<b>Docket Number:</b>	19-SB-100
<b>Project Title:</b>	SB 100 Joint Agency Report: Charting a path to a 100% Clean Energy Future
<b>TN #:</b>	232226
<b>Document Title:</b>	Presentation - Power of Place - Land Conservation and Clean Energy Pathways for California
<b>Description:</b>	By The Nature Conservancy
<b>Filer:</b>	Harinder Kaur
<b>Organization:</b>	The Nature Conservancy
<b>Submitter Role:</b>	Public
<b>Submission Date:</b>	2/25/2020 1:46:24 PM
<b>Docketed Date:</b>	2/25/2020

# SB100 Modeling Inputs and Assumptions Workshop

Presentation by The Nature Conservancy

*Power of Place: Land Conservation and Clean Energy Pathways for California*

*February 24, 2020*

Erica Brand  
California Energy Strategy Director  
[ebrand@tnc.org](mailto:ebrand@tnc.org)

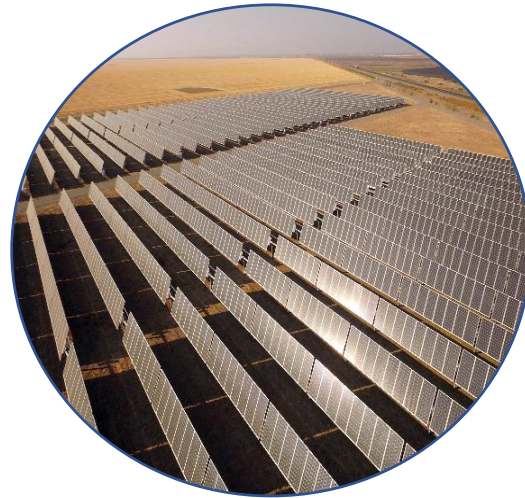

An aerial photograph of a vast solar farm in a desert. The solar panels are arranged in long, parallel rows that stretch across the landscape towards the horizon. The ground is sandy and light-colored, and the sky is clear and bright. The perspective is from a high angle, looking down and across the rows of panels.

**Decarbonizing California through clean power and electrification will require significant land area for new electricity infrastructure**

Integrating environmental and land use data *as a first step* in long term energy models yields multiple benefits

