Wildfire mitigation measures are currently lacking in EPIC 4's plan

Delphire Inc is working to develop remote monitoring systems with the goal of reducing the damage from devastating wildfires in California.

Grid related wildfires accounted for 30% of all acres burned from just 10% of the overall fires because they often start in remote locations and go undetected for too long. Our system aims to tackle a combination of targeted preventative grid maintenance enabled by live remote inspections, together with early detection and accurate reporting of wildfires.

Even a 30% reduction in the grid related acres burned that we expect to achieve from deploying our system is equivalent to taking 6 million cars off the road and 360 million less gallons of jet fuel burned each year.

We also aim to provide nearby communities, which are often disadvantaged rural communities, with an early warning system so that they can evacuate safely (unlike what happened in Paradise).
