Large-Scale Centralized Hydrogen Solicitation Concept

One aspect of Hydrogen producing technology that is often overlooked is where the equipment comes from. We cannot call this green hydrogen production if the equipment is manufactured or fabricated in another state and trucked over on a diesel truck or shipped over on a ship from another country. The initial construction of these facilities offers a small population of California a benefit, but our manufacturing community is often left behind. I suggest a way to incentivize full production in California to offer the best benefit to Californians, not only with the health benefits that come with green technology, but the opportunity to have a career in a healthier community. This is not an unattainable request; the Raven One project fully fabricated its facility here in the state.
