in northeastern Alameda County. Mariposa stores and uses aqueous ammonia (19-percent aqueous ammonia solution) in a selective catalytic reduction (SCR) system to control nitrogen oxides (NOx) emissions from natural gas combustion. Using and storing aqueous ammonia can be a hazard if it is not handled properly. Mariposa personnel take their safety obligations very seriously and ensure that operators involved in the use of aqueous ammonia are trained and knowledgeable of the chemical hazards associated with their jobs. The following document describes what could happen if there were to be an accident, some of the steps taken to ensure a safely operating power plant, and how chemical emergencies are handled. This document complies with the California Accidental Release Prevention (CalARP) Program under Title 19 of the California Code of Regulations (CCR), Division 2, Chapter 4.

#### ES.2 Accidental Release Prevention and Emergency Response Policies

The Mariposa accidental release prevention policy involves a unified approach that integrates proven technology, staff training in operation and maintenance practices, and tested management system practices. Applicable procedures of the State of California are adhered to, including key elements such as training, systems management, and emergency response procedures.

Mariposa recognizes the responsibility to make the environment, community, and employee safety a primary part of daily operations. Mariposa is committed to being a responsible member of the community by giving top priority to operating in a safe and environmentally sound manner. Mariposa is also committed to working closely with community members, environmental groups, and local governmental agencies to meet its obligations to the community and to the environment.

It is the policy of Mariposa that every employee is entitled to a safe and healthful place in which to work and live. Mariposa incorporates the concepts of environmental responsibility and productivity with safety. resulting in efficiency and productivity. As part of Mariposa's obligation to protect the integrity of human, environmental, physical, and financial resources, and to conserve and efficiently utilize those resources, Mariposa strives to:

- Comply fully with laws regulating environmental protection and employee health and safety
- Furnish work places free of recognized hazards likely to cause injury to employees, the public. or the environment
- Train employees in safe and environmentally conscious practices and require compliance with environmental, health, and safety regulations, policies, and procedures

MARIPOSA ENERGY	
PROCEDURES FORM	
PROCEDURE SMP-16	Page 3

 Provide a professional staff to maintain and support environmental, health, and safety programs

#### ES.3 General Facility and Regulated Substances Information

Mariposa is a natural gas-fired, simple-cycle peaking facility with a generating capacity of 200 megawatts (MW). Primary equipment for the generating facility includes four General Electric LM6000 PC-Sprint combustion turbine generators and associated equipment. Power is transmitted to the grid at 230 kilovolts (kV) through a new 0.7-mile transmission line connecting to the existing Pacific Gas and Electric (PG&E) Kelso substation. A new 580-foot natural gas pipeline connects Mariposa to PG&E's Line 002, which is an existing high-pressure natural gas pipeline northeast of the Mariposa site.

A 19% aqueous ammonia solution (ammonium hydroxide) is used as the reduction reagent in Mariposa's proposed SCR system for controlling the turbines' NOx emissions. Aqueous ammonia is vaporized and injected into the flue gas stream from the turbines and then passed through a catalyst bed. In the presence of the catalyst, the ammonia and NOx react to form nitrogen and water vapor, thereby reducing NOx emissions. Aqueous ammonia is a regulated toxic substance under the CalARP regulations. This Program Level 1 Risk Management Plan (RMP) addresses the 19-percent aqueous ammonia solution stored and used at Mariposa. A Material Safety Data Sheet is included as Attachment 6.

### ES.4 Offsite Consequence Analysis Results

Mariposa had an offsite consequence analysis for aqueous ammonia conducted using the SLAB model. SLAB is a computer-based dispersion model, developed by the Lawrence Livermore Laboratory, which simulates the atmospheric dispersion of denser-than-air and neutrally buoyant releases. Prior to modeling with SLAB, an ammonia evaporation release rate was calculated pursuant to the guidance given in *RMP Offsite Consequence Analysis Guidance, U.S. Environmental Protection Agency (EPA), April 1999*, and using the emission calculation tool for evaporating solutions provided in the Areal Locations of Hazardous Atmospheres (ALOHA) model provided by the EPA. Passive mitigation of 90% was included based on placement of high-density polyethylene (poly) balls in the containment basin to reduce the surface area exposed to evaporation. The resulting worst-case release scenario for aqueous ammonia does not extend offsite.

Using the ACDEH requested ALOHA model, it was determined that the Mariposaworstcase release without passive mitigation exceeded the distance to the nearest and only public receptor in range (the PG&E Byron Bethany Gas Pump Station). However alternate scenarios assuming at least 80% passive mitigation through reduction in exposed surface area from the poly balls resulted in a distance to toxic endpoint less than the distance to the PG&E Byron Bethany Gas Pump Station. Provided two layers of poly balls are installed and maintained, ACDEH has agreed to a Program Level 1 Status for Mariposa(see Attachment 8).

#### ES.5 Summary of the Five-Year Accident History

Mariposa Energy completed construction of the Mariposa in mid-2012. There have been no accidents involving aqueous ammonia that have resulted in deaths, injuries, or

PROC		RES FORM RE SMP-16	Page 4

# ES.8 Planned Changes to Improve Safety

Mariposa maintains a high level of commitment towards safety preparedness training of its employees and the continuous improvement of facility safety processes. Mariposa ensures that all employees receive the appropriate level of training at the time of hire and receive annual refresher training. System components essential to the covered process are scheduled for inspection, maintenance and/or replacement that meets or exceeds the manufacturers' recommendation. The inspection/maintenance and replacement frequency is scheduled through MAXIMO; a Computerized Maintenance Management System (CMMS). For the covered process. MAXIMO tracks the preventive maintenance of the ammonia system. Specifically the ammonia sensors are on a preventive maintenance schedule to be calibrated every calendar quarter and to be replaced per the manufacturer's specifications. Any new bulletins or recommendations issued by the manufacturer will continue to be reviewed and implemented in a timely manner and applicable maintenance support (if any) will be added into the MAXIMO CMMS.

MARIPOSA ENERGY
PROCEDURES FORM
PROCEDURE SMP-16

# 1.0 Introduction

Mariposa Energy (Mariposa) is a nominal 200-megawatt (MW), simple-cycle generating facility consisting of four natural-gas-fired turbines located in northeastern Alameda County. Mariposa uses 19 percent aqueous ammonia (ammonium hydroxide) as the reduction reagent in the selective catalytic reduction (SCR) system to control emissions of nitrogen oxides (NOx) from the combustion turbine generators. The maximum quantity of aqueous ammonia stored at a given time is 8,500 gallons or approximately 12,500 pounds of ammonia in solution. Aqueous ammonia is a regulated substance under various programs, as discussed below. As required by California Energy Commission (CEC) Condition of Certification HAZ-2, Mariposa Energy, LLC (Mariposa Energy) prepared and submitted a Risk Management Plan (RMP) to address the potential accidental release of ammonia from the facility. The purpose of this document is to comply with this requirement and the California Accidental Release Prevention (CalARP) Program regulations.

This section includes: (1) a facility description, (2) a discussion of the general regulatory background, (3) additional details of the applicability of the CalARP Program regulations. and (4) the general Program Level 1 facility requirements. The details of the CalARP Program Level 1 major elements (offsite consequence analysis, 5-year accident history, emergency response program, and certification) are provided in Sections 2, 3, 4, and 5, respectively.

# 1.1 Facility Description

Mariposais owned by Mariposa Energy, operated by DGC Operations, LLC, and located in unincorporated northeastern Alameda County. The site is approximately 7 miles northwest of Tracy. California: 7 miles east of Livermore, California; 6 miles south of Byron, California; and 2.5 miles west of the community of Mountain House in San Joaquin County. Mariposa is southeast of the intersection of Bruns Road and Kelso Road. Figure 1-1 provides a site vicinity map for Mariposa.

Mariposa is a natural gas-fired, simple-cycle peaking facility with a generating capacity of 200 MW. Primary equipment for the generating facility includes four General Electric LM6000 PC-Sprint combustion turbine generators and associated equipment. Power is transmitted to the grid at 230 kilovolts (kV) through a new 0.7-mile transmission line connecting to the existing Pacific Gas and Electric (PG&E) Kelso substation. A new 580-foot natural gas pipeline connects Mariposa to PG&E's Line 002, which is an existing high-pressure natural gas pipeline located northeast of the Mariposa site. Service and process water is treated raw irrigation water provided via a new connection to the Byron-Bethany Irrigation District (BBID) via a new pump station and 1.8-mile pipeline. The Mariposa site layout is shown in Figure 1-2.

A 19% aqueous ammonia solution (ammonium hydroxide) is used as the reduction reagent in Mariposa's SCR system for controlling the turbines' NOx emissions. Aqueous ammonia is vaporized and injected into the flue gas stream from the turbines and then passed through a catalyst bed. In the presence of the

catalyst, the ammonia and NOx react to form nitrogen and water vapor, thereby reducing NOx emissions.

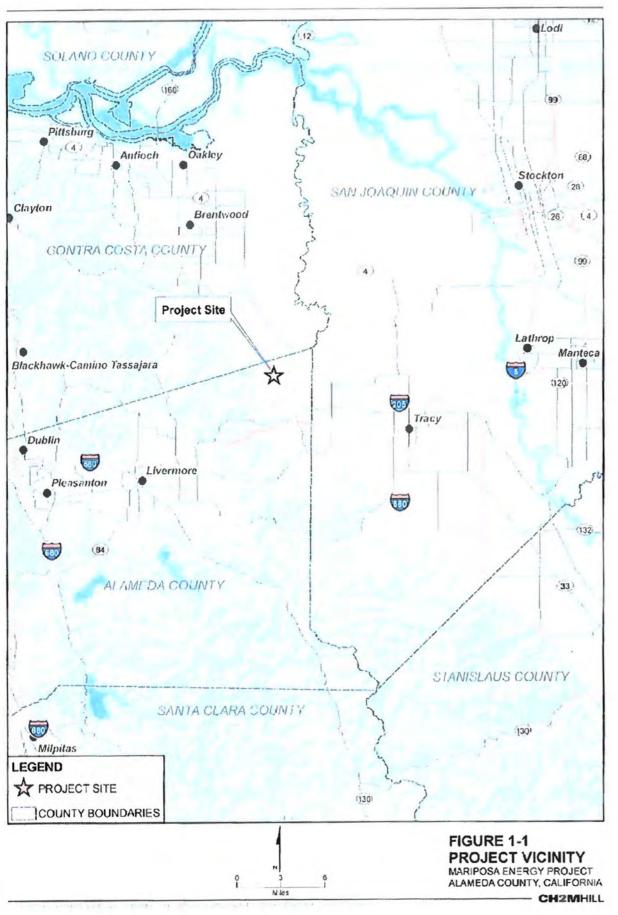

Mariposa has created and maintained an "Ammonia Offloading Procedure" (6480- Mariposa-PRO) and corresponding "Ammonia Truck Unload Checklist" (6480.01- Mariposa -TOL) as required by the California Energy Commission (CEC) "Commission Decision" (Docket 09-AFC-3-May, 2011) HAZ-3 Condition.

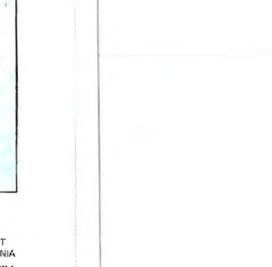

**HAZ-3** The project owner shall develop and implement a Safety Management Plan for delivery of aqueous ammonia and other liquid hazardous materials by tanker truck. The plan shall include procedures, protective equipment requirements, training, and a checklist. It shall also include a section describing all measures to be implemented to prevent mixing of incompatible hazardous materials including provisions to maintain lockout control by a power plant employee not involved in the delivery or transfer operation. It must also address handling and use of natural gas. This plan shall be applicable during construction, commissioning, and operation of the power plant.

Verification: At least 30 days prior to the delivery of any liquid hazardous material to the facility. the project owner shall provide a Safety Management Plan as described above to the CPM for review and approval.

PROCEDURE SMP-16

Page 9

Figure 1-2 Facility Layout

Page 10

Mariposa stores 19-percent aqueous ammonia solution in a single 10,000-gallon above-ground storage tank, filled to a maximum of 8,500 gallons. The tank is surrounded by a 60-foot-long by 20-foot-wide by 3.5-foot-deep secondary containment basin capable of holding the full contents of the tank plus rainwater. Because of the evaporative nature of ammonia, the secondary containment basin is covered with polymer balls reducing exposed liquid surfaces by greater than 90 percent. The secondary containment basin is approximately 20 meters from the eastern and northern property boundaries, 67 meters from the western property boundary, and 244 meters from the southern property boundary.

# 1.2 Regulatory Background

Section 112(r) of the amended Clean Air Act (CAA), signed into law on November 15, 1990. mandated a new federal focus on the prevention of chemical accidents. The main objective of this section is to prevent serious chemical accidents that have the potential to affect public health and the environment. In response to Section 112(r) requirements, the U.S. Environmental Protection Agency (EPA) established a list of regulated substances and thresholds and issued the final Risk Management Program regulations. The final regulations were issued on June 20, 1996 (61 Federal Register [FR] 31668). They address "Risk Management Programs for Chemical Accidental Release Prevention" and are listed in Title 40 of the Code of Federal Regulations (CFR), Part 68. A facility that has more than the threshold quantity of the regulated substance in a process is required to implement a Risk Management Program and submit a summary of the program to the EPA prior to bringing the regulated substance onsite. Aqueous ammonia is a regulated substance under Risk Management Program regulations: the threshold quantity is 20,000 pounds for concentrations 20 percent or greater.

While Section 112(r) was intended to protect human health and the environment outside facilities (i.e., offsite), it also directed attention to worker safety. Section 304 of the 1990 CAA amendments directed the federal Occupational Safety and Health Administration (OSHA) to promulgate regulations requiring chemical Process Safety Management (PSM) in the workplace. This standard is designed to protect employees from accidental releases. PSM requirements became effective nationwide on May 26, 1992, and apply to all manned facilities handling one or more of 128 chemicals listed, or flammable liquids and gases, when stored in amounts exceeding the threshold quantities. Although the PSM standard and Risk Management Program contain many similar requirements, the PSM standard focuses on worker safety and onsite impacts and the Risk Management Program addresses offsite impacts of chemical releases.

The federal OSHA PSM standard was adopted by the California Occupational Safety and Health Administration (Cal-OSHA) under Title 8 of the California Code of Regulations (CCR). Section 5189, in 1992. Aqueous ammonia at concentrations greater than 44 percent is a regulated substance under PSM regulations; the threshold quantity is 15,000 pounds.

Page 11

A State of California Risk Management and Prevention Program (RMPP), including most of the elements of the PSM standard and Risk Management Program, has been in effect since 1989. Senate Bill 1889 required California to implement a new Accidental Release Prevention Program. Thus, effective January 1, 1997, the new CalARP Program replaced the California RMPP; it is found in Title 19 of the CCR, Division 2, Chapter 4.5. The CalARP Program is a merging of the federal and state programs for the prevention of accidental release of regulated toxic and flammable substances. The CalARP Program adopts the federal Risk Management Program rule with certain additional requirements specific to California, pursuant to Article 2, Chapter 6.95, of the California Health and Safety Code. Aqueous ammonia is a regulated substance under CalARP; the threshold quantity is 500 pounds.

Based on the maximum quantity of aqueous ammonia used, Mariposa does not exceed the EPA Risk Management Program threshold quantity (20,000 pounds for concentrations greater than 20 percent). Additionally, Mariposa does not meet the Cal-OSHA PSM threshold quantity (15,000 pounds for concentrations greater than 44 percent). However, the aqueous ammonia process at Mariposa does exceed the CalARP Program threshold quantity requirement of 500 pounds of ammonia.

# 1.3 CalARP Program Applicability

CalARP Program regulations divide covered processes into three categories, thereby reducing the burden of compliance for certain low-risk sources by requiring such sources to implement less prescriptive risk management programs. The eligibility criteria for three program levels are provided below:

- Program Level 1: Processes with no public receptors within the distance to the endpoint from a worst-case release and no accidents with specific offsite consequences within the past 5 years are eligible for Program Level 1. The "worst-case release" is defined as the largest quantity of a regulated substance from a vessel or process line failure that results in the greatest distance to an endpoint.
- Program Level 2: Processes not eligible for Program Levels 1 or 3 are placed in Program Level 2.
- Program Level 3: Processes not eligible for Program Level 1 and either subject to federal or California OSHA PSM standards or in the 10 specified North American Industrial Classification System (NAICS) Codes are placed in Program Level 3.

The aqueous ammonia process at Mariposa qualifies for Program Level 1 because:

- The process of controlling NOx emissions with aqueous ammonia is not part of the NAICS codes listed by the EPA in 40 CFR 68.10(d).
- The concentration of ammonia is below the PSM threshold of 44 percent.

- There have been no accidents with off-site consequences in the last 5 years at this facility.
- The distance to the toxic endpoint does not reach public receptors (see Section 2, "Offsite Consequence Analysis").

Additional requirements for a facility qualifying under Program Level 1 are provided in the next section.

# 1.4 General Program Level 1 Facility Requirements

General requirements for the CalARP Program are discussed in 19 CCR 2735.5. Because the Mariposa aqueous ammonia process qualifies for Program Level 1, the facility must coordinate with the Alameda County Department of Environmental Health, which is a Certified Unified Program Agency (CUPA), in the preparation of documentation required to comply with Risk Management Program regulations. The CalARP Program regulations require submission of an RMP with the following information:

- RMP Executive Summary (19 CCR 2745.3)
- RMP Offsite Consequence Analysis Component (19 CCR 2745.4)
- RMP Five-year Accident History Component (19 CCR 2745.5)
- RMP Emergency Response Program Component (19 CCR 2745.8)
- RMP Certification (19 CCR 2745.9)
- Registration reflecting all covered processes (19 CCR 2740.1)

The details of compliance with the above requirements are provided in various sections of this RMP. Table 1-1 summarizes instructions for implementing and maintaining the CalARP Program and Risk Management Program. This table can be used by Mariposa to track the implementation of the CalARP Program and Risk Management Program and assist Mariposa personnel in maintaining compliance. Actions that may trigger a change to the CalARP Program and Risk Management Program include a change in the concentration of aqueous ammonia; a change in the amount of aqueous ammonia used and stored onsite; commercial, residential, or industrial development within the toxic endpoint distance; a change in emergency response procedures; or an accidental release of aqueous ammonia.