**GEOSPATIAL  
ENVIRONMENTAL  
AND LAND DATA**

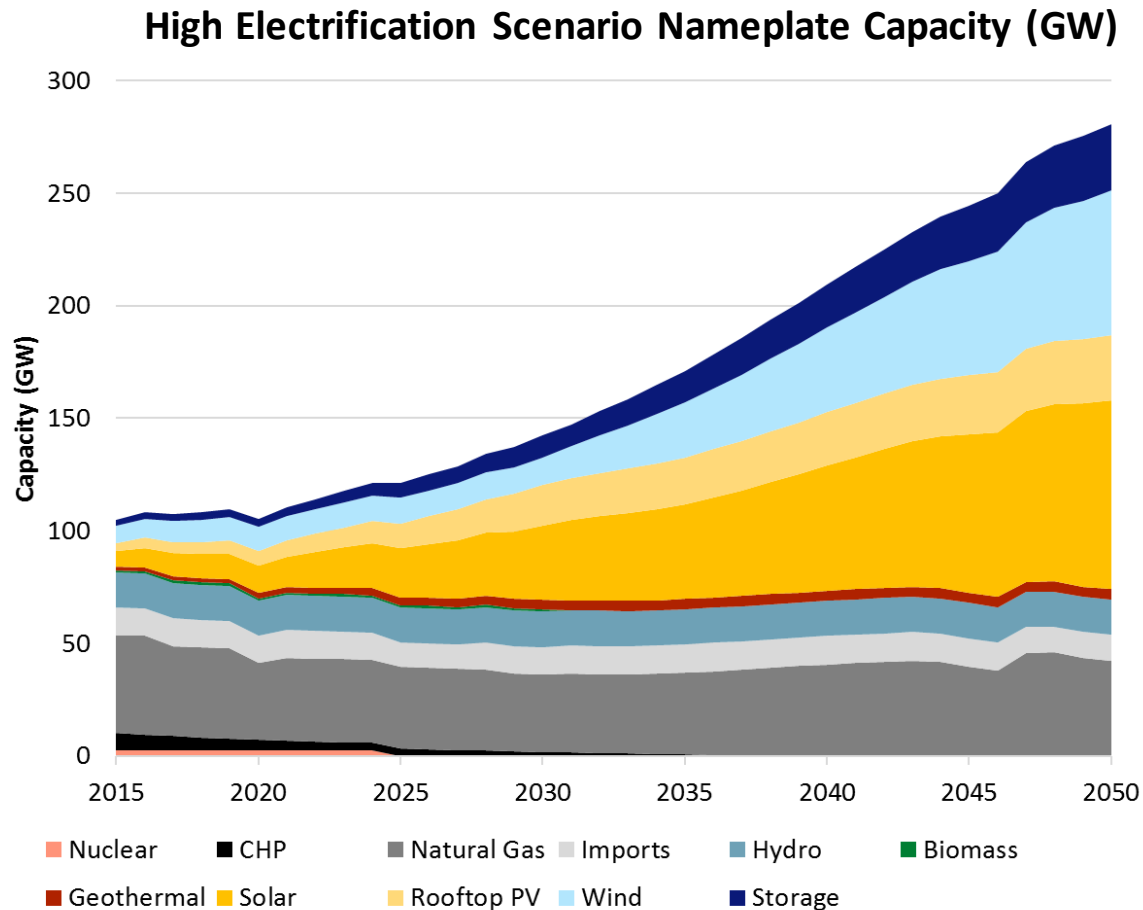

**ENERGY RESOURCE  
PORTFOLIOS**

**Development opportunity areas and constraint areas** become visible much earlier in resource and transmission planning, improving projections and the policy decisions that flow from them.

Can the high renewable build needed to achieve **deep decarbonization** in 2050 be done while **limiting impacts** to natural and agricultural lands across the West?

# Statewide Modeling of California Goals

- The Power of Place study builds upon the California Energy Commission EPIC project “**Deep Decarbonization in a High Renewables Future**”, which considered multiple scenarios for achieving statewide emissions targets
- All scenarios incorporated high levels of vehicle and building electrification
- All scenarios met SB 100 targets of 100% of retail electricity sales with zero-carbon resources and 80 percent reduction in GHGs by 2050

# What Factors Might Shape California's Clean Electricity System in 2050?

The *Power of Place* study developed 61 scenarios that explore pathways to land conservation and clean energy in 2050. Five cases and sensitivities were applied in different combinations to create scenarios that achieved a variety of balanced energy and land protection outcomes for California.\*

## Geographies

Three geographic areas within which renewable energy resources are assumed to be available for development

California =   
Part West =   
Full West = 

## Resource Availability

California agency assumptions that limit renewable resource availability for planning vs. expanded resource availability

## Levels of Land Protection

Four environmental siting levels (SL) with increasing emphasis on land protection to reduce impacts to natural and agricultural lands

## Rooftop Solar Capacity

California agency rooftop solar forecast vs. a **35%** increase

  
**35%**

## Battery Cost

California agency assumptions vs. a **25%** reduction

The *Power of Place* study developed

# 61 Scenarios

All scenarios achieve **80%** greenhouse gas emissions reduction below **1990** levels by 2050.

The scenarios generate **102-110%** zero carbon electricity in 2050 (of retail sales).

\* See the technical report for an in-depth discussion of choices, trade-offs, and implications.

