

DOCKETED	
Docket Number:	20-FDAS-01
Project Title:	Flexible Demand Appliance Standards
TN #:	236334
Document Title:	Transcript of December 14, 2020 Lead Commissioner Workshop
Description:	***SUPERSEDES TN 236250***
Filer:	Cody Goldthrite
Organization:	California Energy Commission
Submitter Role:	Commission Staff
Submission Date:	1/15/2021 9:59:46 AM
Docketed Date:	1/15/2021

CALIFORNIA ENERGY COMMISSION

In the matter of:

Senate Bill 49 Flexible Demand) Docket No. 20-FDAS-01
Appliance Standards)
_____)

LEAD COMMISSIONER WORKSHOP

REMOTE VIA ZOOM

MONDAY, DECEMBER 14, 2020

9:00 A.M.

Reported by:

Martha Nelson

APPEARANCES

COMMISSIONER

Andrew McAllister, Lead Commissioner

CEC STAFF

Bruce Helft, Appliances Office

Todd Ferris, Appliances Office

MODERATORS

Sean Steffensen, California Energy Commission

Nicholaus Struven, California Energy Commission

Messay Betru, California Energy Commission

PRESENTERS

Michael Sokol, California Energy Commission

Severin Borenstein, Energy Institute of HAAS, University
of California, Berkeley

Mary Ann Piette, Lawrence Berkeley National Laboratory

Nate Kinsey, California Public Utilities Commission

Abigail Daken, U.S. Environmental Protection Agency

Jacob Cassady, Association of Home Appliance
Manufacturers

Ashley Armstrong, AO Smith Corporation

Zubair Shafiq, UC Davis

Rolf Bienert, OpenADR Alliance

Walt Johnson, Retired EPRI

Amy Dryden, Association for Energy Affordability,
and Equity for Disadvantaged Communities

APPEARANCES

PRESENTERS

Mel Hall-Crawford, Consumer Federation of America,
and Consumer Perspectives for Appliances

Stacey Tutt, Consumer Law Clinic at UC Irvine Law School

PUBLIC COMMENT

Tristan de Frondeville, SkyCentrics

Laura Petrillo-Groh, Air Conditioning, Heating, and
Refrigeration Institute

Bob Wolfer, Bradford White Corporation

Orly Hasidim, Universal Devices

Christopher Danforth, Public Utilities Commission

Ken Nichols

AGENDA

	<u>Page</u>
Opening Remarks - Need for Flexible Demand Resources	8
Flexible Demand's Connection to CA State Energy Policy	12
Value of Flexible Demand Standards to Consumers and the Grid	20
Flexible Demand Shift Resource Through 2030	32
Supporting Flexible Resources at the California Public Utilities Commission	51
Panel 1 - Criteria for Selection of Candidate Appliances	76
Panel 2 - Communication Technologies and Cybersecurity	159
Panel 3 - Consumer Perspectives and Equity Considerations	207
Public Comments	264
Concluding Remarks and Next Steps	265
Adjourn	269

1 physical distancing, according to the Governor's
2 directives.

3 Next slide.

4 Today's workshop is being held remotely
5 without a physical location for the participants,
6 consistent with Executive Orders N-25-20 and N-
7 29-20, and the recommendations from the
8 California Department of Public Health. This is
9 being done to support social distancing to slow
10 the spread of COVID-19.

11 The public may participate or observe the
12 workshop, consistent with the direction in these
13 executive orders. Instruction for remote
14 participation were provided in the meeting notice
15 for this workshop which is available on the
16 proceeding website shown above. The Public
17 Advisor can facilitate your participation and is
18 available at the email and phone number shown in
19 the above slide.

20 Next slide.

21 Before we get started I need to cover a
22 few housekeeping rules.

23 This is a public hearing and is being
24 recorded by the Court Reporter. All statements
25 communicated today become part of the public

1 record.

2 All attendees will be muted during the
3 presentation. Following each panel there will be
4 a 30-minute question and answer session where we
5 will take questions and public comments.

6 If you have questions during the
7 presentation, you may type them into the question
8 and answer function on Zoom and they will be
9 forwarded to the moderator.

10 If on the phone, raise your hand by
11 pushing star nine and the host will give you the
12 ability to speak during the question and answer
13 session. When it is your turn you can push star
14 six to mute and un-mute. Please state your name
15 and affiliation when speaking.

16 Next slide.

17 This slide presents our morning agenda
18 for today. First, Commissioner Andrew McAllister
19 is going to provide the opening remarks. Next we
20 will hear from Michael Sokol, the Efficiency
21 Division's Deputy Director, about flexible
22 demands connection to the California State Energy
23 Policy. Then we will have several keynote
24 speakers to talk about the value of flexible
25 demand standards to the consumer grid, flexible

1 demand shift resources through the year 2030, and
2 supporting flexible resources.

3 The following keynote speakers --
4 following the keynote speakers we will take a
5 short break and then we will start our series of
6 three panels. The first panel will talk about
7 the criteria for the selection of candidate
8 appliances. We will have a comment period and
9 then we will break for lunch.

10 Next slide.

11 After lunch we will continue our panel
12 discussions starting with the second panel to
13 talk about communication technology and cyber
14 security. Following the second panel we will
15 take a short break and then we will have our
16 third panel to talk about consumer perspectives
17 and equity. After this we will have our final
18 comment period before the concluding remarks.

19 The Lead Commissioner for this workshop
20 is Andrew McAllister, who will make some opening
21 remarks to start us off. Please welcome Andrew
22 McAllister.

23 Next slide.

24 COMMISSIONER MCALLISTER: Hey there
25 everyone. Really happy that -- can you hear me

1 okay, Todd and everybody? There we go.

2 MR. FERRIS: Yeah. I can hear you just
3 fine.

4 COMMISSIONER MCALLISTER: Okay. Great.
5 I keep raising and lowering my stand up desk and
6 it creates trouble. Okay. Great.

7 Well, thanks. Thanks a lot and really,
8 really happy to be here. Thanks, everyone, for
9 attending. It looks like we have 136 and
10 counting right now. I won't take 15 minutes to
11 make comments but I did want to just put this in
12 context.

13 But first, I want to just thank Staff,
14 certainly Todd and Pierre and Nich and all the
15 different staff that's been working on this issue
16 and related issues.

17 It's very clear that a relatively new
18 resource that we have at our disposal, and it has
19 multiple benefits, is load flexibility. And I
20 think it sort of still remains to be seen where
21 its highest and best value will end up landing
22 but it's likely to be in the realms of
23 reliability enhancement for the grid and cost
24 reduction, overall cost reduction for our
25 electricity system. And there's also a

1 significant decarbonization benefit from load
2 flexibility. And so all of these needs of our
3 grid are becoming apparent as we transition
4 towards ever higher percentages of renewables
5 and, in particular, non dispatchable or
6 intermittent renewables.

7 So we have a lot of tools in our toolbox,
8 a growing number, including storage and others.
9 But the digital economy and digitization in
10 general, the ability to cheaply communicate and
11 manage different end-use technologies in real
12 time to customer benefit and to the benefit of
13 the grid, is something that is coming into its
14 own. And we're really at the cutting edge of
15 this in California in terms of having multiple
16 fronts in this discussion, the Building Code,
17 load management standards, and this topic, SB 49,
18 the load flexibility in our appliances.

19 And so this suite of various innovations
20 that we're developing in California, I think,
21 will reap massive benefits going forward. And
22 it's not something that just happens overnight.
23 We're on the front end of this particular SB 49
24 push. And you all who are in attendance, and
25 anyone who can -- who brings some expertise and

1 some viewpoint to this that's grounded in your
2 experience and your analytical viewpoint, and
3 have been working in this field, and we have a
4 lot of great speakers here today to get us
5 started, can have an impact on building this
6 ecosystem that will help us in these ways I'm
7 describing.

8 So I'm really happy that Staff has gotten
9 this initial paper out and that we are convening
10 this workshop to help us inform the path forward
11 and really appreciating everyone being here.

12 In particular, I wanted to thank Severin
13 for being here, as well, and as well as Mary Ann
14 Piette, both good friends, and all the Staff that
15 will present today. From the PUC, we have Nate
16 Kinsey, we have Sean Steffensen from our Staff,
17 Appliances Office, Pierre du Vair, the leader of
18 that office, Nich Stuvan, whose done -- all of
19 them have done lots of yeomen's work on this
20 topic to bring it to us.

21 So very interested in everyone's ideas
22 about how we prioritize, what basis we kind of
23 lay, what groundwork we need to do in terms of
24 test procedures and prioritization of different
25 appliance categories going forward, where the

1 people think the most value will be, and how we
2 can get going sooner, rather than later, in
3 harvesting that value, and all the questions that
4 Staff has lined up in the paper that you have
5 seen and will be working through going forward.

6 So lots of big, interesting stuff
7 happening here in this docket, and looking
8 forward to everyone's best inputs. And with
9 that, I'm really looking forward to the rest of
10 the day. And I believe Mike Sokol is going to
11 follow me.

12 So, Mike, I see you're all teed up.

13 So thanks for the opportunity to open
14 this up. And I really appreciate Todd's intro
15 and everyone's participation.

16 So, Mike, thanks and take it away.

17 MR. SOKOL: All right. Well, let me just
18 say good morning to everyone. And let's see,
19 who -- I have a few slides I'm going to share
20 here, if we can get those posted up?

21 I just wanted to say quickly, thank you
22 to everyone, and echo Commissioner's thanks for
23 everyone attending today. And really wanting to
24 underscore the incredible amount of Staff work
25 and prep and coordination that's gone into

1 pulling together a very good workshop agenda
2 today.

3 I'm Michael Sokol. I'm the Deputy
4 Director of the Efficiency Division here at the
5 Commission. And I'm going to speak just a little
6 bit and add a little more to what Commissioner
7 stated in terms of the overarching kind of policy
8 framework where SB 49 is going to help plug in
9 and lay some groundwork for us on the load
10 flexibility as a resource here in California.

11 So next slide please.

12 So, again, welcome. And we're really
13 excited to have this workshop today. Staff's
14 been working diligently to prepare for some
15 background materials, do some literature review,
16 and talk with a broad range of stakeholders
17 related to load flexibility. And it really
18 points to that there's a lot of interesting
19 material out there and there's a lot to get
20 started with. But there, also, are a lot of
21 questions that we have and some knowledge gaps.
22 And so that's where we're really looking forward
23 to the conversation today and, specifically, the
24 written comments to follow over the coming weeks.

25 We have some good sort of framework and

1 starting point and some criteria for how we're
2 going to begin to tackle Flexible Demand
3 Appliance Standards. But, again, there's a broad
4 range of ongoing activities and some very good
5 research and other lessons learned that we want
6 to make sure are implemented here as we get
7 started with this process here at the Commission.

8 Next slide please.

9 So importantly, as a starting point, you
10 know, we've got to keep in mind that we are in a
11 crisis here, not just in California but, really,
12 as a world. But California is at the forefront
13 of leading the fight against climate change. And
14 here you see a quote from Governor Newsom, given
15 some of the complications in the past year or
16 two, really doubling down on accelerating any
17 activities to support climate change mitigation.

18 And if you layer on top of that, beyond
19 just climate change, of course, we're in a number
20 of different crises sort of stacked -- crises
21 stacked on top of each other at the moment and so
22 there's a lot of drivers here that are important
23 to consider.

24 The good thing is that SB 49 has the
25 ability to support a number of those responses.

1 So, of course, the support of our decarbonization
2 goals, both from a building level and a system
3 level, as we look towards a 100 percent clean
4 energy future from the supply side. But at its
5 core, SB 49 is focused on benefitting the
6 consumer. And so making sure that there's, you
7 know, bill savings generated and other
8 investments that can be deferred or ultimately
9 saving money for utility grid operations at the
10 same time and benefitting the customer.

11 And perhaps most importantly,
12 Commissioner mentioned this, but given, you know,
13 the unexpected reliability issues that we faced
14 this last summer and some, you know, keeping a
15 close eye on in the next couple of years here,
16 load flexibility is an important resource as we
17 look to plan out how to respond, if there are
18 reliability events and need, some quick capacity
19 to support grid operations, so hitting on a
20 number of fronts.

21 And then, as you'll see, as we get into
22 to today's agenda, also considering knowing that
23 we're getting started here and this is a new
24 realm for the State of California, it's how
25 important it is that we take an equity lens and

1 make sure that this is an inclusive set of
2 standards that consider the unique needs of low-
3 income and disadvantaged customers as well.

4 And so, really, you know, this is -- load
5 flexibility is a key aspect of building out this
6 100 percent clean energy future that's clean,
7 reliable, affordable, and inclusive. And we're
8 just excited to get that conversation going
9 today.

10 Next slide.

11 So I already mentioned a range of some of
12 these benefits. But just to add a little more
13 depth, of course, as we're looking to decarbonize
14 the state's economy, we need to look at a
15 portfolio of strategies of which load flexibility
16 is one of those key aspects that sort of cuts
17 across the demand side and the supply side. So
18 as we look at building decarbonization we're
19 going to see load flexibility as one of the key
20 strategies and, certainly, on the system side, as
21 we look at SB 100, the ability to make use of
22 existing resources on the grid, as opposed to
23 building out new generation capacity, has to be
24 something that's a strong consideration.

25 And so the Flexible Demand Appliance

1 Standards are one piece of the puzzle to building
2 out this ecosystem to realize load flexibility as
3 a resource to support California. And you know,
4 there's a few others that are going to be
5 important to consider, as well, as we look at our
6 Load Management Standards the Energy Commission
7 is developing, certainly the building
8 decarbonization activities which I'll talk a
9 little bit more about in a moment, and a range of
10 other activities that are ongoing, including
11 extensive research into technologies that could
12 interface and, eventually, become standards.

13 Consumer savings on electricity bills,
14 really, at it's core, SB 49 is consumer-centric
15 and includes a number of statutory criteria for
16 cost effectiveness and user accessibility, open
17 source standards, and we'll get into a lot more
18 detail about those this afternoon or later today,
19 but really a focus on the consumer benefits, but
20 also supporting the electricity grid, and so
21 working with the utilities, working with the
22 Public Utilities Commission, and working with the
23 California Independent System Operator to make
24 sure we ultimately develop standards that are
25 beneficial and support grid reliability. And

1 last but certainly not least, the benefits to
2 improved air quality, we're, basically, we're
3 reducing demand in a way that offsets the need
4 for additional peaker plants for some frame of
5 reference.

6 Next slide please.

7 So I mentioned it briefly and I won't
8 spend a lot of time here, but we have a number of
9 activities that are happening simultaneously here
10 at the Energy Commission on the planning and
11 analytical side, in addition to our standards
12 setting process that we're kicking off here.

13 And so taking the lens of building
14 decarbonization, you'll see, right in the middle
15 there, in addition to the demand-side strategies
16 on the left and the supply-side strategies on the
17 right that we're taking a close look at, flexible
18 demand and load management are right at the
19 center and cut across both sides to really be a
20 key aspect of our building decarbonization
21 planning efforts.

22 Next slide.

23 I mentioned this but there really is a
24 consumer-centric approach where it's pretty clear
25 in Senate Bill 49 that there is a fundamental

1 consideration for the needs and the drivers that
2 are important to consumers. And so we're really
3 taking that to heart and putting that as a core
4 piece of our implementation approach here for SB
5 49.

6 And so looking at ways that we can engage
7 with locals and do outreach to communities across
8 the state that have unique considerations, and
9 knowing that California is such a diverse state
10 with numerous climate zones, numerous cities,
11 counties, and lots of unique groups of people,
12 and so we want to make sure that we're inclusive
13 and bring equity as a core principle in our
14 implementation approach here. And that would
15 involve collaborating with the Disadvantaged
16 Communities Advisory Group that the Energy
17 Commission has. We've already had some
18 preliminary conversation with them. We intend to
19 work closely with them.

20 But, also, working closely with local
21 communities across the state to make sure that
22 we're hearing what the concerns and interests are
23 of local residents across the state. And, of
24 course, you know, challenging, given the state of
25 the world at the moment, but we are very

1 fortunate to have tools, like Zoom here, and
2 Teams, and, of course, phone calls. So we're
3 going to -- we've been on the phone very
4 regularly but we'll, as we have the opportunity
5 to consult a little more closely, we'll plan to
6 sort of extend that approach, but make sure that
7 we're working with locally-based organizations
8 and making sure that we're representing all those
9 viewpoints in the standards that are developed.

10 A key piece of this is making sure that
11 we do have a good public process. And so we're
12 getting that, again, started today with this
13 workshop. We want to make sure we get a good
14 conversation, not just verbally here but also in
15 written comments that come in, and we really look
16 forward to hearing those.

17 Next slide.

18 So with that, I will go ahead and tie up
19 my remarks and lead into the rest of today's
20 agenda which I think, again, is really exciting.

21 And first up we have Severin Borenstein
22 to talk through the value of flexible demand
23 standards to consumers and to the grid.

24 MR. BORENSTEIN: Thank you, Michael.

25 MR. SOKOL: Thank you.

1 MR. BORENSTEIN: There we go. I am
2 Severin Borenstein. Thanks for inviting me to
3 participate. Thanks to Commissioner McAllister
4 and all of the CEC Staff. I am a professor at UC
5 Berkeley and, also, a member of the CAISO Board
6 of Governors. I should clarify, though, anything
7 I say here today is my opinions alone and not
8 necessarily those of the CAISO or of UC Berkeley.

9 Next slide please.

10 So the last time I was here physically,
11 actually at the CEC, was in January. It's been
12 along year but it did make me remember back to
13 the workshop that Karen Herder ran on
14 implementing dynamic pricing. And I made a pitch
15 at that time for getting prices right so that
16 they reflect the true level and variation in
17 society's cost of providing energy.

18 And of course that's an important piece
19 but today we're back to talk about the other
20 piece which is making sure that consumers can
21 actually respond to those signals because the
22 price variation alone doesn't get you anything if
23 consumers aren't actually seeing that price
24 variation and have a way, in practice, to
25 actually respond to that price variation.

1 Next slide please.

2 That, of course, is becoming more
3 important every year. California is moving
4 towards an ever greater level of renewables, most
5 of which are intermittent and non-dispatchable,
6 which means that we need to make sure the power
7 is still there when we need it while, at the same
8 time, continuing to use the lowest cost renewable
9 resources we can. The great news is, of course,
10 that renewables have gotten cheaper and cheaper
11 and now on a levelized cost basis are competitive
12 with even natural gas-fired power and cheaper in
13 many cases.

14 The bad news is levelized cost isn't what
15 we consume. We actually want electricity when we
16 want it. And, of course, solar doesn't produce
17 when the sun isn't shining and wind doesn't
18 produce when the wind isn't blowing. And so we
19 need to make sure we have a way to either move
20 supply to the periods when demand is there or to
21 move demand to the periods when supply is there,
22 the latter of which we're going to be talking
23 about today.

24 I think any realistic assessment of where
25 we are in California suggests that we really are

1 going to need to do both, move demand and move
2 supply, and that there is clearly some really
3 low-hanging fruit in moving demand, and so that
4 has to be part of the solution.

5 Next slide please.

6 Just to be clear, we can do this without
7 flexible demand, and some people suggest we
8 should. But the argument isn't that it will be
9 impossible, it's just going to be a whole lot
10 more expensive if we do it without taking
11 advantage of demand participation. Storage is
12 expensive still. It will get a lot cheaper but
13 it's going to remain expensive, particularly for
14 long-term storage, and we are going to have to
15 make some of those big investments. But we have
16 a way to avoid many of them through demand
17 flexibility.

18 Also, we can trade power with other
19 areas. And we're doing more and more of that as
20 well. But trading power also has limitations.
21 It has physical limitations through transmission
22 constraints. And it also has institutional
23 limitations through a number of complications of
24 trading power with the rest of the west, both
25 financial and environmental complications, that

1 are really pretty sticky to work out. It's
2 definitely going to be part of the solution as
3 well. But to the extent we can just move demand
4 so that we don't need to import as much power on
5 those peak times, that will be extremely helpful.

6 So on its own we do have other resources
7 that are low carbon and are dispatchable. People
8 talk about green hydrogen. That will probably be
9 part of the solution in the future. It's not
10 here yet. It's still very expensive. There are
11 a lot of practical issues to work out. I am very
12 bullish on it but I think, realistically, we have
13 to recognize it is not going to be the major
14 piece of the solution in the next decade.

15 And finally, I think it's really
16 important to note that we're not talking about
17 shutting off customers. We're talking about
18 flexing demand a bit. And it's clear that there
19 is a lot of demand that can moved at little or no
20 cost. This is an opportunity that we really
21 haven't taken advantage of and it's been there
22 for decades. And when I, even back in the '90s,
23 was talking to engineers about the technology
24 side of doing this, many of them would just roll
25 their eyes and say, yeah, we know how to do this.

1 The problem isn't on the technology side. The
2 problem is on the institutional and regulatory
3 side.

4 Well, the good news is the technology has
5 gotten even better since then. And it is going
6 to be even easier if we can actually take the
7 steps forward to make that demand an integral
8 part of the electricity system.

9 Next slide please.

10 Just a little bit of history. We have
11 had demand flexibility for decades. We called it
12 interruptible load back in the '70s and '80s.
13 That's when we could actually shut off customers
14 when power was tight. That's a pretty kludgy
15 solution. It basically takes all of the demand
16 from a customer offline, both the low-value
17 demand at that time and the super high-value
18 demand. And we know from our own use at home
19 that we have -- demand a very different value.

20 And certainly the public safety power
21 shutoffs have highlighted this for us. You want
22 to keep your refrigerator cold, and your freezer,
23 if it's cold out you want to make sure your
24 furnace can operate, but you probably don't have
25 to have all the lights on. You certainly can

1 change the way you use a lot of other resources,
2 of other appliances, do the laundry at a
3 different time, run the dishwasher at a different
4 time, and so forth. And we can do that manually
5 but now we can do it in an automated way that
6 will just make it much, much easier to do.

7 We have gradually evolved other systems
8 for demand flexibility. And probably the best
9 known one is air conditioning cycling where the
10 utility has the ability to turn off your air
11 conditioning unit for 20 minutes or 30 minutes.
12 And that was a fine 1990's solution to the
13 problem. It always had problems, of course, the
14 main one being that air conditioning is a single-
15 power system that is either on or off. And so
16 when you turn an air conditioner off for 20
17 minutes and there's no change in the setting of
18 the thermostat, when it comes back on it comes
19 back on full blast and runs for quite a long time
20 to get the house back down to the temperature.

21 So we can think of that as demand flexibility
22 1.0. The great news is that we have made real
23 progress since then.

24 All of this sort of fits in this idea
25 that I have been sort of ranting about for a long

1 time, that the whole concept of the value of lost
2 load is incredibly misleading. We talk about
3 that often when we talk about electrical systems
4 because it says there is a single number that
5 captures how much people are losing, or companies
6 are losing, when they consume less, and that's
7 just not the case. There are very low-value uses
8 and there are very high-value uses, so there's no
9 single value of lost load.

10 The way we can get to actually sorting
11 those out is letting customers sort it out
12 themselves. Now they're not going to, probably,
13 do much of that if they have to do it manually.
14 As a Commissioner said to me during the
15 California electricity crisis, when I was
16 advocating for real-time pricing, consumers
17 aren't going to run around shutting off lights
18 when the power goes off, and there's some truth
19 to that. But the great news is the technology
20 has gotten so much better for automation to run
21 around and shut off lights or shut off your air
22 conditioning for a few minutes, or change your
23 setting, more importantly, on your thermostat.
24 And so those are the technologies we now have and
25 that we now need to think about implementing.

1 The key is to reduce the lowest value
2 demand when the cost of incremental electricity
3 rises. That, as I talked about back in January,
4 requires good price signals, and it also requires
5 the technology and the institutions to implement
6 the ability for customers to efficiently respond
7 to those signals.

8 Next slide please. Next slide please.
9 There we go.

10 So the key to essential role of demands
11 in smoothly and efficiently balancing high
12 renewable system is that it will improve grid
13 resiliency. It will allow us to respond to those
14 super-peak demands which are likely to get more
15 common with climate change. It will reduce the
16 cost of integrating renewable electricity and
17 reducing our GHG emissions. And it will reduce
18 reliance on more expensive alternatives, such as
19 storage and transmission.

20 Now if storage were free, if we get to a
21 technology where storage is super cheap, then,
22 obviously, demand flexibility becomes much less
23 important. We can just use storage to move the
24 power around. But we're not there and we're not
25 really, seriously likely to be there any time

1 soon.

2 Likewise with transmission. Transmission
3 is a great key or great piece of the puzzle. We
4 should be building more transmission and
5 integrating electricity markets across the
6 country. But, again, that's not free. And it
7 does require both direct costs and a lot of
8 institutional change, and we're not there, and
9 we're not likely to get there right away. So
10 demand flexibility is, in many ways, the lowest
11 cost way to keep the system balanced.

12 And that allows -- and the technology
13 allows smart implementation of demand
14 participation. What, as I said, what we don't
15 want to do is shut off customers or eliminate
16 high-value usage of electricity. We want to find
17 the low-hanging fruit. And the technology s that
18 we now have allow us to automatically respond to
19 find that low-hanging fruit.

20 Next slide please.

21 So why do we need government
22 participation in this? Why don't we just put the
23 prices out there and the technology will be
24 implemented? And the problem is largely a
25 chicken-and-egg problem that -- or what's called

1 a network externality problem, that we do know
2 how to put the prices out there but there's not
3 much demand for it unless the technologies are
4 out there.

5 Once -- the technologies have to be,
6 obviously, studied closely for effectiveness and
7 cost effectiveness, but once they're there,
8 getting them out there in the appliances is what
9 will trigger the changes in pricing and the
10 changes in usage of those appliances, which is
11 what we -- how we will get from here to there to
12 a system where we have a lot of smart demand that
13 can see the prices, respond to those prices, and
14 help move demand away from the highest cost
15 periods in order to keep the system in balance
16 while supply is varying in ways that, frankly, as
17 long we we're reliant on wind and solar, are not
18 going to be entirely controllable. Storage will
19 help but it's going to be limited and it's
20 another alternative.

21 So there are a lot of pieces to the
22 puzzle. We need to use all of them. We need to
23 use demand flexibility, along with storage, along
24 with trading with other parts of the west, and
25 along with dispatchable resources.

1 All of those have a role to play but we
2 have an opportunity here to really reduce the
3 cost and show the world how we can reduce the
4 cost of lower implementation of intermittent
5 renewables by implementing widespread demand
6 flexibility. And I think that that is an
7 opportunity that will not just benefit California
8 but, since climate change is, obviously, a global
9 problem, will benefit California indirectly when
10 the rest of the world sees how we do this and
11 follows along and implements the same sort of
12 policies.

13 So the question is: How do we get from
14 here to there? As the climate scientists keep
15 telling us, the real question is: How do we get
16 from here to there quickly. We don't have time
17 to waste. We have, unfortunately, frittered away
18 the last decade with very little progress on
19 climate change, and the last four years in
20 particular, and so we need to make changes fast.

21 California, in itself, will be able to
22 reduce its greenhouse gases. But the biggest
23 effect is not California's own reduction but
24 California's leadership and demonstration of how
25 the rest of the world can use these opportunities

1 to reduce their greenhouse gases.

2 So I'm looking forward to the rest of the
3 day, to finding out how we can do this in a fast
4 and efficient way, use the technologies, and
5 implement demand flexibility in a way to get us
6 to a lower cost and lower greenhouse gas system.

7 Thanks a lot.

8 MR. FERRIS: Thank you, Severin.

9 Next slide please.

10 So next up we have Mary Ann Piette, a
11 Senior Scientists and Director of Building
12 Technology and Urban System Divisions in the
13 Energy Technologies Area at Lawrence Berkeley
14 National Laboratory. She oversees LBNL's
15 building energy research activities with the U.S.
16 Department of Energy and is also the Director of
17 the Demand Response Research Center. Today she's
18 here to talk about flexible demand shift resource
19 through the year 2030.

20 Welcome, Mary Ann.

21 Next slide.

22 MS. PIETTE: Good morning everybody. I
23 hope everybody is doing okay on this Monday
24 morning.

25 I want to start by thanking the

1 California Energy Commission for organizing
2 today's event. It's very exciting to be
3 supporting the goals of the Senate Bill 49. And
4 I'm going to talk with you about the California
5 Demand Response Potential studies, which have
6 been funded by the Public Utilities Commission,
7 but I also want to reference some data that's
8 going to be published soon from the Building
9 Technologies Office at the U.S. Department of
10 Energy.

11 It's an exciting time in this field.
12 We've been working with DOE on something called
13 the Grid Interactive Efficient Buildings Roadmap
14 and that will be out early next year. So it's
15 exciting to see both the national leadership, as
16 well as the California leadership, on this
17 activity.

18 Go ahead to the next slide.

19 I'm going to start by giving you an
20 introduction into the Demand Response Potential
21 studies. Those studies started about in
22 2014/2015 with the first publications in 2016.
23 And it's been four phases of activity. These
24 activities, I'll review with you the concepts of
25 shape, shift, shed, and shimmy, and the Phase 3

1 results which were published this year, and then
2 I'll talk a little about Phase 4 because that
3 activity is just starting and we're in the
4 process of resampling the California loads. The
5 purpose of these studies, and I'll talk about, as
6 well, and I want to introduce you to the way we
7 look at the cost for connected devices, and then
8 I'll summarize and present a few future
9 directions.

10 Go ahead to the next slide.

11 One of the challenges in California is
12 that we have a growing amount of curtailment
13 every year. And in 2019 the average in spring
14 was about 5 gigawatt hours a day, so you see that
15 increase over time, and that's the belly of the
16 duck getting deeper and deeper. On Memorial Day
17 of 2019, we actually reached 40 gigawatt hours of
18 curtailment, so that we generated 40 gigawatt
19 hours of solar electricity that we could not use.

20 One of the ways to use that is to use
21 more demand-side loads, so we want to shift loads
22 around during the day. And if we can use more
23 loads during those curtailment hours, then we can
24 have flexible demand and reduce these numbers and
25 have a cleaner electric system and support higher

1 levels of renewables on the grid.

2 Go ahead to the next slide.

3 So let me introduce you to what we've
4 been doing in the Demand Response Potential
5 Study. The basic idea is to model the capability
6 of loads and the characteristics of those loads,
7 the size of them, and the cost of them. This
8 originally was done to support an order institute
9 rulemaking at the PUC on enhancing the role of
10 demand response in meeting the state's needs for
11 operational requirements. We have been
12 supporting the utilities and the CEC, and I'll
13 present some of these results, but the long-term
14 goal is to understand how flexible demand can
15 help meet the state's long-term energy goals?

16 And we've recently started modeling
17 electrification. And as we model
18 electrification, it's really important that we
19 think about the participation and the adoption of
20 these various devices, and I'll speak a little
21 about that. And if we electrify space heat and
22 water heat we need to make sure that it's
23 flexible and can shift or we may have problems
24 with those load shapes. We may become winter
25 peaking and have an early morning electricity

1 peak from space heat and water heat.

2 Go ahead to the next slide.

3 So these are the concepts of shape,
4 shift, shed, and shimmy that I want to share with
5 you.

6 On the upper left is the concept of
7 shape. And we use the word shape to describe the
8 capability of a load to respond to a dynamic
9 price. As we think about time-of-use rates the
10 electricity load shape of an office building or a
11 home or a school might change if they're
12 responding to time-of-use rates, and peak demand
13 charges but we're mostly interested in time-of-
14 use rates, historically, the high price time has
15 been 2:00 to 6:00, but now the high price time is
16 from 5:00 to 9:00 which is, of course, the head
17 of the duck. And so we want to understand what
18 loads can use less at that time of day and shift
19 that to the middle of the day to the belly of the
20 duck?