1.5 Additional Elements

System components essential to the covered process are scheduled for inspection, maintenance and/or replacement that meets or exceeds the manufacturers' recommendation. The inspection/maintenance and replacement frequency is scheduled through MAXIMO; a Computerized Maintenance Management System (CMMS). For the covered process, MAXIMO tracks the preventive maintenance of the ammonia system. Specifically the ammonia sensors are on a preventive maintenance schedule to be calibrated every calendar quarter and to be replaced per the manufacturer's specifications. Any new bulletins or recommendations

Page 13

issued by the manufacturer are reviewed and implemented in a timely manner and applicable maintenance support (if any) will be added into the MAXIMO CMMS.

Page 14

TABLE 1-1 CaIARP Program and Risk Management Program Summary of Instructions ¹ Mariposa Energy Project

CalARP Program and Risk			Date C	ompleted		
Management Program Compliance Activity	2019	2020	2021	2022	2023	2024
Review and update the offsite consequence analysis at least every 5 years. If a change to the aqueous ammonia process might reasonably be expected to increase or decrease the distance to the endpoint by a factor of 2 or more, prepare a revised assessment report no later than 6 months after the change.	6/5/2019 There are no changes to the aqueous ammonia process.					
Evaluate nearby development annually to ensure receptors are not present within the toxic endpoint. If receptors are present. update the offsite consequence analysis and discuss potential program level changes.	There are no recent developments near the facility. No change in receptors.					
Review Emergency Response Plan when information changes or at least annually.	6/5/2019					
Contact the Alameda County Fire Department annually to coordinate response actions.	6/5/2019					

Supporting documents of the CalARP are maintained on-site

PROCEDURE SMP-16	

# 2.0 Offsite Consequence Analysis

CalARP Program regulations (19 CCR 2750.1 through 2750.9) require that an offsite consequence analysis be performed to assess the effects a potential accidental chemical release of the regulated substance would have on the public and environmental receptors. Under Program Level 1, only one scenario must be assessed: the worst-case release scenario. Required elements of an offsite consequence analysis are an estimate of the possible release quantity during an accident, a determination of downwind effects, and a definition of the potential exposure to affected public and environmental receptors are required. The offsite consequence analysis, combined with the facility accident history for the previous 5 years, comprise the hazard assessment. This section describes the offsite consequence analysis for aqueous ammonia (19-percent aqueous ammonia solution) at Mariposa and was prepared in compliance with CalARP Program regulations (19 CCR 2750.1 through 2750.3). The accident history (19 CCR 2750.9) is discussed in Section 3.

# 2.1 Offsite Consequence Analysis Methods and Parameters

# 2.1.1 Methods

The offsite consequence analysis for aqueous ammonia (19-percent aqueous ammonia solution) was conducted using the SLAB and ALOHA model.

SLAB is a computer-based dispersion model, developed by the Lawrence Livermore Laboratory, that simulates the atmospheric dispersion of denser-than-air and neutrally buoyant releases. Atmospheric dispersion of the release is calculated by solving the conservation equations of mass, momentum, energy, and species. The mathematical description of the physics of heavy gas dispersion, as well as the description of the normal atmospheric advection and turbulent diffusion processes, is inherently included in SLAB's conservation equations. A complete description of the SLAB model is available in the User's Manual for SLAB: An Atmospheric Dispersion Model for Denser-Than-Air-Releases, D.E. Ermak, Lawrence Livermore National Laboratory, June 1990. The SLAB user manual contains a substance database, which includes chemical-specific data for ammonia. These data were used in the modeling run without exception or modification. As discussed later, the surface area input to the SLAB model was reduced 90% because of the poly balls added as a passive mitigation measure.

However, also as discussed, ACDEH requested additional modeling scenarios assuming the poly balls would be less effective and using the Areal Locations of Hazardous Atmospheres (ALOHA) model provided by the EPA. ALOHA results were used to determine the distance to endpoint. As a result of the data submitted and requirements for poly balls and other administrative conditions, ACDEH has agreed that the Mariposa would be a Program Level 1 facility.

Page 17

Prior to modeling with SLAB or ALOHA, an ammonia evaporation release rate was calculated pursuant to the guidance given in *RMP Offsite Consequence Analysis Guidance, EPA, April 1999.* Within ALOHA, mass transfer of ammonia across the liquid surface was modeled according to principles of heat transfer by natural convection. The release rate estimated by ALOHA assumed a 1-hour release duration.

The parameters used for the offsite consequence analysis are discussed below.

# 2.1.2 Input Parameters

This section describes the input parameters used in the worst-case release scenario calculations including wind speed, atmospheric stability class, ambient temperature and humidity, height of release, surface roughness, and temperature of the released substance.

# Wind Speed and Atmospheric Stability Class

Risk Management Program regulations require the use of a wind speed of 1.5 meters per second (m/s) and an atmospheric stability class of F for performing an offsite consequence analysis for the worst-case release scenario. Stability classes are categorized by the amount of turbulence in the atmosphere and are typically divided into six classes (A to F), with F being the least turbulent and A the most. A typical Class A stability occurs on a sunny day with a high wind speed, Class D on a cloudy day with an active wind speed, and Class F in the evening with a low wind speed. With increased turbulence, a plume is diluted more rapidly and the distance to the toxic endpoint is shorter. Risk Management Program regulations require a stability class of F and a wind speed of 1.5 m/s (approximately 3.4 miles per hour) for the worst-case release scenario to represent the conditions that result in the least amount of regulated substance dilution and farthest distance to the toxic endpoint.

As requested by ACDEH, the dispersion calculation for this offsite consequence analysis was conducted using the ALOHA model. As required, the release rate for ALOHA was calculated using a wind speed of 1.5 m/s and a stability class of F.

# **Ambient Temperature and Humidity**

Risk Management Program regulations require the use of the highest daily maximum temperature in the previous 3 years and the average humidity for the worst-case release scenario. The highest daily temperature recorded near the Mariposa site during the past 3 years was 110 degrees Fahrenheit (°F) or 316 Kelvin (K), measured at the airport located in Stockton, California. A humidity of 50 percent was used for the worst-case release scenario.

# **Height of Release**

Risk Management Program regulations require that, for the worst-case release analysis, the release should be assumed to occur at ground level (0 feet). The dispersion calculation used for the worst-case release scenario at Mariposaassumes the release occurs at ground level.

# Surface Roughness

The surface roughness contributes to the amount of air turbulence caused by surface features, which, in turn, affects the dispersion of the regulated substance release. Surface roughness is characterized in terms of either urban or rural topography. The rural condition, defined by Risk Management Program regulations as "no buildings in the immediate area and the terrain is generally flat and unobstructed" (40 CFR 68.22[e] and 19 CCR 2750.2[e]), is characterized by a surface roughness of 0.03 meter, whereas the urban condition is characterized by a surface roughness of 1.0 meter (Section D.4.2 of the *EPA Offsite Consequence Analysis Guidance, May 1996*). Urban terrain is characterized by numerous obstacles, such as buildings and trees. In general, a regulated substance plume travels a longer distance if it does not encounter many surface features to create air turbulence.

Located in an unincorporated portion of Alameda County, the area surrounding Mariposa is primarily undeveloped grazing land. As such, the Mariposa location is characterized as a rural area with a surface roughness of 0.03 meter.

# **Dense or Neutrally Buoyant Gases**

Risk Management Program regulations require that the models used for dispersion analysis appropriately account for the density of the released gas. The ALOHA model accounts for the fact that ammonia is a neutrally buoyant gas.

# **Temperature of Released Substance**

Risk Management Program regulations require that, for the worst-case release analysis, liquids shall be considered to be released at the highest daily maximum temperature. The highest daily maximum temperature used in this analysis was 110°F (316 K).

# 2.2 Worst-Case Release Scenario Analysis

Risk Management Program regulations require an offsite consequence analysis for one worst-case release scenario estimated to create the greatest distance in any direction to a toxic endpoint resulting from an accidental release of regulated toxic substances from regulated processes. The worst-case release scenario assumes that the entire contents of the largest single container are released, regardless of the high improbability of that occurring. Only "passive" mitigation methods can be considered. According to the California Accidental Release Prevention (CalARP)

Page 19

Program Administering Agency Guidance manual, passive mitigation consists of equipment, devices, or technology that function without human, mechanical or other energy input. Regulations require that the worst-case release scenario assumes atmospheric conditions that result in large impact areas, even though they may not be representative of typical atmospheric conditions around Mariposa. The passive mitigation provided by the poly-sphere covered secondary containment basin was used in the analysis.

The worst-case release scenario assumes the complete failure of the 10,000 gallon storage tank, the immediate release of the contents of the tank (8.500 gallons), and the formation of an evaporating pool of aqueous ammonia (19-percent aqueous ammonia solution) within the secondary containment basin. Evaporative emissions of ammonia would be subsequently released into the atmosphere through the secondary containment basin's cover.

As discussed above, ALOHA and SLAB was used to model the release of ammonia vapor from an evaporating pool of aqueous ammonia caused by the complete failure of a single 10,000 gallon tank. The distance to the toxic endpoint predicted by SLAB and ALOHA was determined according to the meteorological data listed in Table 2-1, an evaporation release rate 6.57 and 32.7 pounds per minute (lbs/min). respectively, and the surface area of the secondary containment basin (938.5 square feet).

In addition, ALOHA results from reduced surface area are also summarized in Table 2-1. The evaporation release rate was determined using ALOHA and was based on a surface area of 234.625 square feet and 187.7 square feet to account for a 75 percent and 80 percent reduction in evaporative surface provided by the secondary containment basin's cover, respectively.

The parameters selected for the dispersion modeling for 8,500 gallons of 19% aqueous ammonia released from the 10,000 gallon storage tank and drained to the secondary containment basin are presented in Table 2-1.

Page 20

## TABLE 2-1

# Aqueous Ammonia Worst-Case Release Scenario Summary

Parameter		Aqueous	Ammonia Relea	se
	SLAB Output	ALOHA Output	ALOHA Ouput 80% Reduction ²	ALOHA Oupu 75% Reduction ²
Release Quantity (gallons)	8,500	8,500	8,500	8,500
Release Duration (seconds)	3,600	3,600	3,600	3,600
Physical State	Vapor	Vapor	Vapor	Vapor
Release Height	Ground	Ground	Ground	Ground
Release Rate (lbs/min)	6.57	32.7	7.93	9.68
Release Temperature (°F)	110	105	105	105
Release Pressure (atmospheres [atm])	1	1	1	1
Surface Roughness (meter)	0.03	Open Country	Open Country	Open Country
Stability Class	F	F	F	F
Relative Humidity (%)	50	50	50	50
Wind Speed (m/s)	1.5	1.5	1.5	1.5
EPA Toxic Endpoint (parts per million [ppm])	198	200	200	200
Distance to Toxic Endpoint ¹ . (meters)	5.54	1,166.8	538.6	600.8
Distance to Toxic Endpoint ¹ (yards)	6.06	1,276	589	657
Distance to Toxic Endpoint ¹ (feet)	18.2	3,828	1,767	1,971

Notes: 1. Nearest public receptor is PG&E Byron Bethany Gas Pump Station which is 624.8 meters, 683.3 yards, or 2.050 feet.

2. Passive mitigation reduction in exposed surface area from two layers of poly balls.

ACDEH requested in 2013 that the ALOHA model be used for determining the distance to endpoint and wanted other scenarios considered with the poly balls providing less than 90% reduction in evaporation rate due to the reduced surface area exposed. The results were presented to ACDEH on October 21, 2013 (see Attachment 9). The current ALOHA output is provided in Attachment 2 and is summarized above in Table 2-1 for two different assumptions on the effective reduction in exposed surface area form use of the two layers of poly balls. The distance to toxic endpoint using the ALOHA model is 3,828 feet based on the unmitigated 938.5 square feet surface area exposed and is 1,767 feet with an 80% reduction and 1,971 feet with a 75% reduction from passive mitigation of two layers of poly balls.

Results of the worst-case dispersion modeling analysis by SLAB, within the scenario guidelines imposed by the regulations, indicate that an aqueous ammonia concentration of 198 ppm (toxic endpoint) could extend up to a distance of 5.54 meters (18.2 feet) for the aqueous ammonia process at Mariposa. Figure 2-1 shows the distance to the toxic endpoint for the worst-case release scenario for the aqueous ammonia process. As indicated by the figure, the distance to the toxic

Page 21

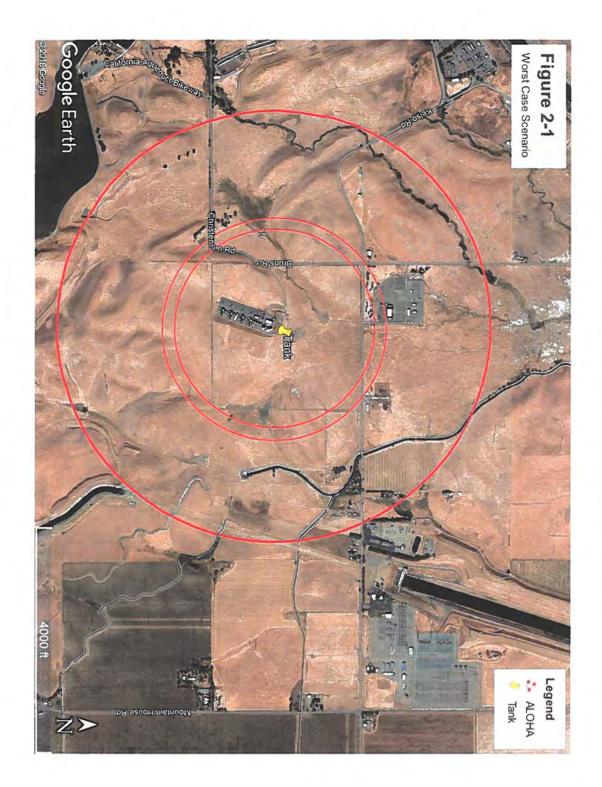

endpoint does not extend beyond the Mariposa property boundary. The SLAB and ALOHA modeling files are included in Attachments 1 and 2, respectively.

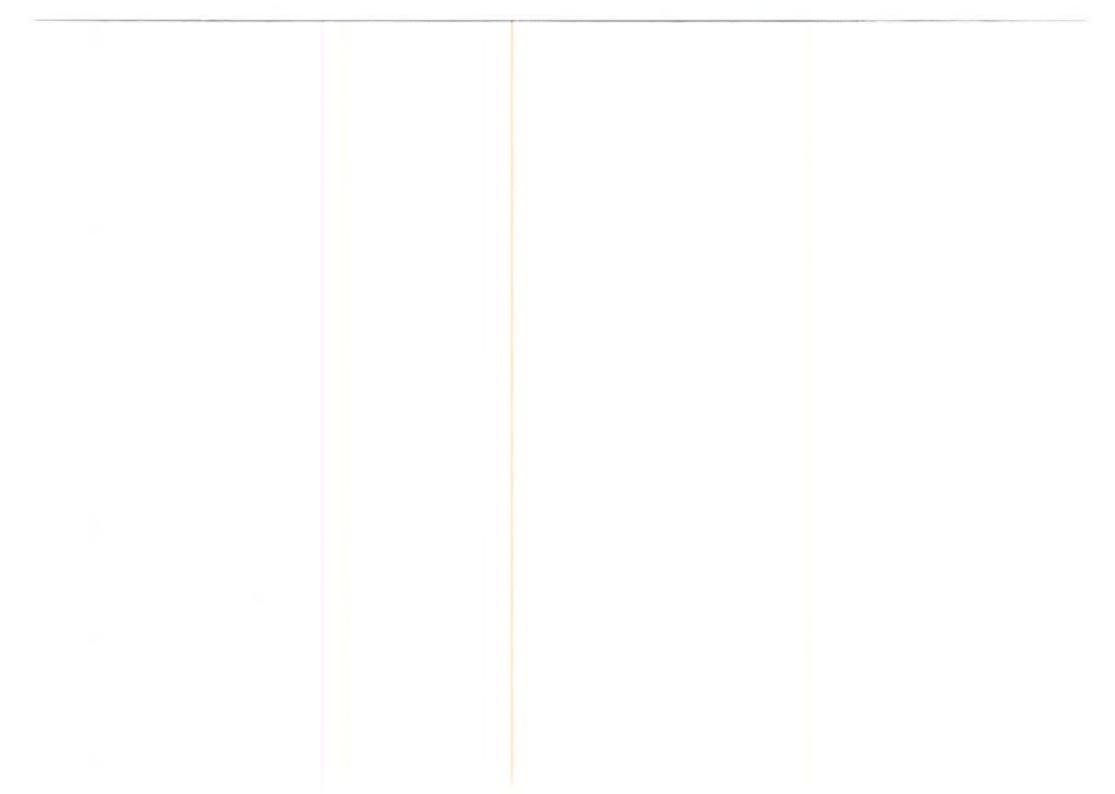

# 2.3 Potential Offsite Impacts

Risk Management Program regulations require the determination of the potentially affected residential population within the toxic endpoint distance, estimated to two significant digits, for the worst-case release scenario. The RMP must also note the presence of institutions (schools, hospitals, long-term health-care facilities, child day-care facilities, and prisons); parks and recreational areas; and major commercial, office, and industrial buildings within the toxic endpoint distance. Because the worst-case release scenario distance for aqueous ammonia at Mariposa using SLAB does not extend beyond the Mariposa property boundary, there would be no residential, recreational, or industrial receptors impacted by a potential release.