# 2050 scale of wind and solar across scenarios

Total acres of **wind** and **solar**  
across the scenarios:

Approximately  
**1.6 million** to  
**3.1 million**  
acres

# 2050 generation capacity differs across geographic scenarios

# 2050 battery capacity differs across geographic scenarios

The resource used to balance the solar generation is the primary difference between cases

When the model (RESOLVE) has access to out-of-state wind resources, it generally prefers them to battery storage

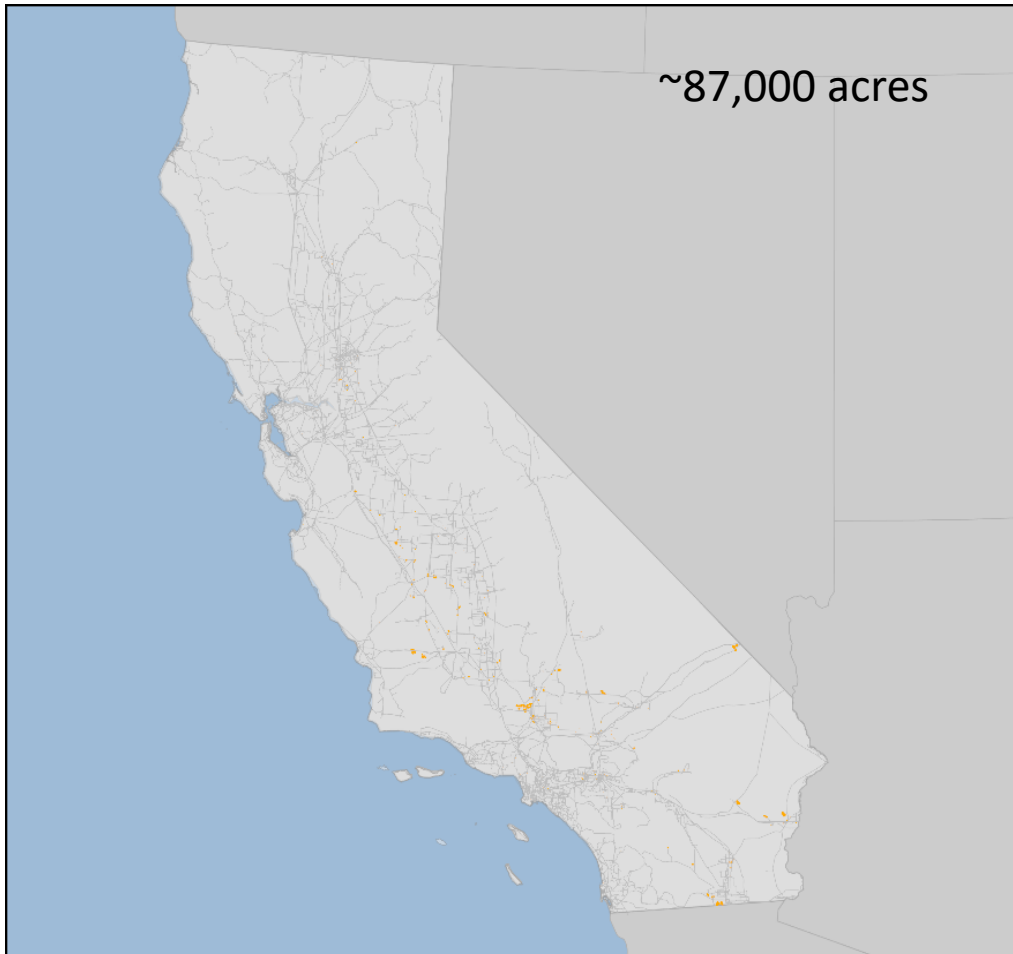

When clean power can be sourced across a **larger area**, there are **more cost-effective** opportunities to create balanced solutions for clean power and land conservation.

