Decommissioning DCPP will create more natural gas plants

Diablo Canyon Power Plant is the last nuclear power plant in California and provides nearly 10% of Californias power. By taking this power plant offline, will California not only spend millions of dollars tearing down a still running power plant, but will create a demand for power that will only be met by natural gas power plants. This has happened before in California. When San Onofre Nuclear Generating Stations(SONGS) were decommissioned, the power that SONGS would have provided, was provided instead by natural gas plants, creating pollution and contributing to climate change. This cycle should not continue again with Diablo Canyon Power Plant. By keeping Diablo Canyon Power Plant open, we will keep supplying clean power to California, prevent harmful greenhouse gasses from being emitted, and keep California as one of the greenest states.