However based on use of the ACDEH requested ALOHA model, the distance to the specified endpoint for the worst-case accidental release scenario for the aqueous ammonia process without mitigation is 3,828 feet based on the unmitigated 938.5 square feet surface area exposed and this exceeds the distance to the nearest public receptor (the PG&E Byron Bethany Gas Pump Station is the only facility) which is approximately 2,050 feet from the aqueous ammonia process. This is the only receptor within the distance to toxic endpoint. However, Mariposa uses a double layer of poly balls to reduce the evaporative emissions. Per February 20, 2014 ACDEH letter (see Attachment 8 which relevant technical information submitted on October 21, 2013 in Attachment 9), ACDEH has agreed to a Program Level 1 Status considering mitigations from the double layer of poly balls and other administrative conditions.

## Offsite Consequence Analysis Review and Update 2.4

Mariposa should review and update the offsite consequence analysis at least once every 5 years. If changes in the aqueous ammonia process, quantity of aqueous ammonia stored or handled, or any other aspect of Mariposa might reasonably be expected to increase or decrease the distance to the endpoint by a factor of two or more. Mariposa should complete a revised analysis within 6 months of the change and submit a revised RMP. The required records for the offsite consequence analysis are provided in Sections 2.1 through 2.3.

### 3.0 **Five-Year Accident History**

Mariposa Energy completed construction of the Mariposa in mid-2012. There have been no accidents involving aqueous ammonia that have resulted in deaths, injuries, or significant property damage onsite, or known offsite deaths, injuries, evacuations, sheltering in place, property damage, or environmental damage at the time this report was prepared.

### 4.0 **Emergency Response**

Mariposa is not a responding facility; staff will not act in a first response role. Employees will be trained to at least an awareness level, and will rely on local emergency responders and spill cleanup contactors for spill response and clean up. Mariposa has developed an emergency response plan following the Alameda County Department of Environmental Health Hazardous Materials Business Plan (HMBP) format. This emergency response plan details the emergency response procedures, spill containment and prevention systems, personnel training, regulatory notification requirements, and post-incident investigation procedures. The emergency response plan also identifies emergency assembly areas and evacuation routes and includes a list of telephone numbers of agencies and individuals to contact in the event of an accidental release or other emergency. The agencies and individuals represent local emergency responders, regulatory agencies, health care providers, etc. Notifications will include the PG&E Byron Bethany Gas Pump Station.

Should tank level alarms or other spill indicator systems be activated, the Mariposa Control Room operator will immediately page the Mariposa Plant Manager. The Mariposa Plant Manager, or his/her designee, will take the role of the Incident Chain Commander (ICC) and will direct the activities conducted by Mariposa personnel. The ICC will first assess whether the incident is considered to be a "controllable" release. A controllable release is one where Mariposa personnel are confident they have the resources, training, and ability to assess, stop, and contain the release. In the event of a controllable release, Mariposa personnel will perform the tasks necessary to contain and mitigate the release.

In the event of an uncontrollable release, the ICC will notify the Alameda County Fire Department by calling 911. The Alameda County Fire Department has a Hazardous Materials (HazMat) Response Team capable of handling any hazardous materials-related incident at Mariposa and responding within approximately 30 minutes. The HazMat Response Team will handle spill/release response and mitigation while Mariposapersonnel remain in the evacuation assembly area, available to provide relevant

Page 24

technical, site-specific details and other necessary information to the HazMat Response Team.

There is a coordinated effort between Mariposa staff and the Alameda County Fire Department for Accidental Release Responses. Captain Randy Carter of the Alameda County Fire Department visited Mariposa on November 21, 2014 and addressed emergency response situations. (See Attachment 7).

Mariposa will work closely with the Alameda County Fire Department to prevent fires from occurring and to quickly mitigate fires. Periodic fire safety inspections conducted by the Alameda County Fire Department, providing information exchange between Mariposa and Alameda County Fire Department personnel, are encouraged. Mariposa has also provided the HMBP to the Alameda County Fire Department.

The emergency response plan should be reviewed whenever a deficiency is noted or at least annually. Employees are trained on the emergency response plan when hired, and all employees receive annual refresher training in emergency response procedures.

# 5.0 Statement of Certification

The Mariposa electrical generating facility located in Byron. CA is a CalARP Program Level 1 status facility, as determined by the offsite distance to the toxic endpoint using ALOHA modeling, as requested by the ACDEH. The Mariposa facility employs passive mitigation through the use of a double layer of poly balls held within the diked containment berm. The ACDEH has agreed to a CalARP Program Level 1 Status with conditions for Mariposa, with the addition of administrative controls to prevent potential offsite impacts, in its letter dated February 20, 2014.

In accordance with Section 2735.5 of Title 19 of CCR, this RMP is certified to the following:

"Based on the criteria in Section 2735.4 of Title 19 of CCR, the distance to the specified endpoint for the worst-case accidental release scenario for the following process is less than the distance to the nearest public receptor: Aqueous ammonia. Within the past five years, the process has had no accidental release that caused offsite impacts provided in the risk management program Section 2735.4 (c)(1). No additional measures are necessary to prevent offsite impacts from accidental releases. In the event of fire, explosion, or a release of a regulated substance from the process. entry within the distance to the specified endpoints may pose a danger to public emergency responders. Therefore, public emergency responders should not enter this area except as arranged with the emergency contact indicated in the RMP. The undersigned certifies that, to the best of my knowledge, information, and belief, formed after reasonable inquiry, the information submitted is true, accurate, and complete."

May 18, 2012

Mr. Bo Buchynsky Mariposa Energy, LLC 333. S Grand Avenue, Suite 1570 Los Angeles, CA 90071

RE: California Accidental Release Program (Cal ARP) / Risk Management Plan (RMP) for Mariposa Energy Power Plant located at 4887 Bruns Road, Byron, CA 94514

Dear Mr. Buchynsky;

Alameda County Department of Environmental Health (ACDEH) received the California Accidental Release Response Plan (Cal ARP)/ RMP submitted via e-mail for the referenced site on March 29, 2012. ACDEH conducted a scheduled site visit on May 8, 2012.

Mariposa Energy Power Plant will store and use 19% aqueous ammonia in a selective catalytic reduction system to control nitrogen oxide emission from the natural gas combustion process for generation of electricity. About 8500 gallons of aqueous ammonia will be in the process. The quantity of ammonia exceeds the Cal ARP threshold of 500 pounds. Therefore, the facility is required to prepare and submit a California Accidental Release Response Plan prior to the date on which a regulated chemical is first present on site in a process above the listed threshold quantity (CCR Title 19, Division 2, Chapter 4.5 Section 2745.1(d)).

Cal ARP/RMP submitted for Mariposa Energy Power Plant calculated the distance to the specified end point for the worst-case accidental release scenario for the aqueous ammonia process is less than the distance to the nearest public receptor and that the process therefore qualifies for program level 1.

The distance to the end point was determined using a reduced release rate (pounds of ammonia/minute) due to passive mitigation. As stated in the document, "passive mitigation provided by the covered secondary containment basin" was used in the analysis. Details of the "cover" of the secondary containment were not provided. During the site visit, we found that the 91% reduction of the vaporization of the 8500 gallon of liquid spilled as in the worst case scenario is based on polystyrene balls that will be used to cover the secondary containment. The manufacturer's claimed reduction of vapor by 91% using such balls was used in the calculation.

The use of poly styrene balls for vapor reduction does not meet the definition of "passive mitigation". Passive mitigation systems may be considered for the analysis of

Mr. Bo Buchynsky RE: 4887 Bruns Rd., Byron,CA May 18, 2012 Page 2

worst case provided that the mitigation system is capable of withstanding the release event triggering the scenario and would still function as intended (Section 2750.3(h)). Only "passive" mitigation methods such as buildings or dikes can be considered. Passive mitigation consists of no mechanical, electrical or human input. The balls will be considered a "mechanical" means of mitigation and cannot be considered as "passive mitigation".

Please resubmit the worst-case release scenario and the end point distance for program level determination.

The following deficiencies identified / found regarding the ammonia system shall be corrected and information provided:

- Piping, tubing, valves and fittings conveying hazardous materials shall be designed and installed in accordance with approved standards and CFC 2703.2.2.1 and 2703.2.2.2.
- Piping, tubing, valves, fittings and related component shall be designed and fabricated of materials that are compatible with the materials to be contained and shall be of adequate strength and durability to withstand the pressure, structural and seismic stress and exposure to which they are subject (CFC 2703.2.2.1(1)).
- Piping and tubing shall be identified in accordance with ASME A13.1 to indicate the material conveyed and with the direction of flow every twenty linear feet (CFC 2703.2.2.1(2)).
- Readily accessible manual valves or automatic remotely activated fail-safe emergency shut-off valves shall be installed on supply piping and tubing at the following locations:
  - a. At the point of use;
  - b. The tank, cylinder or bulk source (CFC 2703.2.2.1(3)).
- Manual emergency shutoff valves and controls for remotely activated emergency shutoff valves shall be identified and the location shall be clearly visible, accessible and indicated by means of a sign (CFC 2703.2.2.1(4)).
- Smoking shall be prohibited and a "No Smoking" sign provided within 25 feet of outdoor storage, dispensing and open use areas (CFC 2703.7.1).
- Where gases or liquids with health hazard ranking of 3 or 4 in accordance with NFPA 704 (aqueous ammonia 19% has a health hazard rating 3) are carried in pressurized piping, above 15 psi, an approved method of leak detection and

Mr. Wayne Forsyth RE: Mariposa Energy Plant 4887 Bruns Road, Byron, CA 94514 February 20, 2014 Page 2

"The surface area of the pool shall be determined by assuming that the liquid spreads to 1 centimeter deep unless passive mitigation systems are in place that serve to contain the spill and limit the surface area. Where passive mitigation is in place, the surface area of the contained liquid shall be used to calculate the volatilization rate"."

The regulatory section cited refers to surface area reduction due to diking/containment. The evaporative rate reduction is effective with the reduced surface area used (983.5 square feet available surface due to containment) and one hour release duration. Without passive mitigation the release time will be 10 minutes with 8500 gallon spread over area of 1 cm deep. <u>EPA has not agreed with the additional 90% area reduction</u> <u>claim due to balls.</u>

Based on the plume data submitted without the poly balls, the worst case release will go offsite and there is public receptor, the PG&E building. The facility therefore qualifies for program level 2. However, allowing for some mitigation (no quantification) with the poly balls and with the additional administrative controls in place (double layers of poly balls, more frequent inspection and ball replacement, open land area), ACDEH will assign the facility **Program Level 1 Status with conditions**.

Please be advised that this program level status will remain effective as long as the facility is in compliance with the Cal ARP regulatory requirements, current and future, implement preventive maintenance, monitor the ammonia process area, provide employee training and training with the identified potential receptor (PG&E employees) for emergency action and there is no accidental release of the regulated material. Any time these conditions change or the topography changes from rural to urban, the facility status will be reviewed and may change depending upon the existing conditions.

If you have any question, please contact Sukla De at 510-304-5446 / sukla.de@acgov.org or me at 510-567-6780/susan.hugo@acgov.org

Sincerely,

an

Susan Hugo CUPA Program Manager

Re: Alameda County Department of Environmental Health (ACDEH) Comment Letter to California Accidental Release Program (CalARP) Risk Management Plan (RMP) for Mariposa Energy Power Plant located at 4887 Bruns Road, Byron, CA 94514

#### Dear Ms Hugo,

Mariposa Energy LLC (Mariposa) submitted a CalARP/ RMP on March 29, 2012 to the ACDEH. Following a site visit on May 8, 2012, the ACDEH sent a letter on May 18, 2012 to Mariposa identifying issues that needed to be addressed regarding the submitted CalARP/ RMP. This letter responds to the issues presented in the ACDEH letter.

Mariposa will store and use 19% aqueous ammonia for use in a selective catalytic reduction (SCR) system to control emissions of oxides of nitrogen (NOx) from natural gas combustion. Mariposa stores the aqueous ammonia solution in a single 10,000-gallon above-ground storage tank, filled to a maximum of 8,500 gallons, or approximately 12,500 pounds of ammonia (NH3) in solution. The tank is surrounded by a 42-foot-long by 23-foot-wide secondary containment basin capable of containing approximately 14,500 gallons (berm height is approximately 2 feet). This is sufficient capacity to contain the full contents of the tank plus rainwater and vapor suppression.

#### Vapor Suppression as Passive Mitigation

Mariposa has installed High Density Polyethylene (HDPE) balls within the secondary containment for the purpose of vapor suppression in the event of an accidental release. The HDPE balls are maintained within the secondary containment through the use of site-specific customized netting designed for the containment structure. In the May letter the ACDEH contended that the balls would be considered a mechanical means of mitigation and cannot be considered as passive mitigation.

Although the ACDEH may conclude that the balls are considered mechanical, in practice they meet the definition of a passive mitigation and have been considered as such in approved CaIARP worst-case scenarios for aqueous ammonia solutions. The Ca/ARP regulation states that "Passive mitigation

systems may be considered for the analysis of worst case provided that the mitigation system is capable of withstanding the release event triggering the scenario and would still function as intended" [Section 2750.3(h)]. As cited by the ACDEH, passive mitigation is defined as "...equipment, devices, or technologies that function without human, mechanical, or other energy input" [Section 2735.3(y)]. The HDPE balls are designed and installed to reduce volatilization without mechanical, electrical, or human input. In this application, the presence of HDPE balls in the secondary containment would reduce the liquid-to-air interface of the aqueous solution following an accidental release by approximately 90-percent. The vapor suppression balls are resistant to freezing and can withstand heat up to 176°F (80°C), which makes it the most suitable material for exterior applications. An ultraviolet (UV) stabilizing additive is also used to prevent the degrading effects of sunlight.

The HDPE balls are lighter than aqueous ammonia and will float on top of any liquid spill. The balls are designed to maintain equal distribution in liquid through the frictional adherence to adjacent balls. Sufficient balls will be used in the containment area to maintain a minimum coverage of 1-layer. The proposed HDPE balls have a 70 millimeters ball diameter with a surface coverage of 22 balls per square foot, or approximately 21,250 to adequately cover the containment area. Further, to ensure that the HDPE balls stay within the containment, mesh netting will be placed over the diked area to prevent any of the balls from escaping the area due to wind or other factors.

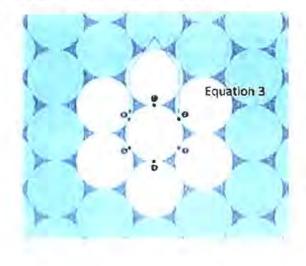

Since the balls are always within the containment area they will perform their duties immediately in the event of a liquid release and with no mechanical, electrical, or human input. Moreover, the HDPE balls require no maintenance and will not be damaged by aqueous ammonia should a release occur. The balls will float on top of the liquid and will not absorb any of the ammonia. Once the spill is cleaned up the balls will fall back to the bottom of the diked containment area and be ready to be used again for the next spill. A brochure for the vapor suppression balls from the manufacturer is attached to this letter in Attachment A.

#### Vapor Reduction Efficiency

This reduction in potential volatilization is based on the highly efficient hexagonal configuration of the balls when floating (see diagram at right). The reduction in liquid-to-air surface area can be estimated

based on the portion of a hexagon which occupied by a set of same sized circles. The ratio of the area of the circle compared to the area of the hexagon can be found using the following equation:

 $A_{CIRCLE} = \frac{2 \times A_{HEX} \times \sqrt{3}}{\pi}$ This can be reduced to:  $A_{CIRCLE} = 0.9069 \times A_{HEX}$ 

In other words, the area of a circle is 90.69% the area of a hexagon. Based on this geometry, the manufacturer of the HDPE balls claims a 91% reduction in the vaporization of the liquid release because the vaporization rate is directly proportional to the surface area available for evaporation.

Because they do not require any activation, they are capable of withstanding the release event triggering the scenario and would still function as intended; HDPE balls have been considered as passive mitigation and used in developing worst-case scenarios pursuant to CalARP. One recent example is the June 2009 revision to the Risk Management Plan (RMP) presented to the Contra Costa County Health Services Department (CCCHSD) by Criterion Catalysts and Technologies L.P. (Criterion) for an aqueous ammonia system that installed vapor suppression balls as passive mitigation around the storage tank to minimize the surface area for evaporation during a spill.

Based on the design of the HDPE balls, their method of use as a non-active (no activation required) form of immediate vapor suppression, the applicable regulatory guidance and definitions, and the precedent established by other agencies, MEP believes use of HDPE balls for vapor suppression meets the regulatory and guidance definition of passive mitigation, and therefore the facility qualifies for Program Level 1 based on a worst-case scenario of a release of 19% aqueous ammonia as originally submitted.

#### Ammonia System Deficiencies Identified/Found

ACDEH identified seventeen (17) California Fire Code standards that MEP is subject to and where additional information was required. Written responses to these items were provided by LG Constructors, builders of the MEP facility. These are provided as Attachment B.

If there are any other questions or comments to either the CalARP RMP previously submitted, the use of the vapor suppression balls as passive mitigation, or deficiencies in the ammonia system, please do not hesitate to contact me or Mr. Wayne Forsyth, Compliance Manager, at the aforementioned address.

Sincerely, to prolumolin Bo Buchynsky

HDPE Balls for Vapor Suppression

#### Not just a ball but a solution to a problem

For many industrial applications, ECC provides not just a pall, but a solution to a problem. Most of our successful installations have resulted from working closely with customers, sharing our ideas and experience and tailoring a solution to meet their specific requirements.

ECC floating ball blankets provide highly effective solutions to difficult liquid storage problems in incustries including Processing. Petrochemical and Metal Treatment. By placing a sufficient quantity of hollow plastic balls onto the surface of a liquid, the balls automatically arrange themselves into a close packed formation over 91% of the surface area. This high surface coverage provides an extremely effective barrier and significantly reduces the mass and heat transfer mechanisms operating between the liquid and sumounding environment. The hollow plastic balls that form a floating cover for ponds, tanks, agoons, and other basins

The balls are of course hollow and full of air. And the plastic balls offer very low heat conductivity. Together, these properties result in a very effective thermal insulation barrier. The air pockets between the balls -- although not sealed -- also contribute to this cellular insulation system, dramatically reducing heat loss.

