CEC Sync with CMC

Hello,

I would like to see more integration between the mechanical and energy code sections of the California codes. I understand this is two separate groups but that is not an excuse for the two sections not being in sync. Design engineers typically look at the mechanical code for system design requirements. If the energy code team and lobbyists are insistent on system design requirements located in that section of the code, then the mechanical code needs to reference those sections more clearly and throughout the code section. The other code sections play well together but the energy section is this rogue beast that does whatever it wants. Please start playing with the other sections. You are creating more headache for the industry. For an example of good referencing, see the CMC and CBC fire/smoke damper requirements.
