Radiation fear is the real killer

Diablo Canyon won't harm anyone.

Fear kills many more people than does radiation. No one was harmed by radiation from the Fukushima accidents, but over 1000 people died from evacuations commanded by frightened, ignorant political leaders. In a radiological emergency the proper precaution is to shelter in place.

In New Hampshire, Seabrook's operators and the ultraconservative NRC monitor radiation exposure levels, limited by regulation to be 1 milliSievert PER YEAR to anyone outside the plant boundary. Radiation regulation levels are simply warnings for action, not danger levels. It would take an exposure of 1000 milliSieverts AT ONCE to raise a person's lifetime risk of cancer from 40% to 45%. Impartial data at OurWorldInData.org shows that nuclear power is the safest electric power source.
