Keep Diablo Open

As an engineer for a Utility in NJ, I know how crucial keeping this plant open is to the state of California. Closing it would be the worst decision possible. You will not be able to support peak loads and will have rolling blackouts. Energy prices will double and triple, just look at Germany who is now burning coal (the Green Party) to meet energy demands. What is really "green" or ESG has always been a misconception, set an example for the rest of the world and choose nuclear. Years from now you will be praised for going against the norm and actually making a difference for protecting our climate.
