Removal of Evaporators

I ask that you reconsider removing Evaporators from the list of eligible technologies. In general, the need for concentration of fruit and tomato products is an essential part of processing as it greatly reduces the carbon footprint of related transportation and storage costs. MVR technology combined with Evaporation has been proven to drastically reduce energy consumption, and MVR compressors can be configured to be powered by either steam turbines or electric motors. Evaporation systems with electric MVR's have a steam (natural gas) consumption of essentially zero.