21 The traditional shed demand response, I'm
22 going to talk about as well, and Severin made a
23 number of comments about that, about hot summer
24 day demand response, that's our traditional loads
25 tend to be cooling loads, so we still have that

1 need. And we, of course, saw this here, the
2 blackouts that we saw, as a result of problems on
3 the wholesale grid which might be related to
4 emergencies or some price issues or a power plant
5 being down. So we still want to have that
6 capability to shed load on a hot summer day.

7 What is quite important is this new
8 concept of shift. And the concept of shift is
9 moving load from one hour to another. In
10 comparison, shedding is often meaning that we're
11 curtailing load and we're not catching it up
12 again. So if we change the temperature in an
13 office building, say from 70 up to 75, we often
14 don't have a rebound, depending on what time of
15 day that's happening. And you can make sure,
16 with controls, that you don't hit a new rebound.

17 With shifting we're actually moving load
18 to part of the day. And an electric battery can
19 shift load. But we also want thermal loads to be
20 able to shift, and even things like pool pumps,
21 and I'll give an example of that.

22 So that is what shedding and shifting is.

23 Now shimmy is what we call fast-acting
24 demand response that's receiving a signal
25 continuously and load following or ancillary

1 services. My presentation is not talking much
2 about shimmy. Shimmy requires more advanced
3 telemetry often. And the advance meters that we
4 have with
5 AMI are sufficient for shed and shift. We may or
6 may not want them for shimmy.

7 So those are the concepts of shape,
8 shift, shed, and shimmy. And we're continuing to
9 model these different loads in the Demand
10 Response Potential Study.

11 Go ahead to the next slide.

12 In this slide on the left I show you the
13 average annual electric load shape with shiftable
14 loads. And you'll see the top gray, you'll see
15 process loads, pumping loads, refrigeration, pool
16 pumps, EV charging, HVAC. The net load is, of
17 course, the duck curve, and then others. So
18 there's a lot of load that we're not modeling.
19 I'll talk a little bit about how this model was
20 derived.

21 In the Phases 1 through 3 we had 200,000
22 electric load shapes and 11 million demographic
23 files to create a model of the IOU service
24 territory where we model residential, commercial,
25 and industrial loads. And you'll see in the

1 table there on end uses the different end uses
2 that we model. So we basically create an 8716
3 (phonetic) hourly load. And that's a load that
4 has different weather climate zones across the
5 state. And we cluster these loads and we look at
6 the capability of these different end uses to
7 respond to some sort of demand response signal or
8 event.

9 We have been modeling space heating and
10 water heating in Phase 3, so that was not in
11 Phase 1 and 2, and those are new electric loads.
12 The majority of California uses gas for space
13 heat and water heat. And when we try to model
14 the electrification of space heat and water heat
15 the numbers that we get and the value of that is
16 going to depend on how quickly it's adopted and
17 how quickly we can retrofit the stock. So we're
18 actually trying to model the cost to implement
19 those different systems. You'll see we don't
20 have residential appliances in Phase 1 through 3
21 but we are adding that in Phase 4, and we're
22 adding commercial space heat and commercial water
23 heat.

24 So when we think about SB 49, it's
25 important to understand that it's oriented

1 towards demand-flexible appliances, not built up
2 systems, so we have some of both in this study.
3 And I want to make sure you understand that the
4 loads that we're modeling here include things
5 beyond SB 49, as well as things that might be
6 available in SB 49. And we'll work with the CEC
7 to dig into the numbers from the study and to try
8 to help them understand the magnitude of the
9 shift potential, as well as the shed potential,
10 from some of these emerging flexible appliances.

11 Go ahead to the next slide.

12 So we've been trying to model, how much
13 does it cost to get a kilowatt of flexible load?
14 And we have a few categories of different costs
15 that we consider. A lot of the technologies that
16 Severin mentioned, like the direct load control,
17 the utilities pay for a switch at an air
18 conditioner. They may pay for a switch at a pool
19 pump. And that's one type of piece of equipment
20 where the utility controls it.

21 Another piece of equipment would be a
22 smart thermostat that a consumer may install in
23 their house, but they may get a rebate from the
24 utility, and the utility may then enable that
25 thermostat to be part of a demand response

1 program. Most of the demand response programs in
2 California at this time are shed programs. We're
3 just beginning to think about shift. And the
4 digital tariffs and load management standards are
5 designed to help us move to this continuous price
6 response that Severin mentioned as well.

7 So the cost that we think about here are
8 both kinds of costs. There's a fixed cost for
9 the communication and the hardware. And most of
10 these communication systems are using the
11 internet. And we consider a cost per site, so
12 it's a cost to turn that automation on for a
13 given building.

14 Then there's a variable cost for the type
15 of controls. And when we think about those
16 controls, it might be the controls for a heat
17 pump, for a thermostat, or for a built up system,
18 as I mentioned, and that would be the cost per
19 kW. So in our accounting system we have both
20 cost per site and cost per kW.

21 And then there's the end use control and
22 communication which are per end use, for example,
23 per HVAC system in a large commercial building.

24 So there's a variety of different costs.
25 And I'm going to show you a report that was

1 published by a few folks at LBNL that has some of
2 these data that you can refer to later.

3 Go ahead to the next slide.

4 Here's some examples of the cost for
5 residential site enablement. And this is the
6 report on the right that I mentioned. These
7 numbers are from that report which was published
8 in August 2017. And I'm going to show you a
9 resource for newer cost data as well.

10 The three on the left under shed are
11 HVAC, that's a direct local control thermostat or
12 direct local control device that the utility
13 controls, a pool pump. Now a room air
14 conditioner, as well, some utilities are actually
15 communicating with room air conditioners, whereas
16 on the right I have the HVAC for a smart
17 thermostat which can both shed and shift load.
18 The historic demand -- the automated load control
19 from utilities is shed only, whereas a smart
20 thermostat might be able to respond to a price
21 and pre-cool a building.

22 So as we move toward these technologies
23 that Severin was describing, we have our
24 traditional shed, and then we have our more
25 flexible shift that can respond continuously to

1 some sort of price.

2 The report here is called Demand Response
3 Automated Controls Framework and Assessment of
4 Enabling Technology Costs. So that's a resource
5 I wanted you to be aware of. And we've been
6 using some of these costs in our modeling
7 activities.

8 Go ahead to the next slide.

9 This is not published yet, even though it
10 says September 2020, but this is a list of
11 devices that Guidehouse has been evaluating for
12 the Department of Energy. And here, DOE uses the
13 concept of grid interactive efficient buildings.
14 And you'll see a good list of technologies here,
15 smart thermostats, heat pump controls, heat pump
16 water heaters, dishwashers, residential window
17 attachments, so these are both energy efficiency,
18 as well as demand flexibility technologies. And
19 there's been a lot of work in the last year
20 looking at the relationship between energy
21 efficiency and demand response technologies. A
22 smart thermostat is a great example of a
23 technology that can help people automate their
24 schedule for their air conditioner, as well as do
25 this sort of pre-cooling and shedding for demand

1 response and shifting events.

2 So as we think about devices for demand
3 flexibility, many of the control systems also can
4 provide energy efficiency. That's true in
5 lighting. That's true in heat pumps. And it's
6 very important, when we think about something
7 like a heat pump water heater, that it is much
8 more efficient than an electric resistance water
9 heater. So we want to move towards devices that
10 are both efficient and grid interactive. And the
11 SB 49 program is going to help us identify those.

12 So this is a report that will be
13 available soon. And I have one slide on the
14 details to show you the kinds of information
15 available from this report.

16 Go ahead to the next slide.

17 So this slide shows you 2020, 2030, 2040,
18 and 2050, so it's a pretty aggressive outlook
19 into the future about what is happening on air
20 conditioning in homes, the seasonal energy
21 efficiency ratios for the south and the north,
22 the average life of the retail equipment, install
23 costs, annual maintenance costs, and reported
24 energy savings. And you'll see there a column
25 that says, "ENERGY STAR Connected Smart

1 Thermostats," so we have smart thermostats in
2 2020, all the way out to 2050. And you'll see a
3 little bit of reduction in costs over time. And
4 they produced tables like this for all those
5 devices that I showed you in the previous slide.

6 So this is a great resource to think
7 about these ENERGY STAR connected device costs
8 and, also, the energy efficiency associated with
9 the end use. And we're moving into a time where
10 our ability to understand the cost effectiveness
11 of adopting these technologies is improving with
12 studies like this.

13 Go ahead to the next slide.

14 Now here is some results from the Phase 2
15 Demand Response Potential Study where I'm showing
16 you results for shed. And when I say that the
17 cost is \$200 per kilowatt, I'm showing you all of
18 the demand response that's available at \$200 a
19 kilowatt. If I showed you a number at \$300 a
20 kilowatt, it would be a higher number. And if it
21 was \$100 per kilowatt, it would be much less.
22 But here, at about \$200 a kilowatt, we think that
23 the state has about 6 gigawatts of demand
24 response potential from the end uses shown here
25 for the year 2025 for a typical weather year.

1 And you can see the division by utility,
2 about -- Edison and PG&E have a similar amount of
3 about 3 gigawatts. San Diego Gas and Electric is
4 a lot smaller. And you can see the different end
5 uses we modeled here. This does not include
6 water heating at this time, or space heating.
7 The HVAC here, in this case, is cooling, and HVAC
8 in large buildings. You can see there's a lot of
9 industrial potential. And some of the industrial
10 loads may be affected by SB 49. But this is --
11 these are using the levelized costs for the
12 technology. And we estimate the size of the
13 reduction for every end use and then we sum it
14 over the year.

15 So for each of these devices we estimate
16 the lifetime of the control system in order to
17 create a cost that is an annualized cost to
18 install the technology and then to use it every
19 year in the hours that it's available. And these
20 are the top 200 to 250 hours where we need this
21 kind of demand response.

22 Go ahead to the next slide.

23 Now shift. This slide shows you on the
24 left a plot of the different end uses, which I'll
25 talk about in a moment, but there's three colors

1 there. The blue is the participating resource
2 that we think can be available in -- this one is
3 2030, which I don't show here but I know it's
4 2030. The orange is technically available --
5 technologically available, meaning that not all
6 of the loads are going to participate. So the
7 blue is what we think will participate. The
8 orange could. And the green is the max.

9 So you'll see, for example, at the very
10 top, pool pumps could shift about a gigawatt hour
11 per year. Now when I say a gigawatt hour per
12 year, that's a sizeable resource that we actually
13 can use once a day. We tend to need it most in
14 the spring. Sometimes we could use it twice a
15 day.

16 So the picture on the right shows you a
17 day, so that's 24 hours, and on the Y axis it's
18 the shift for a particular dispatch. Now over
19 the day, in the morning we want to take load and
20 then shed load because of that morning blip in
21 the duck curve. And then in the middle of the
22 day, when there's plenty of solar, we want to
23 take load and then we want to use less during the
24 shed hours in the late evening. So that's the
25 inverse of the duck.

1 And those are why we may be able to use
2 the resource twice a day. For example, some heat
3 pump water heaters might be able to cycle twice a
4 day. You might have a morning demand and you
5 might have an evening demand. And then you're
6 going to pre-charge it before your morning
7 showers, and then charge it in the middle of the
8 day before everybody comes home, but they're home
9 all the time now, so it may be a different load
10 shape. But those are examples of the kinds of
11 things we do.

12 So the technology costs and the
13 performance levels constrain how much shiftable
14 load is accessible. And that's the key, is that
15 we -- SB 49 will help reduce the cost of
16 providing shift on the grid because the
17 appliances of the future will have that embedded
18 when you buy them, as opposed to the way we
19 modeled them was that you had to pay for that
20 capability to be added to a device. Now
21 residential appliances turn over more quickly
22 than, for example, a large HVAC system. So
23 there's a lot of opportunities in different kinds
24 of loads and the way we think about the adoption
25 cycle.

1 The demand response path model that we
2 use considers the customer historical
3 participation. So we look at the demand response
4 programs that have been in practice for the last
5 few years and then engagement models that are
6 help in the future. So that's basically the
7 concept here. And you'll notice, as I mentioned
8 in the beginning of my talk, that in the spring
9 we had about 5 gigawatt hours per day of
10 curtailment, so we actually are able to soak up
11 that much load with these kinds of devices. And
12 we are able to use demand flexibility to reduce
13 the curtailment significantly.

14 Go ahead to the next slide.

15 These are the new residential appliances
16 that we're going to be including in Phase 4.
17 We're going to be modeling, for the first time,
18 refrigerators, freezers, washer and dryers,
19 dishwashers, and domestic hot water, both
20 residential resistance heat, as well as heat
21 pumps. And we're using the CEC's 2019 Load Shape
22 Study from ADM Associates, and we'll be modeling
23 across numerous climate zones, so we're really
24 excited to be doing that work. Right now we have
25 300,000 load shapes from the utilities for Phase

1 4. And, again, we have this 11 million
2 demographic file, so creating this model of the
3 capability.

4 And I think I have one more slide. Head
5 to the next one.

6 So I just want to say that I'm excited to
7 share with you some thinking about how flexible
8 loads are critical for California's clean energy
9 policies, and the magnitude of that capability,
10 compared with some of the over-generation
11 problems and the kinds of resources we need. We
12 need to -- we are in the process of modeling
13 these new appliances and quantifying the value of
14 the load shedding. We can model the influence of
15 SB 49 on making those loads more cost-effectively
16 available for the shift potential. And a lot of
17 new resources are becoming available for that
18 cost data that I wanted to share with you.

19 I have two links here, the different link
20 to the potential study, and also the Electricity
21 Markets and Policy Group's controls framework of
22 enabling costs.

23 So I'll stop there. And thank you so
24 much for the opportunity to present this work.

25 MR. FERRIS: Thank you, Mary Ann.

1 Up next is Nate Kinsey representing our
2 sister agency from the California Public
3 Utilities Commission. Nate is the Senior
4 Regulatory Analyst on the Building
5 Decarbonization and Renewable Natural Gas Section
6 at the California Public Utilities Commission.
7 Today he's here to speak about supporting
8 flexible resources at the California Public
9 Utilities Commission.

10 Welcome, Nate.

11 MR. KINSEY: Thank you, Todd.

12 Morning everyone and thank you for the
13 opportunity to present on what the CPUC is doing
14 and to coordinate on the implementation of SB 49
15 moving forward.

16 I think the ordering of this conversation
17 was fantastic with Severin kicking off and Mary
18 Ann touching on a lot of the topics and
19 technologies that I'm going to be covering, so
20 I'm excited to be here.

21 And before moving to the next slide, I
22 just want to highlight the language that's in SB
23 49 for coordination between the two agencies, and
24 that is to better align the flexible demand
25 appliance standards with the demand response

1 programs administered by the state and load-
2 serving entities, and to incentivize flexible
3 demand appliances. So when I was developing my
4 slides, I really tried to frame it in that
5 context, specifically in alignment with the
6 language in the legislation.

7 So let's go to the next slide please.

8 So first, I just want to start off by
9 acknowledging, I'm not on the Demand Response
10 Team at the CPUC. I am on the Building
11 Decarbonization and Renewable Gas Team and
12 really, exclusively, focus on the electrification
13 of buildings. And so I spent a lot of time
14 thinking about how buildings already account for
15 a large load on the grid in California and how
16 increasingly they will be serving additional load
17 moving forward as more buildings are electrified
18 due to the installation of heat pump
19 technologies, such as space and water heating.

20 That brings up a really interesting point --
21 next slide please -- that Mary Ann already
22 touched on which is as the grid takes on more and
23 more of electrified building stock a lot of that
24 building load occurs during times of really high
25 or higher GHG emissions on the grid. As we look

1 forward in studies you see as a building gets
2 electrified, especially at space and water
3 heating, you get these morning loads and these
4 evening loads, especially during the winter, that
5 really align with times of really high GHG
6 emissions.

7 So as I'm thinking about not only
8 electrifying the building, removing barriers,
9 providing incentives, I spend a lot of time
10 thinking about how do I truly make a building
11 decarbonized by ensuring that its operational
12 load is in alignment with the greenhouse gas
13 emissions of the grid? And one way to do that is
14 to shift around load as much as possible.

15 Next slide please.

16 And there's been really great research
17 done by folks, like Rocky Mountain Institute,
18 that show on a residential application, where I
19 spend a lot of my time, there is a great ability
20 once you include the right controls, the energy
21 storage, the right price signals, that you can
22 really nicely fit a lot of a residential load
23 into those middle day -- or the middle hours of
24 the day when renewables are high, solar
25 generation is high, and avoid some reliability

1 issues and greenhouse gas issues in the evening.

2 So that's my framing coming into this
3 conversation. I just wanted to be up front and
4 honest that I'm not the demand response guy but I
5 do spend a lot of time thinking about how demand
6 response, how shifting of these types of
7 resources, will be critical for California to
8 achieve its greenhouse gas and reliability goals
9 moving forward.

10 Next slide please.

11 So just taking a second to talk about
12 where we are today. I think Severin did a great
13 job of keying up the examples of past demand
14 response programs and where we were, really, at
15 the turn of the millennia, and in response to the
16 energy crisis and the situation that has
17 developed out of that, or the framework for
18 demand response and flexible resources that has
19 developed out of that over time.

20 Next slide please.

21 And I came up with this catchy little
22 reminder which, if you work in energy efficiency
23 or in any public purpose program, I look at
24 these, the CPUC's enabling flexible resources,
25 through programs, pricing, and products. The

1 programs are your traditional energy efficiency
2 market transformation programs and we'll
3 highlight a few of those next. But, really, the
4 goal of those programs are to lower costs, some
5 of which Mary Ann touched on, increase adoption,
6 remove barriers for adoption, and to provide that
7 marketing, education, and outreach to not only
8 the, you know, the broader California community,
9 but also communities that have been impacted over
10 time, disadvantaged communities, communities that
11 will be impacted largely by climate change more
12 than others have been, and those are our
13 programs.

14 Our pricing is our, you know, time-of-use
15 rates which are slowly rolling out statewide now.
16 EV rates, the Self-Generation Incentive Program's
17 Greenhouse Gas Signal. Future programs -- or
18 future pricing examples could be real-time rates
19 or the pricing provided through the load
20 management standard that's being worked at here
21 at the Energy Commission. And then our products.
22 And these are our products that go into the
23 marketplace at the CAISO and really provide those
24 services there.

25 And if you click one more time, those

1 two, the pricing and the products, are what is
2 enabling the flexible resources and the framework
3 in which we're operating under today. I will say
4 that, as we've highlighted a few times throughout
5 the conversation, this structure is really
6 focused on shedding of demand response. It is
7 not necessarily set up for shifting. Some of the
8 time-of-use rates, we will highlight later on and
9 get to that, but this structure is historically,
10 kind of in its current form, focused on the
11 ability to shed of resources.

12 Next slide please.

13 So when we think about the programs and
14 the programmatic side, there are a range of
15 programs that are offering appliances or
16 incentivizing the adoption of appliances. And a
17 couple key things I want to hit on here is,
18 first, each one of these programs currently lives
19 kind of in its own bucket and its own silo. They
20 have their own goals, they have their own rules,
21 and that changes what types of appliances are
22 incentivized going out the door.

23 For example, energy efficiency will
24 incentivize a heat pump water heater. Now that
25 heat pump water heater might not have the

1 capabilities to provide the shift resources that
2 we're talking about here today because energy
3 efficiencies really focus on, today, on capturing
4 energy savings. It doesn't take into
5 consideration any of that shift that's possible,
6 whereas the AB 2868 Energy Storage Programs,
7 which we'll again talk about later, really are
8 focused on energy storage applications, thermal
9 energy storage, and are trying to get appliances
10 out there that can serve that function.

11 So when you're thinking about programs
12 and when we're thinking about SB 49
13 implementation, and one of the big benefits of it
14 will be that kind of peanut buttering effect
15 across the California marketplace. Appliances
16 across the board, no matter which program they're
17 going to be incentivized through, will have that
18 ability to respond to a signal, shift load, shed
19 load. And I think it's going to be a really key
20 barrier to -- or key benefit to the California
21 marketplace in lowering cost, which Severin and
22 Mary Ann both touched on.

23 Next slide please.

24 So here is our demand response framework.
25 And I want to point out, we want to ignore C for

1 right now. This is a copy/paste from another
2 presentation that was given a little bit earlier
3 on. But our current demand response framework
4 falls into these two buckets of load-modifying
5 resources and event-based resources. And I've
6 highlighted a few of the different types under
7 here. And that goes, again, back up to those
8 pricing and products that we already touched on.

9 So these load-modifying resources,
10 Permanent Load Shift Program was a program that
11 operated from kind of the mid-2000s until about
12 2017 and really focused on how can we get thermal
13 energy resources to shift load on a constant
14 basis? If you take that example and kind of play
15 it down to a smaller appliance level, maybe
16 that's what we're going to be asking some of our
17 appliances to do, like heat pump water heaters,
18 and we'll talk about that. Time of use is
19 another great one. Events, like critical peak
20 pricing. And then this, you know, future of
21 hourly or real-time pricing signals that are
22 going to go out. So those are the load-modifying
23 resources.

24 Supply-side resources, I've touched on
25 already, these are the ones that go play out into

1 the CAISO and into the marketplace. And there
2 are DRAM programs, Demand Response Auction
3 Mechanism, as well as our resource adequacy
4 contracts and broader kind of DR IOU contracts
5 that they might operate. But, again, this is the
6 framework that we're working on today. Is this
7 the best framework for incorporating SB 49?
8 Maybe. Maybe not.

9 I think there's a lot of areas where
10 you're going to have devices that could fall into
11 both of these categories and how do you deal with
12 those? How do those get accounted for is a key
13 question that, I think, all of us need to answer
14 as more of the technologies that are identified
15 by the CEC roll off the lot.

16 Next slide please.

17 And I was also asked by Energy Commission
18 Staff to touch on how do we actually account for
19 the benefits of these resources? So the main
20 function of -- or the main way that the Public
21 Utility Commission values and benefits or avoided
22 costs that a DER and, really, behind-the-meter
23 resource provides is through the avoided cost
24 calculator. And, hopefully, many of you are
25 familiar with the avoided cost calculator. But

1 in the simplest terms it is a forward-looking
2 projection, 30 years on the 8716, the annual
3 basis, that looks at the different costs that are
4 being imposed onto the system or generated onto
5 the system. And we take those costs and
6 considerations, you take the technology and their
7 ability to avoid those costs, and that provides
8 your output for your benefits.

9 Now when you're looking at shed, that's a
10 little bit easier of a calculation to do. You
11 say you're avoiding one hour of costs or one
12 hour -- you're providing one hour of benefits to
13 the California grid. When you start thinking
14 about shedding -- or shifting, excuse me, you
15 really are doing two things. One, you're
16 creating benefits across multiple hours, which is
17 a great thing, but you're also increasing costs
18 at a different time of the day. Now those
19 increased costs might be coming during the middle
20 of the day when renewables are high, costs are
21 low, and we want to encourage that. But, again,
22 it is a different framework in which the programs
23 that have been developed and operated by the CPUC
24 are going to be moving forward in.

25 So it's just -- it's a tweak in the

1 mindset that we need to employ, not only as
2 Energy Division Staff but as all of us, that we
3 are not just generating a benefit, we are also
4 generating benefits and costs.

5 Another thing that I wanted to highlight
6 the difference between the shed and the shift is,
7 in the past, it was my understanding that purely
8 shed resources, and some of the big interruptible
9 programs, the Commission came up with, you know,
10 you're a cost metric for the loss of operations
11 that your factory might be providing or the
12 avoided revenue that you might be providing.
13 Well, in a shifting resource, such as a heat pump
14 water heater, and we'll talk about next, you're
15 really not losing any value. You're moving the
16 value around. You're ensuring that your hot
17 water is still there but providing a reliability
18 and greenhouse gas reduction or a benefit at a
19 different time of the day.

20 So again, the structure and the
21 frameworks at the Public Utility Commission are
22 going to need to update as we move forward with
23 these new appliances coming on and with the
24 technologies that will enable this to happen.

25 Next slide.

1 So again, I spend a lot of my time
2 thinking about the electrification of buildings.
3 And in 2020, I've spent a lot of time thinking
4 about deployment of heat pump water heaters
5 across a variety of different programs and their
6 ability to shift load, their ability to shed
7 load. I've included shimmy in here because there
8 are resource studies out that show electric
9 resistance have the ability to shimmy, as well,
10 so I wanted to walk through an example of just
11 taking one appliance and/or one category of
12 appliances and how the Commission is going
13 through those three Ps of programs, pricing, and
14 products.

15 Next slide please. So -- and we'll click
16 one more time please. Let's get the boxes up.
17 And one more. Great. Thank you.

18 So from a program standpoint there is,
19 actually, a lot of programmatic support for the
20 adoption of heat pump water heaters from the
21 Commission. And these, I believe, are roughly in
22 order of chronological time from when the
23 Commission approved them, but starting with the
24 San Joaquin Valley Clean Energy Pilots, which is
25 approximately about 2,000 homes in the San

1 Joaquin Valley. The Commission sent the signal
2 that, you know, through the electrification of
3 those homes, single-family, mobile homes,
4 manufactured homes, we wanted to encourage the
5 adoption of not electric resistance technologies
6 but heat pump water heater technologies. And we
7 wanted to ensure that those technologies had the
8 ability to shift load, to shed load, and we're
9 kind of under this term of grid-enabled or grid-
10 connected heat pump water heaters.

11 So Cal Edison has taken this as an
12 opportunity to explore the actual real-world
13 analysis or potential of these resources to
14 provide different kind of demand flexibility,
15 whether it's shedding or shifting. And we have
16 kind of grown from there where we've had this
17 small group of about 2,000 who are supported,
18 where we went to PG&E's WatterSaver Pilot
19 Program, which is on the Commission voting
20 meeting this week, but would approve 6,400 heat
21 pump water heaters. And, approximately, 6,400
22 heat pump water heaters would be enabled in
23 PG&E's service territory to provide shifting
24 resources. So Cal Edison also has a secondary
25 application which is a bigger kind of WatterSaver

1 Pilot Program to operate in their service
2 territory to shift resources.

3 So we have this category, again, of
4 programs that are working on the enablement of
5 the shift technology or the shed technology in
6 heat pump water heaters. And each one is
7 providing a little bit different resource.

8 The two boxes below that, the Tech and
9 Energy Efficiency Pilots, are really focused on
10 getting the technology out there. Those don't
11 have the requirement that they be grid enabled,
12 grid connected. The Tech Program might be
13 enabling or -- excuse me, providing a kicker
14 incentive for that technology to be determined.
15 But, again, we've already talked about energy
16 efficiency as getting the technology out there.

17 And as Mary Ann mentioned, we have this
18 kind of chicken or egg scenario where we're going
19 to have to go back to some of these heat pump
20 water heaters and enable them to become the
21 demand flexible resources we want, whereas in an
22 SB 49 implemented world, we're going to actually
23 avoid that whole kind of go-back scenario at a
24 lower cost and provide the benefits that we're
25 looking for on the grid.

1 Finally, I just want to highlight that
2 the end to Self-Generation Incentive Program,
3 about \$45 million that we've -- the actual number
4 is \$44.6 million, has been set aside to explore
5 the implementation of heat pump water heaters in
6 that program as thermal energy storage. And so
7 Staff is going to be issuing a Staff proposal on
8 that shortly. But you can just tell, across the
9 board, the Commission has sent the signal that we
10 want to, one, provide support for the adoption of
11 heat pump water heaters for their efficiency
12 purposes and, two, we want to make sure that in
13 some areas we are studying their ability to shed,
14 shift, and be a flexible resource on the grid.

15 Next slide please.

16 So on to pricing. So what do we look at
17 for pricing for heat pump water heater? So in
18 the time-of-use category, we actually have one
19 time-of-use rate available in So Cal Edison's
20 territory that is not exclusive to heat pump
21 water heaters but is exclusive to kind of -- in
22 trying the resources that could be shifted and/or
23 shedded for reliability purposes. And so you can
24 see the TOU prime rate has a pretty high-peak to
25 off-peak differential during those peak tier

1 periods of 4:00 to 9:00. It's broken by summer
2 and winter. And that is a great (indiscernible)
3 that is sending that signal to the homeowners and
4 to their devices, if they're properly enrolled,
5 to move off those times of high cost, high GHG,
6 and to do -- you know, provide those resources or
7 benefits at another time.

8 Additional pricing signals that are
9 coming for heat pump water heaters, PG&E and
10 SDG&E have both been ordered by the Commission to
11 develop similar beneficial electrification rates.
12 PG&E has filed theirs in an application which is
13 their e-elect (phonetic) proposal. And SDG&E, I
14 believe, is the following fall they will be
15 submitting their beneficial electrification rate
16 as well.

17 Energy Division, also in support of the
18 adoption of water heating, has proposed a
19 baseline credit in the Phase 2 Staff proposal in
20 the building decarbonization proceeding to kind
21 of bring cost parity for these resources. As we
22 electrify and move away from natural gas for
23 water heating to heat pump water heaters there's
24 an adjustment factor that is made for space
25 conditioning but not for water heating. And so

1 Staff had proposed to support it.

2 There are also multiple kind of, you
3 know, explorations of real-time energy rates
4 ongoing at the Commission. Those could, you
5 know, be sent signals with the proper
6 communication technology and telemetry to a heat
7 pump water heater. And we've been active in
8 supporting ongoing conversations at the Energy
9 Commission for the load management standard.

10 Next slide.

11 So products. And I will admit that there
12 is very few exclusive water heating products
13 operating out there in the CAISO markets today.
14 I do know for a fact that there are programs
15 where it's kind of bundled with another set of
16 appliances where heat pump water heaters are
17 shedding load. I'm sure there's some electric
18 resistance tanks out there that are shedding
19 load. But, again, these products are focused
20 pretty much exclusively on their ability to shed
21 and on that kind of key consideration of
22 reliability during peak demand times.

23 I also will note that, you know, electric
24 water heaters in the state of California are a
25 pretty small percentage of the appliance base.

1 This is the 2009 RASS number, which is the
2 Residential Appliance Saturation Survey, it's
3 less than ten percent. And a majority of that,
4 if not all that ten percent at the time of the
5 2009 study, was electric resistance water heating
6 technologies. Now ten percent in California,
7 especially in the residential space, is a still
8 pretty big number.

9 We have about 13.5 million residential
10 homes or, you know, units in the state. And so
11 ten percent of that is 1.3 million. So if we're
12 looking at a million electric resistance water
13 heaters that could be enabled with some go-back
14 technology and appliance standard adopted through
15 SB 49, that if it's for, whatever reason,
16 impossible to replace that electric resistance
17 water heater with a heat pump water heater,
18 capture that benefit and that potential at a
19 later time, that's a lot of, you know, a lot of
20 ability to shed or shift. And that could be
21 helpful to the California grid.

22 And, finally, I'll just note that there's
23 a ton of ongoing research and testing. And we've
24 noted the programs up above on where best these
25 water heaters are going to serve. Is it going to

1 be addressing the spring issue that Mary Ann
2 touched on of we want to soak up as much of that
3 renewable energy and avoid curtailment in the
4 spring? Are we going to want to use these
5 resources for shedding purposes? Are we going to
6 want to shift them on a daily basis, regardless,
7 really, of the conditions out there on the grid
8 and the GHGs because that's the best thing from a
9 participant cost benefit?

10 So I think there's a lot of really unique
11 opportunities to continue this ongoing research.
12 I'm thrilled to see that in Phase 4 of the LBNL
13 research the space heating and water heating will
14 be considered. But there's still this big
15 outstanding question of where and how, and how do
16 you design a program that, if it does all these
17 things, provides these benefits to the grid?

