Keep Diablo Operational

Neither California, the US, nor the world is anywhere near reducing GHGs enough to avoid a climate cataclysm. While there are risks to keeping Diablo Canyon open, they are dwarfed by the risk of adding more fossil fuel combustion and the attendant GHGs. As it stands, taking Diablo offline will require more natural gas-fired electric generation for the next 10-20 years. Keeping Diablo operating until the state has reliable, renewable baseload power is the lesser of two evils.
