Being Reasonable

With automobiles, cooking, and heating energy increasing demand on the electric grid in an effort to decrease CO2 emissions, it does not make any sense to also remove the state's single largest source of clean, electric power merely to replace it with natural gas or other newly constructed generation. A reasonable and pragmatic person recognizes that nuclear energy's real, direct benefits outweigh its statistically-unlikely drawbacks. Now is not that time to take a step back and literally remove clean power from the grid, it is the time to forge ahead with all available clean resources and technologies.