18 Next slide please.

19 So I just pulled together a couple of
20 barriers and key questions here. I'm not going
21 to read these off. This is something that will be
22 considered ongoing with our sister agency and
23 Staff at the Energy Commission.

24 I do think highlighting one of the key
25 considerations here around telemetry is super

1 important for equity reasons. There are heat
2 pump water heaters on the marketplace today that
3 come Wi-Fi enabled and really are set up with the
4 ability to do the shedding and shifting that we
5 want with maybe a couple of tweaks here and
6 there.

7 Now Wi-Fi works great. It is, you know,
8 a fantastic way to communicate back and forth
9 between a utility or a third-party aggregator.
10 But in some parts of the state, as we've noted
11 with COVID, some of our fellow Californians don't
12 have access to Wi-Fi. So how can we ensure that
13 any standard that does move forward, and
14 especially around the topic of telemetry, takes
15 into consideration and centralizes equity at the
16 heart of that? Should these devices be standard
17 with a cell phone signal? So no matter what,
18 really, in the state of California, they're going
19 to operate and be able to connect it. Do we want
20 cell phone and Wi-Fi? Do we want one-way or two-
21 way? I think just that topic alone is a really
22 interesting one to continue to explore as these
23 standards are being developed.

24 So next slide please.

25 And then the final thing I wanted to

1 touch on was the Commission recently adopted an
2 energy reliability new rulemaking. And that
3 rulemaking is focused on how do we ensure, if we
4 have an extreme heat weather event, like we did
5 this last summer which, really, we had probably
6 three if you consider August, September, and end
7 of October, how do we, you know, ensure that the
8 grid is reliable and stays up to -- stays able to
9 provide the resources and electricity that we
10 need?

11 And one of the key questions asked in
12 there is really on this topic of demand
13 flexibility and on what rules, modifications,
14 opportunities there exist to further reduce
15 demand and enable demand response or demand
16 flexible resources to provide that reliability?

17 So I bring this up, really, as an FYI to
18 the audience and as an opportunity for engagement
19 around what should the Commission consider doing?
20 It was just -- reply comments on the OIR itself
21 just closed and so it's just something to keep
22 your eye on. And it will be a quick-moving
23 rulemaking, especially in the context of anything
24 that happens at the Public Utility Commission as
25 we prepare for next summer.

1 So next slide.

2 And here's my contact information. I
3 thank you for the time and really hope that it
4 was a useful kind of background on the programs
5 that are offering incentives for appliances, the
6 demand response framework that is up and running
7 at the Commission, as well as some thoughts and,
8 potentially, how we might need to tweak in
9 response to rules or regulations adopted by the
10 Energy Commission with SB 49.

11 Thank you.

12 MR. FERRIS: Thank you, Nate.

13 So we're finished with our morning
14 keynote speakers. And I wanted to give
15 Commissioner McAllister a chance to comment, if
16 he was interested?

17 COMMISSIONER MCALLISTER: Yeah.
18 Absolutely. Hey, Todd, thanks for the
19 opportunity. I really appreciate that, really,
20 three of the, really, best speakers I could
21 imagine to kick off the proceedings and really
22 highlight the key pieces of this puzzle.

23 There, you know, really are a lot of
24 considerations that overlap and intermingle. And
25 they all are very exciting. So, you know, the

1 idea that we can really use these both in real
2 time to respond in a real life actual events that
3 happen, you know, and perhaps over in the CAISO
4 market, and minus one (phonetic) kind of response
5 back to situations that will come up with climate
6 change evermore intense, such as we had in August
7 and September, and so building on that kind of
8 approach to leverage communication and controls
9 of aggregated appliance flexibility capacity
10 throughout our state

11 But then, also, implicitly and somewhat
12 in a stated way, you know, through the morning we
13 heard that load shaping, kind of permanent load
14 shaping, is also been an obvious and core pathway
15 forward for these flexible resources.

16 There was a lot of talk about water
17 heating, which I completely agree with, but I
18 think we have to learn a lot more about that,
19 about water heating and the duty cycles and, you
20 know, how big the actual loads are and when they
21 tend to operate. Obviously, there's a lot of
22 potential synergy there but, also, we have to go
23 and, you know, roll with eyes wide open and a
24 fair amount of data about how these are actually
25 being used across the state.

1 So if we are going to depend on them for
2 capacity resources during specific parts of the
3 day, in the belly of the duck say, can we do that
4 at scale with a meaningful impact and still get
5 people the hot water that they need without any
6 interruption? So I think we can but I think we
7 need to know, you know, the details about how to
8 make sure that we operate that way.

9 Really excited to continue collaboration
10 with the public on the Build Program and all the
11 different initiatives that we have across both of
12 our agencies in terms of how to kind of wake up
13 this marketplace and make sure that the consumer
14 has the benefit that they deserve if they make
15 the outlay for purchasing these.

16 And as we move through the Building Code
17 and we make it more explicitly beneficial to peat
18 heat pump technologies into the Building Code in
19 new construction, at the same time we build a
20 replacement market through the various programs,
21 you know, I think that's the -- there was
22 acknowledgment throughout this morning that this
23 marketplace is a nascent one and that, you know,
24 we have a lot of -- 90 percent of the state has
25 gas service, and most of the water heaters out

1 there are gas. And so as we shift to heat pumps
2 and we figure out ways to do that sustainably
3 through the Building Code and through programs
4 and really scale that marketplace up, that we
5 have alongside it the market kind of platform
6 through this and, you know, SB 49 and the load
7 management standards alongside those other
8 efforts to really build things in an integrated
9 way.

10 So very excited about how all these
11 pieces work together. And I think those were my
12 comments.

13 I want to, again, thanks Nich and Mary
14 Ann and Severin for being with us this morning to
15 set the stage. And really looking forward to
16 looking at all the issues, the technical and the
17 security issues, that we'll be talking about in
18 the afternoon.

19 So thanks.

20 MR. FERRIS: All right. Great. So we
21 are going to -- we're going to time check. We're
22 basically going to shift in a break here. I'm
23 sorry for the odd start time. We actually have to
24 do some slide maintenance, so we're going to take
25 the full ten minutes. So you can run and get a

1 cup of coffee and a snack or use the restroom and
2 we'll start back here at, basically, 10:37.
3 We'll see you then.

4 (Off the record at 10:25 a.m.)

5 (On the record at 10:36 a.m.)

6 MR. FERRIS: Hello everyone and welcome
7 back.

8 Up next we have Sean Steffensen, who is a
9 Mechanical Engineer from the California Energy
10 Commission, here to speak about the criteria for
11 the selection of candidate appliances.

12 Sean?

13 MR. STEFFENSEN: Good morning. I am Sean
14 Steffensen, a Mechanical Engineer in the Flexible
15 Demand Standards at the CEC. I will talk about
16 Senate Bill 49 and provide a Staff perspective as
17 we gather information to select appliances for
18 Flexible Demand Appliance Standards. After my
19 ten-minute talk, I will lead a panel discussion
20 on approaches to flexible demand in appliances,
21 followed by a discussion with the panel and
22 audience.

23 Next slide.

24 What is the objective of Senate Bill 49?
25 The bill's author, Senator Nancy Skinner, said,

1 "Senate Bill 49 will help bring California's
2 electrical grid into the 21st century and
3 allow us to use clean, renewable power more
4 effectively. Senate Bill 49 will also save
5 ratepayers money because smart appliances can
6 be programmed to use electricity when it is
7 cheapest. Senate Bill 49 is just the tool we
8 need to help us get there. Senate Bill 49 is
9 the intersection of a win for climate and a
10 win for consumers."

11 Next slide.

12 The threats posed by climate change,
13 whether extreme weather, drought, fire, flood,
14 drive us to use more clean renewable energy to
15 reduce our greenhouse gas emissions. Advances in
16 appliance automation and the significant
17 increases in wind and solar power in California
18 will make this possible. Senate Bill 49 fits
19 these trends together to bring about changes for
20 the public good.

21 The Flexible Demand Appliance Standards
22 will evoke appliances to match their electrical
23 load to the clean power of the sun and wind and
24 to reduce our dependence on fossil fuels. Senate
25 Bill 49 does not start this innovation but

1 accelerates existing trends by creating
2 guaranteed markets for innovation.

3 Next slide.

4 In what way does appliance load need to
5 be moved to enable more clean energy in
6 California? This figure shows the changing state
7 of carbon emissions from the California
8 electricity grid. Green means low emissions that
9 typically occur when the sun is shining and
10 demand from appliances is low. Red or high
11 emissions typically occur when load is high or in
12 the night. Two challenges emerge from
13 California's new renewable power supplies, an
14 oversupply of generation in the middle of the day
15 which contributes to the curtailment of renewable
16 generation, and significant ramps in the morning
17 and evening which are demands on non-solar
18 resources to respond to the beginning and end-of-
19 day lead solar production cycle. Adding to the
20 complexity, the impacts of oversupply and ramping
21 varies season to season, day to day, and location
22 to location.

23 The blue arrows I have placed are on a
24 hot summer day to show how load may be shifted
25 from night into day and from evening into

1 afternoon to better align appliance load with
2 low-carbon emissions from the electrical grid.
3 Demand flexible technologies are key to reducing
4 emissions from the homes and businesses.

5 Senate Bill 49 provides three options to
6 change an appliances load, schedule, shift, or
7 curtail. A standard could require appliances to
8 have the capability to delay their energy use
9 through a timer, to move load from evening into
10 morning, say. A standard could require the
11 appliances to have the ability to run ahead of
12 time when renewables are plentiful and load is
13 low. Or the standard may temporarily request an
14 appliance turn down or curtail use during the
15 time of extreme demand. Staff feel that a
16 standard could embrace any combination of these
17 approaches to meet our climate and energy goals.

18 Next slide.

19 What should Staff consider to understand
20 how a proposal could contribute to achieving our
21 climate goals? The calculation provides a list of
22 the key factors Staff considers as they begin to
23 identify proposals. The first factor is load
24 size. How much power does the appliance draw
25 when it is on? How often does it run?

1 Appliances that use more energy have the
2 potential to shift more energy. Appliances with
3 large load include HVAC, heating, ventilation and
4 air conditioning, water heating, and car
5 charging, the load near the emission peak.

6 Staff considered the load shape or how
7 the use of the appliances varies by the time of
8 day and by season. Appliances that are run more
9 often during the peak emission times will lead to
10 a larger potential to shift load. And example is
11 a dishwasher where, on average, dishwashers seem
12 to be on during the early to late evening when
13 emissions are high and not on so much during the
14 middle of the day when emissions are low.

15 The third item is load reduction of
16 shift, meaning how does the proposal effect the
17 energy usage to move it to times of lower
18 emissions? A simple example of load reduction
19 would be to temporarily shut off the appliance.
20 In this case load reduction would be 100 percent.
21 But in the spirit of flexibility, perhaps our
22 proposal would delay the load by minutes or
23 hours, or in ways that would not be perceptible
24 to the customer. Understanding how much and how
25 often the proposed standard is key to the load

1 shift potential.

2 The customer participation rate is
3 another important consideration. Although it
4 will be mandatory that the appliance be sold to
5 meet the standard, the consumer will retain the
6 control of the appliance. We will seek proposals
7 that consider the consumer. What incentives does
8 the consumer receive in turn for flexing their
9 load? The more consumers that participate
10 statewide the more potential to shift load.

11 The final item Staff has identified is
12 the quantity of appliances statewide. The more
13 appliances participating statewide the more
14 potential they will be to -- there will be to
15 shift load.

16 What other factors should Staff consider
17 as they evaluate the load shift potential and the
18 Flexible Demand Appliance Standards proposals?
19 What sources of information should Staff
20 consider?

21 Next slide.

22 What requirements will lead to flexible
23 demand appliances that shift load to meet our
24 climate goals? Will the standards be a minimum
25 list of features, like a checklist? We call this

1 a design standard. An example of a design
2 standard would be the recent Washington State
3 Electric Water Heater Standard requiring a
4 communication port. Design standards may be
5 verified by inspection.

6 Or will the standard provide requirements
7 that are based upon an appliance achieving a
8 minimum level of performance? An example is an
9 appliance that receives a command to cause it to
10 shift its load in a certain way.

11 Performance requirements require test
12 procedures to verify the appliance meets the
13 standard. An example of this framework can be
14 found in the proposed USEPA ENERGY STAR
15 Residential Water Heater Specification. Our
16 preference is performance standards that identify
17 the key functions to enable appliances to provide
18 flexible demand.

19 Next slide.

20 I will now turn our attention to the
21 other side of SB 49, the win for the consumer.
22 The CEC in setting standards must meet the
23 criteria to put the consumer first. The
24 standards will be cost effective, meaning the
25 benefits to the consumer will not exceed any

1 costs. Staff will consider cyber security and
2 reliability. The standards need to care and
3 protect for the consumer without adding
4 uncertainty to the operation of the device.
5 Staff will consider how a standard may affect the
6 ease of use to the consumer. The consumer will
7 also maintain control of their appliances. And
8 the appliance will need their consent for
9 flexible demand operations.

10 Finally, labeling will be the tool Staff
11 will examine to help guide consumers in their
12 pursuing decisions. Labels will indicate
13 compliance to the standards.

14 Next slide.

15 We will work with the California Public
16 Utilities Commission, load-serving entities, such
17 as the California Investor-Owned Utilities,
18 public owned utilities, and California
19 Independent System Operator to develop a
20 consistent statewide foundation for the design of
21 the Flexible Demand Appliance Standards. We
22 recognize the strength in aligning the Flexible
23 Demand Appliance Standards with existing
24 incentive and equity programs.

25 Next slide.

1 Senate Bill 49 grants the CEC the
2 authority to establish regulations to describe
3 the process to promote compliance, protect
4 consumers, and level the playing field for
5 appliance manufacturers, distributors, and
6 retailers. The authority by the statute is the
7 same authority as the Appliance Efficiency
8 Regulations. Staff seeks comments to establish
9 enforcement regulations for the Flexible Demand
10 Appliance Standards.

11 Next slide.

12 Where will the solutions come from?
13 Staff seeks proposals information from the
14 stakeholders and the public. These could be
15 complete proposals, descriptions of problems, or
16 information that could better inform our
17 deliberative process. We are committed to
18 working with stakeholders.

19 A key next step is to identify those
20 appliances ready for standards.

21 To recap my presentation, what appliances
22 would you identify for mandatory standards to be
23 sold or offered for sale in California? What
24 would these standards require? Would they be
25 design or performance standards? What change

1 would the way the -- what change would lead to
2 the way the appliance flexes its load? What
3 benefits or costs would the standards create?
4 And to highlight, we ask that you -- why do you
5 recommend this approach? And the why can
6 increase the persuasiveness of your idea.

7 We look forward to your comments today
8 during our public comment period and via written
9 comment period that will end on January 4th.
10 Information on written comments will occur at the
11 end of today and can be found in the workshop
12 notice on the CEC website.

13 Next slide.

14 So that's the end of my presentation.
15 And I'd like to welcome our panelists to the
16 first panel for today.

17 First I have Abigail Daken from the U.S.
18 Environmental Protection Agency and, for the past
19 decade, has managed the ENERGY STAR's
20 investigations for heating, cooling, and water
21 heating products. Abigail will speak about
22 ENERGY STAR connected appliances.

23 Second I have Jacob Cassady, the Director
24 of Government Relations as the Association of
25 Home Appliance Manufacturers. Jacob will speak

1 about AHAM's capabilities of appliances to flex
2 demand.

3 Third I have Ashley Armstrong, a Director
4 for Regulatory and Technology Policy at AO Smith
5 Corporation. Ashley will speak about appliances
6 that can be used as a form of energy storage.

7 All panelists will provide a ten-minute
8 presentation, followed by a short opportunity to
9 ask clarifying questions from stakeholders. At
10 the conclusion of all three panels, we'll have a
11 30-minute discussion, including questions from
12 stakeholders, those that are attending today.

13 So with that, I will welcome Abigail.

14 MS. DAKEN: Thank you. So I appreciate
15 being asked here to talk about the work that
16 we've done at EPA on connected products.

17 Next slide.

18 So connected, for us, includes grid
19 flexibility and, also, consumer amenities that
20 come from connected. And one of the questions
21 is: Why is this part of ENERGY STAR at all? And
22 there are two reasons.

23 That bottom arrow has been amply covered
24 by the -- plenty of speakers today. So I'll also
25 mention that ENERGY STAR is, fundamentally, a

1 consumer information program. And so the
2 developments in the consumer space are also very
3 important to us and very relevant to this as the
4 internet of things has -- and smart technology
5 have grown, it presents both opportunities and
6 potential problems in terms of energy efficiency.
7 The opportunity is for insight into and control
8 of energy use. And then, of course, it also
9 means that, as we've been seeing for many years,
10 baseload grows.

11 Next slide.

12 So ENERGY STAR has been involved in this
13 for years. I'm not going to go through this in
14 detail but I do want to mention that in 2018 we
15 took a step back and we restrategized, we
16 reviewed our strategy for internet of things
17 products, smart products, and grid strategy
18 overall. And a lot of the information that I'm -
19 - the overview information I'll be presenting to
20 you comes from that. This is a workstream that
21 we've been very busy with in the last two years
22 and we expect to be moving for.

23 Next slide.

24 So this is a quick rundown of the product
25 categories for which we have connected criteria

1 and I'll just point out a couple of things here.

2 The first is that there are two products
3 for which it is not optionably -- option to be
4 connected, where we only recognize the connected
5 version of these products. The first is
6 thermostats. And the second is smart home energy
7 management systems. And for both of those, these
8 are control technologies. And savings come from
9 an intricate interplay between the technical --
10 the product features and consumer behaviors. And
11 we felt there was no way real way to get an
12 insight into energy savings without having data
13 about how the products are used in people's
14 homes. And so for those two product categories,
15 we only recognize connected versions.

16 For the rest of these product categories
17 the connected criteria are optional, which means
18 that a product which meets all of the other
19 ENERGY STAR criteria, in addition to using the
20 ENERGY STAR certification mark, may also be
21 recognized on our list of certified products as
22 connected.

23 Some of these -- why don't you go to the
24 next slide, because I'll be talking about it more
25 there?

1 So there's a bunch of this work going on
2 right now and in the near future, which I was
3 asked to highlight. So we have been working on
4 connected criteria for what we're calling large
5 loads. These are four products which represent a
6 significant grid resource which EPA has ENERGY
7 STAR criteria for. Those are central AC and air
8 source heat pumps, pool pumps, residential water
9 heaters, and electric vehicle charging equipment.
10 So for all of -- actually, all four of those are
11 now in the process of having connected criteria
12 added or revised for those products.

13 For central air conditioning and heat
14 pump, we are approaching the finalizing of
15 Version 6 which will include optional connected
16 criteria, and we expect to finalize that in the
17 next month.

18 For residential water heaters, Version 4
19 includes optional connected criteria and a demand
20 response shift test to demonstrate load shifting,
21 and that should finalize in the first quarter of
22 2021, along with its test method.

23 Electric vehicle chargers, Version 1.1
24 includes an updated connected criteria, also
25 optional. And the idea there is it was updated

1 specifically to become more useful as a tool for
2 utilities to identify chargers that give them the
3 tools they need to control vehicle charging.

4 The pool pumps, Version 3.1, with fairly
5 modest updates to the connected criteria,
6 actually was released last week.

7 In addition, we're working on a way to
8 ease the test burden for demand responsiveness
9 for room air conditioners. And smart thermostats
10 will also launch a revision in 2021.

11 Next slide.

12 So this is probably the most useful piece
13 for this particular purpose. When we, in 2018,
14 rethought how we were approaching connected what
15 we realized is that for some ENERGY STAR products
16 connected looks different than for others. It's
17 always been a combination of user amenity and
18 grid services. But what kind of combination
19 depends on the type of product. And in this
20 table what we have essentially divided by is what
21 is driving connectivity into the market?

22 So for some products, lightbulbs are a
23 great example, consumers want connected product.
24 In fact, we got our 14-year-old a color-changing
25 LED lightbulb for the fixture in her room for her

1 birthday. This is fun. That's why people want
2 it. It doesn't really provide on its own much
3 that's interesting for demand response. So for
4 those products, in addition to controlling
5 standby loss, the ENERGY STAR approach is to look
6 at the integration of them into a smart home as a
7 whole that can, in aggregate, potentially provide
8 a demand response resource.

9 Some of those products, in addition to
10 being, perhaps, useful in an aggregated way may
11 provide occupancy information, which is
12 interesting for energy savings. I'm starting at
13 the bottom of the table, of course.

14 We actually started with our connected
15 criteria in that center line with appliances.
16 And there's a broad jungle of advantages that
17 connectivity can provide. Manufacturers like
18 selling it. Consumers have some interest in it
19 but not like for the color-changing lightbulbs.
20 For some products (indiscernible) is a great
21 example. Electric dryers are another example.
22 There may be some grid service, some sufficiently
23 ripe opportunities that it's worth trying to
24 address the product itself rather than as part of
25 the complete connected home.

1 Then we have the large load products.
2 And for these products, for a couple of them,
3 user service may be somewhat affected by load
4 shifting, so that's true for electric vehicle
5 chargers, that's true for room air conditioners,
6 as has been discussed before. But they still
7 have a significant potential, either because of
8 peak coincidence or because, you know, electric
9 vehicles are an energy storage technology. And
10 in these cases we think that connected, while it
11 may be pulled into those products by consumer
12 demand to some extent, it should not be without
13 an element of grid service.

14 And then for pool pumps and water
15 heaters, these are products for which not only do
16 they provide a significant resource but, in
17 addition to that, users are very unlikely to
18 notice any load shifting. So for these products
19 the primary driver is the interest of
20 organizations, like the CEC, the CPUC, and across
21 the country, jurisdictions and utilities that are
22 interested in controlling costs, particularly as
23 we electrify for a lower-carbon world. So for
24 these products the criteria focused on grid
25 service.

1 Next slide.

2 So as we are considering our considering
3 our approach we're looking for -- we're looking
4 at a bunch of considerations. We prefer -- we
5 are looking for interoperability, both for
6 consumers and for creating value in the market
7 broadly, that favors both common standards and
8 finding how those standards are implemented. We'd
9 like to future-proof as much as possible. It's
10 not really possible but we can help. We see to
11 lower the transaction costs for implementing load
12 flexibility has been amply heard earlier in the
13 keynote speakers.

14 And then we look at what is driving
15 connectivity. So can the demand response
16 capabilities use a connectivity path that is
17 already there for some other reason? Now that
18 may or may not be the best way to do it. But ,if
19 it can, there may be a cost advantage to
20 implementing that way.

21 So one example that's already been
22 brought up there is smart thermostats. People
23 are purchasing smart thermostats because they
24 want them but, obviously, they present quite a
25 significant resource using the same path that is

1 giving consumers what they want and give
2 utilities what they want also.

3 And then the next question, of course,
4 is: How valuable is the DR resource? Is it worth
5 investing a little bit more to get this product
6 connected?

7 All right. Next slide.

8 So I'm just going to close by talking
9 about a couple of the things we're doing now.
10 And I see I'm over time.

11 So for room air conditioners, we have a
12 demand response test. But one of the things it
13 tests is how often the product responds in a 24-
14 hour period, which makes it a long and fairly
15 expensive test.

16 So we've just introduced, as a proposal
17 structure, to let those products rely on test
18 results from one product model to speak to
19 whether another product model will be able to
20 test. And manufacturers felt strongly that they
21 would be able to use -- that test results from
22 one model were applicable to another. This is a
23 structure we use for energy efficiency, as well,
24 for a wide variety of products, so -- and is
25 similar to the Department of Energy's alternative

1 energy determination method. And so there are
2 reasons why this is particularly relevant to room
3 air conditioners. But we may, also, use a
4 similar approach for other product cats.

5 And next slide.

6 So for water heaters and central AC heat
7 pumps, we are coordinating with the criteria in
8 other places, for instances, for central AC and
9 heat pumps the AHRI came up with a technical
10 standard for demand response for two-stage and
11 variable capacity products, so we're referring to
12 that. For water heaters, we closely followed the
13 Joint Appendix 13 criteria and other similar
14 standards.

15 We've specified two specific protocols
16 and included tables of how the various messaging
17 is implemented using those protocols for maximum
18 interoperability.

19 I will mention that price response in
20 these -- all of these criteria is optional. And
21 the reason is because the way programs are being
22 run now relies more on the signals, load up now,
23 curtail now, and less on price response. But we
24 do define, if price response is there, how it
25 would be -- how it's implemented in the

1 messaging.

2 And I think I'll stop there. I have more
3 to say but I'm out of time.

4 MR. STEFFENSEN: Hi. This is Sean
5 Steffensen again. I'll pause right now and look
6 to Bruce for -- to see if any participants have
7 asked any clarifying questions or have their
8 hands raised?

9 MR. HELFT: None at this time, Sean.
10 Thank you.

11 MR. STEFFENSEN: Okay. Okay. Next up is
12 Jacob Cassady from the Association of Home
13 Appliance Manufacturers.

14 Jacob?

15 MR. CASSADY: All right. Let's just skip
16 to the next slide. You know, hello and thank you
17 for the opportunity to participate in today's
18 workshop. Again, my name is Jacob Cassady. I'm
19 the Director of Government Relations at the
20 Association for Home Appliance Manufacturers.

21 To get things started, I really wanted to
22 provide folks a roadmap for kind of where we're
23 going and what we're going to talk about today.
24 So I'll tell you some information on AHAM. We'll
25 talk about the partnerships that industry has had

1 with energy efficiency organizations. And then
2 we'll really talk about the connected home and
3 considerations that go into which appliances and
4 how they should be, how demand response should
5 work.

6 So we'll go to the next slide.

7 So quickly about AHAM, AHAM's roots
8 stretch back to 1915 when manufacturers of
9 clothes washers formed the American Washing
10 Association. Fifty-two years later, in 1967,
11 they determined that a single unified
12 organization would be stronger. So today, AHAM
13 represents manufacturers of major portable and
14 floor care home appliances, as well as their
15 suppliers. Membership at AHAM includes over 150
16 companies throughout the world. And in the U.S.,
17 AHAM members support more than 1 million jobs,
18 have a \$198 billion economic impact, and produce
19 more than 95 percent of household appliances
20 shipped for sale.

21 The home appliance industry, through its
22 products and innovation, is essential to U.S.
23 consumer lifestyle, health, safety, and
24 convenience. And through its technology,
25 employees, and productivity the industry

1 contributes significantly to U.S. jobs and
2 economic security.

3 Home appliance are also a success story
4 in terms of energy efficiency and environmental
5 protection. New appliances often represent the
6 most effective choice for a consumer to make to
7 reduce home energy use and cost.

8 Next slide please.

9 So I want to highlight the energy
10 efficient and smart appliances management of
11 2010. This is an agreement that included a
12 petition to the USEPA, Environmental Protection
13 Agency, and the Department of Energy for a five
14 percent ENERGY STAR credit for connected
15 appliances, which was approved. The cover letter
16 of that petition is on the right side of your
17 screen.

18 So next slide please.

19 So the home appliance industry remains
20 committed to demand response capable appliances
21 and welcomes continued collaboration and
22 partnership with CEC and others to achieve a
23 greater deployment of these appliances.
24 Stakeholder engagement is vital to that goal. A
25 consumer who sets a delay or a timer on the

1 appliance does so without knowing if or when
2 energy costs will be lowest. Consumers are in
3 the dark as to if the delay of the timer leaves
4 the appliance operating with lower energy costs.
5 And utility companies play a major role with
6 demand response and the consumer's application of
7 the technology.

8 For that demand response market to grow,
9 consumer use of it should be incentivized or
10 otherwise promoted by all stakeholders of this
11 value chain. Ultimately, all stakeholders hold
12 the key to successful implementation of demand
13 response technologies.

14 So we'll move to the next slide and we'll
15 talk about the connected home. One more over
16 please.

17 The connected home is consumer-focused.
18 User experience is the key. A product's
19 functions must actually be functional. If a
20 demand response capable appliance does not
21 operate efficiently consumers will ignore or
22 bypass it. Connecting the technologies should
23 also be simple, and that goes beyond the consumer
24 to appliance, but the appliance to the
25 electricity source.

1 Innovative solutions should be ongoing
2 and not restricted. Software updates improve
3 functionality. They fix glitches and take little
4 effort to install.

5 Next slide please.

6 The connected home is secure. A Cloud-
7 based interconnection enabled through Wi-Fi is
8 the safest and most secure solution for
9 manufacturers, utilities, and most importantly
10 for our shared consumers. Protecting consumers,
11 their data and information, and their homes from
12 potential hackers is of utmost importance. This
13 empowers consumers to decide how much security
14 they want to build into their home's network
15 where multiple layers of security exist. And
16 these multiple layers of security produce the
17 likelihood of a single hacker or hack. These
18 layers of security include the appliance itself
19 which has a secure app to control the connected
20 appliance, the Cloud which has security.
21 Utilities would, we expect, offer an additional
22 layer of security between their utility network
23 in the Cloud. The utility would securely
24 interconnect the appliance. And this, again,
25 helps to ensure that one hack or security breach

1 does not expose all stakeholders.

2 Next slide please.

3 Harmonization of a variety of options
4 make the connected home possible. Flexible
5 demand meters and consumer needs are not one-
6 size-fits-all. And regulations are mandates for
7 specific technologies over others should reflect
8 this through enabling utilities to incentivize
9 and promote demand response appliances that
10 already exist on the market today and have the
11 ability to easily connect consumers with utility
12 companies.

13 We understand how, for some products, the
14 CTA-2045 port is a workable solution. However,
15 this would not work for the appliances AHAM
16 represents. Mandating a specific port technology
17 risks consumers removing the module that's
18 plugged into the port and difficult to install on
19 appliances where aesthetics are important, so
20 locations can be problematic. And that's sort of
21 an example, a couple examples there, of fitting
22 it in behind a refrigerator or a stove.

23 Also, mandating a port, a physical port,
24 would take years to fully implement for
25 manufacturers and consumers as they go to replace

1 their appliances.

2 Next slide please.

3 Ultimately, we all want the connected
4 home to be cost efficient. And cost efficiency
5 is a key driver of this as it leads to savings
6 from the use of demand and the use of demand
7 response should reflect this. A mandatory CTA-
8 2045 port would require significant product
9 changes, as I've mentioned, which would increase
10 manufacturing costs and would impact consumers.
11 Lower-income people would feel this the hardest.
12 And for many consumers it would increase the
13 likelihood to repair older, less efficient
14 products that are not connected.

15 Existing products and infrastructure
16 provide cost efficiency and allow manufacturers
17 to innovate. And a key thing to think about here
18 is, you know, these products are made for a
19 nationwide national market, if not, to some
20 degree, international. And we want these
21 products to be used throughout the country and
22 have the utilities work with the local utilities
23 to establish the demand response.

24 Next slide please. I'll quickly
25 conclude.

1 So there is currently market alignment on
2 a Wi-Fi and Cloud-based solution for appliances.
3 Again, the CTA-2045 port may work for some but
4 would stifle appliance innovations and a step
5 back for cyber security. Also, the appliance
6 industry supports CEC's promotion of demand
7 response capable appliances but think that CEC
8 should support adoption of a broad API standards
9 that allow for manufacturers in appliance
10 innovations and ensure security can be
11 prioritized for the consumer. The best path to
12 encourage this growth is not through regulation
13 and mandating these specific demand response
14 communication technologies.

