DCPP Closure Would be Colossal Mistake

The original backroom agreement to close DCPP was not based on science or economics, but was driven by anti-nuclear sentiment coupled with the fact that PG&E would make more money from new expensive renewables than from the depreciated DCPP. DCPP closure would increase California's use of fossil fuel and increase costs to California ratepayers. The seismic safety of DCPP has been reaffirmed by the NRC, and it continues to be a reliable source of 24/7 carbon-free electricity. DCPP is the largest source of carbon-free electricity in the state and the prolonged drought has increased its percentage. The facts support the continued operation of DCPP.
