## **MultiPurpose Ring Pontoon SemiSub Deep Sea Floating Wind Power**

The MPSS developed in the UK in 1990 to provide a zero heave drilling and production for oil production in deep seas is now "the standard" and used in GOM, South China SE and Brazi; mooredl in depths down to 8000 feet. Its resistance to wave induced motions make it suitable for floating wind.

Costs will be greatly reduced since there is no requirement to design for hazardous gases. Costs can be further reduced by building the hulls from concrete as done in WW1 and WW2.