The barner works both ways the low inquid surface area exposed to atmosphere dramatically reduces liquid loss through evaporation and occr release to the atmosphere. It also prevents surface absorption of oxygen. Yet this barrier to the elements does not present an obstacle to product dipping or equipment moving through the iquid surface. The bars are pushed as de, but quickly re-form the ricover as the ecuipment moves forward on products are lifted away from the tank. The balls will rise and fall with liquid revel within storage tanks and also provide a constant cover over liquids held in reservoirs with sloping sides. If the liquid level fails -- causing the surface area to shrink -- the balls simply stack in a double layer; they automatically spread themselves into a single layer again as the level rises.

#### **Technical Data**

#### **Chemical Resistance of Plastics**

PVDF - This material offers significant increases in operating temperatures up to 320°F (160°C), providing resistance to many aggressive chemicals where other plastics would fail

Polypropylene (PP) - Able to withstand continuous working temperatures of up to 230°F 1 0°C. Suitable for contact with most chemicals used in the metal treatment industry.

High Density Polyethylene (HDPE) – Suitable for working conditions up to 176°F (80°C). HDPE is recommended for all external applications due to its enhanced resistance to freezing conditions Black, UV stabilizing additives prevent the degrading effects of sunfight. IDPE is also recommended for demineralized water and Chromic acid applications.

Q

:01

### Innovative Applications for ECC Hollow Plastic Balls Include:

 I feat retention. As the balls cover more than 90% of the surface area, they provide an insulation blanket on the tank.

- Evaporation reduction. Covering the water surface minimizes evaporation and water loss.
- Algae control. The balls block the UM from penetrating the water:
- Oxygen absorption
- Vapor containment. The balls reduce chemical vapor emissions.
- Odor containment. Less exposed surface area results in less odor emission.
- · Radiant protection
- · Acid mist reduction from electrowinning process
- Camouflage pond basins from waterfowl

LCC has more than 30 years experience in the design and distribution of hollow balls.

More than 35,000,000 balls have been delivered as floating covers.

#### Advantages of ECC Balls:

10

ECC Balls plovide several advantages over other cover systems:

- · Heating costs reduced by up to 75%
- Reduction of liquid loss through evaporation by up to 90%
- Reduced chemical consumption
- Improved working environments
- A reduction in coilrosive vapors, ensuring increased life expectancy of building structures
- Reduced demand on an extract systems, saving factory heating and reducing gas scrubber demands
- Dramatic reduction of foul odors reaching the atmosphere
- · Allows movement of equipment through the liquid
- Reduces penetration of UV rays precluding growth of algae and clogging weeds
- Reduction of ice formation in freezing conditions, lowering the ice formation point by up to S0°F (10°C)
- The balls spread automatically as the liquid levels rise and fall

The balls are available in a variety of materials; high density polyethylene (HDPE) is the most popular ball material for outdoor applications:

- Reduced heat loss helps to maintain biological reactions during cold weather;
- Rain water is not a problem. Unlike solid covers, the balls allow rain water to pass directly into the basin. There is no opportunity for ponding to occur:
- Quick and simple to install; installation is as simple as pouring the balls into the tank.
- . The balls naturally assume equal distribution
- · Immediate solution to odur problems
- Virtually maintenance free

#### **Ball Diameter and Surface Coverage**

Diameter (mm) Average weight (g) Number per it? Number per m?

10	0.2	1.076	11,600	
20	.0	270	2,900	
25	1.5	72	1,850	
38	4.5	/4	800 570 -165	
45	70	53		
50	8.6	43		
70	16.0	22	235	
100	40.0	Û	116	
150	100.0	r- 9	51.5	

The percentage of area covered by the balls is independent of the ball diameter, being the ratio of a circle to the hexagon which surrounds it. This equates to 91% of the liquid surface area. The frictional contact points ensure that each ball remains stable when subjected to increased liquid or air turbulence.

Mariposa Energy, LLC 333 South Grand Avenue, Suite 1570 Los Angeles, California 90071 Attn: Gary Normoyle

Subject: Alameda County Health Care Services Response

In reference to the letter sent on May 18, 2012 by Alameda County, LG Constructions has the following responses:

1. Piping, tubing, valves and fittings conveying hazardous materials shall be designed and installed in accordance with approved standards and CFC 2703.2.2.1 and 2703.2.2.2.

Requirements for CFC 2705-2.2.1 are thereized below. The a quarements for 2703-2.2.2 are as follows. The big up group tubing shall have ovelded, threaded, or range transmetions. These qualitications have been user. All of this piping is of welched construction with through at interfacing equipment corrections. D Piping and Information for system of the board outfair correlations or althin acoust for system, or in concerled species in areas not closed or conderground until it reaches the dust work. At is never located in the areas listed above.

- 2. Piping, tubing, valves, fittings and related components shall be designed and fabricated of materials that are compatible with the materials to be contained and shall be of adequate strength and durability to withstand the pressure, structural and seismic stress and exposure to which they are subject (CFC 2701.2.2.1 (1)). Liping, where and fittings are of (et shainless atof construction which has excellent compatibility with 19% appears annound. The aonitonic storage tank is fabricated of 5Å ducarbon steel which also has excellent compatibility with 19% appears annound. The aonitonic storage tank is fabricated of 5Å ducarbon steel which also has excellent compatibility with 19% appears annound. The aonitonic storage tank is fabricated of 5Å ducarbon steel which also has excellent compatibility with 19% appears annound. The aonitonic storage tank is fabricated of 5Å ducarbon steel which also has excellent compatibility with 19% appears annound. The aonitonic storage tank is fabricated of 5Å ducarbon steel which also has excellent compatibility with 19% appears and of the pipers system is 120 pig. Sch 80 pipe is more than adoptate for this pressure. The pipers appears again in this been designed to the structural and seismic stresses required are A5MET(31), par 3.1
- 4. Readily accessible manual valves or automatic remotely activated fail-safe emergency shut-off valves shall be installed on supply piping and tubing at the following locations:
  - a. At point of use
  - b. The tank, cylinder or bulk source (CFC 2703.2.2.1 (3))

The contribute apply  $\frac{1}{2}$  ipply in convergence stop value (EV) with the densities the strange task neurally. Additionally, each amponia mission point has a manually operated value (V) (EV) (503.5  $\pm$  Eq.

7. Where gases or liquids with health hazard ranking of 3 or 4 in accordance with NFPA 704 (Aqueous ammonia 19% has a health hazard rating of 3) are carried in pressurized piping, above 15 psi, an approved method of leak detection and emergency shutoff or excess flow control shall be provided. Where the piping originates from within a hazardous material storage room or area, the excess flow control shall be within the storage room area. Where the piping originates from a bulk source, the excess flow control shall be located as close to the bulk source as practical (CFC 2703.2.2.1 (6)).

An immunicibility monitoring system into place 2 for thread the immunication age task. The antionical leak mentioning system will send treadily alone and commutation signals to the 0.8.5 . As every the council order is bested on the antionic storage task supply not the Ashdulonally submargency store value is breaded downstream of the flow control only:

- 8. Atmospheric tanks having a capacity greater than 500 gallons and which contain hazardous material liquids shall be equipped with a liquid level limit control to prevent overfilling of the tank. Visual observation is not adequate (CFC 2703.2.7). So tion CFC 2703.2.7 of the code captions either a liquid level buric control of another approved capacity of the code captions wither a liquid level buric control of another approved capacity for the code captions wither a liquid level buric control of another approved capacity of the code captions wither a liquid level buric control of another approved capacity of the code captions wither a liquid level buric control of another approved capacity of the code captions and indicates on the rank, digital indicates on the mileoding skiel. Tool, level above are incomposited buck to the DCS.
- Machinery and equipment utilizing hazardous material shall be braced and anchored in accordance with the seismic design requirements of the California Building Code for the seismic design category in which the machine or equipment is classified (CFC 2713.2.8).

- 11. Areas used for the storage of hazardous material liquids shall be provided with spill control to prevent flow of liquids to adjoining areas. Floors in indoor locations and similar surfaces in outdoor locations shall be constructed to contain a spill from the largest single vessel by one of the following methods:
  - i. Liquid-tight sloped or recessed floors
  - Liquid-tight floors provided with liquid-tight raised or recessed sills or dikes.
  - iii. Sumps or collection system
  - iv. Other approved engineered system

Except for surfacing, the floors, sills, dikes, sumps and collection systems shall be constructed of non-combustible material and the liquid-tight seal shall be compatible with the material stored (CFC 2704.2.1). Provide information of the liquid-tight seal to be used/applied.

-x sumptis provided in the containment basin. "Geoenstreak? PVC weterstops are used in all concrete priors to preside a liquid tight sold. This is shown in drawing (i + 1021.

12. Secondary containment for outdoor storage areas of hazardous material shall be designed to contain a spill from the largest individual vessel. If the area is open to rainfall, secondary containment shall be designed to include the volume of a 24-hour rainfall as determined by a 25-year storm history and provisions shall be made to drain accumulations of ground water and rain water (CFC 2704.2.2.4). Provide secondary containment volume calculations for adequacy of the containment. The containment shall be hydrostatically tested for tightness.

Secondary containment was designed for 10% more than the liquid capacity phyandalt from a 25 year-storar event and a 10 minute fire losse stream. Calculations were created (415059-50–18) and 1/E stamped.

13. An approved monitoring method shall be provided to detect hazardous materials in the secondary containment system. The monitoring method is allowed to be visual inspection of the primary and secondary containment. We recommend a liquid detection sensor to be installed at the lowest point in the containment basin for earliest detection of any release. Where secondary containment is subject to the intrusion of water, a monitoring method for detecting water shall be provided. Where monitoring devices are provided, they shall be connected to an approved audible and visual alarm (CFC 2704.2.2.5).

The summaria leak monitoring system is located in at the tank in the secondary containments area. The monitoring system words on alarm to the DUSE A from and starts area area provided or the containment area.

 The type, location and alarm set points for the ammonia release detection system shall be provided.

Type: Encident 2000 Universal Analog Trent Kar, Detremon with Soft (Balthing U-MOTOL 2000 Receiver and Controller

Location. These is these detectors located in the tank containment pix, one against each coall of the pit exception the South wall. The tourth detector is boarded cight above the forwarding pure is on the forwarding skel.

Macarity Ponds, The detection alarmetate set his Support and Support

 Information shall be provided of the type of corrosion protection for the underground piping for the ammonia system - a. induced current or b. sacrificial anode, kind/frequency of inspection and maintenance for the system. Sacrifician Amode.

- Provide information the years of the California Building and Fire Code used for design and construction of the system. The 2010 California Building and Piro Code type used in design
- 17. A Seismic walk through of the ammonia system shall be conducted by a registered engineer for seismic analysis. A copy of the report shall be provided, seismic restraints there for and non-ASATED THE, which has a recommonded table for interal restraints. The modulation has been received by the CBC and apprecial.

Please let us know if you have any questions or require any additional information.

Sincerely,

Theles MATSI-1

Les Mathine

Ms. Susan Hugo CUPA/CWP/Waste Tire Program Manager Department of Environmental Health 1131 Harbor Bay Parkway, Suite 250 Alameda, CA 94502-6577

Re: Alameda County Department of Environmental Health (ACDEH) Email Requesting Additional Information on the California Accidental Release Program (CalARP) Risk Management Plan (RMP) for Mariposa Energy Power Plant located at 4887 Bruns Road, Byron, CA 94514

Dear Ms. Hugo,

On January 11, 2013, ACDEH forward to Mariposa Energy (ME) a request for additional information pertaining to the use of High Density Polyethylene (HDPE) balls as a passive vapor reduction system. The specific information requested was:

- Scientific test data to support 90% vapor reduction of 19% ammonia solution at temperatures of 100 deg F.
- 2) Use of a single layer of balls instead of multiples-how will it affect vaporization.
- Information of the customized net material, chemical compatibility and weather resistance. How it will be held in place.
- Inspection frequency, balls replacement conditions, complete recharge of the balls when and how often.
- 5) Maintenance Schedule.
- 6) Fire suppression system at the tank site.
- Evidence if any, that the balls are accepted by Federal RMP as "passive mitigation" for 20% ammonia solution
- 8) Distance of the stationary source to the property line.

# Museupons a Enterny VI (

Our responses to your requests follow in the same order as the request:

1) The 90% vaporization rate reduction is based upon the decrease in available surface area from which vaporization can take place and the fact that, for constant ambient conditions, vaporization is proportional to the surface area available for the vaporization to take place from. Vaporization takes place through evaporation, whose rate is proportional to the surface area available for evaporation, until boiling occurs; at which point vaporization occurs not at the surface of the liquid but within the liquid. Based upon the calculation of the area covered by the floating HDPE balls, 90.69 % of the area is covered, so vaporization is reduced from 100% to 9.31%, an over 90% reduction in surface area and thus an over a 90% reduction in vaporization amount.

By circumscribing a regular hexagon around each ball we can determine the area of the ball and the area of the hexagon around the ball. The difference between these two areas is the open area of surface left for potential vaporization. Since each ball is right next to the neighboring ball, the regular hexagons are right next to each other and all of the area is accounted for. For the three (3) inch balls used at MEP, the area a ball occupies is  $A_{BALL} = \pi r^2$ , where "r" is the radius of the ball or 1.5 inches. The equation leads to a ball area of 7.06858 in².

As shown in <u>Attachment One</u>, when we circumscribed a regular hexagon around a ball we see that "s", one side of the regular hexagon can be determined form the equation, sine  $60^{\circ}$  = side opposite / hypotenuse or radius "r" / side "s", since a regular hexagon is composed of six (6) equilateral triangles. This produces an equation of 0.8660254 = 1.5 / "s" or "s" = 1.73205 inches. The area of a regular hexagon is  $\Lambda_{\text{HEXAGON}} = (3/2)(\sqrt{3})(s^2)$ , =  $(3/2)(\sqrt{3})(1.73205)^2 = 7.79422$  in². The difference between the two areas, (Area Hexagon- Area Circle), (7.79422 - 7.06858) equals 0.72564 in². This is the open area of the hexagon that is left after the ball in inserted in the hexagon and the area that vaporization / evaporation can still take place from. Therefore, the open area of 0.72564 in² divided by the total area of the hexagon 7.79422 in² equals the percent of the area left open to vaporization, which is 0.0931 or 9.31 percent. The ball covers 90.69 percent of all the area of the hexagon drawn around the ball, so vaporization is decreased by 90.69%.

 In <u>Attachment Two</u> we have a table from ECC, LLC the manufacturer / distributor of the HDPE balls showing what happens to evaporation with one layer of three inch balls and with two layers of three inch balls for temperatures ranging from 70 degrees to 160 degrees Fahrenheit. The results indicate that a second layer of balls only has a slight impact of evaporation losses, 0.005 to 0.070 quarts per square foot hour. Therefore the 90.69 % decrease in vaporization / evaporation that a single layer of balls provides would not be significantly improved by adding a second layer of balls.

- 3) In <u>Attachment Three</u> we have information from the manufacturer / distributor pertaining to the net material, its chemical compatibility and weather resistance along with how the netting will be held in place. The netting is made from the same high density polyethylene material as the three-inch balls. The high density polyethylene chemical resistance guide indicates that the material is satisfactory for both Ammonia, NH3, (100% dry gas) and Ammonium Hydroxide, NH4OH. The netting is a four inch stretched mesh that is cut and hung square with the containment structure to form two inch square openings. The netting will be tied by high density polyethylene ropes to anchors on the sides of the containment structure.
- 4) <u>Attachment Four</u> contains the manufacturers Inspection and Recharge Recommendations. The balls need to be inspected at least annually for UV degradation or physical damage. The balls need to be replaced every ten (10) years. The netting and netting retention system would also be checked for UV degradation on an annual basis. Any replacement of balls or repair to netting or tie down ropes would be with similar high density polyethylene materials.
- 5) The semi-annual HDPE ball and netting inspection form is enclosed in <u>Attachment 5</u>. This form will be filled out every six months based upon work orders issued by the Mariposa Energy automated maintenance system, MAXIMO. Also, every nine years, the system will issue a work order for the replacement of the balls and netting.
- 6) As indicated by the drawings in <u>Attachment 6</u> the aqueous ammonia storage tank is located near both a fire hydrant and water cannon. Drawing G-PE001, Equipment Location Plan, shows the general arrangement of the Mariposa facility and the aqueous ammonia tank located at the north end of the facility. Drawing M-IP01, Fire Protection Plan, indicates the fire water loop around the facility along with the water cannon west of the aqueous tank and the hydrant east of the area. Finally, Drawings P-PU121 and P-PU122 show the underground piping leading to the two firefighting resources and that they are both approximately 65 feet from the aqueous ammonia tank.

# Annational trends [10]

- Currently additional information on the application of these HDPE balls as "passive mitigation" for 19% aqueous ammonia applications is being complied and will be forwarded to you shortly.
- 8) The Mariposa Energy facility is located on approximately 10 acres within a 158 acre property owned by Kelso Landworks, LLC. The closest property line form the aqueous ammonia tank is approximately 1,103 feet to the south of the facility.

We hope that we have been able to respond to most of your questions with enough detail so that your concerns are addressed. We continue to obtain information on question 7) and will provide additional information on where the HDPE ball systems have been accepted as "passive mitigation" by Federal RMP standards. It is also possible that the California Energy Commission may provide you some information on the application of the HDPE ball systems as "passive mitigation".

If you have any additional questions as to the application of this system as passive mitigation for a potential 19% aqueous ammonia spill, please feel free to forward them to us and we hope that these responses assist you in your evaluation of our application.

