Solving the California EV Charging station problem in 16 months

My name is Michael W., I'm part of a group of technologists that specialize in building out EV Charging stations solutions worldwide. We're a California based company and will be headquartered here as well. We have developed a unique EV charging infrastructure solution that solves several problems with one single solution.

THE PROBLEMS:

1. The lack of EV charging stations availability throughout the state and the nation!

SOLUTION: We have solved this problem 3 years ago with our full on solution by covering more locations than any other EV infrastructure company can do today. We can build out less locations with our solution, save money and service more EV cars throughout the state of California than any other EV charge company is implementing today because of our proprietary EV solution. With our solution, we can cover the entire state of California with EV chargers in less than a year of build out, the competition has plans to build 20,000 new locations that will not meet demand, and they require 3 to 4 years of infrastructure build out.

2. Inoperable Charging stations. Today's EV charging stations have a 20% consistent non-operating record!

SOLUTION: In other words, All EV charging stations are broke or not working each day somewhere in the country: We have solved this problem as well, because our stations are never down or not operating because of our proprietary solution. We have eliminated the downtime of all our EV charging stations in our network with our proprietary solution.

3. No one is repairing their own EV charging stations once they're installed. This is pervasive throughout the Nation with all EV manufactures and installers!

SOLUTION: Because of our proprietary EV solution, we have solved this problem as well, because we repair our own EV Stations every day no matter the locations. We service our own stations, we replace any broken or non-working EV charge stations each day, we also do our own maintenance because of our technology that can tell us when a charging station is down or not working, and we can repair them in real time each day from our location with our own proprietary solution. No one in the industry can make these claims today

4. The EV charging infrastructure is not safe or secure for women and children on the road!

SOLUTION: We have solved this problem with our single solution. Women and children can feel safe because our EV charging stations have security built into the system, and we protect each of our locations. In the winter, people are safe with our solution. In the middle of the night, people can be assured they will be protected with our EV charging

solution. No other EV charging company can make these claims.

Thank you
