CSP solutions for California missing in EPIC4 draft

We can provide rooftop heating and electricity for Buildings to reduce their GHG emissions.

I am surprised no mention of CSP was made in the draft though California gets enough solar radiation.

This solution is solid state based and enables many LMI communities to benefit from the free solar resource available in California for HVAC and electricity. Please consider these new technologies for RD&D. California can have rooftop mini virtual power plants on buildings that reduce their GHG emissions.

Best regards.