Note: All cases include an additional \$64.6 Billion in non-modeled costs from existing and planned resources that are expected to remain in service in 2050

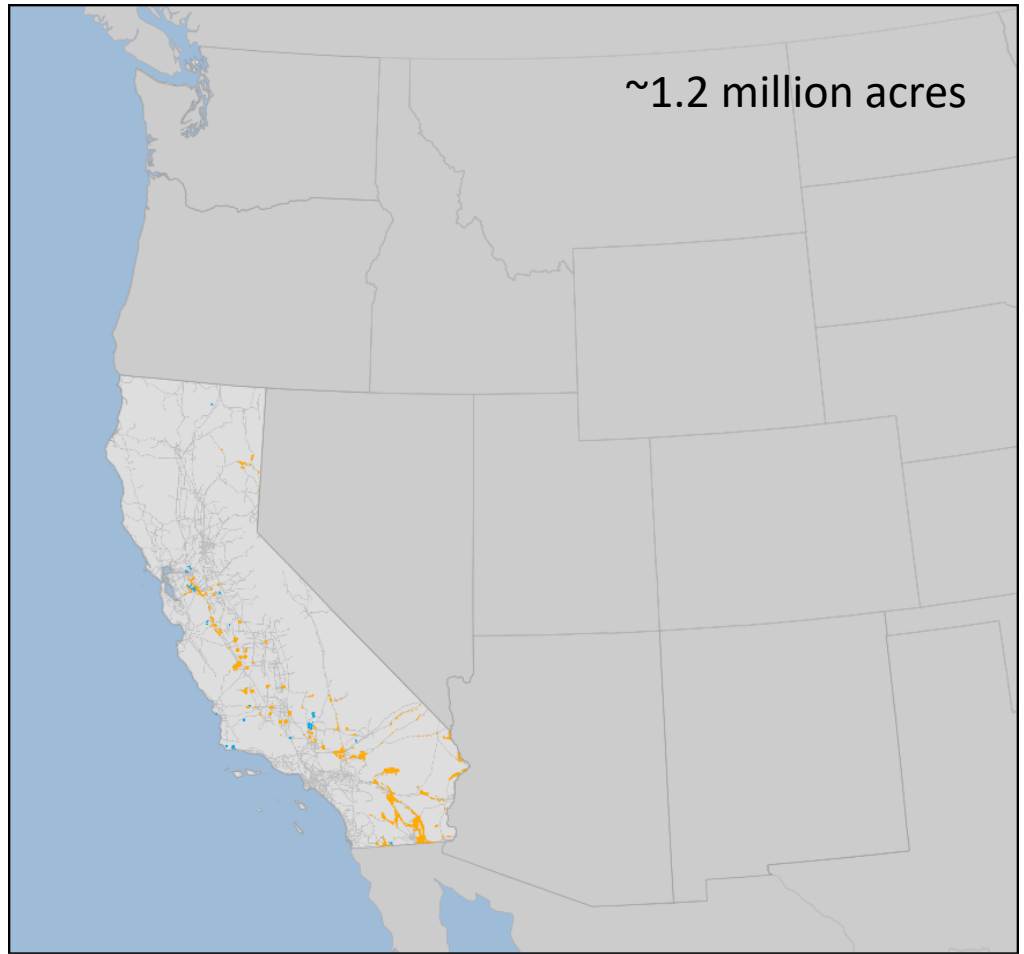

An aerial photograph of a vast solar farm in a desert. The solar panels are arranged in neat, parallel rows that stretch across the landscape. The ground is a mix of dark and light brown soil. In the background, there's a flat horizon under a clear sky. A road or path runs through the middle ground. The overall scene is one of large-scale renewable energy infrastructure in an arid environment.

**SL3**

With planning, California can scale up the clean energy infrastructure needed to decarbonize California through clean power and electrification while limiting impacts to natural and agricultural lands across the west.

# Recommendations

- **Quantitative:** Incorporate environmental and land use data into the modeling for SB100 report
- **Qualitative:** Include chapter or section on land use in SB100 report.
  - Socialize and plan for land use changes that may be needed to meet climate and energy goals.
  - Prioritize additional policy structures and recommendations that can enable lower impact development pathways.
  - Identify opportunities for acceleration of technology deployment.