Sincerely,

the bulsenola

AGENCY ALEX BRISCOE, Agency Director

April 8, 2013

Mr. Bo Buchynsky Marlposa Energy, LLC 333 S. Grand Avenue, Suite 1570 Los Angeles, CA 90071 DEPARTMENT OF ENVIRONMENTAL HEALTH Certified Unified Program Agency (CUPA) 1131 Harbor Bay Parkway, Suite 250 Alameda, CA 94502-6577 (510) 587-6700 FAX (510) 337-9335

RE: California Accidental Release Response Plan (Cal ARP) / Risk Management Plan (RMP) for Mariposa Energy Power Plant at 4887 Bruns Road, Byron, CA 94514

Dear Mr. Buchynsky,

Mariposa Energy LLC (Mariposa) submitted a California Accidental Release Response Plan (Cal ARP) document on March 29, 2012 in response to Alameda County Department of Environmental Health (ACDEH) requirement to prepare and submit the Cal ARP /RMP Plan.

Mariposa Energy Project will store and use about 8500 gallons of 19% aqueous ammonia in a selective catalytic reduction system to control nitrogen oxide emission from the natural gas combustion process for generation of electricity. The quantity of ammonia exceeds the Cal ARP threshold quantity for ammonia (500 pounds). The facility was therefore required to prepare and submit a California Accidental Release Response Plan prior to the date on which a regulated chemical, namely the ammonia, is first present on site in a process above the listed threshold quantity (CCR Title 19, Division 2, Chapter 4.5 Section 2745.1(d)).

By submitting the RMP plan, Mariposa has fulfilled the requirement of CCR Title 19, Division 2, Chapter 4.5 section 2745.1(d)). As a result, Mariposa Energy is allowed to bring in the chemical 19% aqueous ammonia at their Byron facility provided the secondary containment testing for the tank system containment has been completed and compliance with the California Fire Code and ASME requirements had been met. A copy of the test result shall be submitted to ACDEH.

In response to Mariposa Energy letter dated February 6, 2013 regarding the use of HDPE balls for vapor reduction of ammonia release and determination of applicability of Program Level 1(one) to the system, the following issues /concerns need to be addressed:

a. Based on the ammonia concentration and the quantity of ammonia and RMP*Comp plume model, the Mariposa ammonia system is in Cal ARP Program Level 2.

Mr. Bo Buchynsky Re: Mariposa Energy - 4887 Bruns Rd., Byron, CA April 9, 2013 P a g e | 2

> In the absence of scientific test data for actual ammonia vapor reduction with such system, evaluation and verification that 90% vapor reduction using the HDPE balls is not available at this time. Therefore, the facility ammonia system will be in Program Level 2 and is required to comply with Program Level 2 applicable Cal ARP requirements. In addition, management of change and lock out/ tag out are recommended to be incorporated in the RMP plan.

Scientific test data to support 90% vapor reduction of 19% ammonia solution at temperature of 100 deg F.

The 90% vapor reduction is based on area calculation. Please provide scientific test result if any, with 19% ammonia to support the theory. What happens if the ball is damaged? According to available information cracked/ damaged ball, will sink (?) exposing more area unless it is replaced. Also BP of 19% ammonia solution is 84° F. Since the vapor pressure of NH3 is greater than the vapor pressure of water, the ammonia is expected to come out first. We therefore, are not sure that the 90% reduction will be the actual vapor reduction.

c. Use of single layer of balls instead of multiple layers -how will it affect the vaporization?

ACDEH has reviewed the statement provided by the manufacturer. In other neighboring jurisdiction, where such balls are in use, both of the existing facilities have multiple layers, actually 5 or 6 layers of such balls. In case of damaged ball, there are multiple layers to continue the protection. Please provide the reasoning for using a single layer instead of multiple layers.

#### Inspection and Maintenance Issues:

- a. Information of the customized net material, chemical compatibility and weather resistance; how it will be held in place?
   According to the information submitted, the balls will be held in place with a customized net of the same material as the balls.
- b. In the existing facilities in the neighboring jurisdiction, there is metal grid, not the net to keep the balls in place. A metal grid will support personnel conducting inspection. A net on the other hand lacks such rigidity /structure.
- c. What is the containment structure for the netting?

Mr. Bo Buchynsky Re: Mariposa Energy - 4887 Bruns Rd., Byron, CA April 9, 2013 Page | 3

> Please explain/describe "the netting is a four inch stretch mesh that is cut and hung square with the containment structure to form two inch square opening".

Is there a photograph of such netting in place? A visual will be helpful.

- d. Byron is a high wind area. Will the net be strong enough to keep the balls in place or will allow the balls to move around?
- e. What will happen to the rain water that will collect underneath the netting?

It appears that the secondary containment volume submitted may be inadequate since there will be a reduction in available volume for containment of the largest container, the tank and 24 hours of rain based on 25 years of history of rainfall, due to the balls. Please submit containment calculation taking the balls volume into account.

- f. Inspection frequency, balls replacement conditions, complete recharge of the balls - when and how often
  - Information provided states that the balls will be inspected annually at a minimum, but who and how the inspection will be done are not included.
  - Manual inspection -how will it be done since no one can walk on net.
     Please provide the inspection procedure for 22000 of such balls.
  - Byron is an area with extreme weather conditions, high wind and high temperature. In the neighboring jurisdiction the containment is much deeper; 4-5 feet deep compared to 2 feet at Mariposa.

We recommend more frequent inspections in the beginning to establish a baseline.

g. Fire suppression system at the tank site.

The existing two facilities with aqueous ammonia have foam deluge system (information obtained). With fire suppression water, the question comes up regarding the containment as to whether the balls will be able to be held in place with the force of the water cannon. The containment calculation did not include the fire suppression water.

ACDEH recommends the containment to be able to contain 20 minutes of sprinkler water flow per Fire Code requirements.

Mr. Bo Buchynsky Re: Mariposa Energy - 4887 Bruns Rd., Byron, CA April 9, 2013 P a g e | 4

- Evidence if any, that the balls are accepted by Federal RMP as 'passive mitigation' for 20% ammonia solution.
   Pending
- Multiple distances of the stationary source to the property line -1120 feet on the south side is submitted from the property line, while 20 meters is stated in the on-line RMP posted by Mariposa Energy. Please clarify.

Please provide a written response to our comments by July 8, 2013.

If you have any question, please contact Sukla De at 510-304-5446 / sukla.de @acgov.org or me at 510-567-6780 / susan.hugo@acgov.org

Sincerely,

Susan Hugo // CUPA Program Manager

Subject: Mariposa Energy Project Risk Management Plan Supplemental Information

Dear Ms. Hugo:

CH2M HILL is please to submit this supplemental information or behalf of Mariposa Energy, LLC. (Mariposa Energy). This information has been prepared as follow up to our discussions and your request for additional information during the meeting at the Alameda County Department of Environmental Health (ACDEH) office on June 26, 2013. We have prepared additional information related to the following topic areas, as discussed in detail in the sections below and attachments to this letter:

- CalARP facilities currently using poly balls for offsite release mitigation
- OCA modeling results without poly ball evaporation rate reduction
- "Public Receptor" definition guidance

#### CalARP Facilities Currently Using Poly Balls for Offsite Release Mitigation

CH2M HILL conducted a search for California RMP facilities using poly balls for aqueous ammonia systems using the Right-To-Know Network search tool available on-line (<u>http://www.rtknet.org/db/rmp</u>). Since the source of these data is the EPA RMP Registry, it does not capture CalARP RMP facilities with aqueous ammonia concentrations below 20 percent. The search was performed for all power generation facilities using applicable industry NAICS codes. Additionally, key word searches were used to identify facilities that specifically listed poly balls as mitigation. The limitations of this search approach are 1) facilities with aqueous ammonia concentrations below 20 percent were not captured, and 2) mitigation measures such as poly balls are not consistently listed in the submittal data. Therefore, it is highly likely that we were not able to identify all CalARP facilities using poly balls with aqueous ammonia systems.

The results of this search are presented in Attachment 1, including CalARP program level, ammonia concentration, ammonia quantity, and offsite consequence model approach for each facility. In addition to the EPA database search results, CH2M HILL provided information for several power generation facilities based on our staff experience. Attachment 1 demonstrates the variety of approaches used for OCA analyses, and that a majority of the facilities with 19 percent aqueous ammonia were approved as Program Level 1. Three facilities using poly balls were identified; each is discussed below.

#### Criterion Catalyst

CH2M HILL corresponded with Criterion Catalysts & Technologies L.P. in Bay Point, California (personal communication between Doug Urry of CH2M HILL and Mr. Jeffry Luengo, Health, Safety, Security, and Environmental Manager at Criterion Catalyst on July 9, 2013). Criterion Catalyst has a 21,300-gallon tank of 29 percent by weight aqueous ammonia. The facility uses two types of balls, including a layer of black UV-resistant balls as the top layer to resist sun damage. The first set of balls lasted 7 years, and the current set of ball has been in place over 7 years. Criterion Catalyst replaces the entire set of balls when approximately 20 percent show signs of damage during their annual inspections. For the purposes of the OCA, Criterion assumes a single layer of balls (90 percent surface reduction), however they maintain approximately two layers of non-UV resistant balls plus a top layer of black UV-resistant balls. Criterion Catalyst is a Program Level 1 facility with oversight by Contra Costa County Health Services; additional information from the EPA database is provided in Attachment 2.

#### **Cosumnes Power Plant**

CH2M HILL corresponded with the operator of the Cosumnes Power Plant (personal communication between Doug Urry of CH2M HILL and Mr. Frank Miller, Facility Manager, on July 26, 2013). The Cosumnes Power Plant includes a 15,000-gallon tank of 29 percent aqueous ammonia for the emissions control system. The facility uses a single layer of polypropylene balls in their secondary containment system for additional passive mitigation. Cosumnes Power Plant is a Program Level 1 facility; the distance to the nearest public receptor is 451 feet. Cosumnes Power Plant is located in Herald, California; the local CUPA is Sacramento County Environmental Management Department. Additional information from the EPA database is provided in Attachment 2.

#### UCSF Cogen

The UCSF Cogen facility is unique facility in that the ammonia system is indoors. The facility includes an 8,000gallon underground tank of 29.5 percent aqueous ammonia for the emissions control system. Based on information received from USCF staff (personal communication between Doug Urry of CH2M HILL and Mr. Travis Clark, Environmental Programs, UCSF on July 9, 2013), UCSF has a highly redundant spill mitigation system because they are located in a residential area with the nearest residence approximately 50 feet away. Approximately 2-3 layers of poly balls are used in conjunction with other safety measures to mitigate any potential spill during ammonia delivery. USCF Cogen is a Program Level 2 facility with oversight by San Francisco Department of Public Health; additional information from the EPA database is provided in Attachment 2.

#### OCA Modeling Results Without Poly Ball Evaporation Rate Reduction

CH2M HILL performed supplemental OCA modeling to provide results without including the liquid surface area reduction from the use of poly balls in the secondary containment basin. This analysis was performed using the same methodology and parameters used for the previous OCA submitted with the March 2012 RMP to facilitate a direct comparison with and without the surface area reduction using poly balls. The analysis presented in Attachment 3 demonstrates that the maximum toxic endpoint distance (distance to 198 ppm) would not exceed 49.5 feet from the ammonia tank, and therefore would not extend beyond the facility fence line with or without accounting for the additional poly ball mitigation that Mariposa Energy has implemented. As noted above, this OCA methodology has been widely used for aqueous ammonia OCAs and has been accepted by CUPAs as well as the California Energy Commission.

#### "Public Receptor" Definition Guidance

As discussed during our meeting on June 26, 2013, we have compiled a summary of regulatory definitions and guidance relating to the determining the closest public receptor location.

#### CalARP Regulations, 19 CCR Section 2735.3 (nn)

Public receptor means offsite residences, institutions (e.g., schools, hospitals), industrial, commercial, and office buildings, parks, or recreational areas inhabited or occupied by the public at any time without restriction by the

stationary source where members of the public could be exposed to toxic concentrations, radiant heat, or overpressure, as a result of an accidental release.

#### CalARP Regulations, 19 CCR Section 2735.3 (ee)

Offsite means areas beyond the property boundary of the stationary source, and areas within the property boundary to which the public has routine and unrestricted access during or outside business hours.

#### Federal RMP regulations have the same definitions (40 CFR 68.3)

Public receptor means offsite residences, institutions (e.g., schools and hospitals), industrial, commercial, and office buildings, parks, or recreational areas inhabited or occupied by the public at any time without restriction by the stationary source where members of the public could be exposed to toxic concentrations, radiant heat, or overpressure, as a result of an accidental release. Offsite means areas beyond the property boundary of the stationary source, and areas within the property boundary to which the public has routine and unrestricted access during or outside business hours.

# GENERAL GUIDANCE ON RISK MANAGEMENT PROGRAMS FOR CHEMICAL ACCIDENT PREVENTION (40 CFR PART 68), EPA 555-B-04-001, March 2009, page 2-4 – 2-6 (see Attachment 4)

Not all areas offsite are potential public receptors. The point of identifying public receptors is to locate those places where there are likely to be, at least some of the time, members of the public whose health could be harmed by short-term exposure to an accidental release at your site. The basic test for identifying a public receptor is thus whether an area is a place where it is reasonable to expect that members of the public will routinely gather at least some of the time.

The definition of "public receptor" itself specifies the types of areas where members of the public may routinely gather at least some of the time: residences, institutions such as hospitals and schools, buildings in general, parks and recreational areas. There should be little difficulty in identifying residences, institutions and businesses as such, and virtually any residence, institution and business will qualify as a public receptor, even when the property is used only seasonally (as in a vacation home). Notably, a residence includes its yard, if any, and an institution or business includes its grounds to the extent that employees or other members of the public are likely to routinely gather there at least some of the time for business or other purposes (see discussion of recreational areas below). The only circumstances that would justify not considering such a property a public receptor would be where your facility owns or controls the property and restricts access to it, or no member of the public inhabits or occupies it at any time.

Roads and parking lots are not included as such in the definition of "public receptor." Neither are places where people typically gather; instead they are used to travel from one place to another or to park a vehicle while attending an activity elsewhere. However, if a parking lot is predictably and routinely used as a place of business (e.g., a farmer's market) or for a recreational purpose (e.g., a county fair), it would qualify as a public receptor.

In general, farm land would not be considered a public receptor. However, if farm land, or a portion thereof, is predictably and routinely occupied by farm workers or other members of public, even if only on a seasonal basis, that portion of the land would be a public receptor.

#### Conclusion

Regulated processes can qualify for Program Level 1 if the distance to a toxic or flammable endpoint for a worstcase release assessment is less than the distance to any public receptor. CalARP regulations have the same basic definitions as the federal RMP regulations for "offsite" and "public receptor". Roads are generally not public receptors. Per EPA guidance, the basic test for whether public receptors are present is whether it is a place where it is reasonable to expect that members of the public will routinely gather at least some of the time.

#### Closing

Mariposa Energy understands you have general concerns about the certainty of a single layer of poly balls achieving a 90 percent reduction in evaporation rates corresponding to the equivalent reduction in surface area. Based on this concern, Mariposa Energy proposes to double the quantity of poly balls within the containment basin. The additional layer will add redundancy to the system to achieve an evaporation rate reduction in excess of 90 percent, in the event of an aqueous ammonia release.

As discussed in the sections above, the approach used for preparation of the March 2012 RMP was consistent with RMPs for other power generation facilities throughout California. SLAB is an EPA-approved offsite consequence analysis modeling alternative, and has been commonly used and accepted by the California Energy Commission and numerous CUPAs (see Attachment 1). Several similar facilities have been approved under Program Level 1 by other CUPAs.

In this case, the nearest public receptors are located at a significant distance from the project site. The nearest businesses are the PG&E Bethany Compressor Station and Marie Gomes Farms feedlot, both north of Kelso Road and approximately 2,000 feet (0.4 mile) from the aqueous ammonia tank. Neither of these facilities is regularly manned. The nearest residential receptors are approximately 3,000 feet (0.6 mile) from the ammonia tank. The presence of members of the public is very limited in the project vicinity as there is very limited traffic or activity in the general area of Kelso Road and Bruns Road.

Mariposa Energy has gone to great lengths during the development, design, and construction of MEP to minimize the potential for ammonia releases and any offsite impacts, including the following measures:

- Selection of 19 percent aqueous ammonia for emission controls in lieu of more economical higher aqueous concentrations or anhydrous ammonia
- Using less-efficient refrigerants for turbine inlet air chillers to avoid anhydrous ammonia refrigeration systems
- · Rigorous design ammonia system design based on industry codes and standards
- Construction oversight and inspection by the third-party Chief Building Official
- Secondary containment to control any releases
- Addition of poly balls within the secondary containment basin to further reduce ammonia evaporation and downwind impacts from any release

Mariposa Energy has focused on ammonia system safety and minimizing on-site ammonia concentrations and quantities since the inception of this project. Public receptors in the vicinity are limited and not in close proximity to the MEP site. Additionally, it is worth noting that anhydrous ammonia trailers are commonly seen in the area for agricultural use, without implementation of the rigorous controls listed above.

Based on the information provided to date and this supplemental data, Mariposa Energy respectfully requests that ACDEH approve the Program Level 1 RMP submitted in March 2012. The completed CalARP Program Registration Form is included as Attachment 5. As discussed on June 26, please provide additional guidance to clarify secondary containment basin testing requirements noted in your April 8, 2013 letter to Mariposa Energy.

Thank you again for coordinating and hosting the June 26 meeting to discuss the project. Please contact me at 916.286.0348 or by email: <u>doug.orry@ch2nt.com</u> at your convenience should you have any questions or require further information

Sincerely,

W. Doules L

Doug Urry Senior Project Manager

Executive Summary / (Facility #1 : Cosumnes Power Plant, executive summary: all)

Executive Summary

Sacramento Metropolitan Utility District Financing Authority (SMUDFA) constructed the Cosumnes Power Plant (CPP), a nominal 500 megawatt, natural gas-fired, combined cycle power plant approximately 25 miles south south-east of Sacramento, California. The facility will beis operated by Wood Group Power Operations, Inc. under contract to SMUDFA.