15 And that is -- thank you. Thank you for
16 the opportunity.

17 MR. STEFFENSEN: Thank you, Jacob. We'll
18 pause now to ask Bruce if there were any
19 clarifying questions from --

20 MR. HELFT: We've got a hand raised,
21 Sean. I'm going to un-mute Tristan.

22 Please, Tristan, when I un-mute you,
23 state your affiliation.

24 MR. DE FRONDEVILLE: Hello. This is
25 Tristan de Frondeville. I'm with SkyCentrics, so

1 representing the CTA-2045 side of things.

2 So, Jacob, a question for you. You
3 mentioned -- it's true that on a refrigerator or
4 a stove, certainly on the front of the device, we
5 wouldn't want to put a CTA-2045 module, so that's
6 a reasonable point. However, you're making a
7 strong case for Wi-Fi and Cloud.

8 So are you aware that there was an
9 investor-owned utility that controls 800,000
10 water heaters? And they tried to shift to Wi-Fi
11 control for 70,000 and ten percent of those water
12 heaters were going offline every month, so that's
13 7,000 a month. And remember, it's critical, when
14 we have these appliance loads -- you know, all
15 these pilots have been small. But when you're
16 talking a million of 13 million water heaters
17 that are critical to preventing gas peaker plants
18 from coming on it's critical to have a bomb-proof
19 connection that's reliable over many months, if
20 not years, especially after the investment which
21 would be somewhat equivalent to a peaker power
22 plant.

23 So I'm just concerned that you have such
24 a strong resistance and promotion of Wi-Fi. And
25 then similar on the cyber security side.

1 So my question was: Were you aware of,
2 you know, water heaters, it's not that sexy for
3 them to be kept online because there's not much
4 real sex appeal to controlling your water heater.
5 You get it at the right temperature and you don't
6 think about it for 10 to 15 years.

7 So I guess, Jacob, to summarize, would
8 you be open to being equally promoting of CTA-
9 2045 and Wi-Fi, given that sometimes CTA-2045 is
10 actually much better than Wi-Fi?

11 MR. CASSADY: Well, first, thank you for
12 the question. And let me clarify that the key
13 takeaway that I would hope that anyone would get
14 is that it's not a one-side-fits-all solution. I
15 know the next speaker is going to speak to water
16 heaters, so I will just leave that product there.

17 But the key is, is what might work for
18 some does not, necessarily, work for all. And if
19 we want consumers to use it we should have a
20 marketplace of ideas and technologies.

21 MR. STEFFENSEN: Great. Thank you,
22 Jacob. And I think that is an important point.
23 We are searching for what may drive a lot of
24 these initial requirements. What's the function
25 behind a particular requirement or embodiment?

1 So I think, Tristan, as you mentioned,
2 it's vital that the connection remain reliable.
3 And so we're looking for stakeholders to provide
4 those types of solutions and the reasons why
5 certain iterations or interpretations may be
6 better than others. We'll drop more of that into
7 the discussion after Ashley Armstrong is up.

8 And so I'll turn our attention now to
9 Ashley Armstrong and introduce here. She is up
10 next from AO Smith Corporation.

11 MS. ARMSTRONG: There we go. Can
12 everyone hear me? I assume that's a yes.

13 So with that, good morning everyone. My
14 name is Ashley Armstrong and I'm the Director of
15 Regulatory and Technology Policy for AO Smith
16 Corporation. AO Smith is one of the world's
17 leading manufacturers of residential and
18 commercial water heating and hydronic heating
19 equipment, as well as a manufacturer of water
20 treatment and air purification products.

21 I'd like to thank the Energy Commission
22 for organizing this proceeding as I'm excited to
23 be here today to talk about flexible demand
24 appliances, especially water heaters.

25 Can you guys go to the next slide please?

1 Thank you.

2 So buildings are the nation's primary
3 users of electricity. About 74 percent of all
4 U.S. electricity is consumed within buildings.
5 As such, building owners and operators are
6 seeking various ways, both to reduce their
7 utility bills but also take advantage of times
8 when pricing is low and/or renewable generation
9 is abundant.

10 Smart water heaters can be one way -- can
11 be a grid flexibility asset for building owners
12 to utilize. Smart water heaters are conventional
13 electric or heat pump water heaters that have
14 additional controls. Smart water heaters simply
15 allow the utility or the third-party aggregator
16 to control their energy use during the course of
17 the day. Within a given local territory a fleet
18 of water heaters can be controlled to be a
19 flexible energy storage system that can adjust
20 the load on the grid.

21 So a lot of people ask, why water
22 heaters? Well, the simplest answer is everyone
23 has one. Smart water heaters can play a key role
24 in load management within the built environments.
25 Most consumers and commercial customers install

1 their water heaters and they really never turn
2 back unless an issue arises. Even with the
3 implementation of load management functionality
4 within the water heater, it is very unlikely that
5 a consumer would notice their water heater
6 programming is being altered as long as their
7 cold water events are minimized.

8 Smart water heaters can be programed to
9 adjust the times when they are using power. For
10 example, a water heater can reheat to recover
11 from usage during off-peak times. And smart
12 water heaters must have a balanced load.

13 So can you go to the next slide?

14 So this slide is simply showing a couple
15 different ways to connect the water heater at the
16 point of the water heater. So one of the things
17 on there is a CTA-2045 port, which we've kind of
18 heard about already. As mentioned, it's now
19 required by the State of Washington and will be
20 required by the State of Oregon in the coming
21 years. You can also see our water heaters offer
22 open ADR via Wi-Fi. And as of late, our latest
23 generation offers time-of-use pricing, so it can
24 download a local pricing schedule and then
25 execute that TOU schedule when no connectivity is

1 reqd.

2 Next slide please.

3 So one of the things we've heard a lot
4 about is the CTA-2045 Standard. It's a basic
5 standard that governs energy management for
6 various appliances. Currently, AO Smith
7 participates in the development of this standard.
8 And we've implemented the CTA-2045 ports on our
9 DR water heaters. The CTA-2045 port, as I
10 mentioned, is now required in Washington. It
11 will be required, coming the first of the year,
12 for heat pump water heaters and a year later for
13 electric storage water heaters in residences.

14 The CTA-2045 Standard incorporates basic
15 commands like DR commands, such as shedding,
16 loading up, grid emergency signals. And it --
17 also, the CTA-2045 Standard is in the process of
18 being revised and in its final stages of adoption
19 to incorporate a way to address time-of-use
20 pricing.

21 Next standard -- next slide please.

22 So one of the things we participated in a
23 while back was a large water heater demonstration
24 project with the Bonneville Power Administration.
25 And I mention this because the BPA really had two

1 primary objectives. One was to DR events, so
2 install a fleet of water heaters with CTA-2045
3 capabilities. These were electric water heaters
4 and heat pumps. Then they were going to run a
5 set of demand response events throughout the
6 winter and summer season and see what the results
7 looked like. And they really wanted to take this
8 demonstration product and then try to create a
9 market transformation plan and a business case to
10 be able to justify the cost.

11 So I'm not going to go into detail of the
12 results but I do have the reference demonstration
13 project on the slide in case anybody would like
14 more information.

15 So I want to go to the next slide.

16 And I think this is going to be one of
17 the key ones and the key issues for the AO Smith
18 and, perhaps, the broader water heating industry,
19 which is we have a lot of movement in this space.
20 And there's a real need for harmonization. So
21 we're seeing states adopt demand response
22 requirements for water heaters. I've already
23 mentioned Washington and Oregon. We also have an
24 alternative compliance measure which is called
25 JA13 for the State of California for new

1 construction. We're seeing ENERGY STAR, as Abby
2 mentioned, enter into this space with their
3 development of the voluntary connector criteria.
4 We have NEEA, the advanced water heating
5 specification, which requires for a Tier 3 and
6 above a CTA-2045 port for listing.

7 And the one thing I want to mention is
8 AHRI has kicked off kind of a new development
9 effort. And this is Standard AHRI 1430. And
10 this is going to be a demand response standard
11 for electric and heat pump water heaters. And
12 it's in development.

13 One of the reasons it was really kicked
14 off is because there's so many different moving
15 pieces. And manufacturers really want to come
16 out with a national SKU or a national product
17 offering. And so harmonization is key across all
18 the different programs and the state and
19 regulatory policies.

20 So that's one of the goals of AHRI 1430,
21 which has a large amount of stakeholders, a broad
22 base, including the CEC, in its development. And
23 it's looking at all the different programs in an
24 effort to come up with a one-stop shop for a
25 standardized DR electric and heat pump water

1 heater standard.

2 Next slide please.

3 So this is our new heat pump water heater
4 with smart connectively. It has Wi-Fi and
5 Bluetooth, as well as it's California JA13
6 compliant, so that just means it can easily load
7 up time-of-use rates.

8 Next slide please.

9 So this is one of the things that shows
10 how to connect the water through the local Wi-Fi,
11 or you can connect directly to Bluetooth on your
12 phone, or a tablet. So, basically, you can set
13 your set point, you can do notifications that you
14 can get on your phone or through your app on your
15 tablet.

16 Next slide please.

17 So this is kind of what the interface
18 looks like to choose your TOU rates. You can
19 search by your utility, name, or zip code. And
20 then we would download the schedules and accept
21 them. From there, we have software in the water
22 heater that will be able to execute the TOU
23 schedules for your specific zip code and your
24 utility territory from there when your water
25 heater is not connected.

1 Next slide.

2 And then for the other one, we can use
3 the CTA-2045 port route, connected to a third-
4 party module, to execute DR commands, or we can
5 do it through open ADR Wi-Fi.

6 Next slide.

7 So we've kind of already heard today
8 what's needed with regards to some of the load
9 management. But for water heaters specifically,
10 we need to move beyond these pilots to large,
11 sustained, scaled deployments. This will help us
12 get scale.

13 For water heaters specifically, AO Smith
14 hopes that California will stick to uniform
15 national standards, especially for residential
16 water heaters. CTA-2045 would be preferred,
17 mainly because we're already in that route with
18 regards to Washington and Oregon, and we don't
19 want to have a California-specific product.

20 We want to avoid custom one-off DR
21 integrations. They can add cost and burden.

22 And then, somehow, we have to find out,
23 how to we make it worth the customer's effort to
24 participate in a program? It needs properly
25 structured incentives and rate tiers, which we

1 heard a lot about at opening keynote speakers.

2 And then, obviously, customers have to be
3 happy, so we need to minimize the hot water
4 events and show that the savings really can be
5 realized from these programs.

6 Next slide.

7 So with that, I just thank everyone for
8 taking the time to listen. And thanks to the CEC
9 Staff for having me speak today.

10 MR. STEFFENSEN: Thank you, Ashley.

11 We'll turn now and ask if Commissioner
12 McAllister, if he had any comments or questions
13 for the panel? Then after the panel, we'll ask a
14 couple questions including those from the
15 stakeholders.

16 COMMISSIONER MCALLISTER: Thank you,
17 Sean.

18 And I want to thank Abigail and Jacob and
19 Ashley for presenting really good stuff. And
20 it's great to have this partnership, really,
21 between federal industry and Commission. So it
22 shows that there's a real can-do kind of
23 attitude. And there's just a lot of volunteerism
24 to here to make this work.

25 We all know that aggregating load

1 flexibility in water heating but, really, in many
2 device categories across the Board is going to
3 help us solve multiple potential problems and
4 really provide benefit to consumers, and to the
5 grid, and to the environment.

6 So it's really heartening to see the
7 stuff that's happening at EPA. And I really want
8 to just put that at top level of partnership
9 going forward because I think being able to have
10 a broad platform for standardization and
11 discussion and just terminology really helps
12 tremendous. When California tries to do
13 something, and then other states are doing it, it
14 really helps to have the lexicon be something
15 that we don't have to argue about but that,
16 actually, we can leverage, so really appreciate
17 that.

18 And certainly want to acknowledge the
19 industry groups, AHAM and AO Smith and others,
20 that we all know this coming. And they're
21 developing a lot of innovative technologies to
22 figure out how to do it best at least cost and
23 with highest benefit.

24 So I don't have -- I don't want to -- I
25 know there a lot of people on the call here and I

1 want to give people in attendance, many of them
2 very knowledge, an opportunity to ask questions
3 and poke and prod a little bit, because that's
4 really the lifeblood of our process here, whether
5 it's today or whether it's with written comments
6 following up, interactions with Staff. You know,
7 certainly, all of our doors are open for this
8 conversation and we want to get it right, create
9 a real robust platform for scaling.

10 And several people said, we have
11 technology, we've got a lot of experience.
12 Pilots aren't going to do it. We really need to
13 scale. And I absolutely want to endorse that
14 idea.

15 And that's what SB 49 is all about. And
16 I want to just thank Senator Skinner, actually,
17 for her foresight. Working with her on this has
18 been great because I know she gets it. And the
19 time has come for this effort, so really glad
20 we're getting on it here.

21 So thanks everyone for being here. And
22 I'll pass it back to Sean and, hopefully, we do
23 have some public comment.

24 MR. STEFFENSEN: Great. Thank you,
25 Commissioner.

1 Now we'll turn to the panel. We'll, for
2 the next half hour, provide an opportunity for
3 stakeholders to ask questions of the panel and
4 provide each panelist, if they wish, about one
5 minute to respond. We ask the questions are
6 short.

7 And just to lay out, then after this
8 current panel discussion there will be an
9 opportunity for more general public comment for
10 those that want to provide statements of what is
11 on their mind to this proceeding.

12 So to start out with, maybe I'll get the
13 conversation going. I think of central interest
14 to me, as someone who may likely be the one to
15 write the regulation for an appliance's -- which
16 appliance has the most potential to positively
17 impact the climate and benefit consumers in
18 California? And with that appliance, what should
19 that appliance do?

20 And, you know, this may be an opportunity
21 for some of the panelists to recap their
22 presentations, but let's really kind of pull that
23 to the front and center. What appliances should
24 the CEC look at and what should the standard --
25 what sort of capabilities should that appliance

1 have?

2 I'll look to Abigail first.

3 MS. DAKEN: So nationally, I would
4 probably hold up water heaters as the highest
5 potential. But because California has such a
6 high penetration of gas water heaters, I might
7 look to electric vehicle chargers. That's new
8 infrastructure that's rolling out, and that's
9 substantial new load on the grid. And it's,
10 also, load that, when it's on, it's on pretty
11 hard so, you know, it's a high draw at the time
12 that it's on. So I might look there first.

13 As to what should be in it, I hope that
14 the criteria that we're proposed with Version 1.1
15 of ENERGY STAR is helpful. It includes specific
16 commands, such as delay charging, charge now,
17 curtail charge, and all of these can be used to
18 do a signal-based process. There's also price
19 response defined but not required as for other
20 large loads.

21 And then, you know, it's interesting,
22 connected thermostats have the potential to
23 address, really, for incumbent fixed-capacity and
24 dual-capacity equipment. They exercise, pretty
25 much, all the capability for demand response

1 that's available from that equipment, and so you
2 don't need a connected central AC or heat pump
3 for that.

4 MR. STEFFENSEN: Thank you.

5 Jacob, would you like to comment on the
6 question?

7 MR. CASSADY: Yeah. I think we can just,
8 maybe, provide a couple appliances that, during
9 their runtimes, they could be -- that
10 intermittent load could be, you know, curtailed,
11 like heat for a dryer for five to ten minutes.
12 Or, say, the refrigerators defrost mode, you
13 know, someone could schedule that to happen when
14 it's least expensive, and overnight, for example.

15 MR. STEFFENSEN: Okay. Okay. Great.

16 Ashley?

17 MS. ARMSTRONG: Yeah. I think everyone
18 can guess my answer. I mean, certainly we think
19 water heaters have a role to play in demand
20 response and TOU-type scheduling, especially
21 residential water heaters.

22 There's probably some additional work
23 that's investigative-type research work that
24 needs to be done in the commercial space,
25 although there's probably certain appliances that

1 also could play a key role.

2 As far as what requirements might look
3 like, I mean, harmonizing with those that are out
4 there is going to be important as manufacturers
5 have already invested in complying with those
6 regulations, whether that be those for Washington
7 and Oregon, those coming forward in a voluntary
8 space with regards to the ENERGY STAR Program,
9 and those commands that are already part of the
10 CTA-2045 feature, as well as the alternative
11 compliance pathway in JA13.

12 So I would urge CEC to look at those
13 first. And to the extent they're not already
14 addressed by the existing regulations, we would
15 welcome a further conversation.

16 MR. STEFFENSEN: Great.

17 MS. ARMSTRONG: Thank you.

18 MR. STEFFENSEN: Thank you.

19 So I'll turn to Bruce and see what hands
20 may be raised or questions that may have come in
21 through the Q&A section?

22 MR. HELFT: A couple of questions that
23 have been written.

24 John Bade, B-A-D-E, writes, for Ashley,
25 "I have been told that at least some hot

1 water heater manufacturers are concerned
2 about requiring the capability to heat water
3 to higher temperatures, for example, over 140
4 degrees Fahrenheit, due to safety concerns,
5 even a tempering device is already required.
6 What is AO Smith's view on this?"

7 And then there are two other written
8 questions at the moment as well.

9 MS. ARMSTRONG: Okay. Thanks Bruce.

10 So I would say, I mean, one of the
11 functionalities that is required by CEC's JA13 is
12 an advanced load up functionality with requires
13 that the water heater, once the customer has
14 opted into the program, go above the consumer set
15 point to, for lack of a better term, further heat
16 the tank. We would, in that case, strongly
17 recommend that a mixing valve must be installed,
18 and that's reflected in the language, that's in
19 JA13. And then it needs to be installed in
20 accordance with the manufacturers instructions.
21 Safety is, obviously, of the utmost importance
22 when we're working through this.

23 MR. HELFT: And another question.

24 Christopher Danforth asks,

25 "In assessing the cost effectiveness of

1 various demand response technologies, what is
2 the cost per kilowatt hour per year being
3 assumed for batteries or batteries/storage?
4 At the CPUC, in the PG&E GRC, various
5 parties," and he puts in parens, "(PG&E,
6 TURN, Cal Advocates (phonetic) in turn) have
7 presented estimates below \$200 kilowatt hour
8 per year for lithium ion batteries which is
9 lower cost than the six gigawatts of
10 potential presented by the speaker from LBNL,
11 Mary Piette.

12 "Also, is the assumption being made that if
13 these demand response technologies are built
14 into appliances through Title 24 the cost
15 will come way down relative to the costs
16 presented by the speaker from LBNL?

17 "I ask all these questions because Severin
18 Bornstein stated that these technologies are
19 cheaper than batteries."

20 MR. STEFFENSEN: Yeah. I would -- some
21 of these might -- these questions may -- I mean,
22 I'll let the panelists respond, you know, but
23 some of these may have been directed at some of
24 the previous speakers.

25 So I guess I would call upon Abigail

1 first.

2 MS. DAKEN: I'll pass.

3 MR. STEFFENSEN: Okay. And Jacob?

4 MR. CASSADY: The same. Yeah.

5 MR. STEFFENSEN: Okay.

6 MR. CASSADY: I think they were for --
7 I'd seen the dialogue exchange before. I think
8 that --

9 MR. STEFFENSEN: Okay.

10 MR. CASSADY: -- yeah. Thank you.

11 MR. STEFFENSEN: Yeah. I mean, we
12 encourage these kinds of questions, just some of
13 these may be somewhat -- I'm sorry, I didn't mean
14 to skip Ashley.

15 Do you want to respond?

16 MS. ARMSTRONG: Skip on. You did great.

17 MR. STEFFENSEN: Okay. Yeah. We do
18 appreciate these comments, and we will take a
19 look at them, but it may be difficult for some of
20 the panelists to respond.

21 And I think just one -- another question
22 that I have is the concept of interoperability.
23 That's central to the statutes as the Legislature
24 provided them to the Energy Commission.
25 Interoperability means, to me, that I, as the

1 consumer, could use the appliance to participate
2 in flexible demand in the way in which I would
3 prefer to use. And I've seen various business
4 models out there, whether it's a utility rates
5 program, signals being provided, clouds from
6 manufacturers or others, third-party aggregators.
7 And the consumer may have a preference as to
8 which program they may choose to participate in.

9 I guess in some of the existing models
10 out there, I'm just wondering, this concept of
11 interoperability, I mean, do I have that concept
12 correct? I mean, please comment on what you
13 think interoperability means but, as well as like
14 what are the requirements that will bring about
15 interoperability to foster consumer choice?

16 I'll call on Abigail first.

17 MS. DAKEN: You want me to do this in one
18 minimum?

19 MR. STEFFENSEN: Yeah. I mean, that's
20 kind of -- I know. It's hard for me to even ask
21 the question in a minute.

22 MS. DAKEN: So I'll start by saying,
23 that's an interesting definition of
24 interoperability and just a piece of what we
25 think about. We think about, from the utility

1 perspective, that devices from different
2 manufacturers or different models of devices
3 should be able to provide predictable responses
4 when called upon with the same commands by the
5 same D-R-M-S or DRMS.

6 We also, from the consumer point of view,
7 and this is more relevant to the smaller loads,
8 look at interoperability from the perspective of
9 a consumer who has a beautiful, beautiful General
10 Electric refrigerator and what's that to be part
11 of the same home, smart home, for instance, as
12 their Lennox air conditioner. Can those two
13 easily be integrated into a single smart home?
14 And I will say, we are not there yet.

15 From EPA's point of view, we've
16 concentrated for interoperability. There's a
17 two-pronged approach. One is for the large loads
18 to, obviously, provide technical criteria that
19 provide for interoperability between models, and
20 to the extent that it's practical, also, between
21 product types, by choosing the same protocols for
22 a variety of product types for the large loads,
23 which we expect to be addressed on a device-by-
24 device basis, whether that's by an aggregator or
25 a utility directly or whatever.

1 For the smaller loads we are more
2 concentrating on providing pressure for them to
3 be integrated easily into a smart home and which
4 would -- can provide some energy management. And
5 I didn't talk about that but that's through out
6 Smart Home Energy Management System
7 Specification, as well as the connected
8 specifications for each of the smaller load
9 devices.

10 MR. STEFFENSEN: Thank you.

11 Jacob, topic of interoperability?

12 MR. CASSADY: I think it comes back to
13 the focus on the consumer and making sure that
14 these things work and that they can talk to each
15 other. And so I think that that's a real key to
16 this, the interoperability.

17 MR. STEFFENSEN: Ashley?

18 MS. ARMSTRONG: Well, last but not least.

19 So I would say, I think, there's two
20 parts to this, one is hardware and one is
21 software. I want to make sure that water heaters
22 that I ship tomorrow with whatever hardware is on
23 them that's required or supporting DR programs
24 isn't obsoleted in a year or two, so I want to
25 make sure of that. And that's one of the main

1 advantages of the CTA-2045 standardized port. So
2 I want to make sure that that issue is addressed.

3 But, also, I think there's a software
4 point, which we're heard from Abby and Jacob and
5 yourself, which is to make sure everyone's
6 speaking the same language, that the water
7 heaters, in this case, water heaters respond or
8 the appliances respond and in the manner that we
9 expect them to, but also that we understand the
10 signal in the same way, that when the appliance
11 gets it, that it understands what it's being
12 asked to do and then can execute accordingly. So
13 standardized commands, et cetera, and making sure
14 that as iterations of standards or regulatory
15 requirements or voluntary standards move forward
16 that it's not leaving a fleet of stranded assets
17 behind it.

18 MR. STEFFENSEN: Great. Thank you for
19 the responses. Yeah, I think interoperability
20 is, I think, one of the key items that we need to
21 examine as we come up with concepts.

22 Are there questions coming in, Bruce,
23 from the chat, or are hands raised that, if
24 possible --

25 MR. HELFT: No hands but here are two.

1 They're directed to Abigail from David Springer.
2 The first one -- I'm going to read two of them,
3 one from David Springer, the other from Pierre
4 Delforge, for Abigail.

5 "Opportunities for load shifting using house
6 pre-cooling, and even residential thermal
7 energy storage, have been demonstrated. Is
8 there any work going on to enable these
9 strategies and smart thermostats or other
10 controls?"

11 And then Pierre asks,
12 "Thank you for your work on connected heat
13 pump water heaters. One of the main
14 challenges for more rapid market adoption of
15 heat pump water heater and connected heat
16 pump water heater is competition from gas
17 water heaters which have much lower
18 efficiency requirements in ENERGY STAR and
19 utility programs that leverage ENERGY STAR
20 sub-1 UEF for gas competing with greater than
21 two and proposed 3.3 UEF for electric.
22 Accelerating adoption of heat pump water
23 heater and connected heat pump water heater
24 requires a level playing field.

25 "Question: Can ENERGY STAR require heat pump

1 technology in gas water heaters and pause
2 ENERGY STAR for gas water heaters until there
3 are heat pump versions for gas water
4 heaters?"

5 And if that's not clear, I could un-mute
6 Pierre and he could ask it directly.

7 MS. DAKEN: It's clear.

8 MR. HELFT: Okay. And remember David's
9 question.

10 MS. DAKEN: Yes. So I'm going to address
11 Pierre's question first.

12 Now is the time to give us that feedback,
13 Pierre, so I hope that that was included in
14 comments to the Version 4 Draft 1 Specification.
15 And I think it probably makes more sense to
16 answer that question within the context of that
17 specification and we'll be happy to talk about
18 it.

19 To the first question, yes, we are. So
20 for connected thermostats, we were in this, when
21 we established that specification in 2016, we
22 were in this very interesting spot where there
23 were already a variety of business models in the
24 smart thermostat space, including vendors how act
25 as demand response aggregators. And so rather

1 than doing a very specific set of criteria for
2 connected thermostats, we simply required that
3 they provide demand response.

4 And we will be -- I have not done a
5 careful examination of the connected thermostat
6 market to see whether there's anything better
7 that we could be doing with it. But that will,
8 naturally, be part of the Version 2 Specific
9 revision which will launch in 2021. So anybody
10 with information about that, I'd love to talk to
11 you, maybe the second quarter of 2021 would be a
12 better time for that conversation. There's a lot
13 I'm trying to finish in the first quarter. But
14 ping me and we'll set something up.

15 For central AC and air source heat pumps,
16 specifically, there are criteria. And this was
17 following AHRI's ground-blazing work for AHRI
18 1380. There are criteria specifically
19 referencing the ability of a product to pre-cool.
20 So the three types -- or four types of DR
21 requests that are included in that specification
22 include load up, return to normal, general
23 curtailment, and a deep curtailment. So for
24 those products, obviously, those signals could be
25 used for that.

1 And then lastly, any product that chooses
2 to implement the optional price response,
3 obviously, the algorithms that the vendor puts in
4 place to respond to whatever those prices are,
5 that's an excellent time, at least for scheduled
6 price changes, to address it.

7 I will say that we don't currently have
8 anything that looks like the JA13 static time-of-
9 use rate, except in the Smart Home Energy
10 Management System Specification, and so that's
11 one thing we do not have. But mostly, I think,
12 it's pretty thoroughly addressed in our
13 specifications.

14 I'll make one other comment. I'm sorry
15 I'm taking so much time.

16 Our criteria mostly require that the
17 product be able to respond. Only in specific
18 cases do we -- we were cautious about putting
19 criteria on exactly how it responded because
20 that's exactly the way that manufacturers will be
21 able to differentiate their products from each
22 other for balancing consumer needs and grid
23 needs.

24 MR. HELFT: Sean, here's one from Henry
25 Richardson of WattTime.

1 "Do the panelists see a substantial
2 difference between event-based demand
3 response and continuous load optimization?
4 Do the current standards support continuous
5 load management?"

6 MR. STEFFENSEN: Great. Well, I'll pass
7 it along to the panelists. Abigail will walk
8 through.

9 MS. DAKEN: Actually, can Ashley start
10 with this one because --

11 MR. STEFFENSEN: Okay. Okay. Sure.
12 Ashley, would you? Would you?

13 MS. ARMSTRONG: I'm not sure that we see
14 a substantial difference between event-based DR
15 and continuous load optimization. I think it
16 might be too early to know yet for water heaters.
17 The current standards do support it but I don't
18 think we know a substantial difference among the
19 two yet.

20 Back to Abigail. I went first.

21 MS. DAKEN: Yeah, I would agree with
22 that, that the big discussion, really, is whether
23 the load is being continuously managed by the
24 device itself or its vendor or service provider
25 through a time-of-use type response, or whether

1 the utility or an aggregator is managing it
2 directly using signal-based DR, like load up and
3 shed.

4 MS. ARMSTRONG: Yeah. And just to follow
5 on, I think we're just seeing those types of
6 water heaters come onto the market. And it's
7 really going to depend in part of how closely
8 those TOU schedules are going to match the DR
9 events and how active those signals are going to
10 be sent. So I still think we're in the early,
11 early stages of this to do a comparison.

12 MR. STEFFENSEN: Great. Jacob, do you
13 have a comment on this question?

14 MR. CASSADY: Nothing to add. Thank you.

15 MR. STEFFENSEN: Okay. I did see that
16 there was a comment from Phillip Escobedo from
17 Fluidra. And he is asking, "What pool pump types
18 are being considered for requiring DR
19 technology?"

20 So I'll just pass that to the panel.
21 Although, something close to my heart is I had
22 participated via the U.S. DOE efforts to set
23 requirements for pool pumps for efficiency.

24 MS. DAKEN: So from my perspective at
25 EPA, first of all, ENERGY STAR is voluntary and

1 the connected criteria are voluntary within that,
2 so nothing is being required. However, we do
3 have criteria defined for -- the criteria that
4 are there are defined for both self-priming and
5 non self-priming pumps. Any pump that's within
6 the size class is covered by the ENERGY STAR
7 specification, which is intended to cover most
8 residential pool pumps, except for those that are
9 integrated into the pool itself when it's sold.

10 MR. STEFFENSEN: And I'll ask the
11 remaining panel, do you want to comment on pool
12 pumps? No? Okay. And I guess the question was:
13 Which types of pool pumps? I mean, we've heard
14 from Mary Ann this morning. I think that the
15 emphasis would be more on the filtering pool
16 pumps as they tend to have a cycle that makes it
17 perform daily. And there could also be
18 opportunities for the -- there's a booster pump
19 that's used to help run the robot. I mean, again,
20 that could be scheduled to run it at various
21 times.

22 So I mean, I think the CEC is looking for
23 comments from stakeholders as to how pool pumps
24 does -- do fit into solutions to beat this
25 climate goal.

1 Bruce, are there additional questions or
2 hands raised?

3 MR. HELFT: One for Jacob from Tristan
4 from SkyCentrics. What -- this is to Jacob.

5 “What happens when the Wi-Fi goes down versus
6 a cellular CTA-2045 module or an AMI smart
7 meter mesh module which are expected to be a
8 lot more reliable as communication paths for
9 grid-critical infrastructure?”

10 And then he comments after that question,
11 “This is what a low-cost port offers, future-
12 proofing and communication path flexibility,
13 whereas with Wi-Fi and no port, we are stuck
14 with Wi-Fi forever.”

15 So he’s asking for Jacob’s comment on
16 that.

17 MR. CASSADY: All right. There we go.
18 No, I think he’s answering his question. You
19 know, the answer, as he sees it, is there. You
20 know, this is just, the Wi-Fi enabled, it really
21 provides the most consumer focused, it provides
22 layers of security. We’re using Zoom to teach
23 our kids these days and having family events that
24 way. We’re using Wi-Fi. If it goes down a lot,
25 goes down and maybe your power is out so you

1 can't run your appliance anyway, and we're all
2 saving energy at that point, so --

3 MR. STEFFENSEN: I think one thing that
4 we'll want to look to as the comments come in is
5 to understand that the issue of future-proof that
6 some of the panelists have presented, how do we
7 identify requirements that speak to the functions
8 that we hope the appliances segue as technology
9 innovates, that the regulations keep up.

