Please support Vehicle to Home for electrification and resilience

We are making progress electrifying our home and transportation. Last year we replaced our tankless gas water heater with a Rheem HPWH, our gas furnace with a Mitsubishi heat pump, and our gas dryer with an LG electric condensing washer/dryer combo. We also got rid of our last gasoline vehicle. Everything works wonderfully.

However we are now more dependent on the electric grid, and the possibility of storm outages and more PSPS events is worrisome.

Today have over 110 kWhs of battery storage in our garage which could power everything in our home for over a week. Even longer (perhaps indefinitely) with occasional trips to nearby fast charging stations.

With no approved method to power our home from our cars, we are forced to consider fossil-fuel generators. Please help bring V2H technology to California as quickly as possible. Thank you!