The facility is subject to the California Accidental Release Prevention (CalARP) program because the amount of ammonia stored onsite (18,000 total tank size, administratively controlled to 15,000 gallons of 29 percent ammonia, or approximately 32,625 pounds, as ammonia) exceeds the CalARP threshold quantity (TQ) of 500 pounds. CPP is also subject to the federal Risk Management Plan (RMP) requirements because aqueous ammonia is stored in concentrations of greater than 20 percent, and the total quantity of 32,625 pounds exceeds the federal TQ of 10,000 pounds. Wood Group Power Operations, Inc. prepared this RMP to satisfy CalARP and federal RMP requirements for the aqueous ammonia process at the CPP facility.

Ammonia Hydroxide (700 gallons of 19 percent ammonia (30-40 percent ammonia hydroxide) is also used as a boiler water treatment chemical on-site. The material is stored in 350 gallon totes with a total of no more than 700 gallons at any one time. This brings the total volume of aqueous ammonia onsite to 15,700 gallons, 117,750 total pounds, and 33,625 pounds as ammonia. Both of these were considered one process but due to the inherent size of the aqueous ammonia storage tanks the worst case scenario, off-site consequence analysis assumed a complete release from this

http://data.rtknet.org/rmp/rmp.php?combined_name=cosumnes+power&datype=T&reptyp... 7/25/2013

#### vessel.

The major hazards represented by the CPP aqueous ammonia process are the accidental release of ammonia, a toxic substance, due to spill or rupture of the storage vessel, associated piping system, or during a tanker truck unloading accident.

Wood Group Power Operations, Inc. is concerned with the safety of its workers and individuals living a nd working near CPP. Wood Group Power Operations, Inc. has therefore implemented a number of measures to ensure that it maintains a safe working environment.

Wood Group Power Operations, Inc. prepared an Integrated Contingency Plan for the facility. The Integrated Contingency Plan establishes the facility safety systems, procedures, and administrative controls necessary to prevent an accidental release of ammonia, respond to a release, and minimize the consequences of a release should one occur.

Wood Group Power Operations, Inc. has developed a comprehensive safety training program for all employees, has established detailed material handling procedures, and has adopted safe operating procedures for aqueous ammonia off -loading, storage, and use. Initial emergency response training of facility staff is complete.

The ammonia process is monitored by the plant operator. Ammonia detectors (4) with audible alarms are located adjacent to the ammonia storage tank. The containment area is inspected daily by plant operators for evidence of spills, leaks, or other conditions that may lead to a release.

A seismic analysis was conducted for CPP as part of the licensing process. The CPP facility is designed and constructed to conform to the 2001 California Building Standards Code for Seismic Zone 3. As part of the licensing process, the California Energy Commission (CEC) concluded that the CPP facility (including the aqueous ammonia system) will be adequately constructed to provide seismic safety in the event of an earthquake.

The power plant consists of two General Electric 7FA natural gas-fired combustion turbine generators (CTGs). There are twenty full-time employees, and the facility will be manned 24 hours a day, seven days a week. The North American Industrial Class fication System (NAICS) number for the CPP is 221112, Fossil Fuel Electric Power Generation. CPP is located at 14295 Clay East Road in Herald, California. The facility is located on approximate ly 30 acres in Section 29, Township 6N, Range 8E Mount Diablo base and meridian, adjacent to the Rancho Seco Power Plant. CPP is located on the southeastern quarter of APN 140-0050-010 and on the southwestern quarter of APN 140-0050-008. The site is zoned AG-80, which is compabble with the land use designation for a power generation facility.

CPP uses aqueous ammonia (29 percent concentration by weight) as the reducing agent in the selective catalytic reduction (SCR) pollution control system to minimize emissions of nitrogen oxides (NOx) from the CTGs. Acueous ammonia (31 percent concentration by weight) is also used for pH control of the condensate system. Aqueous ammonia is a hazardous substance regulated under the CalARP and federal RMP programs.

Executive Summary (Facility #1 : Criterior Catalysts &Technolog, executive summary: all)

Executive Summary 1.0 EXECUTIVE SUMMARY

This document is a modified revision to the Risk Management Plan (RMP) dated June 2006 presented to the Contra Costa County Health Services Department (CCCHSD) for the Criterion Catalysts and Technologies L.P. (Criterion) facility at 2840 Willow Pass Road in Pittsburg, California. It fulfills the requirements to submit an RMP under the California Accidental Release Prevention (CaIARP) Program. Criterion qualities for Program Level 1 under the Environmental Protection Agency (EPA) RMP and CaIARP regulations.

This revised RMP summarizes the accidental release prevention and emergency response policies at Criterion that minimize the public's exposure to regulated substances used at the facility. Included is a description of the hypothetical worst-case accidental release of aqueous ammonia (29% maximum concentration) from a 20,500 gallon above-ground storage tank (AST). The process for which aqueous ammonia is used is also presented. Passive mitigation equipment has been installed around the AST to minimize the surface area for evaporation during a spill.

#### Risk Management Plan (RMP) Facilities with facility, parent, or owner or operator name( ... Page 2 of 10

Vanadium pentoxide, included in the RMP submittal dated June 2006, is no longer used at the Criterion facility in Pittsburg and is excluded in this revised RMP.

#### 1.1 ACCIDENTAL RELEASE PREVENTION AND EMERGENCY RESPONSE POLICIES

Since Criterion is ISO 9001 certified, there are several programs in place designed to maintain the safe operation, installation, and modification of process equipment at the facility, and to minimize errors and accidents. Criterion is committed to being a responsible member of the community by operating in a safe and environmentally sound manner. This commitment is documented in the company's policy on health, security, safety and environmental (HSSE) performance. Included in this policy are the following statements:

"Criterion and Criterion's parent companies CRI/Criterion and Shell Oil are committed to:

Pursue the goal of no harm to people

Protect the environment

Manage HSSE matters as any other critical business activity

Continuously improve our HSSE Performance

Be recognized to be among the best in our industry in HSSE performance

Promote a culture in which all CRI/Criterion and Shell Oil employees share these commitments

We believe that:

All occupational illnesses, injuries and environmental incidents are preventable

Each individual is personally responsible for their own safety and for following established practices and procedures

Line Management is accountable for HSSE performance"

The HSSE Management System is designed to ensure compliance with the law and to achieve continuous performance improvement.

The HSSE policy is implemented through Criterion's Management System which is designed to identify and manage risk. Although not subject to California's Occupational Safety and Health Administration (OSHA) Process Safety Management requirements, Criterion has developed several similar procedures to protect the health and safety of their workers, the public, and the environment. The following summarizes portions of the Management System that are most closely aligned with OSHA's Process Safety Management requirements:

Management of Change

Criterion has a Management of Change (MOC) procedure requiring a comprehensive review of all proposed process changes. Projects including installation of new equipment must be evaluated by the appropriate department managers (e.g., technical, operations, maintenance, safety, and environmental). Written documentation of department approvals, hazard evaluation, changes in process and instrumentation drawings (P&IDs), and operating procedures are maintained.

Pre-Startup Safety Review

## Risk Management Plan (RMP) Facilities with facility, parent, or owner or operator name(... Page 3 of 10

As part of the MOC process, Criterion requires that new or modified equipment meet all design requirements prior to operation. This review includes updating P&IDs, employee/contractor training, documenting operating/maintenance/safe

ty/emergency procedures, environmental permits, chemical information (including material safety data sheets [MSDS]), and information on technology/equipment.

#### Contractors

Criterion's contractor management program requires HSSE review of each contractor. All contractors are required to complete training on the hazards and emergency response activities at the facility prior to starting work. Contractor activities are monitored to verify safe work practices and appropriate training.

Safety Work Permits/Hot Work Permits/Confined Space Permits

All equipment installation and maintenance work requires use of a work permit process, including issuance of safety work permits for general work, hot work permits, and confined space permits when applicable. Each Safety Work Permit identifies the work to be performed, equipment involved, precautions to be taken, dates, and authorized signatures. For Hot Work Permits, fire prevention measures are also included. Criterion staffs a confined space rescue team, which must be present during confined space entries. Copies of all permits are maintained.

#### Training

To ensure that processes are operated by competent individuals, training is a key component of Criterion's Management System. Initial training is given to employees at the time of hire. Subsequent training is given when there has been a change to relevant systems. On-the-job-training qualification is required for each operator.

Incident Investigation

Each HSSE incident or near miss incident involving an RMP/CalARP material is analyzed and evaluated to determine the underlying cause(s). A Root Cause Analysis (RCA) is conducted and appropriate corrective actions to prevent recurrence are determined. Risk analysis is used to prioritize established actions and records are maintained to track these actions to completion.

Process Safety Information

Criterion maintains copies of all MSDS for all raw materials and substances used at the facility. A list of maximum inventory and largest container s for all regulated substances is maintained. MSDS and inventory data is updated as necessary. MSDS's are maintained electronically on the network drive to allow access to all employees and also with two hard copies (Guard Shack and HSSE Department). Inventory information (i.e., Business Plan) is maintained at the HSSE department.

Process Hazard Review

## Risk Management Plan (RMP) Facilities with facility, parent, or owner or operator name( ... Page 4 of 10

As part of the Management of Change procedures at the facility, safety and operating hazards are evaluated for new or modified equipment. Appropriate personnel involved with the equipment operation, maintenance and safety participate in the hazard review. The review is designed to identify the hazards of the process, possible equipment failures, and safeguards to prevent failures or errors. Results of the hazard review, along with any design changes, are incorporated into the project.

Operating Procedures

Written procedures for aqueous ammonia and other bulk liquids are located in the H2 Plant Operating Procedures. Procedures include handling, off-loading, and tank line-up for ammonia service.

#### Maintenance

Criterion has a preventive maintenance/inspection program established for process equipment and tanks. Ultrasonic thickness (UT) testing is conducted on the aqueous ammonia tank. The passive mitigation vapor suppression balls are evaluated annually and replaced if necessary. Criterion's maintenance department conducts preventive maintenance to assure mechanical integrity of the aqueous ammonia tank & associated pumps.

**Compliance Audits** 

Criterion's Management System includes a compliance auditing component made up of internal compliance audits as well as external assessments by Criterion's parent companies (CRI/Criterion and Shell). HSSE performance compliance issues are documented and require prompt follow up with action plans to prevent reoccurrence.

**Emergency Procedures** 

Emergency procedures have been esta

blished at the Criterion facility. These include response and management of any accidental release and/or injury that may pose an impact to the community. These procedures are included in the Hazardous Material Business Plan (HMBP) submission annually. Emergency response activities for RMP/CaIARP and other hazardous materials are coordinated with the Contra Costa County Hazardous Material Team or the San Ramon Valley Hazardous Material Team. Emergency response activities for medical, rescue and other emergencies are coordinated with Contra Costa Fire, located two blocks from the facility.

1.2 DESCRIPTION OF FACILITY

Criterion's Pittsburg facility manufactures a variety of catalysts for the oil manufacturing industry. Products manufactured are dry solids, containing alumina oxide, and other metals. The primary products are hydrotreating catalysts, an aluminum oxide based catalyst for petroleum refineries. Aqueous ammonia is the only regulated compound used above threshold quantities and is subject to EPA's RMP and CalARP programs.

1.3 DESCRIPTION OF CHEMICAL USAGE

#### Risk Management Plan (RMP) Facilities with facility, parent, or owner or operator name( ... Page 5 of 10

Figure 1 is a simplified block diagram illustrating the equipment connected in the aqueous ammonia process. One 21,300-gallon aqueous ammonia storage tank is located onsite. There is an independent high level alarm set at 20,500 gallons, which will prevent more than 20,500 gallons being loaded into the tank. A maximum of 20,500 gallons (160,000 pounds) of 29% aqueous ammonia may be stored at ambient conditions and is used in two operations manufacture of hydrotreating catalyst and air pollution control.

Manufacture of Hydrotreating Catalyst

Aqueous ammonia is used as a process material during the manufacture of hydrotreating catalyst and is pumped as a liquid into mixing equipment and blending tanks. Generally, the manufacture of hydrotreating catalysts can be described as the following process:

& #8195,

1. Raw materials (including aqueous ammonia) are mixed in a tank.

2. The reaction creates an intermediate product which is removed, dried in an oven, and subsequently dried in a killi-

The intermediate product is infused with a metal salt solution (including aqueous ammonia), kills dried, screened, and packaged.

Air Pollution Control

Criterion also uses aqueous ammonia to recuce air emissions in selective catalytic reduction (SCR) air pollution abatement equipment. Criterion operates two SCR systems to reduce emission of nitrogen oxides (NOx). In these operations, aqueous ammonia is pumped to an ammonia skid at each SCR, filtered, vaporized, and subsequently injected into the process gas stream to convert NOx into nitrogen and water prior to discharge to the atmosphere. The ammonia is consumed in the process.

1.4 THE WORST-CASE RELEASE SCENARIO

Criterion's offsite consequence analysis (presented in the June 2006 RMP submittal) utilizes the EPA's 1996 RMP Offsite Consequence Analysis Guidance, and computer dispersion modeling to estimate impacts of potential worst-case scenario (WCS) from the aqueous ammonia and vanadium pentoxide processes. Vanadium pentoxide is no longer used at the facility and no changes have been made in aqueous ammonia storage and use. Therefore, results from the June 2006 dispersion modeling submittal regarding aqueous ammonia are presented herein. The Off Site Consequence Analysis from the June 2006 RMP submittal (reflecting aqueous ammonia only) is included in Appendix A.

Aqueous Ammonia Process

The WCS associated with the Criterion's aqueous ammonia process is the catastrophic failure of the aqueous ammonia storage tank resulting in the release of 20,500 gallons of 29% concentrated aqueous ammonia solution over a 10minute period. In reality, this event is extremely unlikely since Criterion has many control measures in place preventing this type of event. The aqueous ammonia storage tank is located inside a concrete containment area, and any release would be contained wit

hin the 800 square foot (ft2) diked area. In addition, the containment area is filled with small polypropylene balls that would float on top of the liquid surface, reducing the exposed surface area for evaporation by 90%, and resulting in an effective surface area for evaporation of 80 ft2.

### Risk Management Plan (RMP) Facilities with facility, parent, or owner or operator name( ... Page 6 of 10

According to EPA's 1996 RMP Offsite Consequence Analysis Guidance, using urban conditions and default values for 30% aqueous ammonia solution, the distance to the toxic endpoint of 0.14 milligrams per liter (mg/L) (200 parts per million [ppm], ERPG-2 for ammonia) for the WCS is 0.06 miles (317 feet). This distance from the aqueous ammonia storage tank is within the property boundary, and there are no public receptors within 317 feet of the tank. The Criterion facility has not had an aqueous ammonia release meeting the accident history criteria for five years and emergency response procedures have been coordinated with local emergency planning and response organizations. Therefore, Criterion's aqueous ammonia process gualifies for Program Level 1 under the EPA RMP and CaIARP regulations.

1.5 THE GENERAL ACCIDENTAL RELEASE PREVENTION PROGRAM AND CHEMICAL-SPECIFIC PREVENTION STEPS

Criterion management realizes the importance of establishing administrative and technological safeguards to ensure the safety of workers and the continued safety of public receptors. There are no current recommendations planned for implementation in this RMP plan. Section 1.8; Planned Changes to Improve Safety remains as a place holder for future ideas and plans. The safeguards shown in Table 1 include all the implement ideas for both administrative and technological safeguards that prevent, detect, or mitigate releases of aqueous ammonia.

1.6 THE FIVE-YEAR ACCIDENT HISTORY

Criterion has not had any accidental releases involving aqueous ammonia or other extremely hazardous substances that resulted in deaths, injuries, or significant property damage onsite, or known offsite deat hs, injuries, evacuations, sheltering in place, property damage, or environmental damage. Criterion reviewed incident investigations from June 2006, the date of the previous RMP submittal. This five-year accident history review satisfies the requirements of Section 2750.9 of the CalARP regulation. The purpose of conducting an accidental release review is to promote an informed community while also documenting that accidental releases are investigated and concrete changes are made to protect against reoccurrence.

Criterion has established procedures to investigate accidents and recommend changes to operations to minimize the likelihood that a similar accident might occur again. Although not required under Program Level 1 of the CalARP regulations, Criterion has voluntarily adopted many of the procedural requirements required for a Level 3 facility. These procedural requirements are highlighted under Section 1.1, Accidental Release Prevention and Emergency Response Policies at Criterion.

1.7 THE EMERGENCY RESPONSE PROGRAM

Criterion's emergency response program was developed to comply with Title 19 of California Code of Regulations (T19 CCR2731, AB2185 Business Plan) and emergency action plan requirements under Title 8 of California Code of Regulations (T8 CCR3220, HAZWOPER standard). Criterion has coordinated emergency response plans with local officials and satisfies the requirements of Section 2735.4(c)(3) of the CalARP regulation.

Criterion has developed the emergency response program to minimize the effects of accidental releases of hazardous compounds to employees. Computer dispersion modeling, along with using the EPA's RMP Offsite Consequence Analysis Guidance document, has demonstrated that worst-case releases of aqueous ammonia would not impact any public receptor. The site does not maintain an active hazardous material response team. Any Criterion employees associated with a large scale emergency response with contractors or outside

agencies are only for administrative and coordination of the response and are considered a non-responders. Large scale emergency response scenarios involving aqueous ammonia (or any other hazardous material) are coordinated with Contra Costa County Health Services Hazardous Materials personnel and/or outside emergency response contractors. For very small spills that do not put employees or the community at risk, Criterion's personnel will use proper personal

Risk Management Plan (RMP) Facilities with facility, parent, or owner or operator name(... Page 7 of 10

safety equipment as required by the material's MSDS.