10 So I think an essential part of the
11 comments that I'll be looking forward to seeing
12 is how do we structure the regulation, the very
13 short list of requirements, around requirements
14 that really don't need to change as technology
15 evolves because we've identified the essential
16 function that the appliance needs to provide.

17 And now if the -- any of the panelists
18 want to add on to that kind of thought, how do we
19 future-proof regulations where technology is
20 evolving, or for that case, business models?

21 We'll turn it to Abigail.

22 MS. DAKEN: I don't know that future-
23 proofing is really possible. The main focus of
24 future-proofing from EPA's point of view is to be
25 careful about balancing standardization against

1 innovation. And as much as we can, without
2 throwing out the baby with the bath water,
3 encourage innovation and concentrate on
4 performance, rather than have performances
5 achieved.

6 Now, obviously, for our large load
7 specifications, we have been much more
8 prescriptive than usual around demand response.
9 And I can imagine a future where we are able to
10 be more flexible about that. But all of these
11 products, once they're connected, including
12 firmware updatability, so that's very helpful.

13 And I guess the other thing is take into
14 account not just what the future of demand
15 response is but what the future of connectivity
16 in general is. What communications' pathways are
17 going to be there, we think, for other purposes
18 and might be usable for demand response? That's
19 one way to think about allowing for what the
20 future might hold.

21 MR. STEFFENSEN: Thank you.

22 Jacob, did you -- I think you had talked
23 a bit about future-proofing but did you have
24 anything to add?

25 MR. CASSADY: I think that balance is

1 what we're hoping to achieve.

2 MR. STEFFENSEN: Ashley?

3 MS. ARMSTRONG: No. I think Abby pretty
4 much summarized it. I will just say, you know,
5 this is an evolving market quickly. It's still
6 pretty nascent, so it's still kind of hard to
7 fully future-proof but, certainly, we should try
8 to do that as much as possible while balancing
9 the idea of complicated performance standards
10 that may be very costly or expensive to test with
11 the over-prescriptive design requirements.
12 Putting my old hat on, it's certainly going to be
13 a challenge.

14 MR. STEFFENSEN: Great.

15 Bruce, are there additional questions?

16 MR. HELFT: We're good, Sean. The rest
17 are comments. But, of course, stakeholders are
18 welcome to submit comments after this to the
19 docket or at our other time for submitting
20 questions later on today.

21 MR. STEFFENSEN: Okay. Well, I think
22 we're coming up, I guess, at the end of the half-
23 hour discussion. I would like to thank our
24 panelists for their time today.

25 I think next up we will turn our

1 attention to an open comment period, public
2 comment period, where we'll ask that stakeholders
3 raise their hand or present comments in the Q&A.
4 This will be a half-hour opportunity, the first
5 of two today.

6 And so I'll again look to Bruce and Nich
7 to lead this conversation. And so just -- so,
8 yeah, we're about at noon today, so I was
9 thinking we could just move into the public
10 comment period.

11 So moving on to the next slide please, so
12 the next slide, public comments.

13 This public hearing is being recorded by
14 a Court Reporter and all statements today become
15 part of the public record.

16 If you have any questions, you may type
17 them into the question and answer function and
18 they'll be forwarded to the moderator.

19 If you are on the phone, raise your hand
20 to speak by pushing star nine and the host will
21 give you the ability to speak. Then you can push
22 star six to mute and un-mute.

23 So if you'd like to make a public comment
24 at this point, please raise your hand or press
25 star nine on the phone. Comments may be limited

1 to three minutes per person and one person per
2 organization. Please state your name and
3 affiliation when speaking. And we'll look to
4 Bruce to identify the first participant that
5 would like to make a public comment.

6 MR. HELFT: Yes. I'm going to give those
7 that have not yet commented the chance to make
8 those comments first. So I do see a hand up from
9 someone who spoke before but I'm going to pass.

10 I'll come back to you, Tristan.

11 I'm going to read this one from Chris
12 Granada for the panel.

13 "Some products with relatively low ability to
14 shed or shift load, is it better to use
15 simpler control approaches? For example,
16 would it make sense for all freezer defrost
17 cycles to be set to operate during daylight
18 hours during solar production?"

19 MR. STEFFENSEN: Okay. Great. So are
20 the panelists still with us?

21 MS. DAKEN: I am.

22 MR. STEFFENSEN: Okay.

23 MS. ARMSTRONG: Me too.

24 MR. STEFFENSEN: Okay. Well, great.

25 Well, let's start with Abigail and we'll address

1 this question.

2 MS. DAKEN: So we started in 2011 or '12
3 with exactly that criteria for the first
4 connected product criteria we were considering,
5 which is refrigerators and freezers. And the
6 problem we came across is that, speaking of
7 future-proofing, it's difficult to predict
8 whether that is going to be the right time.

9 I mean, in general, the answer to your
10 question is, yes. I once heard a Commissioner --
11 I can't remember whom, which state, I'm sorry --
12 recommend the simplest possible method which is
13 to us FM, or even AM radios to -- for the ISOs or
14 RSOs to transmit price, real-time price data, and
15 just have the product respond as it sees fit.
16 But -- which would be admirably cheap except you
17 have to put that processing in the product, which
18 may not be as cheap as it sounds at first.

19 So I mean, yes, but you have to account
20 for the fact that what the grid needs is very
21 likely to change in the next five to ten years.

22 MR. STEFFENSEN: Jacob?

23 MR. CASSADY: Nothing more to add.

24 MR. STEFFENSEN: Okay.

25 MR. CASSADY: Thank you.

1 MR. STEFFENSEN: Ashley?

2 MS. ARMSTRONG: Nothing on fridges.

3 MR. STEFFENSEN: Okay. Well, thank you.

4 Bruce, do we want to -- again, we'll move
5 on to the public comment.

6 MR. HELFT: There's a question --

7 MR. STEFFENSEN: Do we have --

8 MR. HELFT: -- a question. Well, it's
9 directed for Jacob. Do you want to take that
10 question now?

11 MR. STEFFENSEN: Okay. Okay. Sure.

12 MR. HELFT: "Does AHAM recommend an open
13 standard in the Cloud or does AHAM suggest
14 the utilities integrate with 150 different
15 member-company Cloud system? If the latter?
16 What performance and design testing standards
17 are suggested to evaluate each of the 150
18 different member-company Cloud systems?"

19 This was a question from Dan Nephin,
20 N-E-P-H-I-N, for the Court Reporter, from
21 e-Radio.

22 MR. CASSADY: No, I get the question, I'm
23 just trying to give it a little bit to kind of
24 consider it. It's -- we're not talking about 150
25 different, or over, systems and apps or programs,

1 so I just -- so there's no real -- there's no
2 real answer to that. And I understand the
3 direction the question is going, so I'll just
4 leave it at that. I just -- it's not answerable.
5 We're not there. You're talking about a whole,
6 you know, the entire product industry. We're not
7 talking that the entire industry would need to
8 have this type of technology.

9 MR. HELFT: Okay. Thank you, Jacob.

10 A question coming in the phone from Laura
11 Groh from AHRI.

12 Laura, I'm un-muting you.

13 MS. PETRILLO-GROH: All right. Hello.

14 This is Laura Petrillo-Groh. Hello. This is
15 Laura Petrillo-Groh with the Air Conditioning,
16 Heating, and Refrigeration Institute. AHRI
17 represents 332 air conditioning, heating, and
18 refrigeration equipment manufacturers in North
19 America, including the majority of the North
20 American water heater, central air conditioner,
21 and heat pump manufacturers, all of which have
22 been discussed or, at least, mentioned today.

23 Thank you very much for holding this
24 workshop. AHRI originally identified the need to
25 discuss our smart or connected products in 2011.

1 The first work product outcome was, as Abigail
2 Daken mentioned, a consensus standard targeting
3 standardized responses and dual-capacity and
4 variable-capacity residential and light
5 commercial air conditioners and heat pumps, or
6 AHRI 1380. Stakeholders included utilities,
7 EPRI, EPA, and others. The certification program
8 to ensure that equipment using 1380 as the basis
9 for developing those responses is anticipated to
10 launch in this coming year.

11 Now, as was mentioned, AHRI is working
12 with water heater manufacturers on AHRI 1430.
13 And we hope that the progress on that standard
14 will move much more quickly now that there are
15 established base and other programs for that.

16 So these test procedures have and will
17 standardize demand response performance and
18 characteristics on the equipment side for air
19 conditioners and heat pumps and water heaters,
20 respectively. But manufacturers require
21 flexibility to innovate and address market needs.
22 There is a lack of a common communication
23 protocol from electric utilities which complicate
24 the benefit and slow the adoption of demand
25 response technologies. These manufacturers sell

1 products nationwide and, as Ashley Armstrong
2 mentioned, a California-specific product is not
3 desirable.

4 All have acknowledged this is a
5 complicated problem. A December 9th Staff report
6 lists a page of questions that require a
7 thoughtful response. AHRI has submitted a
8 request for an extension of the 30-day January
9 4th deadline and hopes that CEC will approve that
10 request in order for industry to provide a
11 reasonable and helpful response to this issue.

12 Thank you.

13 MR. STEFFENSEN: Thank you, Laura. Staff
14 has received your request to extend the comment
15 deadline and we are currently evaluating it.

16 MS. PETRILLO-GROH: Thank you.

17 MR. HELFT: Tristan, you are un-muted
18 now, if you want to make your comment?

19 MR. DE FRONDEVILLE: Thank you. This is
20 Tristan de Frondeville at SkyCentrics. I want to
21 make comments about competition and cyber
22 security.

23 So on the cyber security, when you have
24 an alternative communication path capability that
25 is available if you have a CTA-2045 port, you can

1 actually avoid the public internet entirely. And
2 as we know, once you're on the public internet,
3 that is much easier to hack than when you're off
4 it. So by going VPN between cellular and, for
5 example, a modular Cloud, and then over -- and
6 then through cellular, you're avoiding the public
7 internet entirely.

8 On the competition side, first, there are
9 smaller OEMs that don't have Clouds. By putting
10 a port in they can actually provide internet-of-
11 things functionality through a CTA-2045 module
12 vendor, so that allowed smaller OEMs to
13 participate.

14 If there's -- the API integration fees
15 that I've seen charged so far by the people who
16 do demand response are \$20,000 to \$50,000 per
17 API. Now once somebody like Enbala has
18 integrated with Ecobee thermostats, then they can
19 brag to utilities that they've already done the
20 integration and so, typically, they don't need to
21 charge that \$20,000 to \$50,000.

22 So that speaks to Dan Nephin's point that
23 was made earlier at e-Radio that I think is
24 valid. And, certainly, that's why open ADR
25 exists, although the open ADR items, integrations

1 can sometimes take some money as well.

2 And finally, I want to let the Commission
3 know that there's going to be a CTA-2045 test
4 harness. And that testing tool will allow
5 manufacturers to practice sending demand response
6 signals to all -- anything that's a CTA-2045
7 product.

8 And then the last thing, on the
9 competition, if an OEM, such as Nest, which has
10 been out in the field for a long time -- and you
11 should speak to utilities about their
12 frustrations, having to go through a single-
13 vendor Wi-Fi solution -- but imagine that an OEM,
14 such as a water heater manufacturer, has 10
15 million water heaters with Wi-Fi only and no CTA
16 port, and they're now preventing a \$25 million
17 peaker power plant from being turned on. Don't
18 you think that over time they're going to start
19 charging a lot more for access to those 10
20 million water heaters because they know the value
21 to the grid and they'll have an effective
22 monopoly?

23 So we all know that the CEC is all about
24 regulating monopolies. And I'm concerned about
25 introducing one more monopoly. So the CTA-2045

1 port allows that flexibility. And once you have
2 a brain on an appliance that can do Wi-Fi, it's
3 very inexpensive to use that same brain, add the
4 plastics for the port, adds very little cost as
5 some people have mentioned.

6 Thank you for your time. I cede my 20
7 seconds.

8 MR. STEFFENSEN: Thank you, Tristan.

9 MR. HELFT: Dean Taylor is asking or
10 making a comment with a question.

11 "Transportation electrification seems to be
12 different as both EV and EVSE are possible
13 points of regulation. How to be tech
14 neutral?"

15 Then he goes on,
16 "EVs are analogous to smart thermostats that
17 can work on existing loads rather than
18 regulating the other point, for example, the
19 AC or the EVSE. EV OEMs are working on being
20 able to do demand response and other grid
21 services direct to the grid."

22 MR. STEFFENSEN: Thank you.

23 MR. HELFT: His question is how to be
24 tech neutral with these kinds of devices?

25 MR. STEFFENSEN: Well, we're up to, I

1 think, the public comment period, so let's just
2 continue through seeing if there are other
3 comments coming in from the public at this time.

4 MR. HELFT: There's a hand raised from
5 Bob Wolfer.

6 I'm un-muting you. You can speak.

7 MR. WOLFER: Terrific. Can you hear me?

8 MR. STEFFENSEN: Sorry, there's a bit of
9 feedback (indiscernible). Turn down your other
10 devices.

11 MR. WOLFER: Okay. How is this?

12 MR. STEFFENSEN: Somewhat better.

13 MR. WOLFER: Okay. So good afternoon.

14 Thank you for the opportunity to speak today. My
15 name is Tom Wolfer. I am the Manager of
16 Government Relations for Bradford White
17 Corporation. Our company is an American-owned
18 major manufacturer of water heaters, boilers, and
19 unfired hot water storage tanks. In the state of
20 California, a significant number of individuals,
21 families, and job providers are buying our
22 products that are hot water and space heating
23 needs.

24 We appreciate today's discussion, as well
25 as the overarching goal advanced by the passage

1 of Senate Bill 49. Our company believes this
2 action is pivotal to achieving more energy
3 efficiency in the state, while also having the
4 added benefit of promoting our shared goal of
5 increasing the market for electric heat pump
6 water heaters throughout California.

7 As CEC continues to consider this matter,
8 Bradford White urges the Commission and Staff to
9 allow product manufacturers as much intellectual
10 flexibility as possible when designing and
11 developing demand response products. This market
12 is still in its infancy, as was mentioned today.
13 This means that manufacturers and utilities alike
14 will be constantly learning about and adapting to
15 new challenges and opportunities as this market
16 matures.

17 For this reason it will be important for
18 manufacturers, utilities, and regulatory bodies
19 to have a full arsenal of options at their
20 disposal when troubleshooting various consumer
21 concerns that will arise as adoption and use of
22 flexible demand response products increases.

23 Additionally, we would ask that the
24 Commission continue their consideration of
25 hosting conversations between utilities and

1 manufacturers. If their own utility demand
2 response programs will be affected, it must
3 include clearly defined responsibilities between
4 these two groups of stakeholders. This will help
5 to clarify the expectations of home and building
6 owners who choose to participate in these
7 programs and will assist in directing them to the
8 appropriate body when they have any questions or
9 concerns.

10 Bradford White encourages the Commission
11 to consider actions that have been taken by other
12 regulatory bodies related to connected water
13 heaters while examining the best path for
14 California's own utility demand response program.
15 These include actions by the Washington
16 Department of Commerce, the Oregon Department of
17 Energy, AHRI Standard 1430, ENERGY STAR, and the
18 Commission's own Joint Appendix 13 to the 2019
19 Building Energy Efficiency Standards, all of
20 which previous speakers have touched on today.

21 In designing a program for California, we
22 urge the Commission to maintain as much
23 consistency as possible with aspects of these
24 existing measures as many manufacturers have
25 already made significant investments to achieve

1 the goals and requirements that are included in
2 them.

3 Thank you, again, for the opportunity to
4 address you on this matter. Bradford White
5 Corporation looks forward to being a partner with
6 the Commission as this important work continues.

7 MR. HELFT: We have a comment next from
8 Orly of Universal Devices, for the Court
9 Reporter, O-R-L-Y.

10 You're un-muted.

11 MS. HASIDIM: Thank you very much for
12 giving --

13 MR. STEFFENSEN: Sorry. We've lost your
14 audio.

15 MS. HASIDIM: Can you hear me now?

16 MR. STEFFENSEN: Yes.

17 MS. HASIDIM: Okay. So I'm Orly. I'm
18 part of Universal Devices. We manufacturer
19 energy efficiency hubs and devices.

20 I would like to ask the Commission to
21 consider requesting manufacturers to make their
22 APIs, the interface to their devices, public so
23 things are not custom and private, just so energy
24 management systems, such as ours and others, can
25 communicate with multiple devices. At least in

1 our organization, we believe that the solution is
2 just not one per device. Every home, every
3 location has their preferences, maybe the water
4 heater more than the EV or vice versa. And we'd
5 like to give the homeowner the opportunity to
6 make these choices. It will be much easier when
7 devices have public APIs and we can all
8 communicate with each other.

9 Thank you very much.

10 MR. STEFFENSEN: Thank you.

11 MR. HELFT: A comment from Brian Pickett.

12 "This is Brian Pickett with Ariston Thermal
13 USA, a global manufacturer of water heaters
14 and more.

15 "It seems to me that one of the stickiest
16 issues affecting demand response
17 implementation for water heaters is scalding
18 risk liability related with advanced load-up.
19 I suggest that protections from manufacturers
20 be included in any regulation that is
21 implemented, specifically manufacturers will
22 not be held responsible in scalding incidents
23 where a required mixing valve was not
24 present, a mixing valve malfunctioned, et
25 cetera."

1 MR. STEFFENSEN: Thank you for the
2 comment.

3 MR. HELFT: A comment from Peter
4 Mustacich, M-U-S-T-A-C-I-C-H.

5 "Could the federal precedence that connected
6 devices fall outside of simply being a
7 feature support California to regulate these
8 products?"

9 That's a -- I'm sorry, that is a
10 question.

11 MR. STEFFENSEN: Thank you for the
12 question.

13 MR. HELFT: Deepak Sivaraman.

14 "How easy is it to retrofit existing
15 residential water heaters with flexible
16 demand capabilities, as opposed to adding
17 such capabilities to newly manufactured water
18 heaters?"

19 From Dean Taylor --

20 MR. STEFFENSEN: Sorry, Bruce. I'll just
21 interject, I mean, that is a key question we want
22 to understand. And to phrase it another way, we
23 want to understand the difference between a water
24 heater that has the demand flexible capability
25 versus a water heater that does not, what the

1 cost difference may be at the point of sale. I
2 think that's a key way that we'll look to see the
3 readiness of various proposals that we will
4 evaluate, as Staff, as well as, hopefully,
5 receive from stakeholders.

6 Bruce, you may be on mute. I'm not sure.

7 MR. HELFT: No, I'm not, but Christopher
8 Danforth wants to know if he could -- if this is
9 an appropriate time to bring up his comments?
10 Did you want to read that in the Q&A box or would
11 you like me to restate that?

12 MR. STEFFENSEN: This is Christopher
13 Danforth's comment?

14 MR. HELFT: Yes. It's at the top.

15 MR. STEFFENSEN: Yeah, we may. Yeah, we
16 may read that for the record. I think that would
17 be okay.

18 MR. HELFT: Christopher Danforth.

19 "In assessing the cost effectiveness of
20 various demand response technologies, what is
21 the cost per kilowatt hour -- per kilowatt
22 year being assumed for batteries?

23 "At the CPUC, in the PG&E GRC, various
24 parties, PG&E, TURN, Cal Advocates, have
25 presented estimates below \$200 a kilowatt

1 hour per year for lithium ion batteries,
2 which is lower -- a lower cost than the six
3 gigawatts of potential presented by the
4 speaker from LBNL.

5 "Also, is the assumption being made that if
6 these demand response technologies are built
7 into appliances through Title 24 the cost
8 will come way down relative to the cost
9 presented by the speaker from LBNL?

10 "Finally, I ask all these questions because
11 Severin Bornstein stated that these
12 technologies are cheaper than batteries."

13 Christopher, if you wanted to raise your
14 hand and speak further on this as a comment, you
15 can be un-muted. This would be the time to do
16 that.

17 From Mitsubishi Electric, Bruce Severence
18 writes,

19 "Does the CEC have research already on the
20 cost benefit of demand response in space heat
21 pump applications, specifically average cost
22 of demand response features across
23 manufacturers relative to Southern California
24 Edison, PG&E, and SDG&E time-of-use rates,
25 and whether the return on investment over

1 energy savings will actually pay for the
2 demand response feature over ten years?"

3 Christopher, you are able to speak. Ah,
4 I see. I'm un-muting you but --

5 MR. DANFORTH: Okay.

6 MR. HELFT: -- there you go.

7 MR. DANFORTH: Okay. Well, it's just a
8 question. I presume that in the course of this
9 proceeding the cost effectiveness question will
10 be looked into further. But I just wanted to
11 alert people that it appears that the cost of
12 batteries at the utility scale is coming down
13 significantly. And the capital cost is around
14 \$1,200 per kilowatt. And when you apply real
15 economic carrying charge amortization factor, it
16 comes down to around \$120 per kilowatt year.

17 And you know, the calculations done in
18 the CPUC proceeding also incorporated offsets to
19 those capital costs from energy arbitrage and
20 participation in the ancillary services market by
21 the utilities that own those batteries. So it's
22 something to consider in determining what's the
23 most cost effective way for society to deal with
24 the duck curve issues that we've talked about
25 this morning.

1 I think that's all I have to say at this
2 point.

3 MR. HELFT: Would you like to share your
4 affiliation please for the Court Reporter?

5 MR. DANFORTH: Oh, I'm sorry. I thought
6 it was already indicated in the comments. I'm
7 with the Public Utilities Commission, Public
8 Advocates Office.

9 MR. HELFT: Deepok Sivaraman asks,
10 "In terms of the avoided cost model by CPUC,
11 my understanding is that we should treat it
12 as marginal cost and not prices. Is that
13 consistent with your understanding?"

14 So, Sean, that wraps up what we have
15 open for the moment at this period.

16 MR. STEFFENSEN: Okay. Well, I think,
17 yeah, we'll be performing the last call for this
18 comment period.

19 I would remind everyone that we'll have
20 two panels after lunch with opportunities to ask
21 those panelists questions. So there's, by far,
22 more opportunities to participate and provide
23 what's your mind, as well as a final comment
24 period coming up at the conclusion of Panel 3, I
25 believe around 3:30 today.

1 So at this point, seeing that -- or just
2 to conclude, we're up against about the scheduled
3 break for lunch. Lunch is scheduled for one hour
4 today. And just looking for confirmation that
5 would -- I do have confirmation that we will,
6 seeing that there are no additional comments at
7 this time, we will begin the lunch break. We
8 will resume at 1:30 p.m., Pacific Standard Time,
9 and proceed into the Panel 2 discussion on
10 Communications and Cyber Security at that time.
11 Again, we will break for lunch now and resume at
12 1:30 p.m.

13 Thank you.

14 (Off the record at 12:21 p.m.)

15 (On the record at 1:28 p.m.)

16 MR. FERRIS: Okay, everybody, welcome
17 back to the afternoon portion of our Senate Bill
18 49 Flexible Demand Lead Commissioner Workshop. I
19 hope you all had a nice break.

20 As we move to the second panel, I'm going
21 to turn our workshop over to Nicholas Struven.
22 He is the Senior Mechanical Engineer for the
23 Appliance Office.

24 Nich?

25 MR. STRUVEN: All right. Thank you.

1 Let's look at our agenda. It's approximately
2 1:30 p.m. We'll now continue on to the afternoon
3 panels and discussion.

4 Good afternoon and welcome to Panel 2,
5 Communication Technologies and Cyber Security.
6 My name is Nich Struven and I am the Moderator
7 for this panel. I am the Flexible Demand
8 Appliances Project Lead at the Appliances Office
9 at the CEC.

10 The concept of connecting appliances,
11 objects and devices of all types over the
12 internet is called the internet of things, or
13 IOT. Today, consumers can purchase all kinds of
14 products with an internet connection, everything
15 from vehicles to refrigerators. Expanding
16 network capabilities to all corners of our lives
17 can make us more efficient, help save time and
18 money, and helps put our digital lives at our
19 fingertips whenever we need it.

20 The best way to ensure strong cyber
21 security in the internet of things devices is to
22 ensure that security is built into that device
23 from the start. That means working with people
24 who recognize the risk and have taken steps to
25 protect their products. The panel I have for you

1 today has been carefully selected to address
2 these risks and steps that could be taken to
3 reduce these risks.

4 First, I have Professor Zubair Shafiq from
5 University of California, Davis to speak about
6 cyber security for flexible demand appliances.
7 Second, I have Rolf Bienert from the OpenADR
8 Alliance to speak to us about open ADR for
9 communications and standards that promote
10 flexible demand capabilities in appliances. And
11 third, I have Dr. Walt Johnson, who is a retired
12 technical executive at the Electric Power
13 Research Institute and will speak to us today
14 about technologies and communications and
15 standards that promote flexible demand
16 capabilities in appliances.

17 The subject matter experts will provide a
18 ten-minute presentation, followed by a short
19 opportunity to ask clarification questions, and a
20 20-minute panel discussion on stakeholder
21 questions after the last presentation.

22 Welcome Professor Zubair.

23 MR. SHAFIQ: Thanks. Thank you. I
24 really appreciate (indiscernible) cyber security
25 considerations and Flexible Demand Appliance

1 Standards.

2 So I'm hoping to, today, present the
3 academic point of view. Basically, what are some
4 of the lessons that we have learned in more than
5 two decades of academic research on security and
6 privacy issues in the broader IOT ecosystem, as
7 Nich laid out?

8 I organized my remarks around three key
9 questions. One is, why? What? And then how
10 cyber security and privacy considerations should
11 be taken into account in developing flexible
12 demand appliance standards?

13 So let me jump right in. First, I will
14 try to briefly motivate why we should care about
15 cyber security and privacy considerations? And,
16 really, what we have learned from the past two
17 decades of research on security and IOT is that
18 most IOT devices, unfortunately, have like little
19 or no built-in security or privacy built in. And
20 this not only has an impact on their own security
21 and privacy, but it also has a downstream impact
22 on the broader critical infrastructure, not just
23 the smart home but the broader internet, for
24 example. And, hopefully, I will be able to
25 convince you that the standards threat model

1 should not only consider this like immediate
2 impact on flexible demand appliances, but also
3 the holistic view of the critical in fact, such
4 as the smart grid and beyond.

5 And just to illustrate these two points,
6 let me first talk about some of the cyber
7 security issues that have been observed in the
8 last few years.

9 So the most notable cyber security
10 incident that recently happened was a large-scale
11 denial-of-service attack that was carried out
12 using hundreds of thousands of small, innocuous
13 internet-of-thing devices, like home routers,
14 sensors, like air quality monitors, and personal
15 surveillance cameras. And at its peak this
16 botnet, which is also -- which was called the
17 Mirai botnet, consisted of more than 600,000 one-
18 able internet-of-things devices. And this botnet
19 was used to conduct a series of attacks over the
20 last few years.

21 For example, in 2016, the infamous Mirai
22 attack happened where the botnet was used to
23 attack the domain name service infrastructure
24 which underpins most of the internet. And this
25 attack resulted in outage of many popular

1 websites on the internet, including sites like
2 Amazon, GitHub, Airbnb, Netflix, Twitter, and so
3 on.

4 And after that there were multiple,
5 additional denial-of-service attacks launched
6 through this botnet, which primarily consisted of
7 compromised IOT devices. For example, it was
8 used later that year to take down the network
9 entire country. And then further, later that
10 year, the same botnet was actually used to
11 significantly undermine the connectivity provided
12 by one of the largest telecom providers in
13 Germany by compromising its more than 1 million
14 routers.

15 So this shows that compromised IOT
16 devices in a home, including flexibility
17 monitored appliances, once they are compromised
18 they can be, potentially, recognized to launch
19 broader-scale attacks.

20 Then I will talk a little bit about some
21 of the privacy considerations. And what we have
22 seen in research is many of these, like IOT
23 devices, unfortunately send and receive
24 information in the field. And this often can
25 contain sensitive information. So even

1 appliances, such as water heaters, might actually
2 sometimes communicate some sensitive information
3 that might reveal information about people in a
4 household. And sometimes, even when you encrypt
5 this communication, depending upon the coupling
6 of the device activity with the users of that
7 device, there are these so-called side channel
8 attacks which can be launched, which can reveal
9 the information which is being sent, even if it
10 is encrypted.

11 So, for example, in the diagrams here I
12 am showing a couple of examples where, for
13 example, a sleep monitor or a Nest camera, even
14 just by looking at encrypted communication, you
15 can actually tell when there was someone inside a
16 home, or whether certain activities were taking
17 place. So this shows that, in addition to cyber
18 security, privacy considerations should also be
19 taken into account.

20 So I will briefly talk about what are
21 some of the major privacy considerations that we
22 should take into account? And some of my remarks
23 here are inspired by some of the recent
24 regulations which have been put forward in the EU
25 and UK, and specifically, actually, recently

1 released standardization of the recommendations
2 for cyber security for consumer internet-of-
3 things devices. And there are three main things
4 that stood out which I think should be -- should
5 constitute the minimum baseline that should be
6 advised in the CEC Flexible Demand Appliance
7 Cyber Security Standards.

8 The first one is there should be
9 authentication. So these appliances, they should
10 have -- they should -- you know, the access
11 should be authenticated using passwords. And
12 there should be regulations which make sure that
13 these devices don't use default passwords. And,
14 if possible, these devices should also support
15 two-factor authentication to mitigate large-scale
16 denial-of-service attacks which are possible when
17 attackers can predict the passwords used by
18 users.

19 The second key requirement that should --
20 is absolutely critical, and I think some of my
21 colleagues who are speaking afterwards will talk
22 about, the need for secure communications. So
23 standards, such as an Open ADR, already support
24 some of this but it is very important that they
25 use best practices, like TLS, and use public

1 infrastructure to ensure secure communications.

2 And lastly, we know that vulnerabilities
3 and exploits are inevitable, so there should be
4 mechanisms to report these vulnerabilities. And
5 all of these appliances or devices should be
6 patchable. So once we figure out that there are
7 exploits there should be a safe way to do
8 firmware updates.

9 And lastly, I want to, very briefly, talk
10 about a recommendation in basically discussing,
11 how should be convey these cyber security and
12 privacy considerations, not just to
13 manufacturers, but how should manufacturers
14 convey these considerations to users?

15 And one of the things which has gained
16 like a lot of popularity over the last few years
17 are, after a lot of research, academics and
18 researchers have converged onto this simple idea
19 of something like a nutrition label which is,
20 conceptually, very similar to an ENERGY STAR
21 label which is used to convey energy efficiency
22 of different appliances. So I think a similar
23 kind of nutrition label can be designed or added
24 to existing labels which can help consumers
25 understand the security practices implemented in

1 that appliance and, also, list off different data
2 collection and privacy considerations that the
3 appliance adheres to.

4 So with this, I will conclude my remarks,
5 and happy to take any clarification questions or,
6 maybe, at the end of the panel.

7 MR. STRUVEN: Thank you, Professor.

8 Let's just first check in with the
9 Commissioner if there's any additional comments?
10 Okay.

11 Hearing none, Bruce, are there any
12 additional clarifying questions?

13 MR. HELFT: No hands raised. And no
14 questions submitted to the Q&A. Oh, just a
15 second, one just came in from James Frey, F-R-E-
16 Y, of 2050 Partners. "Zubair, do you support
17 bricking devices that remain disconnected and
18 create a security issues?"

19 MR. SHAFIQ: So I just want to make sure
20 I understand the concept of bricking completely.
21 But if I understand it correctly, the idea is
22 that these devices should be kind of like
23 separated or kind of like bricked so that they
24 cannot communicate, so they become non-usable,
25 essentially. So I think this definitely is an

1 extreme last resort. So if these devices are not
2 patchable and they are -- if they don't get
3 admitted to the latest firmware, so, yeah, so
4 this could be another definition for those
5 devices.

