Energy System Reliability

Complex large scale energy projects act like monopolies. As such they tend toward rigidity and inefficiencies that detract from the energy resilience that we need in facing the multiple and fast-changing conditions of global warming.

According to Food and Water Watch, we can have the energy we need, without mega projects, and will actually get more for our money. We will end up with more water without the drain on our resources of the mega projects. Less is more, with the power and resilience with renewable energy.