Criterion's emergency action plan contains detailed spill, injury, fire, and other emergency response procedures as well as the performance of emergency training, evacuation, and notification.. The emergency action plan includes instructions and lists the telephone numbers of agencies and individuals that are to be contacted in the event of an emergency situation (e.g., fire, hazardous material spill, injury). The agencies and individuals to be contacted include emergency responders (e.g., Fire Department/Haz Mat Team), internal plant contacts (e.g., Plant Manager), and those required to request public notification sirens according to the following protocol:

1. The Day Supervisor or Team Lead will determine the level of the incident.

a. If the incident is a Level 2, the Day Supervisor or Team Lead will notify the Plant Manager or Operations Manager or HSSE to determine whether to sound the siren and/or order a SIP depending upon wind direction and the type of release and whether the downwind public could be impacted.

b. If the incident is a Level 3, the Day Supervisor or Team Lead will notify the Plant Manager or Operations Manager or HSSE that they will be notifying CCHS to sound the siren.

c. The Day Supervisor or Team Lead will then call CCHS and advise them to sound the alarm/SIP..

 The operations supervisor will update CCHS at least once per hour for levels 2 (which required sounding the alarm or a SIP), or 3 until plant management arriv es.

3. If a unified incident command is created, they will take the lead communication with CCHS.

4. If no unified incident command is created, the Day Supervisor or Team Lead will have responsibility to communicate with CCHS.

"Emergency Response Notification Forms" are completed when notifying an agency and document when the telephone calls were placed and the name and position of the person contacted. All completed notification forms are maintained.

CCCHSD performs a triennial audit of the RMP/CalARP programs, as well as periodic unannounced inspections of all areas in their jurisdiction (including RMP/CalARP) as the local CUPA. The Fire Department conducts annual inspections of Criterion's processes. Criterion has discussed the details of hazardous materials maintained onsite and mitigating measures available with CCCHSD personnel and the Fire Department. The emergency response program is reviewed annually to ensure that it remains accurate and current. Employees are trained on the emergency response program when initially hired, after changes to the emergency response plan, and when employees' responsibilities are changed. Facility personnel are trained on safety issues and appropriate material handling procedures.

1.8 PLANNED CHANGES TO IMPROVE SAFETY

Although facilities with Program Level 1 processes are not required to develop additional safety measures to prevent offsite impacts from accidental releases, Criterion is continually evaluating potential improvements to worker safety that could minimize a potential release of a hazardous material. Recommendations for improvement routinely come from safety meetings, equipment inspections, technology improvements and employee suggestions. There are no current planned changes to the ammonia system and Table 1 incorporates all the implemented ideas from pre vious plans.

Executive Summary ' (Facility #1 . University of California San F, executive summary all).

Executive Summary Section 1: Executive Summary

This section is specified in 40CFR68.155 and 19CCR2745.3

The University of California, San Francisco (UCSF) at its Parnassus Heights Campus generates power and steam at the Central Utilities Plant (CUP). The plant provides electricity, steam and chilled water to meet current and future campus demand. The CUP contains two gas turbine generators rated at 4.75 megawatts (MW) each, two heat recovery steam generators (HRSGAs) and associated duct burners, two steam turbine generator (rated at 3.75 MW), two auxiliary boilers (each rated at 90,000 lb/hr of steam), and three diesel generators (each rated at 2 MW) for emergency electric power.

In order to meet the nitrogen oxides (NOx) emissions limit required by the Bay Area Air Quality Management District's (BAAQMD) Regulation 9, Rule 7, the two HRSGAs and two gas turbines are equipped with a selective catalytic reduction (SCR) system. The SCR system uses ammonia, in the presence of a catalyst, to convert NOx contained in the gas turbine exhaust into nitrogen gas and water vapor. The ammonia gas is obtained from a 29.5% solution of aqueous ammonia (aqua ammonia) which is stored in an 8,000-gellon steel underground storage tank located on UCSF property at the corner of Parnassus Avenue and Medical Center Way. Aqua ammonia was chosen over anhydrous ammonia because it is significantly less hazardous. The aqua ammonia system consists of unloading, storage, transfer, vaporization and injection systems.

The aqua ammonia unloading system will receive and transfer the contents of the delivery tanker truck from the unloading station to the underground double wall steel storage tank in the containment structure. This tank is anchored to a concrete slab in a pit filled with pea gravel and covered by the containment building floor slab. All lighting and equipment in the building are designed as Aexplosion proofA. Smoking and other ignition sources in the vicinity of the containment structure w

ill be strictly forbidden. Outside the containment structure, bollards (steel cylindrical posts filled with concrete) are placed at strategic locations to prevent traffic from impacting the containment structure.

Deliveries to the containment structure are prescheduled between UCSF and the deliverer. The route of the delivery truck to Parnassus Avenue have been discussed with interested UCSF neighbors and representatives from the San Francisco Fire Department (SFFD), Local Emergency Planning Committees (LEPCAs), and San Francisco Department of Public Health Hazardous Materials Unified Program Agency (SFDPH/HMUPA). The delivery truck is met by a UCSF plant operator at the entrance of the containment structure. Prior to delivery, appropriate containment structure systems are activated such as the ventilation system. The UCSF plant operators remains at the containment structure until the unloading process is completed. After the delivery truck reaches Parnassus Avenue, it proceeds easterly crossing Medical Center Way and entering the west end of the containment structure.

Once the truck is inside the containment structure, the doors are lowered, hose connections are made, and the driver and UCSF operator enter the vestibule/observation room. From the vestibule/observation room, the driver and UCSF operator initiate the unloading process (transfer by gravity) and monitor its progress until completion. The filled storage tank contains an approximate thirty-day supply of aqua ammonia; however, regular deliveries to refill the tank are planned at 30-day intervals by a 3500-gallon tanker truck. The 30-day supply provides for potential deferrals of deliveries in inclement weather without depleting the tank supply. Upon completion of delivery, the hose is uncoupled. It should be noted that the hose coupling is a dry lock coupling type similar to those used in gasoline transfer hoses. The east end door is then raised and the delivery truck will drive out and p

roceed easterly along Parnassus Avenue. This delivery configuration (Adrive throughA) will maintain traffic flow along Parnassus Avenue and Medical Center Way. No backing maneuvers are required by the driver nor is the delivery truck required to drive on Medical Center Way. The Adrive-throughA procedure minimizes impact on both vehicle and pedestrian traffic.

The aqua ammonia transfer system will convey aqua ammonia as needed from the storage tank to the CUP facility via a 700 foot, 3/4 inch, double-walled underground pipe. The aqua ammonia transfer system consists of two pumps and associated piping. The pumps are self contained and located inside the containment structure.

The injection system is located at the CUP is computer controlled to minimize NOx emissions. The system receives, vaporizes, and regulates the rate of ammonia fed into the SCR catalyst bed. Ammonia emissions from the plant are limited by BAAQMD permit to less than 20ppm.

The administering agency, SFDPH/HMUPA, has required UCSF to prepare and submit a Risk Management Plan (RMP) in accordance with the federal, state and local laws. The federal law is provided under the provisions of the Clean Air Act (CAA) Section 112(r); state law is specified in the California Health and Safety Code (Article 2, Chapter 6.95, Division 20) and in the California Code of Regulations (19CCR2735-2785.1); and the local law is found in the San Francisco Municipal Health Code (Article 21, Chapter 5).

The RMP has been reviewed and evaluated by design, construction, operations, and health and safety personnel. The prevention program has resulted in the identification of potential problems and allowed for modifications to upgrade the facility. UCSF is committed to maintaining the highest standards in the design, construction, operation, and maintenance of the facility.

The following information is presented as required in 40CFR68.155 and 19CCR2745.3 and their subparts. (a) UCSF policy requires adhere

nce to applicable federal, state, and local laws, rules, and regulations. The safe handling of ammonia is enhanced by designing the facilities to include multiple safety devices and engineering controls, by implementing effective training programs for personnel, and by following standard operating procedures. Both passive and active mitigation measures have been incorporated into the facility design.

These measures are complemented by the presence of a robust emergency response program. In particular, UCSF maintains an Emergency Response Team (ERT) that is knowledgeable and trained to handle hazardous material spills such as aqua ammonia. The ERT can resolve accidental releases of a hazardous material by controlling and mitigating the release to allow a safe return to normal operations. This RMP identifies the system/process controls to further clarify the extent to which UCSF has identified and implemented the necessary measures to ensure the safe and efficient operation of the facility. The UCSF accidental release prevention program has been established to provide to the maximum extent possible a risk free environment for employees, patients, visitors and neighbors.

(b) The stationary source consists of an aqua ammonia unloading facility and underground storage tank located on the corner of Parnassus Avenue and Medical Center Way on the Parnassus Heights campus. A transfer pump and piping delivers the aqua ammonia to the selective catalytic reduction unit located on the first floor of the Central Utilities Plant. The regulated substance is 29.5% aqua ammonia, an ammonia solution consisting of just over 70% water. The regulated substance has a maximum inventory of 8,000 gallons at any given time. The maximum delivery quantity is approximately 3,500 gallons.

(c) The general accidental release prevention and chemical-specific prevention steps are based on passive and active mitigation systems. The passive mitigation measures include an emergency cont

ainment basin (spill chamber), which is sized to be four times larger than the delivered quantity of ammonia and

contains a floating polypropylene ball blanket to further reduce the evaporation area (by 91%). The structure itself also acts as a passive mitigation device.

Active mitigation measures include a foam spray vapor suppressant system, fog misters, fire sprinkler system, emergency response program, and process controls. In addition, the interior air is exhausted to the outside atmosphere through a gaseous ammonia scrubber (impregnated activated charcoal) system.

An ammonia leak detection system is provided to monitor the ambient air concentrations near the aqua ammonia storage tank. In particular, gaseous ammonia detectors are located inside the containment structure, inside the catch basin, outside the structure at the vent exhausts and other selected ambient air locations, and in the interstitial annular space of the double walled storage tank and piping. Ammonia concentrations above 25 ppm will be alarmed at the control room of the ammonia facility and CUP.

The CUP is staffed 24 hours a day. A visual inspection of the exterior components of the aqua ammonia system will be performed daily by plant operation personnel. Preventative maintenance procedures will be followed and documented. Low and high-pressure alarms are provided to monitor the underground storage tank, transfer system, and the ammonia injection unit. If a leak (release) is detected in the aqua ammonia system, the extent of the leak will be identified and the entire system will be rigorously inspected. A record keeping process will begin upon detection of a leak and continue to document subsequent inspections and appropriate actions taken to mitigate leaks, including repair efforts, until such time as the system is properly functioning.

Delivery of aqua ammonia to the facility is between the times of 6am-10am.

(d) In five years of operation, this facility has had no acci

dental releases. The aqua ammonia delivery vendor, Hill Brothers Chemical Company, located in San Jose, CA, is a major supplier of aqua ammonia in the Western United States. They have been in business since 1923 and have had no reportable accidents in the transport and delivery of aqua ammonia.

(e) The UCSF Emergency Response Program is well established and has Standard Operating Procedures (SOPs) that are regularly reviewed and updated. SOPs specific to the aqua ammonia process are kept in the Chief EngineerAs office in the CUP. In addition, there are extensive and comprehensive references located at the UCSF Environmental Health & Safety Office to assist in addressing hazardous material situations. The Emergency Response Program meets local, state, and federal standards for training and competency. The aqua ammonia facility is included in this program and appropriate personnel from EH&S, plant operations, and the UCSF Police Department will be trained to respond to potential aqua ammonia spills. Training will be coordinated with the San Francisco Fire Department, San Francisco Department of Public Heath and with the aqua ammonia vendor. UCSF maintains a liaison with the local responders and has a full time Fire Marshal on staff. The ERT is on call 24 hours/day, 7 days/week.

(f) Planned changes to improve safety are an on going UCSF commitment. The aqua ammonia process facility has been designed to meet and exceed applicable codes and regulations. UCSF has conducted hazard assessments (Hazard Operability Study - HAZOP) with the intent to identify and improve the facility.

UCSF conducts regular inspections, audits, and training and will continue to solicit ideas for modifications that could enhance and improve plant safety. UCSF reviews and updates the RMP as needed, but at a minimum of every five years. An audit of the RMP was conducted to ensure completeness and accuracy in June 2009.

# Mariposa Energy Project Off-site Consequence Analysis

PREPARED FOR:	Alameda County Department of Environmental Health
PREPARED BY:	CH2M HILL
DATE:	July 25, 2013

This Offsite Consequence Analysis (OCA) has been prepared at the request of Alameda County Department of Environmental Health (ACDEH) to support review of the Mariposa Energy Project (MEP) Risk Management Plan (RMP). This OCA has been prepared using the same assumptions and methodologies used for the previous OCA included in the RMP submitted in March 2012, without including the use of poly balls to achieve a reduced evaporation surface area.

## Background

MEP is a nominal 200-megawatt (MW) peaking facility in the northeast portion of Alameda County, California. The proposed MEP consists of four General Electric (GE) LM6000 PC-Sprint natural gas-fired combustion turbine generators (CTG) and associated equipment as well as connection to natural gas, water, and electrical transmission interties.

Aqueous ammonia (ammonium hydroxide at 19 percent nominal concentration by weight) is used to reduce NOx emissions. One 10,000-gallon aqueous ammonia aboveground storage tank (holding 8,500 gallons of aqueous ammonia) provides aqueous ammonia for the emission control system. The ammonia tank will is approximately 30 feet long and 10 feet in diameter.

Aqueous ammonia is delivered to the plant by truck transport. The ammonia delivery truck unloading station includes a bermed and sloped pad surface. The bermed truck drainage pad slopes from the south end to a collection trough on the north end that drains into the basin underlying the ammonia tank. The ammonia storage tank also drains into the basin capable of holding the full contents of the tank, plus rainwater.

The ammonia tank is equipped with a pressure relief valve set at 50 pounds per square inch gage (psig), a vapor equalization system, and a vacuum breaker system. The storage tank is maintained at ambient temperature and atmospheric pressure.

## Worst-Case Release Scenario

A worst-case release scenario was evaluated following CaIARP regulations in 22 CCR 2750.2 and 2750.3. An analysis of a tank failure and subsequent release of aqueous ammonia was prepared using a numerical dispersion model. The analysis assumed the complete failure of the storage tank, the immediate release of the contents of the tank and the formation of an evaporating pool of aqueous ammonia within the secondary containment structure. Evaporative emissions of ammonia would be subsequently released into the atmosphere. Meteorological conditions at the time of the release would affect the evaporation rate, dispersion and transport of ammonia released to the atmosphere.

## Meteorological Parameters

Worst-case meteorological parameters in 22 CCR 2750.2 were used for purposes of this analysis.

The maximum temperature recorded in the last three years near MEP was 110 T or 316.5 Kelvin, measured at the Western Regional Climate Center Station at the Tracy Pumping Plant, California (http://www.wrcc.dri.edu/cgi-bin/cliMAIN.pl?ca9001). Maximum temperatures combined with low wind speeds and stable atmospheric conditions would be expected to result in the highest ammonia concentrations at the furthest distance downwind of the release site.

Table 1 displays the meteorological data values used in the modeling analysis.

#### TABLE 1

Parameter	Worst Case Meteorological Data
Wind Speed (meters/second)	1.5
Stability Class	F
Relative Humidity, Percent	50
Surface Roughness Length (m)	0.03 (rural)
Ambient Temperature, Kelvin ("F)	316.5 (110"F)

## **Release Rate**

The release rate for animonia vapor from an evaporating 19-percent solution of aqueous ammonia was calculated assuming mass transfer of ammonia across the liquid surface occurs according to principles of heat transfer by natural convection. The ammonia release rate was calculated using the emission calculation tool for evaporating solutions provided in the Area locations of Hazardous Atmospheres (ALOHA) model provided by the EPA (http://www.epa.gov/ceppo/cameo/index.htm) assuming a secondary containment area of 1,200 square feet¹.

For the worst-case release scenario, an initial ammonia evaporation rate was calculated and assumed to occur for one hour after the initial release. This is a conservative estimate of time, as EPA guidance suggests that the majority of the toxic component would be released during the first 10 minutes after the release. For concentrated solutions, the initial

¹ The as-built secondary containment basin is 42 feet x 23 feet, with two concrete supports (9.5 feet x 2 feet), for an available liquid surface area of 942 ft². The larger surface area was used for this analysis to be conservative and directly comparable with previous submittals.

evaporation rate is substantially higher than the rate averaged over time periods of a tew minutes or more since the concentration of the solution immediately begins to decrease as evaporation begins.

Although the edge of the tank containment area is raised above ground level, the release heights used in the model were set at 0 m above ground level (AGL) to maintain the conservative nature of the analysis. Downwind concentrations of ammonia were calculated at heights of 0 and 1.6 meters above ground level. The California Office of Environmental Health Hazard Assessment (OEHHA) has designated 1.6 meters as the breathing zone height for individuals.

## **Dispersion Modeling**

Modeling was conducted using the SLAB numerical dispersion model. A complete description of the SLAB model is available in User's Manual for SLAB: An Atmospheric Dispersion Model for Denser-Than-Air Releases. D. E. Ermak, Lawrence Livermore National Laboratory, June 1990. The SLAB user's manual contains a substance database, which includes chemical-specific data for ammonia. These data were used in the modeling run without exception or modification.

One reason ALOHA and SLAB were used is that they are more rigorous and accurate methods to calculate the toxic endpoint distance than using RMP*Comp. EPA states that "RMP*Comp is a planning tool, designed to help you to easily identify high-priority hazards at your facility "(EPA Finergency Management website,

http://www.epa.gov/osweroel/content/rinp/rinp_comp_faq.htm, July 25, 2013). More sophisticated models (e.g., ALOITA, DEGADIS, and SLAB) typically provide a more accurate estimate of the toxic endpoint that RMP*Comp because they account for many more factors that affect dispersion of hazardous chemicals (EPA Emergency Management website, http://www.epa.gov/osweroel/content/rmp/rinp_comp_faq.htm, July 25, 2013).