6 At a certain point I think this should be
7 a consideration that they should be forcefully
8 removed from the network so they cannot be
9 compromised, so I do support this.

10 MR. STRUVEN: So --

11 MR. HELFT: Okay to move on.

12 MR. STRUVEN: Okay. All right. Now I
13 have Rolf Bienert from OpenADR Alliance to speak
14 with us about OpenADR for communications
15 standards that promote flexible demand
16 capabilities in appliances.

17 MR. BIENERT: Excellent. Thank you. And
18 thank you to the Commissioner and the CEC for
19 having me here today. It's great to be able to
20 present.

21 So we've heard already OpenADR mentioned
22 a few times today, so for those of you who don't
23 really know much about it yet, I'm going to just
24 give a really quick intro here and a very high-
25 level use case on how this works.

1 So if you'd go to the next slide?

2 Essentially, OpenADR is an open
3 communications protocol between a demand response
4 service provider, most of them, of course, at the
5 utility level, and the resources outside in the
6 customer demand. This connection can be
7 established straight through existing internet,
8 or it could go through a facilitator or an
9 aggregator, as shown here on the right side of
10 this image. We have heard talk about thermostats
11 earlier, from Nest to Ecobee and so on, but this
12 is, for example, a way to communicate OpenADR, as
13 well, by driving the signals through the internet
14 to the Cloud-based controller. And then the
15 companies would then independently control the
16 thermostats, for instance, that sit on the
17 consumer end of things.

18 So OpenADR is not new.

19 If you'd go to the next slide?

20 Just a brief history here. I'm not going
21 to go into details but the idea of OpenADR was
22 conceived after the energy crisis of 2001. And
23 it became a CEC grant opportunity with a few
24 companies, as well as the Lawrence Berkeley
25 National Lab, participating in the creation of

1 OpenADR 1.0. And then as the smart grid efforts
2 seriously kicked into gear in the last 2002s, it
3 became clear pretty quickly that we wanted to
4 make this an interoperable and implementable
5 standard.

6 So starting in 2010 and '11, we created
7 the two OpenADR 2.0A and B specifications, tested
8 them, ran them through all kinds of schemes out
9 there, until they were ready for publication.
10 And in 2018, it also became an IEC standard,
11 also known as IEC 62-746-10-1.

12 If you go that next slide, we will see
13 where we are right now in the Alliance. The OpenADR
14 Alliance, we, ourselves, we do not make products.
15 As you can imagine, we are a nonprofit industry
16 alliance that manages the standard and the
17 certification. We have, currently, eight test
18 houses locally. And, in fact, I think I have
19 three more products here on my desk, so we have
20 about 218 certified systems, and 165 member
21 companies.

22 So if you go to the next slide, just a
23 real quick overview again because this will come
24 up a lot in the discussions, we are talking about
25 two different actors here, the virtual top node

1 for VTN, which is, essentially, the server or the
2 demand response, or DER, management system,
3 again, typically located at the utility level or
4 some aggregator. And that server manages all the
5 resources that are connected. That doesn't mean
6 that the server or the utility will need to know
7 each and every lightbulb at the end of this
8 chain, but they will need to know the endpoints
9 in a sense. So the VENS, the virtual end nodes,
10 which are the clients that receive the OpenADR
11 events and will react to them, are coordinated.

12 One important thing with the cyber
13 security in mind that we just heard about from
14 Zubair is that each of these green OpenADR links
15 here is a peer-to-peer connection, so we are not
16 doing networking here. If you look on the left
17 side of this sketch here the utility would not
18 talk, necessarily, to that residential unit
19 directly but, rather, the aggregator would
20 receive the OpenADR signal, would apply it there
21 under their mechanisms, their intelligence, and
22 then control other resources underneath them, so,
23 generally, a fairly detached system here.

24 So if you go to the next slide, just a
25 really quick overview here. And I'm only going

1 to touch on the one service, the so-called event
2 service in OpenADR, which you can imagine like a
3 calendar notice. It has a start time and there's
4 an end time. And it can have, if you will, an
5 agenda. We call these time periods intervals
6 within the event. And within these intervals you
7 can have a number of different signal types from
8 just simple price communications to more
9 complicated energy up and down regulations, and
10 so on and so forth. We have a large table of
11 different signal types that can be embedded in this,
12 so calendar notice, if you will here.

13 And earlier this morning there was a
14 discussion about this more event-based versus
15 kind of real-time control. And, really, it
16 doesn't make any difference for us because the
17 event could start, of course, in a week from now,
18 in a month from now, in a year from now, or it
19 could start at this very moment. So any kind of
20 control window here is possible. So from a
21 communications perspective it makes no
22 difference.

23 We're using XML payloads. And as I
24 mentioned before, typically, the communication
25 goes through existing broadband. And, in some

1 instances, it could be a dedicated
2 interconnection, like a cellular modem, for
3 instance. We use TLS 1.2.

4 And if you go to the next slide, Nich?

5 And I've outlined this a little more
6 here. In OpenADR, we are using server and client
7 certificates, which I fully understand that this
8 can give someone, effectually, some grief because
9 not everybody is used to having client
10 certificates on the client side here. And it
11 adds cost, of course, because, you know,
12 certificates have to be validated, have to be
13 generated by a certain route. And we have, in
14 fact, contracted with a company that manages this
15 for us, so we have dedicated OpenADR ECC and RSA
16 certificates that are being generated by a
17 certificate authority.

18 So this has gone through a number of
19 reviews over the years, initially, Nest and SGIP
20 laid out the IEC. And while we tried our hardest
21 to keep this as simple as possible we also wanted
22 to make it secure. And the only way for us to do
23 that was, of course, to have these server and
24 client certificates in place.

25 The application of all of this -- and I

1 want to emphasize, that is, of course, really up
2 to the user of the utilities. So I would
3 encourage them to really look carefully at
4 security and what to use. Just like with a Wi-Fi
5 router that you buy for your home, if somebody
6 sets the password for 1234 or turns off security,
7 not much the manufacturer of this router can do.

8 One thing to also keep in mind, based on
9 what we just saw in the previous presentation,
10 OpenADR does allow for a fairly solid demarcation
11 point between the utility network and the
12 customer-owned equipment, simply because the
13 server really is the gateway for these downstream
14 clients and there's only that single connection
15 there, so there's no extension of the utility-
16 controlled network all the way into the customer
17 building.

18 So we go to the next slide.

19 Just a real quick overview of how this
20 typically looks like. And originally, of course,
21 in 2002, '03, '04, and so on we were only talking
22 about the peak load management, the one aspect
23 that you have seen in Mary Ann's presentation
24 this morning, really, simply, to cut off the
25 peaks. But now, of course, we are seeing a much

1 greater variety of resources out there, both just
2 consuming resources or both generating and
3 consuming resources, storage, renewables, EV
4 chargers, bit topic for demand response, demand-
5 side management. And there's, of course, also
6 microgrids and smart communities.

7 So all of this can be controlled through
8 an architecture, like you see here. And you
9 know, you could you this DR controller that is
10 right in that mix and use them, either
11 proprietary technologies to the resources or, of
12 course, the OpenADR could also go directly to
13 that resource, per se.

14 That being said, another
15 standard -- if you go to the next
16 slides? -- that we talked about this morning is
17 the CTA-2045. And we will hear a little more
18 about that from Walt here in a minute. But,
19 essentially, the CTA-2045 module provides another
20 way of connecting that sort of last, you know,
21 typically we say, the last mile; right? In this
22 case, it's more like the last few yards here in
23 the building.

24 So as I've shown here, some of the
25 potential architectures for the local

1 connectively have either a router there, or a
2 building control system here at the top, that
3 controls the individual units, or you have, of
4 course, OpenADR built into a unit, whether this
5 is a water heater, or this here is an air
6 conditioning unit, it doesn't really matter. But
7 if a company really wants to do that, then they
8 can absolutely do that. I believe we heard from
9 AO Smith earlier that they have that. And
10 they're also a different product.

11 And then you can also terminate OpenADR
12 in the CTA-2045 module which makes the
13 communication here to the appliance, or
14 potentially easier, I should say, because there's
15 certainly other aspects here. But we'll hear
16 more about that from Walt.

17 So if you'll go to the next slide?

18 I just wanted to briefly mention to
19 folks, we sometimes hear that people are not
20 quite clear on the certification process. So,
21 really, it is very simple in OpenADR. And it
22 will be the same for CTA-2045 since the OpenADR
23 Alliance will be managing that certification
24 process as well.

25 The vendors need to review the standards,

1 of course, build the products according to their
2 requirements. And then you can go directly to
3 one of the test houses that are enabled for the
4 testing. They will need a conformance statement
5 from you to understand what they need to test.
6 And then after the tests are done the conformance
7 documents will be sent to the certification body,
8 in this case the OpenADR Alliance, and we'll
9 review and create the certification and the WEB
10 listing. And the WEB listing is really key
11 because it then provides users, both utilities,
12 implementers, and so on a good way to verify that
13 the product is, for instance, OpenADR tested and
14 certified, or CTA-2045 tested and certified.

15 So with that, if you go to the next
16 slide, my contact is there. Please feel free to
17 shoot me an email, if necessary, and I'll turn it
18 back to Nicholas, and then to Walt.

19 MR. STRUVEN: Thank you, Rolf.

20 Let's first check with the Commissioner
21 for additional comments.

22 Commissioner McAllister, do you have any
23 comments?

24 Well, hearing none, Bruce, do we have any
25 questions and answer or clarifying questions?

1 MR. HELFT: A couple of clarifying
2 questions for Rolf.

3 "What features of OpenADR 2.0 can
4 mitigate denial-of-service attacks by virtual end
5 nodes on virtual top nodes?"

6 That's from Fred Hewett of the NWECC.

7 MR. BIENERT: Yeah. Thank you, Fred. I
8 do have to admit, I'm not a security expert but I
9 think I know what this means.

10 So what, essentially, the VEN and VTN, in
11 fact, operate in a very, very specific
12 protocolic's change pattern. So if, for
13 instance, the VEN would start pinging the VTN at,
14 let's say, crazy rate it would be, actually, very
15 simple for the VTN to either ignore that or
16 completely disassociate that VEN, since we are
17 not necessarily talking about a very open
18 internet connection here; right? We are talking
19 about a connection that is initially set up and
20 authorized through the exchange of the keys and
21 the certificate information.

22 So a VTN -- and, again, I'm not an expert
23 for this -- but they should be able to ignore the
24 VEN or disassociate them, as I mentioned.
25 Because the VEN, like I said, if they would just

1 crazily ping the VTN, I think it would be very
2 easy for that to be identified here.

3 I hope that helps.

4 MR. HELFT: And then, well, from James
5 Frey from the 250 partners, he asks, "For a sense
6 of scale, how many nodes are in the network now?"
7 Now he's not specifying if they've been certified
8 or not. I think you mentioned last week, there
9 were maybe 216 but then he's asking -- certified.

10 Then he's asking, "How many watts are
11 influenced by the OpenADR at this time?" Also,
12 "Do you have a sense of how many devices there
13 are that use OpenADR that are not certified
14 versus how many are certified?"

15 MR. BIENERT: Yeah. Very, very good
16 question, actual. And I wish I had the exact
17 answers here. In fact, we are just preparing a
18 survey, together with a partner company, to
19 evaluate exactly that. So hopefully by the end
20 of Q1 next year we should have pretty good
21 answers here. But maybe a few like more kind of
22 partial answers here.

23 Just on the sense of scale, it is really
24 only limited to the IT infrastructure that is
25 available at the utility. Because, as you can

1 imagine, you know, if you think about big
2 services, big web services, like Facebook,
3 Twitter, and so on, their biggest bottleneck is
4 in their service, of course. That's why they
5 built all these network operation centers all
6 over the world to accommodate that traffic;
7 right?

8 So I think it's really important for a
9 utility, when they are thinking about
10 implementing an OpenADR VTN, that the pipeline,
11 if you will, is big enough to accommodate,
12 eventually, all the devices that they have.
13 Because, otherwise, there's really no, in the
14 protocol itself, there is no limitation on how
15 big the networks can be.

16 And I do know that there are several DR
17 programs in place, in California, for instance,
18 that have, you know, thousands of participants
19 here. And the exact number of watts is, of
20 course, also a good question. I believe in
21 California it is increasing. A few years ago it
22 was about 300 megawatts but it is going up as far
23 as I know. So hopefully by the end of Q2 we
24 have, actually, much better answers to this.

25 MR. HELFT: Thank you, Rolf.

1 No other questions at this time.

2 MR. STRUVEN: Okay. Thank you, Rolf.

3 Now I have Dr. Walt Johnson, who is a
4 retired Technical Executive at the Electric Power
5 Institute and will speak to us today about
6 technologies and communications and standards
7 that promote flexible demand capabilities in
8 appliances.

9 Welcome Walt.

10 DR. JOHNSON: Thank you and welcome. I'd
11 like to express my appreciation for being excited
12 to speak to this workshop. And I want to pick up
13 sort of where Rolf left off and, also, tie back
14 to a couple of the other things that we've heard
15 today with respect to the end-to-end nature of
16 communications that will be required for full
17 utilization of flexibility of demand resources.
18 I'm going to use a couple of examples of
19 technologies here in order to illustrate this.
20 But in ten minutes, this is not a tutorial, nor
21 is it a survey of all the different ways these
22 things can be done.

23 So let's start with the next slide.

24 The first thing I want to address is the
25 issue of OpenADR and CTA-2045. I'm using OpenADR

1 as an example of wide area inform and motivate
2 sort of protocol, as we speak of it. Because
3 primarily, as Rolf explained, the messages are
4 sent to controllers, not to specific devices. And
5 those messages typically provide information
6 about the state of the grid, such as a request
7 from a grid manager to reduce consumption or,
8 potentially, to increase consumption if there's,
9 let's say, excess solar available, but they are
10 not specific device commands. There's not a
11 command and control protocol that would tell a
12 device to turn on or turn off, or a specific
13 thermostat to adjust its set point.

14 Instead, the information in the OpenADR
15 message typically either has, like a said, a grid
16 condition, or it may have some kind of a tie to a
17 motivational element such as, in particular,
18 price. It might simply be indicating a time of
19 use or, let's say, a critical peak period where
20 the price is implicit and it is derived from a
21 tariff, or it might contain a specific pricing
22 mechanism if we go to, let's say, in the future
23 some kind of real-time price distribution
24 mechanism.

25 But when the message gets to a controller

1 of some sort, whether that's a campus-wide
2 controller, a building energy management system,
3 or a residential home energy management system,
4 it would typically be translated from that or
5 interpreted by the local device into specific
6 instructions to, let's say, turn on a pool pump
7 and run a pool sweeper if we're trying to
8 consumer some excess power, or to reset at a
9 thermostat or something.

10 What distinguishes CTA-2045 from most all
11 the other protocols we talk about is that it also
12 defines a physical interface. It's not simply a
13 set of messages, although it does contain message
14 definitions for controlling the consumption of a
15 smart grid device, which is what they call the
16 end loads, water heaters, thermostats, pool
17 pumps, whatever. But it defines, actually, two
18 physical port architectures or designs, one for
19 low-voltage type devices that operate and don't
20 need -- don't operate at line voltages but
21 operate a lower DC Voltages, such as thermostats
22 where a small device can be tucked in behind a
23 thermostat without significant physical impact,
24 or for larger devices, typically HVAC units.
25 Water heaters tend to use the larger AC type.

1 Now that module defines the specific set
2 of pins. It's a connector, just like a USB port
3 is, for example, on a computer. And I can plug
4 in a module that let's me talk cellular. I can
5 plug in a Wi-Fi, Bluetooth, FM radio, whatever I
6 wanted. And then manufacturer of the device, of
7 the actual appliance, does not have to concern
8 himself with which of those types of
9 communications are being employed.

10 So the distinction then is that OpenADR
11 and similar high-level sort of informative
12 communications typically don't depend or define
13 the specific physical interface. CTA does that
14 and then defines the actual electrical messages
15 across that interface.

16 Let's go to the next slide.

17 So the end-to-end system looks something
18 like this. At the upper left-hand side of this
19 figure we see the OpenADR VTN that Rolf just
20 described, the top node, that's operated by the
21 utility or demand response operator. Since
22 communication is through the internet, it's
23 intercepted or received by a module on the
24 appliance, which is that little box floating
25 there that the internet is connecting to. Now

1 there may be intermediate steps and I'll talk
2 about the deployment architectures in a moment.

3 I just said internet there but there
4 could and there usually would be some kind of a
5 terminating controller that terminates the
6 OpenADR message, for example, and then reissues
7 some other kind of local command message for the
8 CTA module. It could potentially, as Rolf
9 mentioned though go directly to the CTA module if
10 that module has an OpenADR VEN built into it.

11 But in any case, that same kind of module
12 could then be plugged into any of the kinds of
13 smart grid devices we see at the bottom of the
14 screen, to give some examples, an EVSE or a water
15 heater or a thermostat. And that's where the CTA
16 standard could be used to provide a uniform
17 mechanism for speaking to and interfacing to any
18 manufacturer's devices.

19 Next slide please.

20 So the reason why we can do this is
21 because the OpenADR and CTA protocols are both
22 message oriented. And both are intended for
23 implement or for describing and controlling the
24 flexibility of these demand resources. They use
25 a slightly different language or a different

1 dialect to do so.

2 For example, in OpenADR, it's quite
3 common in the current implementations that are
4 widespread to express the grid condition as being
5 in one of several states. We may be asking for
6 the grid to -- we may want to express that the
7 grid is in a critical peak period, for example,
8 and that might be mapped to an OpenADR Tier 3 or
9 Level 3 message that's a simple protocol or
10 simple.

11 Too, there's an arbitrary mapping between
12 the grid condition and a set of signals in
13 OpenADR. We can then remap those in the
14 controller into CTA messages that might say load
15 up or shed or might express the fact that we're
16 in grid emergency. So because we're just simply
17 mapping information, it's simply like a language
18 translation problem that we have to face.

19 At the same time, or in addition, we
20 could use that to simply reflect an established
21 time-of-use tariff, or we could use it to
22 communicate a specific price if we wanted a price
23 response from the device -- or from the
24 controller of the device.

25 So those are possible and can be mapped

1 between the two protocols.

2 Next slide please.

3 I don't intend this to be a technical
4 discussion but I thought I would show at least a
5 little bit about why this works.

6 At the upper left we see some kind of a
7 controller entity, utility, demand response,
8 aggregator, whomever, issuing an OpenADR message
9 that is pushed down into the network system, if
10 you will. And it goes through a bunch of magic
11 at the different layers of the network, again,
12 we're not describing that in detail, gets
13 communicated over some wide area communication
14 mechanism -- the medium is irrelevant for
15 OpenADR -- and it comes out at the VEN, in the
16 second column there.

17 The message is then extracted from that
18 by the controller. And it may be translated, as
19 I said, into a CTA language, or it could even
20 pass through the message in its -- just
21 preserving the OpenADR message itself and send it
22 from the VEN into the communication module, the
23 UCM, which is what the CTA module is called. So
24 we could either translate the message into CTA
25 language from OpenADR, or we could actually pass

1 the OpenADR message all the way through to the
2 end device if the end device has an OpenADR VEN
3 capability within it, and we've heard a little
4 bit about that earlier today.

5 Next slide please.

6 So the way we deploy these is pretty
7 straightforward. Actually, there was a little
8 preview of this in Rolf's presentation. We have
9 an OpenADR VTN on the left which is sending an
10 OpenADR signal into the internet.

11 One more click.

12 And the most common deployment mechanism
13 today for this is that there's a VEN, a
14 virtual VEN, which resides in the Cloud. And
15 that does a translation into the local command
16 protocol. Sometimes it's proprietary protocol,
17 like, for instance, Nest would do this, or it
18 could be translated into CTA-2045 messages.

19 Those are then sent, again, through the
20 internet to the target device, generally through
21 a home gateway perhaps. But in my case, I have
22 some devices that talk directly to the cellular
23 network, for instance, to get this information.
24 This is called the VEN in the Cloud architecture
25 and is, like I said, by far the most commonly

1 deployed, even if CTA or OpenADR are not the
2 specific protocols which are employed.

3 Another click please.

4 A more common or more common we see
5 coming in the future, and certainly for larger
6 installations, the OpenADR message is terminated
7 in a VEN in an energy management system at the
8 home, or a residential system, or a building
9 energy management system, for example. That then
10 gets translated to the CTA or local protocol,
11 sent to the local module, and then that's
12 connected into the smart grid device. This is
13 the gateway architecture, we call it.

14 And then, finally, one more click.

15 This is the ultimate end-to-end,
16 something that requires the smartest device, in
17 that the OpenADR message is sent through the
18 internet, retains its OpenADR message structure,
19 and the entire OpenADR VEN is implemented inside
20 the UCM -- or inside the CTA-2045 module, which
21 is then plugged into the smart grid device,
22 giving it direct OpenADR connectivity for use by
23 the aggregator or response operator.

24 That's a quick overview of how some of
25 these protocols can be used and how a couple of

1 the leading ones can be used and how they differ
2 from one another or compliment one another in an
3 end-to-end architecture for flexible device
4 controls.

5 In fact, I'm at the end. I'll just --
6 one more click and I think I have a contact
7 there.

8 And I'll turn it back to you, Nich.
9 Thanks.

10 MR. STRUVEN: Thank you, Walt.

11 Let's first check with the Commissioner
12 for additional comments.

13 Commissioner McAllister, do you have any
14 comments?

15 COMMISSIONER MCALLISTER: Hey. So I just
16 want to thank everybody. I've been listening in
17 this afternoon since we came back and, yeah, just
18 good solid information. I'm really glad,
19 everybody, for being here.

20 And I'll kick it back to you, Nich.
21 Thanks for moderating.

22 MR. STRUVEN: Sure.

23 Bruce, are there any questions in the
24 Q&A?

25 MR. HELFT: No raised hands and no

1 submitted questions at this time, Nich.

2 MR. STRUVEN: Okay. Now you've heard
3 from the individual panelists. We'll go to a
4 panel discussion on some possible questions that
5 stakeholders might have. So let's have -- I'll
6 pose this question.

7 Can any you speak directly to cyber
8 security that would be applicable for standards
9 for flexible demand capabilities and appliances?
10 And I'll just throw that out there and see if any
11 of you have any comments?

12 MR. BIENERT: Maybe I'll kick it off.
13 And I'm sure Zubair has, probably, way more
14 information on that than myself.

15 But I think one thing to always keep in
16 mind is that, you know, we are looking at a
17 number of different components here in this
18 overall system; right? So we're not only looking
19 at securing, basically, the transport layer,
20 which we are trying to do in OpenADR with the TLS
21 1.2 and server client certificates. But
22 certainly, you know, what the server does and
23 what these client devices, as Walt mentioned,
24 some building management systems, energy
25 management systems, gateways and so on, how they

1 secure themselves is, of course, outside of the
2 OpenADR protocol. So, right, I always like to
3 emphasis that, you know, just by doing,
4 basically, TLS 1.2 in OpenADR, that does not
5 necessarily secure the entire chain here; right?
6 And I'm sure Zubair can chime in on that.

7 But one of the biggest issues is,
8 certainly, not only like brute force attacks but
9 rather like phishing and other things that would
10 affect them, more or less. For instance, a
11 server or a utility network or a gateway, you
12 know, open Wi-Fi nodes in homes and buildings,
13 and so on and so forth.

14 So just really wanted to make sure
15 everybody kind of understands that we are talking
16 about multiple components here which, each on its
17 own, needs to take care of security.

18 MR. SHAFIQ: Yeah. Just to add to that,
19 I would say that, just mainly on this point, it
20 is important that the standard takes that
21 holistic picture into account so it is not just
22 looking at the communication protocol, per se,
23 but is also looking at securing these endpoints,
24 the devices which are going to implement this,
25 and then maybe on the server side, maybe from the

1 utility side. And I think the standards should
2 also take into account the human aspect of
3 security as well.

4 So it's great if some of the security is
5 built in. This has been the mindset of the
6 security community for many years. But after
7 painful -- we have learned painful lessons, that
8 if you just think of this as a technical issue
9 and don't take into account the human element, so
10 if there's some security built in. But to
11 properly configure it, you need to inform the
12 user of the device, and they need to take certain
13 actions, for example, changing the default
14 passwords. That is also important that these
15 standards emphasize the human element as well.

16 MR. STRUVEN: Okay. Thank you.

17 We also -- it looks like we have some
18 questions.

19 Bruce, would you --

20 MR. HELFT: There's a question, a written
21 question, from Laura Petrillo-Groh from AHRI.
22 She asks,

23 "Specifically thinking about security, do the
24 panelists have any thoughts around the
25 transfer of connected appliances between

1 homeowners or tenants? Some of the
2 appliances are fixed within the house, for
3 example, water heater, air conditioning, a
4 heat pump air conditioner, and could present
5 problems if not transferred properly. Any
6 research, best practices or suggestions would
7 be appreciated."

8 MR. SHAFIQ: I can maybe jump in.

9 So one of the things I was actually just
10 reading this morning initiative the XE Cyber
11 Sector Standard are recommendations for
12 monitoring devices. One of the recommendations
13 was, indeed, that appliances, when possible, do
14 support having multiple accounts.

15 So in cases where devices are used by
16 multiple users or, for example, there is a change
17 of ownership there should be capability for users
18 to, in some sense, like factor reset the devices
19 when there is change of ownership, and the
20 ability to create like a brand new account which
21 does not contain, let's say, some personal
22 information for the previous user.

23 So that is certainly relevant. And there
24 are some industry best practices. And this is
25 definitely something that the standards can take

1 into account.

2 MR. HELFT: A comment from Dean Taylor,
3 that,

4

5 Electric vehicles seem to be different with
6 additional laws and regulations. Rule 21
7 requires IEEE 2030.5." And also comments here,
8 "Don't know if OpenADR 2 will be added.

9 "Also, Senate Bill 676 is vehicle grid
10 integration requirements. And Low-Carbon
11 Fuel Standard Regulation has greenhouse gas
12 signals for smart charging via the EV of
13 EVSE."

14 MR. BIENERT: So maybe I'll chime in
15 briefly. I think this looks more like a comment
16 than a question, per se.

17 But just the general thinking from our
18 end here is that we have to distinguish a little
19 bit between using EV charging or EVSE in general
20 as a grid resource in demand response programs
21 may, in the end, be different from, for instance,
22 controlling invertors for a vehicle-to-grid
23 implementation and controlling these invertors
24 for power quality and other aspects. So a lot of
25 the Rule 21, of course, is looking at, you know,

1 both, you know, safety, emergency shutoffs, power
2 quality aspects, and so on and so forth, which is
3 a very valid opportunity and proposition there.

4 But on the other hand, to really
5 incorporate larger-scale charging networks, or
6 whether this is based on home or residential
7 chargers or commercial chargers, that seems to be
8 more along the lines of demand response. So
9 that's where, you know, you could see an OpenADR
10 signal going, for instance, to a ChargePoint
11 controller. And from there, you know, it could
12 be going OCPP or other technology to the charger,
13 or in turn, then eventually 2030.5, if there is
14 an inverter involved that feeds back into the
15 grid.

16 MR. STRUVEN: Are there any other
17 questions in the Q&A or any --

18 MR. HELFT: All clear.

19 MR. STRUVEN: All right. While we wait
20 for some more questions to come in, I'll pose
21 kind of a non-technical question that a lot of
22 people can relate to.

23 So what are some of the cyber security
24 measures that consumers are using right now and
25 not even realizing it?

1 MR. SHAFIQ: So if I can maybe jump in?

2 I think one of the big things which is
3 really, you know, I think a major security
4 milestone over the last few years is that most
5 communication, including communication by
6 internet-of-things devices, has shifted from
7 clear text or plain text to encrypted, and
8 primarily using TLS and public infrastructure.
9 And this is something which is completely
10 seamless to everyday consumers. They probably
11 don't know this. So in regular, let's say, web
12 browsing, you see that green lock icon internet
13 browser. But on IT device there is no such
14 visual element to it.

15 So I would say like that's probably one
16 of the most crucial and important security
17 features, which a lot of users of smart devices
18 are probably using without actually realizing it.

19 MR. BIENERT: Yeah. I mean, I can only
20 speak from my personal experience. And, of
21 course, I kind of keep an eye on it a little bit.
22 But, absolutely, you know, the two-factor
23 authentication basically, you know, a lot of --
24 many people might not understand that really, but
25 it's really there because the consumer side, for

1 instance, does not use specific security
2 certificates as well; right? So, I mean, there's
3 multiple, multiple users to that.

4 But like I said, in OpenADR, of course,
5 it's machine to machine, so you cannot really
6 have a two-factor authentication which then, you
7 know, makes it necessary that we have these
8 security certificates on both sides so that,
9 essentially, server and client can both
10 independently verify that the other party is
11 correct. And server certificates, it's certainly
12 something that a lot of people do not realize are
13 being used.

14 Like Zubair said, you know, when you go
15 to any kind of website and it goes to an HTTPs
16 mode with the little lock there, you know, are
17 you are -- you have never realized that,
18 essentially, the server has identified itself
19 with a valid cyber security certificate. So the
20 browser that you're using has verified that
21 certificate.

22 And, you know, a quick note for
23 everybody, it's not technical. If you get these
24 little messages that say the website you're
25 trying to reach does not have a valid security

1 certificate, you may want to consider not further
2 continuing on that link because that's exactly
3 the reason why that message pops up.

4 DR. JOHNSON: I have a question for
5 Zubair. Although it's not completely transparent
6 to the users, I'm seeing increasing usage of
7 VPNs, virtual private networks, in securing
8 residential communications. Is there a role for
9 that in IOT, a more automated sort of version of
10 that? It does address more problems than just the
11 HTML security of HTTP security does.

12 MR. SHAFIQ: Yeah. I think it really
13 depends on the tech model. And most people use
14 VPNs to protect against a network adversity.

15 So let's say, so the classic motivation
16 for using VPNs is when you are not on a trusted
17 network and you are concerned that someone might
18 intercept your traffic, might try to decrypt it.
19 This could be, let's say, if you're using
20 internet in a coffee shop, that's the classic
21 example. But there could also be cases where,
22 let's say, you don't trust your internet service
23 provider for some reason, or maybe you don't
24 trust some of the network in the community
25 because the traffic has to traverse the public

1 internet. So in those case, using a VPN is
2 particularly useful.

3 So I think if the motivation is to secure
4 the communications from a network adversary who
5 can potentially intercept or do this so-called
6 man-in-the-middle attack the use of VPN is
7 definitely going to be quite useful. But it does
8 not protect against other sorts of attacks which,
9 for example, directly attack the endpoints, the
10 device, or the server at the utility site.

11 MR. STRUVEN: It looks like there's two
12 more questions.

13 MR. HELFT: Dan Nephin of e-Radio asks,
14 for Zubair,

15 "Two-factor authentication is one of your
16 recommendations. Are there good ways for
17 internet-of-things of devices to do two-
18 factor authentication that you can speak
19 about? Will the human element always be
20 present in the initial bootstrapping of
21 devices? What about after initial setup?"

22 MR. SHAFIQ: Yeah. So two-factor
23 authentication is a little bit more challenging
24 on IOT devices, in part because there is no like
25 visual interface.

1 So I will give -- maybe like start off
2 with the example of Alexa device which many of us
3 have in our homes. And these are smart
4 assistants. And the way they do kind of like
5 two-factor authentication is through voice
6 recognition, so recognizing who is the speaker of
7 a particular command. So this is kind of like
8 one type of biometric authentication technique
9 which is, essentially, a two-factor.

10 So other examples could include things
11 like things like fingerprints or retina, or other
12 types of like facial recognition, again,
13 depending upon the cost and how much security you
14 want. So these are the stronger two-factor
15 authentication mechanisms which can be used.

