Save Diablo Canyon Nuclear Power Plant

The Diablo Canyon, as a carbon-free power source must be kept in operation if California has any hope of meeting climate mitigation goals, which intermittent and space and materials-intensive solar and wind sources cannot achieve, except with fossil fuel backup, as scientific and engineering data shows.

Diablo Canyon is a wonderfully compact, energy-dense and safe plant that was built to last indefinitely, and whose site can accommodate more reactors, which should now be considered for construction, especially following the unnecessary and counterproductive closure of the San Onofre plant, and owing to the state's increasingly desperate need for clean water for agriculture and public consumption, which Diablo Canyon can provide in addition to supplying low cost electricity for the region.

Gavin Newsom has apparently finally come to his senses, and can now undo the harm inflicted by Jerry Brown, and misguided anti-nuclear environmentalists, Greenpeace, Friends of the Earth, and the NRDC.