As required by CalARP regulations, the toxic endpoint for anhydrous ammonia is 0.14 mg/L, or 198 parts per million (ppm) by volume. As defined by the American Industrial Hygiene Association (AIHA) Emergency Response Planning Guideline (ERPG)-2, these levels represent "the maximum airborne concentration below which it is believed that nearly all individuals could be exposed for up to 1 hour without experiencing or developing irreversible or other serious health effects or symptoms, which could impair an individual's ability to take protective action."

An individual at the toxic endpoint distance would be affected *less than the results* represented in the worst-case scenario because the cloud from an ammonia leak would disperse relatively quickly; an individual at a toxic endpoint distance would be exposed to a concentration of 198 ppm for much less than the 1 hour assumed by the ERPG-2. In addition, the ERPG-2 levels result in relatively minor health effects.

## Modeling Results

Table 2 shows the modeled distance to the CalARP toxic endpoint (198ppm) for two cases: 1) without poly ball surface area reduction, and 2) with 90 percent surface area reduction using poly balls (based on the March 2012 RMP OCA modeling results). Two potential receptor

MEP CCA 20130725

breathing height of 1.6 meters.	
TABLE 2	
Distance to CalARP Toxic Endpoint Level	

heights were analyzed to determine worst case results: ground level and a representative	
breathing height of 1.6 meters.	

Distance to CalARP Toxic	Endpoint Level	Distance in
Scenario	Distance in Meters to CalARP Toxic Endpoint without poly ball mitigation (198 ppm)	Meters to CalARP Toxic Endpoint with poly ball mitigation (198 ppm)
Worst Case, 0 m AGL	11.6	5.54
Worst Case 1.6 m AGL	15.1	9.44

The model input file and the output files are available upon request.

The results of the off-site consequence analysis for the worst case release scenario of ammonia at MEP indicate that the toxic endpoint distance would not extend off the project site, whether or not poly balls mitigation is used. The maximum toxic endpoint distance at ground level or 1.6 meters above ground is 15.1 meters from the point of release, or 49.5 feet. The distance to the facility fence line is approximately 20 meters, or 66 feet.

## Assessment of the Methodology Used

A number of conservative assumptions were used in the worst-case release scenario. These include the following:

- Worst-case of a constant mass flow, at the highest possible initial evaporation rate for the modeled wind speed and temperature was used, whereas in reality the evaporation rate would decrease with time as the concentration in the solution decreases.
- In the case of the tank rupture, worst-case stability class was used which almost exclusively occurs during nighttime hours, but the maximum ambient temperature of 110 °F was used, which would occur during daylight hours.
- Again worst-case meteorology corresponds to nighttime hours, whereas the worstcase release of a tank failure would most likely occur during daytime activities at the power plant. At night, activity at a power plant is typically minimal.

## **Risk Probability**

Accidental releases of aqueous ammonia in industrial use situations are rare. Statistics compiled on the normalized accident rates for RMP chemicals for the years 1994-1999 from *Chemical Accident Risks in U.S. Industry-A Preliminary Analysis of Accident Risk Data from U.S. Hazardous Chemical Facilities, J.C. Belke, Sept 2000, indicates that ammonia (all forms) averages 0.017 accidental releases per process per year, and 0.018 accidental releases per million pounds stored per year. Data derived from <i>The Center for Chemical Process Safety,* 

1989, indicates the accidental release scenarios and probabilities for ammonia in general shown in Table 3.

#### TABLE 3

General Accidental Release Scenarios and Probabilities for Ammonia

Accident Scenario	Failure Probability
Onsite Truck Release	0.0000022
Loading Line Failure	0.005
Storage Tank Failure	0. 000095
Process Line Failure	0.00053
Evaporator Failure	0.00015

## Conclusions

Several factors need to be considered when determining the potential risk from the use and storage of hazardous materials. These factors include the probability of equipment failure, population densities near the project site, meteorological conditions, and the process design. Considering the results of the above analysis, and accounting for the probabilities of a tank failure resulting in the modeled ammonia concentrations at the conditions modeled, the risk posed to the local community from the storage of aqueous ammonia at MEP is less than significant.

The results of the worst-case release scenario analysis indicate that the probability of a complete storage tank failure in combination with the conservatively modeled meteorological conditions would pose an insignificant threat since ammonia concentrations above the CalARP threshold of 198 ppm at both ground level and breathing height would not extend offsite.

As described above, numerous conservative assumptions have been made at each step in this analysis. The conservative nature of these assumptions has resulted in a significant overestimation of the probability of an ammonia release at the MEP site, and the predicted distances to toxic endpoints do not pose a threat to the public. Therefore, it is concluded that risk from exposure to aqueous ammonia due to MEP is less than significant.

# ATTACHMENT 4 EPA PUBLIC RECEPTOR DEFINITION GUIDANCE

#### WHAT IS A PUBLIC RECEPTOR?

The rule (§ 68.3) defines **public** as "any person except an employee or contractor of the stationary source." Consequently, employees of other facilities that may share your site are considered members of the public even if they share the same physical location. Being "the public," however, is not the same as being a public receptor.

**Public receptors** include "offsite residences, institutions (e.g., schools and hospitals), industrial, commercial, and office buildings, parks, or recreational areas inhabited or occupied by the public at any time without restriction by the stationary source where members of the public could be exposed to toxic concentrations, radiant heat, or overpressure, as a result of an accidental release." Offsite means areas beyond your property boundary and "areas within the property boundary to which the public has routine and unrestricted access during or outside business hours."

The first step in identifying public receptors is determining what is "offsite." For most facilities, that determination will be straightforward. If you restrict access to all of your property all of the time, "offsite" is anything beyond your property boundaries. Ways of restricting access include fully fencing the property, placing security guards at a reception area or using ID badges to permit entry.

If you do not restrict access to a section of your property and the public has routine and unrestricted access to it during or after business hours, that section would be "offsite." For example, if your operations are fenced but the public has unrestricted access to your parking lot during or after business hours, the parking lot is "offsite." In the case of facilities such as hospitals, schools, and hotels that shelter members of the public as part of their function or business, the parts of the facility that are used to shelter the public would be "offsite."

Not all areas offsite are potential public receptors. The point of identifying public receptors is to locate those places where there are likely to be, at least some of the time, members of the public whose health could be harmed by short-term exposure to an accidental release at your site. The basic test for identifying a public receptor is thus whether an area is a place where it is reasonable to expect that members of the public will routinely gather at least some of the time.

The definition of "public receptor" itself specifies the types of areas where members of the public may routinely gather at least some of the time: residences, institutions such as hospitals and schools, buildings in general, parks and recreational areas. There should be little difficulty in identifying residences, institutions and businesses as such, and virtually any residence, institution and business will qualify as a public receptor, even when the property is used only seasonally (as in a vacation home). Notably, a residence includes its yard, if any, and an institution or business includes its grounds to the extent that employees or other members of the public are likely to routinely gather there at least some of the time for business or other purposes (see discussion of recreational areas below). The only circumstances that would justify not considering such a property a public receptor would be where your facility owns or controls the property and restricts access to it, or no member of the public inhabits or occupies it at any time. Where a hospital, school, hotel or other entity that provides public shelter is itself subject to the part 68 rule, it will be its own public receptor except for those areas where members of the public are not allowed to go at any time.

2-5

Buildings other than residences, institutions or businesses are also highly likely to qualify as public receptors since the function of most buildings is at least in part to shelter people. Accordingly, toll booth plazas, transit stations, and airport terminals would qualify as public receptors. For a building not to qualify as a public receptor, one of the circumstances mentioned above would have to apply.

Every designated park or recreational area, or at least some portion thereof, is apt to be a public gathering place by virtue of facilities made available to the public (e.g., visitors' center, playground, golf course, camping or picnic area, marina or ball field) or attributes that members of the public routinely seek to use (e.g., beach). It does not matter whether use of such facilities is seasonal; routine use for at least part of the year would qualify the area as a public receptor.

At the same time, some portion of a designated park or recreational area may not be a public receptor. For instance, a large state or national park may include relatively inaccessible tracts of land that do not contain public facilities or receive routine use. Occasional hiking, camping or hunting in such areas would not qualify the areas as public receptors.

An area need not be designated a recreational area to be one in fact. If an area is routinely used for recreational purposes, even if only seasonally, it is a recreational area for purposes of the part 68 rule. For example, a marina may not bill itself as a "recreational area," but if a marina houses recreational boats, it qualifies as a public receptor. Further, if your facility or a neighboring property owner allows the public to make routine recreational use of some portion of land (e.g., a ball field or fishing pond), that portion of land would qualify as a public receptor.

Roads and parking lots are not included as such in the definition of "public receptor." Neither are places where people typically gather; instead they are used to travel from one place to another or to park a vehicle while attending an activity elsewhere. However, if a parking lot is predictably and routinely used as a place of business (e.g., a farmer's market) or for a recreational purpose (e.g., a county fair), it would qualify as a public receptor.

In general, farm land would not be considered a public receptor. However, if farm land, or a portion thereof, is predictably and routinely occupied by farm workers or other members of public, even if only on a seasonal basis, that portion of the land would be a public receptor.

If you are in doubt about whether to consider certain areas around your facility as public receptors, you should consult with the relevant local officials and land owners and your implementing agency for guidance.

## Qs & As Public Receptors

Q. My processes are fenced, but my offices and parking lot for customers are not restricted. What is considered offsite? What is considered a public receptor?

A. The unrestricted areas would be considered offsite. However, they would not be public receptors because you are responsible for the safety of those who work in or visit your offices and because parking lots are not generally public receptors.

Q. What is considered a recreational area?

A. Recreational areas would include land that is designed, constructed, designated, or used for recreational activities. Examples are national, state, county, or city parks, other outdoor recreational areas such as golf courses or swimming pools and bodies of waters (oceans, lakes, rivers, and streams) when used by the public for fishing, swimming, or boating. Public and private areas that are predictably used for hunting, fishing, bird watching, bike riding, hiking, or camping or other recreational use also would be considered recreational areas. EPA encourages you to consult with land owners, local officials, and the community to reach an agreement on an area's status; your local emergency planning committee (LEPC) can help you with these consultations. EPA recognizes that some judgment is involved in determining whether an area should be considered a recreational area.

Q. Does public receptor cover only buildings on a property or the entire property? If the owner of the land next to my site restricts access to the land, is it still a public receptor?

A. Public receptors are not limited to buildings. For example, if there are houses near your property, both the houses and their yards are considered public receptors because it is likely that residents will be present in one or the other at least some of the time, and, in fact, people are likely to be in more danger if they are outside when a release occurred. The ability of others to restrict access to an area does not change its status as a public receptor. You need to consider whether that land is generally unoccupied. If the land is undeveloped or rarely has anyone on it, it is not a public receptor. If you are not sure of the land's use of occupancy, you should talk with the landowner and the community about its status. Because it is the landowner and members of the local community who are likely to be affected by your decision, you should involve them in the decision is you have doubts.

#### WHAT IS A DISTANCE TO AN ENDPOINT FROM A WORST-CASE RELEASE?

In broad terms, the distance to an endpoint is the distance a toxic vapor cloud, fire, or explosion from an accidental release will travel before dissipating to the point that serious injuries from short-term exposures will no longer occur. The rule establishes "endpoints" for each regulated substance and defines the circumstances of a worst-case release scenario (e.g., release type, rate and duration, weather) (see Chapter 4 or the *Risk Management Program Guidance for Offsite Consequence Analysis* for more information). You will have to define a worst-case release (usually the loss of the total contents of your largest vessel) for each Program 1 process and determine the distance to the endpoint for that release. (EPA has developed

Subject: Mariposa Energy Project Risk Management Plan Supplemental Information – Aloha OCA Modeling Results

Dear Ms. Hugo:

CH2M HILL is pleased to submit this supplemental information on behalf of Mariposa Energy, LLC. (Mariposa Energy) This information has been prepared per your request during our teleconference on September 24, 2013 As directed by ACDEH, we have performed additional offsite consequence analysis modeling using the U.S. Environmental Protection Agency (EPA) ALOHA (Areal Locations of Hazardous Atmospheres) chemical release and dispersion model. We understand ACDEH requires the use of ALOHA for OCA modeling. The information below provides the basis and results for this modeling analysis.

#### Consideration of Poly Ball Passive Mitigation

Mariposa Energy has and will continue to maintain poly balls within the secondary containment basin to serve as passive mitigation in the event of a release to the secondary containment basin. The balls would act as a barrier to ammonia release to atmosphere from a liquid pool. For a given ammonia concentration, release parameters, and atmospheric parameters, the rate of ammonia release to atmosphere is limited by the surface area available for evaporation. As noted in previous submittals, the floating balls reduce the surface area available for ammonia transfer via evaporation by approximately 90 percent based on the geometry of the floating balls.

Based on our teleconference on September 24th, we understand that ACDEH has consulted with EPA staff regarding the use of poly balls, and that EPA staff responded confirming that poly balls are an acceptable passive mitigation technique; however, the EPA staff was not aware of an EPA-approved assumption for reduction in evaporation rate¹. Please note that the ACDEH-specified ALOHA model calculates evaporation rates based on available surface area, the evaporation rate reduction is not an assumption in the analysis. Therefore Mariposa Energy respectfully requests that ACDEH allow this passive mitigation to be considered in the OCA analysis, in accordance with Section 2750.3(d)(1)(A) of the CalARP regulations which reads:

"The surface area of the pool shall be determined by assuming that the liquid spreads to 1 centimeter deep unless passive mitigation systems are in place that serve to contain the spill and limit the surface area. Where passive mitigation is in place, the surface area of the contained liquid shall be used to calculate the volatilization rate".

¹ Information is paraphrased based on AEDEH comments thin ag the September 24, 2013 teleconference. Manposa Energy has requested copy of the e-main correspondence from EPA to fully understand and benefit from the information provided by EPA, this information has not been received as of the date of this letter.

As detailed in previous submittals, one layer of poly balls will reduce the liquid pool exposure area in excess of 90 percent. We understand ACDEH has concerns regarding this assumption based on discussions to date, and propose the following practical responses to address these concerns.

- Apply a safety factor of 2 to account for any gaps in floating ball placement (assume a surface area reduction of 80 percent instead of 90 percent)
- As noted in the previous data suomittal, Mariposa Energy proposes to double the quantity of balls, to achieve two layers of floating balls in the event of a spill. The second layer of balls nested on top of the floating layer will provide added release reduction in two ways: 1) drop to fill any gaps in the floating layer, and 2) provide an additional barrier to migration of ammonia vapor from the liquid surface to atmosphere.
- It was noted during our teleconference there was a concern about the floating balls providing increased wetted surface area for ammonia evaporation. The balls would need to be continuously rolling to provide a wetted surface for ammonia evaporation. Both liquid surface tension and the friction between the tightly packed balls would not allow the balls to continuously roll. Additionally, the proposed second layer of balls will serve as a barrier to this unlikely scenario.

Therefore, additional OCA modeling analyses using ALOHA have been performed for two cases for ACDEH review:

- 1) No consideration of the poly ball passive mitigation, in accordance with ACDEH direction, and
- Including poly ball passive mitigation with a corresponding surface area reduction of 80 percent, as described above.

#### **ALOHA Modeling Analysis**

We have updated OCA input parameters where appropriate, including secondary containment basin area and maximum ambient temperature.^{2,3} Default input parameters for wind speed, stability, and relative humidity were used as specified in Section 2750.2 of the CalARP Program Regulations. The "open county" ground roughness parameter was selected to be representative of the open and undeveloped nature of the project area. The ALOHA model "Threat Zone" was set to 200 parts-per-million (ppm) (or 0.14 milligrams per liter) of ammonia, the CalARP Toxic Endpoint defined in Appendix A of the CalARP Regulations. The results of the modeling analysis are summarized in Table 1 below, and modeling output is included as Attachment 1.

Scenario	Surface Area (square feet)	Ammonia Evaporation Rate (Ib/min)	Toxic Endpoint Distance - 200 ppm (feet)
No Poly Balls	938.5	32.7	3,822
Poly Ball Passive Mitigation	187.7	7.93	1,767

#### Table 1. ALOHA Modeling Results

As we discussed on the September 24th teleconference, ACDEH considers the closest public receptor to be the PG&E Bethany Compressor Station. The distance from the MEP aqueous ammonia tank to the PG&E compressor station building (closest location where personnel would potentially gather or work) is approximately 2,050 feet.

² Aqueous animonia containment pasin area is based on basin internal dimensions of 42 D feet by 23 25 feet, julitracting out the two concrete tank supports measuring 9.5 feet by 2.0 feet. The resulting that mum surface area of the basin is 938,5 square feet.

³ The maximum temperature recorded during the last three years (2010 through 2012) at the Fracy Pumping Plant on Xalso Road was 105 degrees Fahrenheit (Western Regional Elimate Contell, https://www.wr.lattonu/)

Therefore the nearest public receptor is beyond the distance to the toxic endpoint when the poly ball passive mitigation is considered in the ALOHA OCA analysis.

#### Administrative Controls

In addition to the measures described above, Mariposa Energy proposes the following measures to ensure effectiveness of the passive mitigation system.

- Quarterly hydrodynamic testing of the floating poly balls by filling the secondary containment area sufficiently to observe the floating poly balls. Defective balls will be removed and logged. Any balls removed will be immediately replaced with spares.
- Change-out of the poly balls every 5 years (manufacturer recommendation is every 9 years)
- Daily visual inspections of the containment area for netting integrity, debris intrusion, and liquid accumulation
- Annual staff training on the MEP RMP will include review of the RMP, verification of emergency contact
  phone numbers, mandatory location of RMP book, daily inspections, quarterly hydrodynamic testing
  (including replacement of failed poly balls), and the 5-year replacement plan for the poly balls as a
  complete set.

#### Closing

Based on the information provided to date and this revised OCA using the ALOHA release and dispersion model, Mariposa Energy respectfully requests that ACDEH approve MEP as a Program Level 1 facility. Thank you for your continued efforts to review the project. Please contact me at 916.286.0348 or by email: <u>doug.urry@ch2m.com</u> at your convenience should you have any quest ons.

Sincerely,

W Dontos J

Doug Urry Senior Project Manager