16 But since many IOT devices' cost is like
17 a huge concern and you probably don't -- if you
18 cannot, let's say, afford these kind of like
19 stronger biometric two-factor authentications,
20 the classic technique which has been used is
21 where the second factor simply shows that you are
22 in ownership of the device, you possess the
23 device. So this protects against a network
24 attacker how is, let's say, launching an attack
25 from some other part of the world. And the

1 techniques which are commonly used here are
2 things which, let's say, there could be like
3 Bluetooth or Wi-Fi-based proximity sensing which
4 can be used. Or let's say there could be a
5 physical button on the device. And this is a
6 technique used by routers, that you have to press
7 a button to actually configure something, which
8 shows that you are, actually, in physical
9 ownership of a device.

10 So these are the best practices for two-
11 factor authentication.

12 MR. HELFT: We have a question.

13 Thank you.

14 We have a question from Abigail Daken of
15 ENERGY STAR.

16 "How do you think about consumer willingness
17 to trade security or privacy away for
18 convenience amenity when considering IT
19 security for demand response devices?"

20 MR. BIENERT: I'm not sure about the last
21 part of that question about, you know, the demand
22 response aspects here. But from a consumer
23 perspective, I mean, I'm just thinking out loud
24 here about how many people have an iPhone and
25 have their location services and everything on.

1 So if your iPhone suggests to you that, oh, today
2 at four o'clock you wanted to drive to the gym,
3 you certainly know that your iPhone is monitoring
4 your moves; right? So there are certainly
5 aspects to that being, you know, laid wide open
6 when the technology is convenient.

7 Now, again, how that would translate to
8 demand response, that's a good question; right?
9 Because I think if people do not directly benefit
10 from something, you know, they might be more
11 conservative on, you know, wanting to see, or at
12 least wanting to hear that there is a certain
13 level of security available.

14 At the same time, I think over the last
15 10 to 15 years, we have also noticed that -- at
16 least that's what I hear here, and the
17 manufacturers on the call can certainly chime in
18 on that -- but the most success seems to be, you
19 know, when a program does not require constant
20 consumer input; right? Initially the idea was,
21 hey, we need to engage the consumer in all of
22 this. And pretty quickly, I think, it became
23 clear that, well, knowing your energy price and
24 knowing whether your pool pump turns off or turns
25 off is not really something that the consumer

1 wants to be reminded of every five minutes.

2 And so more of the set-it-and-forget-it
3 attitudes that now more modern energy management
4 systems provide is certainly a part of this. And
5 that can then play into the security aspects --
6 right? -- so to give consumers a choice to, you
7 know, how much they want to open up to the
8 outside.

9 MR. HELFT: There's a -- oh, yeah,
10 there's a hand raised. I'm going to un-mute Ken
11 Nichols.

12 MR. NICHOLS: Sorry. I was muted on my
13 side. Can you hear me?

14 MR. HELFT: Yes.

15 MR. NICHOLS: Hey, Rolf, how's it going?
16 I haven't seen you in a while about OpenADR.

17 MR. BIENERT: Hi.

18 MR. NICHOLS: Hey, I was just curious. I
19 wanted to just throw this out. I wrote it in the
20 Q&A as well. But I'm curious, why not just do
21 one-way price signals and then let, you know,
22 appliance vendors respond, and let the existing
23 utility metering system, you know, price consumer
24 load.

25 And I realize part of that, I'll just

1 say, is, you know, there's some bit of services,
2 like reserves and things that are really fast
3 responding where that doesn't work, like you
4 can't really accommodate it or, more, transact
5 it. But, in general, you could get a lot of what
6 Mary Ann is talking about as far as shifting with
7 just price signals.

8 Thanks.

9 MR. BIENERT: Yeah. Maybe I'll start
10 real quick, I think.

11 Oh, hey, Ken, by the way.

12 Yeah, I think, in fact, the Energy
13 Commission is, in fact, looking at a price
14 distribution-type server. I believe there's a
15 grant out there to maybe do exactly what you have
16 in mind, Ken, to do just a simple -- to implement
17 a simple server -- maybe I shouldn't call it
18 simple at the end of the day -- but to implement
19 a server where via machine-to-machine
20 communication, folks (indiscernible) pool the
21 current price, depending on which tariff they are
22 on and then, you know, use that price for their
23 own purposes and to curtail or not when it's
24 convenient and stuff like that.

25 So I think there are thoughts about that

1 going on. And we are also thinking about having
2 a reduced function set OpenADR certification plan
3 to really only have price-sensitive notes there.
4 But at the end of the day, if you're talking
5 about demand response, I think we do need
6 additional, you know, actionable functions, so
7 that would then, really, in the end require still
8 some demand response functionality.

9 MR. STRUVEN: Thank you, panelists and
10 stakeholders. We're about out of time for Panel
11 2. And we'll be now moving on to Panel 3, so
12 I'll be taking a look at the agenda.

13 Okay, next up we have Messay Betru from
14 the CEC to speak about consumer perspective and
15 equity.

16 MR. BETRU: Okay. Thank you. And
17 welcome, everyone, to Panel 3. My name is Messay
18 Betru. I'm an Energy Commission Specialist I in
19 the Flexible Demand Standards Unit. And I'll be
20 the moderator for this panel while we discuss
21 consumer --

22 MR. STEFFENSEN: I think the audio is
23 pretty bad.

24 MR. HELFT: Yeah. You've got a problem
25 with your audio.

1 MR. BETRU: Okay. I apologize. One
2 second. Is that any better?

3 MR. STEFFENSEN: No, it's the same.

4 MR. HELFT: No.

5 MR. BETRU: How about now?

6 MR. STEFFENSEN: It's mechanical.

7 MR. BETRU: I switched my mike. Is that
8 any better?

9 MR. STEFFENSEN: That's perfect.

10 MR. BETRU: Okay. Great. Okay. My
11 apologies. Let me start over.

12 So my name is Messay Betru. I'm an
13 Energy Commission Specialist I with the Flexible
14 Demand Standards Unit. And I'll be the moderator
15 for this panel on Consumer Perspective and Equity
16 Considerations.

17 So as we think about implementing Senate
18 Bill 49, how do we ensure that Californians have
19 equally inclusive access to flexible demand
20 appliances without adverse impacts to consumer
21 confidence and choice? So we'll explore this
22 conversation from three tracks, looking at
23 consumer perspective, equity inclusivity via
24 housing stock, and then exploring programs and
25 barriers regarding the financial decision making

1 process.

2 Next slide please.

3 So before we explore these issues in
4 depth, let's think briefly about what energy
5 equity means. So the Energy Commission defines
6 energy equity as the quality of being fair or
7 just in the availability and distribution of
8 energy programs. It is crucial to end users that
9 low-income Californians achieve this energy
10 equity from flexible demand appliances, which is
11 a critical component of the state's strategy
12 towards ambitious climate change and clean energy
13 goals, including alignment within the framework
14 we are discussing in Senate Bill 49.

15 Next slide please.

16 So let's also talk about energy equity in
17 terms of what a utility bill and what impacts
18 comes from a utility bill. So the Energy
19 Commission created the Energy Equity Indicators
20 Report in 2018. And it reported that
21 Californians in disadvantaged communities
22 continued to pay a disproportionately high amount
23 towards their utility bills.

24 I'll give two examples, the first one
25 being that in around 23,000 households in the

1 low-income census tracts that is in the Los
2 Angeles Basin received a Summer 2014 electric
3 bill of more than \$300. This is equivalent to or
4 almost ten percent of their monthly average
5 income. And in nearby Riverside County, low-
6 income areas in 2015 paid up to 15 percent of
7 their average income towards electric and other
8 public utilities. So these disproportionate
9 payments are classified as a metric called an
10 energy burden.

11 Next slide please.

12 So thinking about ways to resolve this,
13 I'll quickly highlight two examples of the
14 state's progress on targeting and solving these
15 solutions.

16 In the first report the Energy Commission
17 released, in the summer of 2020, and with work
18 from its partner agencies, created a final report
19 on the Retail Automated Transactive Energy
20 System, or RATES, platform. This is a
21 subscription-based tariff system with the grid
22 operator, like California Independent System
23 Operator, and a utility, Southern California
24 Edison, using over 200 participants. In this
25 pilot, they demonstrated flexible appliance

1 utilities and pool pumps. And they also utilized
2 algorithms to help customers automate and self-
3 manage their energy usage. This was able to
4 fairly allocate cost amongst consumer classes,
5 supporting investment in energy efficiency, all
6 exclusive to disadvantaged communities.

7 In the second report the Energy
8 Commission also studied barriers to energy
9 efficiency and weatherization investments for
10 low-income customers and made these
11 recommendations on how to increase access in the
12 Senate Bill 350 Barriers Report.

13 I'll quickly run through some of the key
14 recommendations, the first one being the ensuring
15 that metric and target setting is being done.
16 Specifically, the legislature is requiring
17 collaboration to establish metrics so that low-
18 income persons have product selection options and
19 information necessary, recognizing that low-
20 income appliances and consumer products are
21 commonly less efficient than other appliances and
22 products.

23 The second is regarding market delivery
24 and program setting. So programs, essentially,
25 should be guided by the renewable energy needs of

1 low-income customers rather than, quote, "relying
2 on qualified product lists that exist today,"
3 such as ENERGY STAR. This could entail
4 developing program criteria or a qualified
5 appliances list for disadvantaged community
6 applicability.

7 However, if an entire subsection is to be
8 created, the study cautions in striking the
9 balance between compliance and noncompliance
10 strategies. As, quote, "multifamily housing
11 markets already suffer from a dearth of standards
12 used to gage efficiency retrofits and
13 maintenance."

14 And, lastly, the lack of information for
15 consumers continues to be a stumbling block for
16 disadvantaged communities, specifically, quote,
17 "Building owners often have difficulty obtaining
18 tenant-level and whole-building energy data from
19 utilities, thus reducing awareness for potential
20 benefits for energy upgrades."

21 Next slide please.

22 So as we think about all of these issues
23 and components and how they intersect, I want to
24 pose this question to the panelists. So what
25 solution or resources can Senate Bill 49

1 Standards for Flexible Appliances provide to help
2 address energy equity, capacity, or inadequacy
3 issues with consideration to consumer choice?

4 Next slide please.

5 So with that, I'd like to introduce our
6 three panelists who are subject matter experts in
7 their respective fields.

8 So first up we will have Amy Dryden, who
9 is the Director of Strategic Energy Innovations
10 at the Association for Energy Affordability. At
11 AEA, Ms. Dryden leads business development
12 initiatives and spearheads research and
13 development projects focused on advanced energy
14 technologies in low-carbon buildings. Ms. Dryden
15 will also speak about what appliances equity
16 means in the renter, tenant, and end-user
17 dynamic.

18 Second we have Mel Hall-Crawford, who is
19 the Director of Energy Programs for the Consumer
20 Federation of America, who will speak to us about
21 consumer education and consumers concerns for
22 low-income users of flexible appliances. Ms.
23 Hall-Crawford is responsible for the CFA's energy
24 efficiency work, advocating for policies,
25 practices, and cost-effective standards for home

1 appliances, all to help consumers save money on
2 their energy bills while also benefitting the
3 environment.

4 And third we have Stacey Tutt, Visiting
5 Professor and Director at the Consumer Law Clinic
6 at the University of California, Irvine Law
7 School. He will speak about the financial
8 decision-making process and consumer protection-
9 level areas as appropriate for Flexible Demand
10 Appliances Standards. Ms. Tutt focuses on
11 keeping low-income consumers in their homes after
12 experiencing home improvement fraud through the
13 property-assessed Clean Energy Program.

14 And as a reminder, panelists will provide
15 a ten-minute presentation, followed by a short
16 opportunity to ask follow-up questions. After
17 that there will be a 20-minute panel discussion
18 on stakeholder questions that I will pose
19 following the last presentation.

20 So with that, let's go ahead and queue up
21 Amy's slides please. Thank you.

22 MS. DRYDEN: Great. Thank you very much.
23 Hopefully, you can all hear me okay.

24 Thank you to the Energy Commission for
25 hosting this workshop and inviting me to speak.

1 I'm honored to be here. Hopefully I can shed
2 some light on a little bit of my perspective in
3 this industry. We've heard from a number of
4 experts of far, great presentations throughout
5 the day, and hopefully I'll try to tie those into
6 what we're -- what I will be talking about.

7 Before I get into it, as I mentioned, my
8 name is Amy Dryden. I'm with the Association for
9 Energy Affordability. We are a nonprofit that
10 does training, research and development, and
11 program implementation, really focusing on our
12 more vulnerable populations. And we are not an
13 environmental justice organization. We partner
14 with folks, like those organizations, to be more
15 effective in our work.

16 So with that context, my approach for
17 this presentation is to provide, first, some
18 context just on what we're talking about here,
19 building off of what was just presented, some
20 references for our framework of putting equity at
21 the center, and then some consideration based on
22 our experience working in the multifamily
23 industry, doing research and development, program
24 implementation, you know, from load shifting, R
25 and D, to Low-Income Weatherization Program

1 implementation.

2 So with that, next slide please.

3 So as I said, just put this up here for
4 some context. As was mentioned, under SB 350, we
5 have the development of CalEnviroScreen to kind
6 of categorize all the census tracts within the
7 state of California in terms of a number of
8 variables from income to environmental factors to
9 help prioritize where we're investing to serve
10 our more vulnerable populations. And so this is
11 important as we think about we're targeting to
12 kind of develop metrics and definition so we can
13 focus our resources appropriately.

14 On the left-hand side is the definition
15 of environmental and social justice
16 communications from the CEC. There's definitely
17 overlap in these two kind of metrics but not 100
18 percent. If we take the CalEnviroScreen and then
19 we look at, well, what are the disadvantaged
20 communities within that, because we see that full
21 spectrum -- can we go to the next slide? -- the
22 DACs are really the top 25 percent of all of
23 those census tracts. So you can see then, here
24 in this slide, with the large portion kind of
25 concentrated in the Central Valley. You know,

1 I'm so far zoomed out you can't quite see, you
2 know, where else in Northern California, but a
3 lot in Los Angeles as well. And just to provide
4 as reference, about 33 percent of our
5 Californians are low-income, with approximately
6 25 percent of those living in disadvantaged
7 communities. And out of those, 75 percent of our
8 low-income are renters.

9 So just some high-level characteristics,
10 just to think about as we start looking at -- you
11 know, we've been hearing about technologies and
12 cyber security and systems and products, and now
13 we're thinking about geography and people.

14 The table on the bottom that I have there
15 for you is, actually, the climate zones across
16 the top. The percentages there are the
17 percentage of the census tracts within that
18 climate zone that are considered DACs. So, you
19 know, population might have been a better metric
20 to put out there but this is what we did. But
21 what you can see, and just kind of keep this in
22 mind as we think about kind of the strategies --
23 right? -- that SB 49 is considering, like timers
24 and thermostats and plugs and water heater
25 controls, how do these relate to where,

1 geographically, where we're targeting?

2 So eight and nine -- right? -- not a lot
3 of heating or cooling, a little bit. Ten, pretty
4 mild, with 29 percent. And then we have 12 and
5 13, kind of our hotter climate zones that are
6 going to see both heating and cooling at that
7 end. So we kind of have a spectrum there. And
8 so that, I think, I think is an important context
9 just in terms of as we're thinking about the
10 different geographies and conditions that we're
11 trying to target.

12 Next slide please.

13 So that's just some context on the
14 population. What I wanted to do in the next two
15 slides is just provide some framework. I
16 mentioned, you know, AEA is not an environment
17 justice organization. But two things that have
18 come out over the past -- or last year, in 2019,
19 I think are really useful. A lot of folks have
20 put in time and energy and expertise in providing
21 guidance and frameworks and putting these forward
22 to support affordable equitable electrification.
23 And so as we navigate this path forward and we
24 take our flexible demand as one of our tools --
25 right? -- in our electrification toolbox, in our

1 decarbonization toolbox, these frameworks may be
2 useful context.

3 So this first one here is from Gridworks,
4 again, released in 2019. It documents a number
5 of different policies and approaches, local and
6 statewide, designed so that carbon neutrality and
7 our emission reductions can be executed to ensure
8 a just transition. They talk -- there's
9 discussion of long-term planning, new
10 construction strategies, and I just pulled out a
11 couple of bullet points to raise up for this
12 conversation, so this is a narrow slice of what
13 they have presented.

14 So under the comprehensive strategy to
15 ensure low-income are empowered in benefit from
16 electrification a number of things that they
17 outlined, like undertaking barriers for low-
18 income electrification. They're looking at bill
19 protections of protections for renters,
20 developing programs to enable electrifying, and
21 aggregating kind of our resources together. And
22 I think that aggregating the resources together
23 is something we heard previously as well.

24 Next slide.

25 So those recommendations also resonate

1 with the equitable electrification framework that
2 was put out by Greenlining, also, in 2019.
3 What's important here for building
4 electrification, it must be pursued equitably.
5 It must ensure that environmental social justice
6 communications can access the major benefits of
7 electrification, including cleaner air, healthier
8 homes, good jobs, and provide greater access to
9 clean energy and energy efficiency to reduce
10 bills. So, again, it's a comprehensive approach.
11 It's not kind of a single strategy. We've heard
12 that a number of times throughout the day.

13 They provide five steps in here, from
14 assessing the community needs, what are the
15 challenges to electrification? What programs
16 have been supported? What relationships exist?
17 Bringing in the community for decision making.
18 Developing metrics so we can ensure that we're
19 meeting our goals. Bringing program and funding
20 to the table and kind of layering those, and I'll
21 talk about that in a moment. And then,
22 obviously, reflecting back so we can evaluate our
23 metrics and are we having the outcomes we want so
24 we can continue to iterate and improve and ensure
25 that we are serving all of our communities and

1 benefitting our more vulnerable populations.

2 So both of these frameworks, before I go
3 into kind of my next couple of slides, really
4 highlight kind of a multidimensional approach.
5 So building electrification must be holistic.
6 And my considerations -- so we can go to the next
7 slide.

8 The next two slides are tables of
9 considerations from my perspective and how we
10 have been interacting, you know, in the industry.
11 And it's nicely laid out in a table and bullet
12 points, which kind of gives you the sense that
13 it's siloed. And really, I think, a better
14 representation would be if it was circles and
15 connected lines because these are overlapping.
16 It's not a siloed piece. It's integrated
17 planning. So we just want to kind of set that
18 framework before I kind of take each one by one.

19 So the first is support and complimentary
20 and comprehensive scope to maximize benefits.
21 This is really about harmonizing efforts, I'll
22 use that word from Ashley earlier today, and
23 demand flexibility, again, is kind of one of our
24 tools; right? But it must be coupled with other
25 programs, like energy efficiency, PV and/or

1 storage, to be most effective. I think we'll
2 see, you know, if we just do thermostats with
3 poor systems or really leaky envelopes, we're
4 going to squander those benefits of pre-heating
5 and pre-cooling. So, really, we want these to be
6 integrated services that are delivered.

7 We want to align the criteria with
8 replacement programs so we can ensure that what
9 we want to see from a demand flexibility
10 standpoint is getting installed now and we
11 minimize some of those go-backs.

12 And there are a number of things here but
13 I'm only going to hit a couple given kind of our
14 time frame to set the stage and we can discuss
15 other ones later.

16 So understanding the loads, generally
17 we'll see low-income households, they have larger
18 households. They also have increased hours of
19 occupancies. Earlier we were hearing about kind
20 of early morning peaks and early evening peaks,
21 so we've seen a lot of that in our monitoring of
22 low-income households that we've been doing in
23 all-electric buildings, particularly with varying
24 shifts, like farmworker housing. So these are
25 all things to kind of consider where we have

1 potential to shift loads and where we don't.

2 We also see a higher proportion of in-
3 home cooking, probably twice as much as the Title
4 24 has estimated. And that's a really hard load
5 to shift that's going to occur right during that
6 kind of shed period. So these need to be kind of
7 considered.

8 And last on this slide, we want to make
9 sure we define that service of standard, and I've
10 heard this a couple of times, because we must
11 have customer satisfaction, as well as reducing
12 greenhouse gas emissions and minimizing costs.
13 And we need to consider how to minimize
14 unintended energy use in the shed or post-shed
15 period.

16 So kind of an example of that is if I'm
17 trying to kind of supercharge my water heater
18 right during the afternoon solar peak but,
19 because of my scheduling, I'm going to have a
20 significant drawdown right at the end of it, I'm
21 going into that shed period with not a full tank.
22 And that's going to be a little bit -- that's
23 going to be harder from a cost standpoint and a
24 usage standpoint.

25 We also heard about rate structures

1 before. And again, if we think about the loads
2 that can be shifted or not shifted and
3 occupancies and schedules, maybe not having such
4 an extreme price difference between peak and non-
5 peak that may really erode benefits of being on
6 an all-electric time-of-use pricing where folks
7 are kind of heavily penalized during the peak
8 period because of things that may not be
9 shiftable.

10 Next slide.

11 Trying to keep myself going. I've got --
12 this is the last slide, so this will be okay.

13 So a couple of things. In all of these
14 frameworks we talked about, engaging with all the
15 stakeholders is key. And so the one thing I just
16 want to call out here is landlords. I had
17 mentioned earlier that 74 percent of our low-
18 income are renters. And so how do we engage
19 those landlords? We have different conditions,
20 kind of metering conditions in these homes,
21 whether they're central metered or individually
22 metered. And so how do we consider getting to
23 both of those stakeholders and ensuring benefits
24 can get to the renters when they may not be in
25 that decision making for selecting appliances?

1 We've heard a lot about accessibility to
2 technology, so I'm going to touch on it briefly,
3 but I will confirm what others have said, Wi-Fi
4 is unreliable or low quality or even nonexistent.
5 We've seen a project where we were assessing
6 homes for heat pump water heaters and 50 percent
7 of them who were going to receive it didn't have
8 access to Wi-Fi. And many folks are accessing
9 the internet through smart phones. So, again,
10 figuring out how to meet people where they're at
11 so they can access the benefits.

12 And quickly, kind of in closing, just in
13 terms of we talk about supporting education. And
14 it's really important to take that opportunity to
15 engage with residents so we can support their
16 education on how to use these devices to maximize
17 TOU benefits of that rate. And so with that, you
18 know, we have this opportunity of bringing demand
19 flexibility, coupled with our energy efficiency
20 and other electrification efforts, to really
21 deliver some great benefits if we take all of
22 these things into consideration.

23 And I think I'm a couple minutes over, so
24 I'm going to leave it there.

25 MR. BETRU: All right. Thank you so

1 much, Amy, for that conversation. I really liked
2 how you highlighted the multidisciplinary
3 approach.

4 So I want to also pause and see if
5 there's any comments or questions from
6 Commissioner McAllister?

7 COMMISSIONER MCALLISTER: Hey everyone.
8 And thank you, Messay. You're all familiar to me
9 and, obviously, great, knowledgeable advocates in
10 this role, and really appreciate you being with
11 us here today and helping us frame these issues.

12 You know, the low-income space, and the
13 equity issues, and really the inclusion and
14 inclusiveness is really the top priority in all
15 of these. And the consumer benefit is a
16 requirement for getting this done right. So
17 don't have any particular questions for you but
18 thanks for your substantive presentation. I
19 really appreciate you being with us here today
20 and, certainly, look forward to interacting with
21 you as we plan and prioritize and begin to
22 implement and create this program. It's really
23 going to serve us all for the long term, and it's
24 fundamental that we get it right, so thank you.

25 MR. BETRU: Okay. Thank you,

1 Commissioner.

2 At this time let's move to see if there's
3 any raised hands or questions from the Q&A?

4 MR. HELFT: Nothing yet, Messay. All
5 clear.

6 MR. BETRU: Okay. Great. Thank you,
7 Bruce.

8 Let's go ahead and move over to Mel's
9 presentation please.

10 MS. HALL-CRAWFORD: Great. Can you hear
11 me okay?

12 MR. BETRU: We can, yes.

13 MS. HALL-CRAWFORD: Okay. Great. Hi.
14 My name is Mel Hall-Crawford. I'm the Director
15 of Energy Programs for the Consumer Federation of
16 America, also known as CFA. CFA is a Washington
17 DC-based association of appropriate 250national,
18 state, and local organizations working in the
19 consumer interest through advocacy, research, and
20 education. I appreciate the opportunity today to
21 provide the Commission with CFA's perspective on
22 consumer and equity considerations as you work on
23 developing an approach to Flexible Demand
24 Appliance Standards.

25 Please bear in mind that while we get

1 involved in state proceedings relating to
2 Appliances Efficiency Standards, CFA brings more
3 of a broader but not as in-depth perspective as
4 our work is largely on the federal policy level,
5 but we clearly recognize and appreciate
6 California's leadership in the area of energy
7 efficiency and have been pleased to participate
8 in a variety of Commission proceedings. We are
9 keenly aware that greater efforts need to be
10 made to bring energy equity to disadvantaged
11 communities, as well as communities of color.

12 Next slide please.

13 So let's talk about the considerations
14 that should be made, some of them that -- for a
15 flexible demand appliances program. So first,
16 from the consumer perspective, here are some
17 areas we think the CEC should be considering or
18 is considering.

19 First, the cost effectiveness of flexible
20 demand appliances, that encompasses our natural
21 first set of questions, what is the first cost
22 increase to the appliances to make it demand
23 flexible? What is the payback period for the
24 increase in the cost of the product? At what
25 point will the consumer be paid back for the

1 incremental cost increase and actually start to
2 realize net savings on his or her utility bill?
3 How much are the annual savings to the consumer,
4 as well as over the life of the product?

5 So in thinking about this issue, it would
6 -- I want to talk about the categories of
7 consumers that seem to break down in my mind.
8 There are distinct ways consumers will respond to
9 participating in having their appliances subject
10 to flexible demand management. These are the
11 grips or buckets that came to mind at this point.

12 And assuming this is an opt-in program,
13 there will be consumers who opt out, opt out by
14 default, in other words, not proactively opted
15 in. There will be those who simply opt in,
16 allowing their flexible demand appliances or
17 certain appliances to respond when it is
18 determined by the grid operator or utility that
19 the load needs to be shifted. There are those
20 who opt in but wish to have the capability to
21 override the response of their appliances.

22 So some questions I'd like to pose are
23 what are some good ways to handle this? Should
24 it be a certain number of times per year or month
25 that the consumer can override or turn off the

1 demand response capability? There may be
2 extenuating circumstances, a medical situation,
3 where activating the demand response of an
4 appliances would not be desirable for the
5 resident to compromise his or her health or
6 safety in some manner.

7 An important category, which Amy also
8 mentioned, was the landlord-tenant relationship
9 or situation. The optimal situation is that both
10 simply opt in. But how is this formalized? And
11 the other question would be should the party who
12 is paying the utility bill decide? What if it's
13 the landlord who's paying the bill and wishes to
14 opt in, should the tenant have the right to
15 decline participation? So then how do you
16 incentive the tenant? These are some challenging
17 questions to the landlord-tenant scenario.

18 Next slide please.

19 Now some other considerations from the
20 consumer vantage point include the consumer
21 should not experience any discomfort or harm when
22 the flexible demand appliances, be it room or
23 central ACs, water heaters, heat pumps are
24 responding to load shifting. The appliances
25 should function as needed at all times.

1 And just to call it out separately, the
2 health and safety of the consumer cannot be
3 compromised. If a consumer has a medical
4 condition, what options make sense in this
5 situation?

6 Consumers must be guaranteed that their
7 privacy is protected and that the data is secure,
8 that it will not be exploited or used for any
9 other purposes. And I'm really glad that the
10 previous panel went into this subject area.

11 Next, the rate design needs to be
12 equitable to those who do not opt in, especially
13 if lower rates are an incentive for those who do
14 opt in, for those who opt in and may not be
15 workable, such as those with a long-term medical
16 condition, as I mentioned, or those who work
17 swing shifts, night shifts, or are likely to be
18 from low-income or communities of color when they
19 should be held harmless.

20 Some other considerations I'd like to
21 just throw into the mix are if there's a
22 substantial price differential with the cost of a
23 flexible demand appliances for a low-income
24 homeowner can a subsidy be made available,
25 perhaps modeled after the Weatherization

1 Assistance Program eligibility criteria?

2 Will there be a possible longer-term
3 impact of COVID-19 if more people continue to
4 work from home? How might this impact load
5 management with flexible demand appliances?

6 Next slide please.

7 So onto messaging and outreach with an
8 eye toward disadvantaged communities and
9 communications of color. The underlying building
10 blocks for messaging are education and
11 motivation, i.e. incentive to participate.
12 Messaging needs to clearly highlight the benefits
13 of flexible demand appliances' cost savings on
14 the energy bill, as well as helping to address
15 climate change, decarbonization. Messaging needs
16 to be straightforward, simple, if you will. A
17 description of how the flexible demand appliances
18 will work/operate and what will the consumer
19 experience?

20 Next, clear disclosure is an absolute.
21 If the incentive is energy bill saving, the
22 consumer needs to have a full understanding of
23 the implications of opting in. Again, what will
24 he or she experience when the flexible demand
25 appliances is helping to levelize or shift

1 demand? It's important to avoid surprises and
2 misunderstandings about the program as they would
3 have the potential to sour the consumer and
4 impact the success of the program.

5 Next, as was discussed again by the last
6 panel, privacy data protections must be
7 guaranteed and the data must not be exploited.

8 Lastly, messaging needs to be culturally
9 sensitive and in non-English languages with an
10 awareness of cultural aspects, as appropriate,
11 for respective ethnic communities.

12 Next slide please.

13 Now here are some outreach possibilities,
14 peer support, a neighbor talking to neighbor.
15 Church groups, other community networks.

16 Next, an obvious one of our times, social
17 media, Facebook, Instagram, Twitter, Next Door,
18 those are good conduits. Traditional media,
19 radio, PSAs, free print. And then ethnic
20 broadcasting stations. I guess there is an
21 organization or an in-language radio entity that
22 helps outreach to ethnic communities.

23 There are a variety of state-administered
24 programs in which you can do outreach, such as
25 the Low-Income Home Energy Assistance Program,

1 the California Weather Assistance Program,
2 CalFresh. Credit counseling agencies can be
3 helpful. Flexible demand appliances can be a
4 strategy to help the client reduce debt.

5 There is the possibility of funding a
6 nonprofit with an extensive network of community
7 groups and a track record of success with
8 outreach to communities of color and
9 disadvantaged communities to coordinate the
10 outreach.

11 A subset to help with targeted
12 communities would be to have influencers who
13 would be funded, those who already have a base of
14 followers. This would be community-based
15 organizations.

16 And I believe that consulting with the
17 Commission's Disadvantaged Communities Advisory
18 Group, which I learned about today, will be
19 extremely important and useful.

20 Next slide.

21 So what can help make -- help with making
22 sure you get it right to engage consumers? Here
23 are some possibilities.

24 Conduct a random sample survey to measure
25 public receptivity to the program or concept to

1 having certain appliances respond to demand or
2 load management. In the survey you can ask or
3 find out what's the response to various
4 incentives or benefits? You can pose questions
5 about the data you need to help inform your
6 messaging and outreach efforts.

7 Next, employ focus groups. They can help
8 determine the right messaging and, especially,
9 with different cultures and communications. And
10 through focus groups, you can learn where various
11 groups or communities get their information,
12 social media, print media, what's the best
13 networking or media source for them?

14 Then you could actively test the
15 information collected by using a pilot program to
16 see how the outreach and messaging works. And
17 then you would adjust accordingly to whatever the
18 pilot program would reveal in terms of improving
19 the program. Then, ultimately, you'd go
20 statewide with metrics to measure response or
21 success.

22 Next slide.

23 So in closing, with good implementation,
24 i.e. smooth experience by the consumer, energy
25 bill cost savings and other benefits, clear

1 messaging about how flexible demand appliances
2 work, they can help consumers save on their
3 energy bills, as well as reduce climate and
4 pollution impacts, which will help California
5 meet it's decarbonization goals.

6 I hope this input through the consumer
7 lens is helpful to the Commission. Again, thank
8 you for the opportunity to appear before you
9 today.

10 Then last slide.

11 Here's my contact information if you have
12 any questions. Thank you.

13 MR. BETRU: Thank you so much, Mel. I
14 really appreciated the discussion about the
15 appropriate choice levels needed when looking at
16 the opt-in versus the automated opt-out selection
17 criteria. And then the creating the messaging
18 platform is really important too.

19 MS. HALL-CRAWFORD: You're welcome.

20 MR. BETRU: So thank you again.

21 And while Commissioner McAllister is out,
22 we'll just go ahead and jump right into any Q&A
23 or raised hands, if any.

24 MR. HELFT: Well, I also want to thank
25 you, Mel. Thank you very much.

1 There are none, no raised hands or open
2 questions at this time, Messay.

3 MR. BETRU: Thank you, Bruce.

4 And we'll go ahead and move on to our
5 final presentation by Stacey.

6 Take it away, Stacey.

7 MS. TUTT: Thank you. And I do
8 appreciate this opportunity to come before
9 everyone today and discuss this very important
10 policy and considerations for consumers in
11 looking at its development.

12 So what I'd like to discuss is go a
13 little bit more into the question of -- and we've
14 already heard about the energy cost burden on our
15 low-income households -- but why might it be that
16 low-income households aren't choosing efficient
17 products or engaging in optimizing their energy
18 usage?

19 So if we can go ahead and turn to the
20 next slide here?

21 I think it's important to first
22 understand the burden that is on our low-income
23 households that are experiencing financial
24 scarcity and what that does to the decision-
25 making process for those consumers.

1 The visual here, actually, highlights a
2 book that I recommend on learning and
3 understanding the financial decision-making
4 process for those who experience scarcity of
5 resources. And largely, what the book covers is
6 the fact that financial scarcity unconsciously
7 captures attention, whether the mind's owner
8 wishes it to or not, and makes it harder for them
9 to focus on anything else.

10 And then what they do experience, as
11 well, is a bandwidth tax in which people are
12 forced to constantly focus on that most immediate
13 crisis which causes them to ignore other
14 decisions and this tunneling or focusing on the
15 most immediate or pressing financial need to the
16 exclusion of all others. This, in large part, is
17 why we have found that financial education is not
18 as effective as such methods as financial
19 coaching or being there with the person when they
20 need to make that important decision and
21 understand fully the cost-benefit analysis of any
22 decision that they are making.

23 We also can hear, too, that, you know,
24 one of the biggest problems for low-income
25 households with this, as well, is access to those

1 kind of higher-cost efficient products. We heard
2 that low cost is usually more inefficient with
3 that product usage.

4 But if we look at this financial scarcity
5 question and the decision making that occurs,
6 what often we see is that the consumer is faced
7 with a situation in which they may have had an
8 appliance break down, or that they've had to move
9 in which they now have to obtain a new appliances
10 for that property. And when those types of
11 things occur it's more of a crisis situation when
12 somebody is dealing with financial scarcity,
13 which makes it harder to think about those long-
14 term consequences of the less expensive product
15 and take into consideration that value of maybe a
16 higher priced, more efficient product instead.

17 And so looking at that analysis and
18 trying to do that, we have to keep in mind, when
19 people are acting in crisis, it is harder for
20 them to process the information, make decisions,
21 and weigh all of the relevant factors.

22 But one thing we do know about our low-
23 income households and communities is that energy
24 costs is such a significant burden for them that
25 they are continually looking for ways in which to

1 reduce those costs and find a better way to use
2 their resources instead of expending it on those
3 significant percentages of energy cost.

4 So if we can go ahead and go on to the
5 next slide?

6 I do want to share, as I call it, a
7 cautionary tale of the Property Assessed Clean
8 Energy Program, which is an area my clinic has
9 worked extensively on, both in representing the
10 homeowners that have had these assessments, as
11 well as working on policy and regulatory measures
12 regarding this program. Now what I'm showing you
13 here is just a bit of a legislative history of
14 this program and that's part of that cautionary
15 tale that I'm sharing with you.

16 So first, let me explain what PACE is.
17 PACE is the Property Assessed Clean Energy
18 Program which what that program was designed to
19 do was to provide up-front financing to allow
20 homeowners to make energy efficiency improvements
21 to their homes. As the up-front costs would then
22 be financed and then a lien would be placed on
23 their property which would allow the homeowner to
24 pay back those costs over an extended period of
25 time, sometimes as many as 20 years they had to

1 pay back those improvements. And the idea of
2 this and the design of the program was that the
3 energy efficiency improvements that would be
4 allowed would be limited to those that would help
5 to pay for themselves, that were on designated
6 product lists and would, hopefully, ensure then
7 that the homeowners would receive a net benefit
8 value from the program itself.

9 However, what you can see here is that
10 when the program was implemented, initially we
11 did not have any consumer protections put in
12 place. And, in fact, it took almost -- I think
13 we're looking here at about ten years to get even
14 the most basic consumer protections in place, and
15 also ensuring that there was a net gain, and that
16 the homeowners had an ability to pay back that
17 financing.

18 Now the one thing we've learned from PACE
19 is, is that our low-income homeowners want these
20 energy efficient improvements, that they look at
21 this as a way to benefit themselves, especially
22 when they're on a limited or fixed income.

23 One of the homeowners who often times
24 took advantage of the PACE Program were older
25 adults that had more significant equity in their

1 home. And what we may kind of characterize that
2 as is older homeowners who are equity rich but
3 they're income poor because they're on that fixed
4 income from their retirement benefits. And so
5 the idea of being able to have their homes become
6 more energy efficient, and then also looking at
7 their carbon footprint, was something we saw
8 again and again on why homeowners decided to
9 utilize this program.

10 However, because there weren't basically
11 consumer protections in place, regrettably, what
12 happened is that we did see fraud and
13 misinformation and unfair practices taking place
14 under this program when those consumer
15 protections were not taken into consideration
16 from the very beginning and development of the
17 program.

18 And now, regrettably, the PACE Program is
19 facing numerous class actions, different actions
20 that have been taken against the program
21 administrators and home improvement contracts
22 that have been operating under this program, for
23 the failure to appropriately disclose information
24 and make sure that the improvements that were put
25 in place were actually energy efficient, that met

1 those standards, and really helped homeowners to
2 make good choices about what they wanted to do
3 for energy efficient improvements.

4 One example of that is, though there
5 would be approved product lists, there were no
6 energy audits or assessments on what the home
7 really needed for energy efficient improvements.

8 So if we can go on to the next slide?

9 This right here shows some of the lessons
10 that were learned from PACE as they particularly
11 apply to our low-income households. And so what
12 we can see here is some of those recommendations
13 that I think can be taken into consideration now
14 is ensuring that there is careful explanation,
15 both written and verbal, in this situation. Now
16 in PACE, we're dealing with complex financing.
17 And so it's also a recommendation not to use the
18 financial sector jargon.

19 We've also heard about the importance of
20 ensuring that there is equal language access to
21 the information that is being provided to ensure
22 that there's, again, full, complete disclosure of
23 what's happening. And there needs to be
24 significant up-front communications, as well as
25 being realistic about how people tend to manage

1 their budgets.

2 And I would add a few more points to this
3 list that we saw with PACE, in particular, that I
4 think are relevant as we talk about the usage of
5 technology, as well as what disclosures need to
6 be made and what format that those need to occur.

7 So one, I would echo what we've heard
8 here today from my fellow panelists, as well as
9 others, is that low-income households have more
10 limited access to technology. One of the issues
11 that occurred in PACE is all the transactions
12 that were done were done through electronic
13 signatures and communications and electronic
14 disclosures.

15 Regrettably, then what we saw is, with
16 our low-income households, is that that
17 information actually wasn't conveyed to them.
18 Those individuals may or may not have had an
19 email address, which was particularly relevant
20 for our older adults. Many of our older adults
21 had no email address or information. And so
22 instead of providing the information in written
23 disclosures or in an up-front way that would help
24 the consumers make good decisions, that
25 information was transmitted through electronic

1 communications in which the homeowner didn't even
2 have access to the information.

3 So I think that using technology through
4 this or -- and providing information to low-
5 income households or older adults should be
6 carefully considered, given the lessons that we
7 have learned from this program.

8 What we also saw in the PACE Program is
9 that when the program administrators had an
10 eligible product list and they actually put a
11 maximum amount of what those products could be
12 sold for or financed for under the program, we
13 actually saw that it was often misconstrued in
14 such a way whereby which the home improvement
15 contractors used that as a way to up-sell the
16 products and only sell at the highest amount,
17 rather than what the cost was, and a
18 misconstruing of the information of actual cost
19 to the homeowners which, regrettably, inflated
20 those energy efficient improvements rather than
21 making them more cost effective and accessible to
22 low-income populations.

23 And so, again, these are just some of the
24 lessons that we learned through the Property
25 Assessed Clean Energy Program. And as I said,

1 just a cautionary tale as we move forward with
2 this on how we can assure that low-income
3 households and older adults have equal access to
4 information, as well as the energy efficient
5 measures that we would want to take. And, again,
6 I would echo much of what my fellow panelists
7 said on different measures and thoughts in
8 protecting consumers within this program.

9 Thank you.

10 MR. BETRU: Great. Thank you so much,
11 Stacey. I really like the idea that you were
12 hitting home regarding some of the
13 inaccessibility issues with the older tenants,
14 whether that be an email address of understanding
15 what an electronic disclosure document might look
16 like, so thank you again.

17 While Commissioner is dealing with a
18 phone call, let's go ahead and jump right into
19 the question and answer or raised hands, if any.

20 MR. HELFT: There are none at this time,
21 Messay.

22 MR. BETRU: Okay. Great. Thank you,
23 Bruce. All right.

24 So with that, we have heard from the
25 individual panelists. So let's go ahead and move

1 on to the discussion portion of the panel.

2 Next slide please.

3 So with the conclusion of those thought-
4 provoking presentations, let's go ahead and think
5 about the following questions. The first one,
6 the first question I'll open up to everyone.

7 What mechanisms can be implemented to
8 ensure equity considerations are woven into the
9 Flexible Demand Standards?

10 So we kind of talked about this broadly
11 but I wanted to see if there were any specific
12 thoughts regarding what a transactive mechanism
13 might look like with regards to, I don't know,
14 that could be like load protections? What about
15 any communicative mechanisms like that a smart
16 appliances might be required to have?

17 And I'll pause there.

18 MS. DRYDEN: I think, Messay, I'll take a
19 crack at it first and provide some thoughts there
20 on some things I kind of didn't cover.

21 I think there's a couple of things that,
22 you know, I was thinking about in terms of, I
23 guess part of it is, into the Flexible Demand
24 Standards. But maybe we could also expand that
25 to offerings as well.

1 So one thing I would say is to be
2 effective, I think a number of these efforts and
3 kind of technologies that we want to target
4 should be integrated into electrification
5 retrofits because I think there's a number of
6 things where a number of households could have
7 really limited appliances that would be available
8 because they may happen to be gas appliances at
9 this time. And some of that could be seen, like
10 in like Climate Zones 7, 8, and 9 where we just
11 see like single-point space heating that's gas,
12 with no air conditioning, and they have water
13 heating that may be gas. And so I would say to
14 try to reach these households, we need to make
15 sure that there's appliances in there that can
16 benefit and that can be connected. So I think
17 that's one, just kind of, a coupling.

18 The other thing I was thinking about is,
19 you know, again, as I think about renter
20 populations and/or multifamily, thinking about
21 the appliances that are in every home because
22 often renters are not supplying those appliances.
23 And I think Ashley touched on this earlier, like
24 everybody's got a water heater. Everybody's got
25 a refrigerator. So kind of thinking about

1 prioritizing those.

2 What we've seen in some of our data, like
3 dishwashers and laundry don't exist to the number
4 of apartments. And even if dishwashers exist,
5 they're not used, so kind of figuring out how to
6 prioritize those loads is one thing.

7 And then the other, I guess I would add,
8 just in terms of Demand Standards, is are there
9 particular things that we need to look at for,
10 and I'll take water heaters as an example, for
11 like system sizing, ensuring that mixing valves
12 are installed, ensuring that there are certain
13 temperature set points so folks, and particularly
14 in higher population households, can still
15 benefit from the opportunities?

16 MS. HALL-CRAWFORD: I'll address a couple
17 of the questions. I mean, I think I mentioned
18 them in my presentation, lack of access to
19 information. It's about education. It's about,
20 you know, non-English materials so that people in
21 ethnic communities can understand the program.
22 And I have to say, in talking with some of my
23 colleagues in the consumer advocacy community, it
24 takes time. It's going to take time. And I know
25 the Commission wants to move on this quickly but

1 just, you know, it is going to take some time.

2 And with regards to consumer interests in
3 flexible demand appliances, I think it feels to
4 me like it's relatively new. So consumers,
5 again, need to be educated.

6 That's it from me.

7 MS. TUTT: And I would like to add on
8 another aspect to this, when we look at lack of
9 access to information, and again, going back to
10 looking at what happened under the PACE Program,
11 but what we saw with that program in particular
12 for having access to the information, and again,
13 thinking about that financial decision-making
14 process and when people are able to engage and
15 make that decision, one of the reasons PACE was,
16 I think, so effectively marketed and used as,
17 actually, door-to-door solicitation because they
18 met people where they were at. They didn't need
19 to go out and search out the information or
20 obtain it in some other way. And, instead, that
21 information was just directly provided to them in
22 that moment to allow for that decision to be
23 made.

24 Now, regrettably, what that did in the
25 PACE Program is mean that people were not

1 educated on all the different aspects of it. And
2 the only person who was there to really provide
3 that information was the solicitor who actually
4 had an interest in the homeowner signing up for
5 that program.

6 And so that's another cautionary tale, I
7 guess, on access to information is that, though
8 door-to-door solicitation was a very effective
9 way to meet consumers where they were at, it was
10 the incentivizing of the solicitors to enroll
11 people actually backfired within the program
12 itself. And it kind of incentivized them to up-
13 sell or do price gauging within the products
14 themselves.

15 And so, instead, some of the things that
16 have been looked at in this, and one of the
17 things that we've looked at before as we were
18 helping to look at how to help those experiencing
19 financial scarcity to make those financial
20 decisions, is partnership with a number of the
21 community organizations that really help
22 consumers in these particular situations.

23 For example, there are a number of what
24 we call financial opportunity centers that are
25 put on by SparkPoint, is just one that I can

1 think of, that actually provides financial
2 coaching to consumers to help them make effective
3 decisions. They look at their budget. They look
4 at way to save costs and that, as well as
5 maximize benefit programs, like weatherization
6 and other things, in order to help affect that
7 monthly budget in a very concrete way with
8 information provided to the consumer at the time
9 they need it and to make that decision.

10 Often times, they even have savings
11 programs to help map savings to invest in, maybe,
12 energy efficient appliances or things of that
13 nature that would actually help the budgeting
14 circumstances of those low-income households or
15 populations.

16 And so I think if we look at access to
17 information, it is important that that access is
18 there, that it is done. But I, again, would echo
19 a number of the recommendations, I think Mel made
20 it in hers, as well, is engaging with those
21 community organizations.

22 Also, if we have the individuals that are
23 already working within those communities, working
24 with them because they built that trust and
25 relationship and have an understanding of the

1 needs of the populations that they serve.

2 MR. BETRU: Okay. Great. Thank you.

3 Thank you so much for that feedback and

4 discussion.

5 Moving along, I think we kind of already

6 touched on the lack of access to information, so

7 let's move on to the third question and take a

8 step back a little bit and more broadly think

9 about thinking about the barriers that exist

10 today and anticipating what might happen long-

11 term, what do we think that might look like?

12 MS. TUTT: Well, I think -- and I may

13 have touched on this too much, so I'll definitely

14 make sure I don't talk too long so the other

15 panelists can join in here. But, you know, I

16 think one of the barriers that we see, again,

17 just representing low-income populations in this

18 respect, is that ability to make the up-front

19 investment in this or to bear the cost or the

20 burden of that new, maybe more costly appliances.

21 And that, really, just that up-front cost is that

22 barrier for so many.

23 And I did notice that someone had posted

24 in the Q&A about, "Are there any programs that

25 help Californians assist in own or lease EVs and

1 things of that nature?" And I think that would
2 be important in looking to ensure that there is
3 equal access. And equity and opportunity is
4 recognizing that as a significant barrier that is
5 there.

6 In addition to that, we cannot forget
7 that barrier of access to technology, the Wi-Fi
8 problems, or access to internet. And that
9 ability to have Wi-Fi can be very problematic for
10 a number of our households. And so I think until
11 that barrier is addressed it will continue to be
12 a problem as we look at these issues.

13 MR. BETRU: Yes. I think affordability
14 can be a major stumbling block here and tomorrow.
15 I really do like the financial mechanisms of the
16 Clean Vehicle Rebate Program that made EVs more
17 affordable. And I think maybe mimicking that
18 model can be really crucial to adopting flexible
19 appliances.

20 Does anyone have anything else to think
21 about implementation for the future?

22 MS. HALL-CRAWFORD: Well, I had
23 mentioned earlier that, you know, if there could
24 be a subsidy given to low-income households,
25 disadvantaged households and communities, modeled

1 after the Weatherization Program, that might be a
2 place to start.

3 MS. DRYDEN: I would just add on, you
4 know, as we think about this, you know, what's
5 the opportunity to align standards for other
6 programs, like energy savings assistance program,
7 like low-income weatherization? Adjusting the
8 standards of federal programs might be a little
9 bit more challenging. But how can we look to
10 align those programs so when appliances are
11 getting replaced and they're covered for low-
12 income populations, that we get something in
13 there that aligns with Demand Flexibility
14 Standards and we're not trying to, again, go
15 back; right?

16 I think one of the things I've seen in
17 terms of working with low-income customers is,
18 you know, getting the time and getting in the
19 home is the biggest effort. And I think the
20 opportunity is, once we're there, how can we
21 aggregate all the resources that, ideally, are
22 harmonized in their standards to deliver kind of
23 maximum benefits to the customers?

24 So I think from an implementation
25 standpoint, I think, you know, this is new. And

1 I know there's all these programs in these
2 different silos. But an opportunity to try to
3 figure out how to align things or kind of weave
4 them together to be complimentary would be hugely
5 beneficial.

6 I also think the rate structure will
7 definitely be, you know, something to consider,
8 too, particularly if it's -- you know, if we're
9 fuel switching and there's not solar PV, and we
10 don't have a favorable TOU electrification rate,
11 you know, we may need to think about things in
12 the short term to minimize utility costs.

13 MS. HALL-CRAWFORD: The other barrier, I
14 think, is the people who work the evening and
15 night shifts, the nontraditional work hours, you
16 know, how do they fit into this program, or can
17 they? So I don't have the answer but it's an
18 important question to look at.

19 MS. DRYDEN: One of the things I wanted
20 to add, because I saw a question, just in terms
21 of like replacement upon failure, I don't think
22 that's something unique to low-income
23 populations. I think it's something we're
24 addressing kind of across the Board in the market
25 in terms of when we have a failed appliance, and

1 particular like space conditioning appliances,
2 you want to get that rectified as quickly as
3 possible.

4 And so, you know, our challenge, it's
5 often easy to do like-for-like. And I think our
6 challenge is working with the market and working
7 with installers and contractors and distributors
8 and retailers to kind of make appliances that
9 we're looking for kind of more accessible, you
10 know, easier to access so they can be turned to,
11 you know, in that regard, versus kind of
12 perpetuating appliances in there that we cannot
13 connect to.

14 MS. TUFF: And then, also, on that
15 question that was posed, I just wanted to add
16 another point in there about what happens when
17 there is a failure of one of these major systems.
18 And, regrettably, what we see when there's that
19 failure, most of our homeowners have not even
20 \$500 in savings. I think I've seen a number of
21 reports that show how few Americans have more
22 than \$500 in savings or that ability to meet a
23 crisis like that with their current financing.

24 Regrettably, then what we see with our
25 low-income households, or even our older adults

1 who have less income coming into the home and,
2 again, maybe just the equity in their property,
3 their access to credit is extremely limited.
4 And, in fact, most of the time what they have to
5 do is seek out high-interest, high-cost financing
6 in those emergency situations, payday loans,
7 things of that nature, with such significant
8 interest and cost being there that, if they're
9 even able to get access to that high-cost credit,
10 it ultimately will create that debt spiral and
11 respond in other problems of other bills and
12 things not being paid as they were forced to make
13 that, again, that scarcity, that tunnel-vision
14 decision and then suffer later the long-term
15 consequences.

16 I have worked a great deal with
17 foreclosure prevention. And I've actually seen a
18 number of homeowners come in facing foreclosure
19 that was actually brought about because of maybe
20 the loss of a furnace or things of that nature
21 and they need to immediately invest and instead
22 of being able then to meet their ongoing monthly
23 expenses.

24 So I think it's very significant. And
25 these costs are very significant to the

1 populations we serve. And it will remain a
2 barrier to the households to be able to access
3 this if there's not a better way to effectively
4 deal with the up-front costs.

5 MR. BETRU: All great, great points, so
6 thank you so much for that. Let's move on to the
7 last question.

8 So what do we think consumer interests
9 will look like for flexible demand appliances?
10 Are there some key attributes that we need to
11 consider specifically? And, if so, do they need
12 to be grouped by, for example, by appliances
13 type, or should it be segmented in another way?
14 But how do we make sure that these consumer
15 interests are indeed met, first and foremost?

16 MS. DRYDEN: I have one comment. I'm
17 sorry, I'm not sure. It's tangential to the
18 question, I think, somewhat related, but I just
19 want to make sure it's kind of tagged in this
20 conversation.

21 I think in terms of what our consumers'
22 interest in it -- right? -- may also depend on
23 what kind of building they live in. And so I
24 think that's just something to consider. And
25 I'll just throw out there, like the centrally

1 metered versus tenant metered.

2 If I'm in a tenant metered building, I
3 can -- my interest in this would be a convenient
4 appliances that is accessible that I could use
5 that is not too constraining on my schedule;
6 right? But I'm going to see those benefits of it
7 because I am directly paying the utility bill. I
8 may not have the choice in the purchase of that
9 appliances though. So, again, I think my
10 interest in that benefit may not be the same
11 interest as the purchaser of the appliances, or
12 the landlord.

13 In a centrally metered property, you
14 know, owner may have some interest in providing
15 flexible demand appliances. But as the tenant,
16 am I going to get the signal, am I going to get
17 the benefit of it, I'm not paying the utilities
18 directly, and so that kind of response so loads
19 and benefits may not come to me as an individual
20 because of the structure of the metering, and
21 because of the utility allowances.

22 So I just wanted to put that out there
23 because I think it's an important consideration
24 as we're thinking about what's the consumer
25 interest and say who's the consumer; right? But

1 when, I think, Mel, you had brought this up, like
2 who's buying it or who's using it and how do we
3 kind of benefit probably both parties, you know,
4 given the relationship?

5 So I know it's slightly tangential but it
6 crossed my mind. You know, it's something I've
7 been thinking about, and I just wanted to make
8 sure that it got shared.

9 MR. BETRU: Well, I think you hit on some
10 valid points there, too. I've heard stories of,
11 you know, people in multi-unit dwelling
12 apartments or otherwise do not pay their water
13 bill. It's shared by the entire building so they
14 have no incentive to save water; right? Unless
15 their tenant bears down and sends a message. So,
16 you know, we have to make those considerations
17 when adopting an efficient or a smart water
18 heater; right?

19 So with that, is there any final closing
20 comments? All right.

21 Well, thank you so much, panelists and
22 stakeholders. So that will conclude the time
23 that we have for Panel 3.

24 MS. HALL-CRAWFORD: Thank you.

25 MR. BETRU: Thank you so much.

1 Let's move to the next slide please.

2 So doing a time check, it's currently
3 3:44, let's be cognizant of the agenda. And just
4 as a quick reminder, we'll be jumping into the
5 public comment period next. And then the
6 conclusionary portion of the workshop will
7 follow.

8 Next slide please.

9 So this public hearing is being recorded
10 by a Court Reporter. And all statements today
11 will become part of the public record.

12 Just a few housekeeping rules.

13 All attendees are muted. If you have
14 questions, you may type them into the question
15 and answer function and they will be forwarded to
16 the moderator.

17 If on the phone, please raise your hand
18 by pushing star nine and the host will give you
19 the ability to speak. Then you can push star six
20 to mute and un-mute.

21 As a reminder, comments may be limited to
22 three minutes per person and one person per
23 organization. Prior to speaking, please state
24 your name and affiliation.

25 MR. STRUVEN: And before we start, let's

1 give the Court Reporter a quick five-minute
2 break.

3 MR. FERRIS: Perfect. Thanks. Thanks
4 Nich.

5 So we'll come back at, basically, about
6 3:50, 3:52, I guess.

7 (Off the record at 3:45 p.m.)

8 (On the record at 3:50 p.m.)

9 MR. FERRIS: Okay, we'll get into the
10 closing comments.

11 Messay, do you want to repeat the public
12 comment rules, must for convenience, and then
13 we'll get started?

14 MR. BETRU: Sure.

15 So this public hearing is being recorded
16 by a Court Reporter. And all statements today
17 become part of the public record.

18 As I note, all attendees are muted. If
19 you have questions, you may type them into the
20 question and answer function and they will be
21 forwarded to the moderator.

22 If on the phone, please raise your hand
23 to speak by pushing star nine and the host will
24 give you the ability to speak, and then you can
25 press star six to mute and un-mute.

1 Comments may be limited to three minutes
2 per person and one person per organization.
3 Prior to stating your comment, please state your
4 name and affiliation.

5 (Pause)

6 MR. BETRU: Bruce, can we check to see if
7 we have any comments?

8 MR. HELFT: All clear.

9 MR. BETRU: Okay. I'll pause for a few
10 more seconds to make sure no one is missed.

11 (Pause)

12 MR. BETRU: Okay. And with that, we can
13 go ahead and move to the next slide please. I'll
14 pause again for last call for comments.

15 COMMISSIONER MCALLISTER: So, Messay, is
16 that my queue? This is Andrew McAllister.

17 MR. BETRU: No, Commissioner. I just
18 wanted to also confirm that we have the Court
19 Reporter back --

20 COMMISSIONER MCALLISTER: Oh, got it.
21 Okay.

22 MR. BETRU: -- before moving forward,
23 so --

24 COMMISSIONER MCALLISTER: Great.

25 MR. BETRU: -- please bear with us.

1 COMMISSIONER MCALLISTER: Okay. Great.
2 I wasn't hearing -- if there are public comments,
3 obviously, we want to get those in.

4 MR. BETRU: Okay, if there are none, I'll
5 go ahead and pass it off to Nich.

6 MR. FERRIS: Commissioner, did you want
7 to say something before we let Nich do the
8 closing remarks?

9 COMMISSIONER MCALLISTER: Whatever the
10 best -- I was hearing no public comment and so I
11 was thinking we were, basically, ready to go.

12 But, Nich, do you want to go ahead and
13 I'll just wrap up and adjourn after that?

14 MR. STRUVEN: Yeah, we're ready to go, if
15 you wanted to say anything?

16 COMMISSIONER MCALLISTER: Yeah. I think
17 this has been a complete day. I wanted to just
18 commend all the presentations, all the
19 presenters, both in the morning and the
20 afternoon. We hit, I think, the big ticket items
21 that we need to think about in order to begin to
22 develop, really, a rulemaking infrastructure for
23 this enterprise which, you know, it needs a
24 frame, it needs a super structure. And then as
25 we get started with prioritization, figuring out

1 which device categories and technologies we want
2 to include in this discussion, and then which
3 device categories, actually, we're going to begin
4 to move ahead first with -- to develop actual
5 regulations and actual requirements that then
6 would have the force of law.

7 So, obviously, we don't do this lightly.
8 And the reason we're doing it is because it will
9 create tremendous value for the State of
10 California, the citizens of California by, as we
11 heard in the morning, I think pretty clearly, and
12 many of us strongly suspect or even think we
13 know, by producing really kind of a trifecta of
14 optimization of the electricity grid that
15 improves reliability, and decarbonization in, you
16 know, some flavor and some magnitude, and also
17 lowering costs.

18 And those three are really the big --
19 those are the big three, the trifecta of what we
20 need going forward as we move, as we really scale
21 up our electric system, as we onboard a lot of
22 new loads, both in the electric transportation
23 sector, as well as the -- as well as in the
24 building sector, and as we try to free up space
25 in the grid to optimize investment with those new

1 loads coming on.

2 So lots of real excitement here. And,
3 you know, fortunately, we have lots of good
4 technology, we heard about much of it today, but
5 we can always do better. And we can invest
6 through our EPIC Program, work with our sister
7 agencies, and partner with innovative firms in
8 our broader economy. And, certainly, we must
9 focus on the disadvantaged communities, low-
10 income sector, multifamily buildings, existing
11 building retrofits, bring a lot of capital to
12 places where it doesn't always appear just on its
13 own. And so we really do need to be paying good
14 attention.

15 And so all of the stakeholders that we've
16 heard today, I've been very happy with the
17 attendance, maxed out at 180 or so. And thanks
18 to all of you who have stuck it out throughout
19 the day. But really happy to get this train
20 moving down the track.

21 And, finally, thank you to Staff's
22 extreme competence throughout the day. And I
23 really have faith that we've got the right team
24 on this to move it forward and prioritizing DR
25 responsibly. So really, really looking forward

1 to what the future holds on this and thanks very
2 much.

3 And I'll pass it back to Nich.

4 MR. STRUVEN: Well, thank you,
5 Commissioner.

6 Today we've heard from subject matter
7 experts that have talked about many aspects about
8 flexible demand appliances. And most important,
9 we've heard from you, the stakeholders. Thank
10 you.

11 Today, Staff introduced Senate Bill 49
12 and highlighted the work that will be
13 incorporated into Flexible Demand Appliance
14 Standards. The Flexible Demand Appliance
15 Standards plays an important role in achieving
16 California's ambitious goals to decarbonize
17 California's energy, transportation, and building
18 sectors, consumers savings on electricity bills,
19 electricity grid reliability, and improving air
20 quality, and Staff values your input.

21 Today was the Lead Commissioner Workshop
22 to request comments from the public. Staff will
23 review and analyze comments received. Commission
24 Staff will have future meetings to discuss
25 comments on proposals for Flexible Demand

1 Appliance Standards. Shareholders are encouraged
2 to sign up for the load management LISTSERV to
3 receive updates and notices on this topic. Note
4 that this is the load management LISTSERV.

5 The table shows approximate dates for key
6 milestones for pre-rulemaking and rulemaking
7 schedules. Staff plans to recommend to the CEC
8 for adoption the first Flexible Demand Appliance
9 Standards in the third quarter of 2022, with an
10 effective date one year after adoption.

11 Thank you for your comments today.
12 Please submit your comments in one of the three
13 following ways before 5:00 p.m. on January 4th of
14 2021. We welcome your comments.

15 This slide shows the CEC team that has
16 been created to develop Flexible Demand Appliance
17 Standards. Thank you for your hard work and
18 dedication to prepare for the workshop today.

19 And, finally, the last slide. Here's our
20 contact information for those that wish to reach
21 out to us directly.

22 This concludes the meeting. Thank you.

23 (The workshop concluded at 4:00 p.m.)
